contractId	String	ID of the Contract record that you want to sync with the cancellation quote.	Optional	62.0
opportunityId	String	ID of the Opportunity record that you want to sync with the cancellation quote.	Optional	62.0
outputRecordId	String	ID of the quote or order that you want to cancel.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
`outputRecordType`	String	Type of cancellation record that you want to create.	Required	62.0

Response body for POST

Cancellation

Asset Renewal (POST)

Initiate and execute the renewal of an asset.

Special Access Rules

To use this API, you need the InitiateRenewal API permission set.

Resource

```
/connect/revenue-management/assets/actions/renew
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/revenue-management/assets/actions/renew
```

Available version

62.0

HTTP methods

POST

Request body for POST

JSON example

```
{
  "assetIds": [
    "02iSG0000003NMhYAM",
    "02iSG0000006DvSYAU"
  ],
  "contractId": "800SG00000CFpepYAD",
  "opportunityId": "006SG000004W5tVYAS",
  "outputRecordId": "801SG00000DX1jWYAT",
  "outputRecordType": "Quote",
  "renewalEndDate": "2024-10-03T23:59:59",
  "renewalStartDate": "2023-10-04T00:00:00"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`assetIds`	String[]	IDs of the assets that you want to renew.	Required	62.0

Name	Type	Description	Required or Optional	Available Version
contractId	String	ID of the Contract record that you want to sync with the renewal of the Quote or Order record.	Optional	62.0
opportunityId	String	ID of the Opportunity record that you want to sync with the renewal quote.	Optional	62.0
outputRecordId	String	ID of the Quote or Order record that you want to renew.	Optional	62.0
outputRecordType	String	Type of renewal record that you want to create.	Required	62.0
renewalEndDate	String	End date of the renewal process for the assets.	Optional	62.0
renewalStartDate	String	Start date of the renewal process for the assets. Required for early asset renewals and renewing expired assets, using today's date or a future date.	Optional	62.0

Response body for POST

Renewal

Clone Sales Transaction (POST)

Create a clone of a sales transaction, such as a quote or an order. You can also clone a quote line item or an order item record with its related records and configurations.

This API supports the cloning of records for these objects.

- Quote
- QuoteLineItem
- OrderItem
- QuoteLineGroup
- Order
- OrderItemGroup

You can clone all items in a quote line group or order item group when the record to clone is a quote line group or an order item group record.

Resource

```
/connect/rev/sales-transaction/actions/clone
```

Resource example

```
https://<varname>yourInstance</varname>.salesforce.com/services/data/v64.0/connect/rev/sales-transaction/actions/clone
```

Available version

64.0

HTTP methods

POST

Request body for POST

JSON example

This is a sample request to clone a record within a sales transaction.

```
{
  "recordIds": ["0QLxx0000004CBYGA2"],
  "salesTransactionId": "0Q0xx0000004CE0CAM"
}
```

This is a sample request to clone all line items in a ramped group within a sales transaction.

```
{
  "recordIds": ["0QLxx0000004CBYGA2"],
  "salesTransactionId": "0Q0xx0000004CE0CAM",
  "options": {
    "lineScope": "AllLines"
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`recordIds`	String[]	ID of the record to be cloned. You can specify a single record ID only.	Required	64.0
`salesTransactionId`	String	ID of the sales transaction related to the record IDs to clone.	Required	64.0
`options`	Clone Options Input	Specifies options to clone a ramp segment within a sales transaction. You can clone only the last ramp segment.	Optional	65.0

Response body for POST

Clone Sales Transaction

Create Promotions (GET, POST, PUT)

Get rewards based on a product selling model template.

```

```
    "0QLxx0000004E7eGAE",
    "0QLxx0000004GCeGAM",
    "0QLxx0000004E7gGAE"
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`lineItemIds`	String[]	List of line item IDs to evaluate for promotions. The object type is auto-determined from the sales transaction ID.	Required	66.0
`salesTransactionId`	String	The sales transaction ID, such as an order ID or a quote ID, for the promotion evaluation.	Required	66.0

Response body for POST

Get Eligible Promotions

Initiate Downgrade (POST)

Move to a lower-tier or lower-value product. The change is tracked as a downgrade request with linked asset actions and quote or order line linkage for reporting and auditing. This API creates an amendment quote and order with downgrade-specific order actions and quote action subtypes.

After assetization, the original asset receives an asset action with business category as Downgrade (or equivalent). This step indicates that the downgrade-from product and the new asset is created with an asset action (downgraded to), with relationships between the two. This step also enables sales reps to process downgrades and makes sure that downgrades are auditable and reportable separately from cancellations and new sales.

Resource

```
/revenue/transaction-management/assets/actions/downgrade
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/revenue/transaction-management/assets/actions/downgrade
```

swapGroups	Swap Group[]	Groups that contain the asset details for the downgrade.	Required	66.0
swapStartDate	String	Amendment start date for the downgrade action.	Required	66.0

Response body for POST

Initiate Downgrade Response

SEE ALSO:

Salesforce Help: Swap, Upgrade, or Downgrade Assets

Initiate Swap (POST)

Exchange one product for another of equivalent or different value. The change is tracked as a swap request with linked asset actions and a net-zero order total where applicable. The API creates an amendment quote and order with order actions and quote action subtypes.

When the order is assetized, the source asset gets an asset action with business category as `Swap` (reduced quantity). The new asset is created with an asset action that identifies it as swapped in, with relationships that link the swapped-from and swapped-to assets. The swaps are auditable and reportable separately from cancellations and new sales. This API also supports use cases such as trading unused licenses for credits or moving spend between products while preserving contract intent.

Salesforce Help: Swap, Upgrade, or Downgrade Assets

Initiate Upgrade (POST)

Move a lower-tier product to a higher-tier product. The change is tracked as an upgrade request with linked asset actions and quote or order line linkage for reporting and auditing. This API creates an amendment quote and order with order actions and quote action subtypes.

The original asset receives an asset action with an `Upgrade` (or equivalent) business category. This step indicates that the upgrade-from product and the new asset is created with an asset action (upgraded to), with relationships between the two. This step also enables sales reps to process upgrades and makes sure that upgrades are distinguishable in reporting and analytics from cancellations plus new sales.

Instant Pricing (POST)

Fetch instant pricing data on the quote or order line data grid and associated summary component. This API offers capabilities to either create a context or update the existing one based on the provided context ID.

You can also group quote line items or order items based on location, work types, or departments, if groups are enabled for your org. Groups provide a visualization of the products to view large quotes.

                "QuoteLineGroupId": "{@GroupId2}"
            }
        },
    ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`contextId`	String	ID generated by the context service. If you don't specify a context ID, a new context is created.	Optional	59.0
`correlationId`	String	Client-generated ID for tracking multiple related API requests.	Optional	59.0
`records`	Object with Reference Input[]	List of pricing data to be fetched.	Required	59.0

Response body for POST

Instant Pricing

Place Order (POST)

Place orders with integrated pricing, configuration, and validation, and manage them throughout their entire lifecycle. Additionally, update an order or insert order items.

You can also group order items based on location, work types, or departments, if groups are enabled for your org. Groups provide a visualization of the products to view large quotes.

This API supports a maximum of 300 transaction line items.

Note: This API has been deprecated as of API version 63.0. In API version 63.0 and later, use the new Place Sales Transaction API.

Special Access Rules

You need the PlaceOrder API permission set to use this API.

}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`catalog RatesPref`	String	Rate card entries defined in the catalog that must be fetched for order items with usage-based pricing during the order creation process. Valid values are: • `Fetch`—Retrieves the rate card entries defined in the catalog for order items during the order creation process. • `Skip`—Skips the retrieval of rate card entries for order items during the order creation process. The default value is `Skip`.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
		This property is available when the Usage-Based Selling feature is enabled.		
configurationInput	String	Configuration input for the place order process. Valid values are: • `RunAndAllowErrors`—Specifies to run the configuration and to proceed order ingestion upon encountering any configuration errors. • `RunAndBlockErrors`—Specifies to run configuration and to block order ingestion upon encountering any configuration errors. • `Skip`—Specifies to skip configuration. The default value is `RunAndBlockErrors`.	Optional	60.0
configurationOptions	Configuration Options Input[]	Configuration options during the ingestion process.	Optional	60.0
graph	Object Graph Input	The sObject graph of the order payload to be ingested. You can perform create, update, or delete operations on objects from the Sales Transaction context definition by using this property. Additionally, perform create, update, or delete operations on custom objects and fields in your extended context definition.	Required	60.0
pricingPref	String	Pricing preference during the create order process. Valid values are: • `Force`—Specifies to force pricing during the order ingestion process. • `Skip`—Specifies to skip pricing during the order ingestion process. • `System`—Specifies the system to determine whether a pricing calculation is required. The default value is `System`.	Optional	60.0

Response body for POST

Place Order

Place Quote (POST)

Create a quote to discover and price products and services. Additionally, insert, update, or delete a quote line item.

You can also group quote line items based on location, work types, or departments, if groups are enabled for your org. Groups provide a visualization of the products to view large quotes.

This API supports a maximum of 300 transaction line items.

Note: This API has been deprecated as of API version 63.0. In API version 63.0 and later, use the new Place Sales Transaction API.

Special Access Rules

You need the Create on Quotes user permission to create quotes.

             }
       ]
    }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`catalog RatesPref`	String	Rate card entries defined in the catalog that must be fetched for quote line items with usage-based pricing during the quote creation process. Valid values are: • `Fetch`—Retrieves the rate card entries defined in the catalog for quote line items during the quote creation process. • `Skip`—Skips the retrieval of rate card entries for quote line items during the quote creation process. The default value is `Skip`. This property is available when the Usage-Based Selling feature is enabled.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
configuration Input	String	Configuration input for the place quote process. Valid values are: • RunAndAllowErrors • RunAndBlockErrors • Skip The default value is RunAndBlockErrors.	Optional	60.0
configuration Options	Configuration Options Input	Configuration options during the ingestion process.	Optional	60.0
graph	Object Graph Input	The sObject graph representing the quote structure. You can perform create, update, or delete operations on objects from the Sales Transaction context definition by using this property. Additionally, perform create, update, or delete operations on custom objects and fields in your extended context definition.	Required	60.0
pricingPref	String	Pricing preference during the quote process. Valid values are: • Force • Skip • System The default value is System.	Optional	60.0

Response body for POST

Place Quote

Place Sales Transaction (POST)

Create a sales transaction, such as an order or a quote, with integrated pricing and configuration. Also, update an order or a quote, and insert and delete order or quote line items to calculate the estimated tax.

You can also group order or quote line items based on location, work types, or departments, if groups are enabled for your org. Groups provide a visualization of the products to view large quotes.

Keep these considerations in mind when you use this API.

- You can add up to 1000 quote line items for a quote, and 1000 order products for an order. For complex flows that involve a large volume of records, make sure that the number of line items that are sent to this API are within this limit.
- A quote can have up to 3000 quote line item attributes, and an order can have up to 3000 order line item attributes.
- This API doesn't support creation of amendment, renewal, or cancellation quote or order. Use the amendment, renewal, or cancellation APIs or invocable actions.

- Create or update quote lines with an associated group ID if you plan to use the sales transaction line editor after the API request.
- Bundle quantity handling depends on the AssociatedQuantScaleMethod field in the payload. If AssociatedQuantScaleMethod field value is `Proportional`, child quantity is `parent × child`. For example, 10 × 2 = 20. Without this value, the API can enforce quantity or cardinality restrictions and return validation errors. Include it explicitly for predictable results. See OrderItemRelationship for details of AssociatedQuantScaleMethod field.
- For custom objects at level 2 or deeper in the sales transaction hierarchy, configure context mapping so that `parentReference` maps to the custom object's immediate parent field. For custom object `child_one` under QuoteLineItem object, map `parentReference` to quote_line_item_c in QuoteEntitiesMapping object. Without this mapping, this API fails as delta processing can't reconcile all input records.
- This API saves and commits the quote header first, then processes configuration, pricing, and persistence for components, such as line items and groups. If a later step fails, the header isn't rolled back.

      {
        "referenceId": "refQuote",
        "record": {
          "attributes": {
            "type": "Quote",
            "method": "PATCH",
            "id": "0Q0xx0000004DQ4CAM"
          }
        }
      }
    ]
  }
}
```

To see examples that specify actions to create ramp deals for groups, see Group Ramp Action Input on page 1491.

To see examples that apply to usage-based products, see Usage-Based Product Input on page 1502.

Properties

Name	Type	Description	Required or Optional	Available Version
catalogRatesPref	String	Rate card entries defined in the catalog that must be fetched for sales items with usage-based pricing during the creation of the sales transaction. Valid values are: • `Fetch`—Retrieves the rate card entries defined in the catalog for sales items during the creation of the sales transaction.	Optional	63.0

Name	Type	Description	Required or Optional	Available Version
		• `Skip`—Skips the retrieval of rate card entries for sales items during the creation of the sales transaction. The default value is `Skip`. This property is available when the Usage-Based Selling feature is enabled.		
`configurationPref`	Configurator Preference Input	Configuration preference during the quote process. These preferences ensure that quotes are defined as per the requirement.	Optional	63.0
`contextDetails`	Context Input	Context details that are created for a sales transaction.	Required if the `graph` property isn't specified.	63.0
`graph`	Object Graph Input	The sObject graph of the sales transaction to be ingested. You can perform create, update, or delete operations on objects from the Sales Transaction context definition by using this property. Additionally, perform create, update, or delete operations on custom objects and fields in your extended context definition. To create custom objects that are at the grandchildren level from a line item, you must create the hierarchy of objects until the grandchild object in the same request.	Required if the `contextDetails` property isn't specified.	63.0
`groupRampAction`	String	Specifies the action that you want to perform on group ramp segments. You can also convert a non-ramped group into a ramped group. Valid values are: • `AddProducts`—Adds rampable products to group ramp segments. • `DeleteProducts`—Deletes ramped products. • `EditGroup`—Converts a non-ramped group into a group ramp segment, or edit group ramp segment attributes such as name and description, except the start and end dates.	Optional	65.0

Name	Type	Description	Required or Optional	Available Version
		• `EditRampSchedule`—Edits details of the group ramp segments, including start and end dates. • `DeleteSegment`—Deletes the first or last segment in a group ramp schedule. • `ConvertToNonRampedGroup`—Converts the first or last group ramp segment into a non-ramped group. To add or delete ramped line items from multiple group ramp segments, specify the applicable values in the `graph` property. See Group Ramp Action Input on page 1491 to refer to examples.		
`pricingPref`	String	Pricing preference during the creation of a sales transaction. Valid values are: • `Force`—Enforces pricing during the creation of sales transactions. • `Skip`—Skips pricing during the creation of sales transactions. • `System`—Determines whether a pricing calculation is required. The default value is `System`.	Optional	63.0
`taxPref`	String	Specifies whether to execute or skip the tax calculation step for each sales transaction record. Valid value is `Skip`. If you don't specify this value, then tax calculation request is performed by default.	Optional	65.0

Response body for POST

Place Sales Transaction

Place Supplemental Transaction (POST)

Create a supplemental order or change orders after they are submitted for processing, such as during the fulfillment process.

Keep these considerations in mind when you use this API.

- The original order must not be assetized.
- If Billing is enabled and configured for the order, verify that the original order hasn't been billed.
- If Dynamic Revenue Orchestration (DRO) is enabled and configured for the order, ensure the original order hasn't reached the point of no return milestone. If point of no return milestone hasn't been reached, the fulfillment plan is frozen.

JSON example

This sample creates a supplemental order, which is a clone of the original order. The supplemental order is related to the original order.

```
{
  "relatedSalesTransactionId": "801S70000001VKgIAM"
}
```

This sample overrides a field value of an order line item to supplement the order item with ID value as `802SG000003vZ15YAE`.

```
{
    "relatedSalesTransactionId": "801S70000001VKgIAM",
    "pricingPref": "System",
    "supplementalGraph": {
        "graphId": "1",
        "records": [
            {
                "referenceId": "refOrder",
                "record": {
                    "attributes": {
                        "type": "Order",
                        "method": "PATCH",
                        "id": "801S70000001VKgIAM"
                    },
                    "EffectiveDate": "2025-03-01",
                    "QuoteId": "0Q0xx0000004DQ4CAM"
                }
            },
            {
                "referenceId": "refOrderItem",
                "record": {
                    "attributes": {
                        "type": "OrderItem",
                        "method": "PATCH",
                        "id": "802SG000003vZ15YAE"
                    },
                    "QuoteLineItemId": "0Q0xx0000004E2mYLK"
                }
            }
        ]
```

```
    }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`pricingPref`	String	Pricing preference for this supplemental transaction or order ingestion process. Valid values are: • `Force`—Enforces pricing during the creation of sales transactions. • `Skip`—Skips pricing during the creation of sales transactions. • `System`—Determines whether a pricing calculation is required. If `pricingPref` value is defined as either `Force` or `System`, the supplemental order can have a different pricing from the original order.	Optional	64.0
`relatedSalesTransactionId`	String	Related or the original sales transaction upon which a supplemental transaction is created.	Required	64.0
`supplementalGraph`	Object Graph Input	The sObject graph that represents a payload with the additional changes to be ingested. The attribute's HTTP method must be PATCH. The attribute ID must be the ID of the original order or order item that you want to supplement.	Optional	64.0

Response body for POST

Supplemental Transaction

Read Sales Transaction (POST)

Retrieve sales transaction data efficiently from an initialized or a hydrated context.

Resource

```
/connect/revenue/transaction-management/sales-transactions/actions/read
```

Resource example

```

POST

Request body for POST

JSON example

```
{
  "contextId": "008d27d7-e004-4906-a949-ee7d7c323c77",
  "queryTags": [
    "Quote",
    "QuoteLineItem",
    "Product"
  ],
  "sobjectFieldMap": {
    "Quote": [],
    "QuoteLineItem": [
      "Quantity",
      "Product2Id"
    ]
  },
  "filters": [
    {
      "sObjectName": "Quote",
      "fieldName": "Status",
      "operator": "Equals",
      "operands": [
        {
          "value": "Draft",
          "type": "STRING"
        }
      ]
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`contextId`	String	ID of the context to retrieve the data records.	Required	65.0
`queryTags`	List<String>	List of objects that must be retrieved from the context.	Optional	65.0
`sobjectFieldMap`	Map<String, List<String>>	Mapping of an sObject name to a list. The list includes the sObject field names on the object or can be an empty list. An empty list specifies that all fields on the object must be queried.	Optional	67.0

Name	Type	Description	Required or Optional	Available Version
`filters`	List<Sales Transaction Filter Condition>	Filter conditions to query the context data.	Optional	67.0

Response body for POST

Read Sales Transaction

Retrieve Sales Transaction API Errors (GET)

Retrieve any asynchronous error details associated with a sales transaction request.

This API returns detailed error status and a retryable payload from Place Sales Transaction API that runs asynchronously. Also, view any blocking errors that prevent a subrequest from persisting. This request doesn't return any non-blocking warnings, such as configuration or tax warnings.

You can view the list of `rollbackedReferenceIds`, which shows synthetic or reference IDs that roll back when the batch fails.

Resource

```
connect/revenue/transaction-management/sales-transactions/actions/place/trackerId/errors
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/revenue/transaction-management/sales-transactions/actions/place/16PRM000000004DBq/errors
```

Available version

66.0

HTTP methods

GET

Request parameter for GET

Parameter Name	Type	Description	Required or Optional	Available Version
`includeRetryablePayload`	Boolean	Indicates whether to return a subset of the original Place Sales Transaction API payload errors (`true`) or not (`false`). The default value is `false`.	Optional	66.0

Response body for GET

Sales Transaction Async Error

Create Ramp Deal (POST)

Create a ramp deal for a customer on a product. Sales reps can use ramp deals to provide yearly deals to a customer, resulting in long-term revenue and customer relationship. A customer can create, update, or view multiple segments of periods for their subscription term with different attributes for each segment.

This API request creates segments based on the specified input properties such as term, segment type, and trial details. The API response includes the context ID and the updated context object for the sales transaction. You must call the Place Sales Transaction API by specifying this context ID to apply the ramp deal updates. See Place Sales Transaction API.

Note: This API is applicable when you're working with line ramps. To work with ramp deals for groups, you must use the Place Sales Transaction API and specify the `groupRampActions` property.

  "segmentType": "YEARLY",
  "executionSettings": {
       "executePricing": true,
       "executeConfigRules": false
   }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`execution Settings`	Execution Settings Input[]	Settings to run the pricing or configuration rules.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
`segmentType`	String	Type of segment that the user wants to create. Valid values are: • `FREE_TRIAL` • `CUSTOM` • `YEARLY`	Required	62.0
`subscriptionTerm`	Integer	Subscription length of the term-defined product.	Required	62.0
`subscriptionTermUnit`	String	Unit of time for the subscription length. Valid value is: • `MONTHS`	Required	62.0
`transactionId`	String	ID of the sales transaction that's configured, such as quote or order.	Required	62.0
`transactionLineId`	String	Quote line item ID or order item ID that the price ramp is created for.	Required	62.0
`trialTerm`	Integer	Length of the trial period, if any.	Optional	62.0
`trialTermUnit`	String	Unit of time for the trial period. Valid value is: • `DAYS`	Optional. Required if `trialTerm` property is specified.	62.0

Response body for POST

Ramp Deal Service

Delete Ramp Deal (POST)

Delete a ramp deal to convert a ramped product to include a single quote line item or order item.

This API request deletes the segments related to the product. The API response includes the updated context with the context ID. You must call the Place Sales Transaction (POST) API by specifying this context ID to apply the ramp deal updates. See Place Sales Transaction (POST) API.

Note: This API is applicable when you're working with line ramps. To work with ramp deals for groups, you must use the Place Sales Transaction API and specify the `groupRampActions` property.

Resource

```
/connect/revenue-management/sales-transaction-contexts/resourceId/actions/ramp-deal-delete
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/revenue-management/sales-transaction-contexts/0QLxx0000004CfIGAU/actions/ramp-deal-delete
```

Available version

62.0

HTTP methods

POST

Path parameter for POST

Name	Type	Description	Required or Optional	Available Version
`resourceId`	String	ID of the context.	Required	62.0

Request body for POST

JSON example

```
{
  "rampDealIds": [
    "0Q0xx0000004CDxCAM",
    "0QLxx0000004CSOGA2"
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`rampDealIds`	String[]	Ramp identifier on the quote line item or order item.	Required	62.0

Response body for POST

Ramp Deal Service

Update Ramp Deal (POST)

Modify a ramp deal in scenarios where a segment has updates such as quantity, discount, or date change.

Update a ramp deal in these scenarios.

- A segment has quantity or discount changes.
- A trial segment or custom segment has a date change. A custom segment is an added or deleted segment. In this scenario, you can update a ramp deal during the initial sale before assetization.

This API request returns the updated context with the context ID. You must call the Place Sales Transaction (POST) API by specifying this context ID to apply the ramp deal updates. See Place Sales Transaction (POST) API.

Note: This API is applicable when you're working with line ramps. To work with ramp deals for groups, you must use the Place Sales Transaction API and specify the `groupRampActions` property.

Resource

```
/connect/revenue-management/sales-transaction-contexts/resourceId/actions/ramp-deal-update
```

Resource example

Path parameter for GET

Name	Type	Description	Required or Optional	Available Version
`resourceId`	String	ID of the quote line item, order item, or context.	Required	62.0

Request parameters for GET

Parameter Name	Type	Description	Required or Optional	Available Version
`transactionId`	String	ID of the quote or order required to hydrate the context and retrieve the quote lines.	Required	62.0
`transactionLineId`	String	ID of the quote or order line required to retrieve the segmented details.	Required	62.0

Response body for GET

Ramp Deal Service

Request Bodies

Learn more about the available API request bodies.

Amendment Input

Input representation of the details of the request to create an amendment record.

Cancellation Input

Input representation of the details of the request to cancel a quote or an order.

Create Ramp Deal Input

Input representation of the request to create a ramp deal.

Clone Options Input

Input representation of the options to clone a sales transaction.

Clone Sales Transaction Input

Input representation of the request to clone records within a sales transaction.

Configuration Options Input

Input representation for the configuration options.

Configurator Preference Input

Input representation of the configuration preference for the place sales transaction request.

Context Input

Input representation of the context that's associated with a sales transaction for a quote or an order.

Context Node Input

Input representation of the details of the context nodes for ramp segments.

Delete Ramp Deal Input

Input representation of the request to delete a ramp deal.

Eligible Promotions Input

Input representation of the request to get eligible promotions for line items. This representation includes the details to accept line item IDs and a sales transaction ID.

Execution Settings Input

Input representation of the execution settings for a ramp deal.

Initiate Downgrade Input

Input representation of the details of the request to initiate a downgrade action.

Initiate Swap Input

Input representation of the details of the request to initiate a swap action.

Initiate Upgrade Input

Input representation of the details of the request to initiate an upgrade action. The response includes the ID of the sales transaction that the upgrade action creates.

Instant Pricing Input

Input representation to fetch the instant pricing details.

Object Graph Input

Input representation of an sObject with a graph ID.

Object Input Map

Input representation of an sObject record in a key-value map format.

Object with Reference Input

Input representation of a list of records to be inserted or updated. To update a record, specify the record ID.

Place Order Input

Input representation of the request to create or update an order.

Place Quote Input

Input representation of the request to create or update a quote.

Read Sales Transaction Input

Input representation of the filter criteria details to read a sales transaction.

Renewal Input

Input representation of the details of the request to initiate the renewal of an asset.

Sales Transaction Filter Condition Input

Input representation of filter conditions used to query sales transaction context data.

[Sales Transaction Input](#)

Input representation of the details of the request to place a sales transaction, such as a quote or an order.

[Sales Transaction Operand Input](#)

Input representation of a filter operand for reading sales transaction context data.

[Supplemental Transaction Input](#)

Input representation of the details of the request to create a supplemental order.

[Swap Group Input](#)

Input representation of the details of the swap groupings for swap operations.

[Update Ramp Deal Input](#)

Input representation of the request to update a ramp deal.

[Usage-Based Product Input](#)

Understand the sample request structure to specify and manage usage-based products within a sales transaction.

Amendment Input

Input representation of the details of the request to create an amendment record.

JSON example

```
{
  "assetIds": [
    "02iSG0000003NMhYAM",
    "02iSG0000006DvSYAU"
  ],
  "amendmentStartDate": "2023-10-04T00:00:00",
  "contractId": "800SG00000CFpepYAD",
  "opportunityId": "006SG000004W5tVYAS",
  "outputRecordId": "801SG00000DX1jWYAT",
  "outputRecordType": "Quote",
  "quantityChange": 5
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`assetIds`	String[]	IDs of the assets that you want to add to the amendment record.	Required	62.0
`amendmentStartDate`	String	Start date of the amendment.	Required	62.0
`contractId`	String	ID of the Contract record that you want to sync with the amendment quote.	Optional	62.0
`opportunityId`	String	ID of the Opportunity record that you want to sync with the amendment quote.	Optional	62.0
`outputRecordId`	String	ID of the quote or order record that you want to add the assets to.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
outputRecordType	String	Type of amendment record that you want to create. For usage products, set this value to `Quote`. The usage-related records (`QuoteLineItemUseResourceGrant`, `QuoteLineItemUsageResourcePolicy`, and `QuoteLineRateCardEntry`) are copied in the quote action flow, not in the amend order flow.	Required	62.0
quantityChange	Double	Quantity to add to or reduce from the asset's existing quantity.	Required	62.0

Cancellation Input

Input representation of the details of the request to cancel a quote or an order.

JSON example

```
{
  "assetIds": [
    "02iSG0000003NMhYAM",
    "02iSG0000006DvSYAU"
  ],
  "cancellationDate": "2023-10-04T00:00:00",
  "contractId": "800SG00000CFpepYAD",
  "opportunityId": "006SG000004W5tVYAS",
  "outputRecordId": "801SG00000DX1jWYAT",
  "outputRecordType": "Quote"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
assetIds	String[]	IDs of the assets that you want to cancel. All assets in a request must belong to the same price book.	Required	62.0
cancellationDate	String	Effective date of the cancellation.	Required	62.0
contractId	String	ID of the Contract record that you want to sync with the cancellation quote.	Optional	62.0
opportunityId	String	ID of the Opportunity record that you want to sync with the cancellation quote.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
output RecordId	String	ID of the quote or order that you want to cancel.	Optional	62.0
output RecordType	String	Type of cancellation record that you want to create.	Required	62.0

Create Ramp Deal Input

Input representation of the request to create a ramp deal.

JSON example

```
{
  "transactionId": "0Q0xx0000004C92CAE",
  "transactionLineId": "0QLxx0000004C9VGAU",
  "subscriptionTerm": 14,
  "subscriptionTermUnit": "MONTHS",
  "trialTerm": 45,
  "trialTermUnit": "DAYS",
  "segmentType": "YEARLY",
  "executionSettings": {
       "executePricing": true,
       "executeConfigRules": false
   }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
execution Settings	Execution Settings Input[]	Settings to run the pricing or configuration rules.	Optional	62.0
segmentType	String	Type of segment that the user wants to create. Valid values are: • FREE_TRIAL • CUSTOM • YEARLY	Required	62.0
subscription Term	Integer	Subscription length of the term-defined product.	Required	62.0
subscription TermUnit	String	Unit of time for the subscription length. Valid value is: • MONTHS	Required	62.0

Name	Type	Description	Required or Optional	Available Version
`transactionId`	String	ID of the sales transaction that's configured, such as quote or order.	Required	62.0
`transaction LineId`	String	Quote line item ID or order item ID that the price ramp is created for.	Required	62.0
`trialTerm`	Integer	Length of the trial period, if any.	Optional	62.0
`trialTermUnit`	String	Unit of time for the trial period. Valid value is: • `DAYS`	Optional. Required if `trialTerm` property is specified.	62.0

Clone Options Input

Input representation of the options to clone a sales transaction.

JSON example

This is a sample request to clone all line items in a ramped group within a sales transaction.

```
{
  "recordIds": ["0QLxx0000004CBYGA2"],
  "salesTransactionId": "0Q0xx0000004CE0CAM",
  "options": {
    "lineScope": "AllLines"
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`recordTypeId`	String	ID of the record type related to the record to clone.	Optional	65.0
`lineScope`	String	Specifies the scope for cloning a ramp segment. You can clone only the last ramp segment. This property determines which line items must be cloned and added to the cloned segment. Valid values are: • `AllLines`—Specifies whether all line items in a ramped group must be cloned. • `RampedLinesOnly`—Specifies whether only the ramped line items must be cloned. A segment identifier is created for the newly cloned line items, ensuring date	Optional	65.0

Name	Type	Description	Required or Optional	Available Version
		continuity between the existing and cloned segment.		

Clone Sales Transaction Input

Input representation of the request to clone records within a sales transaction.

JSON example

This is a sample request to clone a record within a sales transaction.

```
{
  "recordIds": ["0QLxx0000004CBYGA2"],
  "salesTransactionId": "0Q0xx0000004CE0CAM"
}
```

This is a sample request to clone all line items in a ramped group within a sales transaction.

```
{
  "recordIds": ["0QLxx0000004CBYGA2"],
  "salesTransactionId": "0Q0xx0000004CE0CAM",
  "options": {
    "lineScope": "AllLines"
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
recordIds	String[]	ID of the record to be cloned. You can specify a single record ID only.	Required	64.0
salesTransactionId	String	ID of the sales transaction related to the record IDs to clone.	Required	64.0
options	Clone Options Input	Specifies options to clone a ramp segment within a sales transaction. You can clone only the last ramp segment.	Optional	65.0

Configuration Options Input

Input representation for the configuration options.

JSON example

```
{
  "configurationOptions": {
    "validateProductCatalog": true,
    "validateAmendRenewCancel": true,
    "executeConfigurationRules": true,
```

```
    "addDefaultConfiguration": true
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
addDefault Configuration	Boolean	Indicates whether to automatically add default configurations to the order (true) or not (false).	Optional	60.0
execute Configuration Rules	Boolean	Indicates whether the order must adhere to configuration rules during processing (true) or bypass them (false).	Optional	60.0
validateAmend RenewCancel	Boolean	Indicates whether to run validations related to amend, renew, or cancel processes (true) or not (false).	Optional	60.0
validate Product Catalog	Boolean	Indicates whether the order must be validated against the product catalog (true) or not (false).	Optional	60.0

Configurator Preference Input

Input representation of the configuration preference for the place sales transaction request.

JSON example

```
{
  "configurationPref": {
    "configurationMethod": "Skip",
    "configurationOptions": {
      "validateProductCatalog": true,
      "validateAmendRenewCancel": true,
      "executeConfigurationRules": true,
      "addDefaultConfiguration": true
    }
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
configuration Method	String	Configuration method for the place sales transaction request. Valid values are: • Force—Specifies to enforce the predefined configuration process during the sales transaction process.	Optional	63.0

Name	Type	Description	Required or Optional	Available Version
		• `Skip`—Specifies to skip the configuration process during the quote creation process. • `System`—Specifies the system to determine whether the configuration process is required. The default value is `Skip`.		
`configurationOptions`	Configuration Options Input	Configuration options during the ingestion process.	Optional	63.0

Context Input

Input representation of the context that's associated with a sales transaction for a quote or an order.

JSON example

```
{
  "contextDetails": {
    "contextId": "e055bb18-d4e8-41c3-881e-0132b9561708"
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`contextId`	String	ID of the context that represents the created session for the sales transaction. This property is supported only for a PATCH request. If the `contextId` property isn't specified, the Place Sales Transaction API generates the context ID for the sales transaction.	Optional	63.0

Context Node Input

Input representation of the details of the context nodes for ramp segments.

JSON example

```
  "updatedNodes": [
     {
      "contextNodePath": [
       "4f23961a5c98806f89305e064c67b397e93f1bb8a2a7a3a80db506f1d4110ee9", // ContextId
```

```
        "0Q0xx0000004CPACA2", //Quote or OrderId
        "0QLxx0000004CfIGAU" // Quote Line ID or Order Line ID to update
      ],
      "contextNode": {
          "Discount": 10,
          "Quantity": 5
      }
    },
    {
      "contextNodePath": [
        "4f23961a5c98806f89305e064c67b397e93f1bb8a2a7a3a80db506f1d4110ee9",
        "0Q0xx0000004CPACA2",
        "2b6401d144904e10aa"
      ],
      "contextNode": {
          "Discount": 20,
          "Quantity": 15
      }
    }
  ]
```

Properties

Name	Type	Description	Required or Optional	Available Version
contextNode	Map<String, Object>	Details of the context node to be added, updated, or deleted.	Required	62.0
contextNode Path	String[]	Path to the context node to be added, updated, or deleted.	Required	62.0

Delete Ramp Deal Input

Input representation of the request to delete a ramp deal.

JSON example

```
{
  "rampDealIds": [
    "0Q0xx0000004CDxCAM",
    "0QLxx0000004CSOGA2"
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
rampDealIds	String[]	Ramp identifier on the quote line item or order item.	Required	62.0

Eligible Promotions Input

Input representation of the request to get eligible promotions for line items. This representation includes the details to accept line item IDs and a sales transaction ID.

JSON example

```
{
  "salesTransactionId": "0Q0xx0000004EOECA2",
  "lineItemIds": [
    "0QLxx0000004E7eGAE",
    "0QLxx0000004GCeGAM",
    "0QLxx0000004E7gGAE"
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`lineItemIds`	String[]	List of line item IDs to evaluate for promotions. The object type is auto-determined from the sales transaction ID.	Required	66.0
`salesTransactionId`	String	The sales transaction ID, such as an order ID or a quote ID, for the promotion evaluation.	Required	66.0

Execution Settings Input

Input representation of the execution settings for a ramp deal.

JSON example

```
  "executionSettings": {
       "executePricing": true,
       "executeConfigRules": false
   }
```

Properties

Name	Type	Description	Required or Optional	Available Version
`executeConfigRules`	Boolean	Indicates whether to run configuration rules (`true`) or not (`false`). The default value is `true`.	Optional	62.0
`executePricing`	Boolean	Indicates whether to run pricing request (`true`) or not (`false`). The default value is `true`.	Optional	62.0

Initiate Downgrade Input

Input representation of the details of the request to initiate a downgrade action.

JSON example

```
{
  "swapStartDate": "2025-12-01T00:00:00Z",
  "outputRecordType": "Quote",
  "swapGroups": {
    "groups": [
      {
        "referenceId": "DOWNGRADE-001",
        "outGroup": {
          "swapAssets": [
            {
              "assetId": "02ixx0000004HOAAA2",
              "quantity": 1
            }
          ]
        },
        "inGroup": {
          "graphId": "downgradeRequest",
          "records": [
            {
              "referenceId": "refQuoteLine0",
              "record": {
                "attributes": {
                  "type": "QuoteLineItem",
                  "method": "POST"
                },
                "Product2Id": "01txx0000006iVlAAI",
                "PricebookEntryId": "01uxx0000008ym4AAA",
                "UnitPrice": 1049,
                "Quantity": "1",
                "StartDate": "2022-09-22"
              }
            }
          ]
        }
      }
    ]
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`contractId`	String	ID of the contract record to downgrade.	Optional	66.0
`opportunityId`	String	ID of the opportunity record to downgrade.	Optional	66.0

Name	Type	Description	Required or Optional	Available Version
outputRecordType	String	Record type of the output for the downgrade.	Required	66.0
swapGroups	Swap Group[]	Groups that contain the asset details for the downgrade.	Required	66.0
swapStartDate	String	Amendment start date for the downgrade action.	Required	66.0

Initiate Swap Input

Input representation of the details of the request to initiate a swap action.

JSON example

```
{
  "swapStartDate": "2025-12-01T00:00:00Z",
  "outputRecordType": "Quote",
  "swapGroups": {
    "groups": [
      {
        "referenceId": "SWAP-001",
        "outGroup": {
          "swapAssets": [
            {
              "assetId": "02ixx0000004HOAAA2",
              "quantity": 1
            }
          ]
        },
        "inGroup": {
          "graphId": "swapRequest",
          "records": [
            {
              "referenceId": "refQuoteLine0",
              "record": {
                "attributes": {
                  "type": "QuoteLineItem",
                  "method": "POST"
                },
                "Product2Id": "01txx0000006iVlAAI",
                "PricebookEntryId": "01uxx0000008ym4AAA",
                "UnitPrice": 1049,
                "Quantity": "1",
                "StartDate": "2022-09-22"
              }
            }
          ]
        }
      }
    ]
```

```
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`contractId`	String	ID of the contract record to swap.	Optional	66.0
`opportunityId`	String	ID of the opportunity record to swap.	Optional	66.0
`outputRecordType`	String	Record type of the output for the swap.	Required	66.0
`swapGroups`	Swap Group[]	Groups that contain the asset details for the swap.	Required	66.0
`swapStartDate`	String	Amendment start date for the swap action.	Required	66.0

Initiate Upgrade Input

Input representation of the details of the request to initiate an upgrade action. The response includes the ID of the sales transaction that the upgrade action creates.

JSON example

```
{
  "swapStartDate": "2025-12-01T00:00:00Z",
  "outputRecordType": "Quote",
  "swapGroups": {
    "groups": [
      {
        "referenceId": "UPGRADE-001",
        "outGroup": {
          "swapAssets": [
            {
              "assetId": "02ixx0000004HOAAA2",
              "quantity": 1
            }
          ]
        },
        "inGroup": {
          "graphId": "upgradeRequest",
          "records": [
            {
              "referenceId": "refQuoteLine0",
              "record": {
                "attributes": {
                  "type": "QuoteLineItem",
                  "method": "POST"
                },
                "Product2Id": "01txx0000006iVlAAI",
                "PricebookEntryId": "01uxx0000008ym4AAA",
                "UnitPrice": 1049,
                "Quantity": "1",
```

```
                "StartDate": "2026-03-22"
              }
            }
          ]
        }
      }
    ]
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`contractId`	String	ID of the contract record to upgrade.	Optional	66.0
`opportunityId`	String	ID of the opportunity record to upgrade.	Optional	66.0
`outputRecordType`	String	Record type of the output for the upgrade.	Required	66.0
`swapGroups`	Swap Group[]	Groups that contain the asset details for the upgrade.	Required	66.0
`swapStartDate`	String	Amendment start date for the upgrade action.	Required	66.0

Instant Pricing Input

Input representation to fetch the instant pricing details.

JSON example

```
{
  "correlationId": "7847127122596",
  "contextId": "0000000b28op21g00281751271041790cc1e5686282849a387dd3c59b310418b",
  "records": [
    {
      "referenceId": "0Q0xx0000004DOSCA2",
      "record": {
        "attributes": {
          "type": "Quote",
          "method": "POST"
        },
        "Name": "Test Quote Proration Pricing",
        "OpportunityId": "006xx000001a4ISAAY",
        "Pricebook2Id": "01sxx0000005ptpAAA"
      }
    },
    {
      "referenceId": "refQuoteLine",
      "record": {
        "attributes": {
          "type": "QuoteLineItem",
          "method": "POST"
```

```
        },
        "QuoteId": "0Q0xx0000004DOSCA2",
        "PricebookEntryId": "01uxx0000008zHmAAI",
        "Product2Id": "01txx0000006jmWAAQ",
        "Quantity": 2,
        "UnitPrice": 25,
        "StartDate": "2022-09-28",
        "EndDate": "2028-09-27",
        "PeriodBoundary": "ANNIVERSARY",
        "BillingFrequency": "ANNUAL"
      }
    }
  ]
}
```

This example shows a sample request to specify grouping of lines based on criteria.

```
{
    "contextId": "0000000b28op21g00281751271041790cc1e5686282849a387dd3c59b310418b",
    "correlationId": "7847127122596",
    "records": [

                    "method": "POST",
```

```
                    "action": "GroupBy",
                    "criteria": {
                        "Quantity": 5
                    }
                },
                "Name": "record"
            }
        }, {
            "referenceId": "GroupId2",
            "record": {
                "attributes": {
                    "type": "QuoteLineGroup",
                    "method": "POST",
                    "action": "GroupBy",
                    "criteria": {
                        "Quantity": 2
                    }
                },
                "Name": "record1",
            }
        }
    ]
}
```

This example shows a sample request for the initial grouping of the quote with the quote lines assigned to the first group.

```
{
    "contextId": "0000000b28op21g00281751271041790cc1e5686282849a387dd3c59b310418b",
    "correlationId": "7847127122596",
    "records": [
        {
            "referenceId": "0Q0xx0000004CAgCAM",
            "record": {
                "attributes": {
                    "type": "Quote",
                    "method": "PUT"
                }
            }
        },
        {
            "referenceId": "GroupId1",
            "record": {
                "attributes": {
                    "type": "QuoteLineGroup",
                    "method": "POST",
                    "action": "GroupAll"
                },
                "Name": "sample"
            }
        }
    ]
}
```

This example shows a sample request to ungroup a quote but retain the quote lines.

```
{
    "contextId": "0000000b28op21g00281751271041790cc1e5686282849a387dd3c59b310418b",
    "correlationId": "7847127122596",
    "records": [
        {
            "referenceId": "0Q0xx0000004CAgCAM",
            "record": {
                "attributes": {
                    "type": "Quote",
                    "method": "PUT"
                }
            }
        },
         {
            "referenceId": "0QLxx0000004CBYGA2",
            "record": {
                "attributes": {
                    "type": "QuoteLineItem",
                    "method": "PUT"
                },
                "Quantity": 2,
                "QuoteLineGroupId": null
            }
        },
        {
            "referenceId": "GroupId1",
            "record": {
                "attributes": {
                    "type": "QuoteLineGroup",
                    "method": "DELETE",
                    "action": "Ungroup"
                }
            }
        }
    ]
}
```

This example shows a sample request to create a new group.

```
{
    "contextId": "0000000b28op21g00281751271041790cc1e5686282849a387dd3c59b310418b",
    "correlationId": "7847127122596",
    "records": [
        {
            "referenceId": "0Q0xx0000004CAgCAM",
            "record": {
                "attributes": {
                    "type": "Quote",
                    "method": "PUT"
                }
            }
        },
        {
```

```
            "referenceId": "GroupId1",
            "record": {
                "attributes": {
                    "type": "QuoteLineGroup",
                    "method": "POST"
                },
                "Name": "sample"
            }
        }
    ]
}
```

This example shows a sample request to delete a group.

```
{
    "contextId": "0000000b28op21g0028175127104179 0cc1e5686282849a387dd3c59b310418b",
    "correlationId": "7847127122596",
    "records": [
        {
            "referenceId": "0Q0xx0000004CAgCAM",
            "record": {
                "attributes": {
                    "type": "Quote",
                    "method": "PUT"
                }
            }
        },
        {
            "referenceId": "GroupId1",
            "record": {
                "attributes": {
                    "type": "QuoteLineGroup",
                    "method": "DELETE",
                    "action": "DeleteGroup"
                },
                "Name": "sample"
            }
        }
    ]
}
```

This example shows a sample request to move a group.

```
{
    "contextId": "0000000b28op21g00281751271041790cc1e5686282849a387dd3c59b310418b",
    "correlationId": "7847127122596",
    "records": [
        {
            "referenceId": "0Q0xx0000004CAgCAM",
            "record": {
                "attributes": {
                    "type": "Quote",
                    "method": "PUT"
                }
            }
```

```
        },
        {
            "referenceId": "0QLxx0000004CBYGA2",
            "record": {
                "attributes": {
                    "type": "QuoteLineItem",
                    "method": "PUT"
                },
                "Quantity": 2
                "QuoteLineGroupId": "{@GroupId2}"
            }
        },
    ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
contextId	String	ID generated by the context service. If you don't specify a context ID, a new context is created.	Optional	59.0
correlationId	String	Client-generated ID for tracking multiple related API requests.	Optional	59.0
records	Object with Reference Input[]	List of pricing data to be fetched.	Required	59.0

Object Graph Input

Input representation of an sObject with a graph ID.

JSON example

```
{
  "graph": {
    "graphId": "1",
    "records": [
      {
        "referenceId": "refOrder",
        "record": {
          "attributes": {
            "type": "Order",
            "method": "POST"
          }
        }
      }
    ]
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
graphId	String	The ID of the graph.	Required	60.0
records	Object with Reference Input on page 1464[]	List of the records to be ingested.	Required	60.0

Object Input Map

Input representation of an sObject record in a key-value map format.

JSON example

```
{
  "records": [
    {
      "referenceId": "refOrder",
      "record": {
        "attributes": {
          "type": "Order",
          "method": "PATCH",
          "id": "402xx000003KY5vJGH"
        },
        "Quantity": 5
      }
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
attributes	Map <String, String>	Configuration input for the record process. Valid values are: • type—Type of sales transaction such as Quote or Order. • method—HTTP methods such as POST, PATCH, and DELETE. • id—Unique identifier for the record. Required for PATCH and DELETE operations.	Required	60.0

Name	Type	Description	Required or Optional	Available Version
		• `criteria`—Criteria to group order or quote line items. For example, group order or quote line items based on a monthly billing frequency. • `action`—Action to group order or quote line items. Valid values are: – `GroupBy` – `Group` – `Ungroup` – `GroupAll` – `DeleteGroup`		

Object with Reference Input

Input representation of a list of records to be inserted or updated. To update a record, specify the record ID.

This is a sample request to create a sales transaction for an order line item.

JSON example

```
{
  "referenceId": "refOrderItem0",
  "record": {
    "attributes": {
      "type": "OrderItem",
      "method": "POST"
    },
    "OrderId": "@{refOrder.id}",
    "OrderActionId": "@{refOrderAction.id}",
    "PricebookEntryId": "01uRM000000igZG",
    "Quantity": 2
  }
}
```

This is a sample request to update an order line item.

JSON example

```
{
  "referenceId": "refOrderItem0",
  "record": {
    "attributes": {
      "type": "OrderItem",
      "method": "PATCH",
      "id": "402xx000003KY5vJGH"
```

```
    },
    "OrderId": "@{refOrder.id}",
    "OrderActionId": "@{refOrderAction.id}",
    "PricebookEntryId": "01uRM000000igZG",
    "Quantity": 2,
    "UnitPrice": 800
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`referenceId`	String	Reference ID that maps to the response and can be used as a reference in later subrecords. This property value starts with a letter or number only and can contain letters, numbers, and underscores. It's also case-sensitive when used for referencing.	Required	60.0
`records`	Object Input Map on page 1463	Details of a record to be ingested.	Required	60.0

Place Order Input

Input representation of the request to create or update an order.

JSON example

```
{
  "pricingPref": "System",
  "configurationInput": "RunAndAllowErrors",
  "configurationOptions": {
    "validateProductCatalog": true,
    "validateAmendRenewCancel": true,
    "executeConfigurationRules": true,
    "addDefaultConfiguration": true
  },
  "graph": {
    "graphId": "graphId",
    "records": [
      {
        "referenceId": "refOrder",
        "record": {
          "attributes": {
            "type": "Order",
            "method": "POST",
            "Id": "POST"
          }
        }
      },
      {
         "referenceId":"refOrderItem",
```

```
          "record":{
          "attributes":{
              "type":"OrderItem",
              "method":"POST"
             },
             "OrderId":"@{refOrder.id}",
             "OrderActionId":"@{refOrderAction.id}",
             "ListPrice":"144.99",
             "Quantity":3,
             "PricebookEntryId":"01uxx0000008yXPAAY",
             "Product2Id":"01txx0000006i2UAAQ",
             "UnitPrice":"199.49"
        }
       }
     ]
   }
}
```

This example shows a sample request to define grouping of order items.

```
{
    "pricingPref": "system",
    "graph": {
        "graphId": "placeOrder",
        "records": [
            {
                "referenceId": "refOrder",
                "record": {
                    "attributes": {
                        "type": "Order",

                    }
                },
                "Name": "Billing Frequency: Monthly",
                "OrderId": "@{refOrder.id}"
            }
        }
    ]
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
catalog RatesPref	String	Rate card entries defined in the catalog that must be fetched for order items with usage-based pricing during the order creation process. Valid values are: • Fetch—Retrieves the rate card entries defined in the catalog for order items during the order creation process. • Skip—Skips the retrieval of rate card entries for order items during the order creation process. The default value is Skip. This property is available when the Usage-Based Selling feature is enabled.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
configurationInput	String	Configuration input for the place order process. Valid values are: • `RunAndAllowErrors`—Specifies to run the configuration and to proceed order ingestion upon encountering any configuration errors. • `RunAndBlockErrors`—Specifies to run configuration and to block order ingestion upon encountering any configuration errors. • `Skip`—Specifies to skip configuration. The default value is `RunAndBlockErrors`.	Optional	60.0
configurationOptions	Configuration Options Input[]	Configuration options during the ingestion process.	Optional	60.0
graph	Object Graph Input	The sObject graph of the order payload to be ingested. You can perform create, update, or delete operations on objects from the Sales Transaction context definition by using this property. Additionally, perform create, update, or delete operations on custom objects and fields in your extended context definition.	Required	60.0
pricingPref	String	Pricing preference during the create order process. Valid values are: • `Force`—Specifies to force pricing during the order ingestion process. • `Skip`—Specifies to skip pricing during the order ingestion process. • `System`—Specifies the system to determine whether a pricing calculation is required. The default value is `System`.	Optional	60.0

Place Quote Input

Input representation of the request to create or update a quote.

JSON example

This example shows a sample request to create a quote.

```
{
  "pricingPref": "System",
  "configurationInput": "RunAndAllowErrors",
  "configurationOptions": {
    "validateProductCatalog": true,
    "validateAmendRenewCancel": true,
    "executeConfigurationRules": true,
    "addDefaultConfiguration": true
  },  "graph": {
    "graphId": "createQuote",
    "records": [{

               "attributes": {
                  "type": "Quote",
                  "method": "PATCH",
                  "id":"0Q0xx0000004C99CAE"
               },
               "Name": "From Place Quote API"
            }
         },
         {
            "referenceId": "refQlg1",
            "record": {
               "attributes": {
                  "type": "QuoteLineGroup",
                  "method": "POST",
                  "action": "GroupBy",
                  "criteria": {
                    "Quantity": 1
                  }
               },
               "Name": "From Place Quote API Group",
               "QuoteId": "@{refQuote.id}"
            }
         },
         {
            "referenceId": "refQuoteItem1",
            "record": {
               "attributes": {
                  "type": "QuoteLineItem",
                  "method": "PATCH",
                  "id":"0QLxx0000004DJcGAM"
               },
               "QuoteLineGroupId": "@{refQlg1.id}",
               "Quantity": 1
            }
         }
      ]
   }
}
```

This example shows a sample request for the initial grouping of the quote with the quote lines assigned to the first group.

```
{
  "pricingPref": "Force",
  "graph": {
    "graphId": "test",
    "records": [
      {
        "referenceId": "refQuote",
        "record": {
          "attributes": {
            "type": "Quote",
            "method": "PATCH",
            "id": "0Q0xx0000004CAmCAM"
          }
        }
      },
      {
        "referenceId": "refQlg1",
        "record": {
          "attributes": {
            "type": "QuoteLineGroup",
            "method": "POST",
            "action": "GroupAll"
          },
          "Name": "From PQ API Group",
          "QuoteId": "@{refQuote.id}"
        }
      }
    ]
  }
}
```

This example shows a sample request to ungroup a quote but retain the quote lines.

```
{
   "pricingPref": "Force",
   "configurationInput": "skip",
   "graph": {
      "graphId": "test",
      "records": [
         {
            "referenceId": "refQuote",
            "record": {
               "attributes": {
                  "type": "Quote",
                  "method": "PATCH",
                  "id":"0Q0xx0000004C99CAE"
               },
               "Name": "From Place Quote API"
            }
         },
         {
            "referenceId": "refQlg1",
            "record": {
```

```
                "attributes": {
                    "type": "QuoteLineGroup",
                    "method": "DELETE",
                    "id": "{GroupId}",
                    "action": "Ungroup"
                }
            }
        }
    ]
  }
}
```

This example shows a sample request to create a new group.

```
{
   "pricingPref": "Force",
   "configurationInput": "skip",
   "graph": {
      "graphId": "test",
      "records": [
         {
            "referenceId": "refQuote",
            "record": {
               "attributes": {
                  "type": "Quote",
                  "method": "PATCH",
                  "id":"0Q0xx0000004C99CAE"
               },
               "Name": "From Place Quote API"
            }
         },
         {
            "referenceId": "refQlg1",
            "record": {
               "attributes": {
                  "type": "QuoteLineGroup",
                  "method": "POST"
               },
               "Name": "From PQ API Group",
               "QuoteId": "@{refQuote.id}"
            }
         }
      ]
   }
}
```

This example shows a sample request to delete a group.

```
{
   "pricingPref": "Force",
   "configurationInput": "skip",
   "graph": {
      "graphId": "test",
      "records": [
         {
```

```
            "referenceId": "refQuote",
            "record": {
               "attributes": {
                  "type": "Quote",

                    "type": "QuoteLineItem",
                    "method": "PATCH"
                    "id": "0QLxx0000004CBYGA2"
                },
                "Quantity": 2,
                "QuoteLineGroupId": "@{GroupId2}"
            }
```

```
        ]
    }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`catalogRatesPref`	String	Rate card entries defined in the catalog that must be fetched for quote line items with usage-based pricing during the quote creation process. Valid values are: • `Fetch`—Retrieves the rate card entries defined in the catalog for quote line items during the quote creation process. • `Skip`—Skips the retrieval of rate card entries for quote line items during the quote creation process. The default value is `Skip`. This property is available when the Usage-Based Selling feature is enabled.	Optional	62.0
`configurationInput`	String	Configuration input for the place quote process. Valid values are: • `RunAndAllowErrors` • `RunAndBlockErrors` • `Skip` The default value is `RunAndBlockErrors`.	Optional	60.0
`configurationOptions`	Configuration Options Input	Configuration options during the ingestion process.	Optional	60.0
`graph`	Object Graph Input	The sObject graph representing the quote structure. You can perform create, update, or delete operations on objects from the Sales Transaction context definition by using this property. Additionally, perform create, update, or delete operations on custom objects and fields in your extended context definition.	Required	60.0
`pricingPref`	String	Pricing preference during the quote process. Valid values are: • `Force` • `Skip`	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
		• `System` The default value is `System`.		

Read Sales Transaction Input

Input representation of the filter criteria details to read a sales transaction.

JSON example

```
{
  "contextId": "008d27d7-e004-4906-a949-ee7d7c323c77",
  "queryTags": [
    "Quote",
    "QuoteLineItem",
    "Product"
  ],
  "sobjectFieldMap": {
    "Quote": [],
    "QuoteLineItem": [
      "Quantity",
      "Product2Id"
    ]
  },
  "filters": [
    {
      "sObjectName": "Quote",
      "fieldName": "Status",
      "operator": "Equals",
      "operands": [
        {
          "value": "Draft",
          "type": "STRING"
        }
      ]
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`contextId`	String	ID of the context to retrieve the data records.	Required	65.0
`queryTags`	List<String>	List of objects that must be retrieved from the context.	Optional	65.0

Name	Type	Description	Required or Optional	Available Version
sobjectFieldMap	Map<String, List<String>>	Mapping of an sObject name to a list. The list includes the sObject field names on the object or can be an empty list. An empty list specifies that all fields on the object must be queried.	Optional	67.0
filters	List<Sales Transaction Filter Condition>	Filter conditions to query the context data.	Optional	67.0

Renewal Input

Input representation of the details of the request to initiate the renewal of an asset.

JSON example

```
{
  "assetIds": [
    "02iSG0000003NMhYAM",
    "02iSG0000006DvSYAU"
  ],
  "contractId": "800SG00000CFpepYAD",
  "opportunityId": "006SG000004W5tVYAS",
  "outputRecordId": "801SG00000DX1jWYAT",
  "outputRecordType": "Quote",
  "renewalEndDate": "2024-10-03T23:59:59",
  "renewalStartDate": "2023-10-04T00:00:00"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
assetIds	String[]	IDs of the assets that you want to renew.	Required	62.0
contractId	String	ID of the Contract record that you want to sync with the renewal of the Quote or Order record.	Optional	62.0
opportunityId	String	ID of the Opportunity record that you want to sync with the renewal quote.	Optional	62.0
outputRecordId	String	ID of the Quote or Order record that you want to renew.	Optional	62.0
outputRecordType	String	Type of renewal record that you want to create.	Required	62.0
renewalEndDate	String	End date of the renewal process for the assets.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
`renewal StartDate`	String	Start date of the renewal process for the assets. Required for early asset renewals and renewing expired assets, using today's date or a future date.	Optional	62.0

Sales Transaction Filter Condition Input

Input representation of filter conditions used to query sales transaction context data.

JSON example

```
{
  "filters": [
    {
      "sObjectName": "Quote",
      "fieldName": "Status",
      "operator": "Equals",
      "operands": [
        {
          "value": "Draft",
          "type": "STRING"
        }
      ]
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`sObjectName`	String	Name of the sObject that contains the field to filter on.	Required if the `fieldName` property value isn't specified. Or, specify the `nodeName` and `attributeName` property values.	67.0
`fieldName`	String	Name of the field on the specified sObject to filter on.	Required if the `sObjectName` property value isn't specified. Or, specify the `nodeName` and `attributeName` property values.	67.0

Name	Type	Description	Required or Optional	Available Version
`operator`	String	Operator to use to filter the results. Valid values are: • `Equals` • `NotEquals` • `Gt`—Greater Than • `GtEq`—Greater Than or Equals • `Lt`—Less Than • `LtEq`—Less Than or Equals • `In`	Required	67.0
`nodeName`	String	Name of the context node to apply filtering on.	Optional	67.0
`attributeName`	String	Name of the node attribute to apply filtering on.	Optional	67.0
`operands`	Sales Transaction Operand[]	Operand values with explicit value and type metadata.	Required	67.0
`underlyingFilters`	Sales Transaction Filter Condition[]	Nested filter conditions used to compose a composite filter.	Optional	67.0
`operatorLogic`	String	Logical expression that defines how underlying filters are combined. Valid values are: • `AND` • `OR`	Optional	67.0

Sales Transaction Input

Input representation of the details of the request to place a sales transaction, such as a quote or an order.

JSON example

This is a sample request to create a sales transaction for a quote. This example also skips tax calculation by specifying a value for the optional `taxPref` property.

```
{
  "pricingPref": "System",
  "catalogRatesPref": "Skip",
  "configurationPref": {
    "configurationMethod": "Skip",
    "configurationOptions": {
      "validateProductCatalog": true,
      "validateAmendRenewCancel": true,
      "executeConfigurationRules": true,
      "addDefaultConfiguration": true
```

```
    }
  },
  "taxPref": "Skip",
  "contextDetails": {
    "contextId": "e055bb18-d4e8-41c3-881e-0132b9561708"
  },
  "graph": {
    "graphId": "createQuote",
    "records": [
      {
        "referenceId": "refQuote",
        "record": {
          "attributes": {
            "method": "POST",
            "type": "Quote"
          },
          "Name": "Quote_Acme",
          "Pricebook2Id": "01sDU000000JvhbYAC"
        }
      },
      {
        "referenceId": "refQuoteLine0",
        "record": {
          "attributes": {
            "type": "QuoteLineItem",
            "method": "POST"
          },
          "QuoteId": "@{refQuote.id}",
          "Product2Id": "01tDU000000F7b8YAC",
          "PricebookEntryId": "01uDU000000fxt2YAA",
          "UnitPrice": 100,
          "Quantity": "1",
          "StartDate": "2024-10-29",
          "EndDate": "2025-03-01",
          "PeriodBoundary": "Anniversary"
        }
      },
      {
        "referenceId": "refQuoteLine1",
        "record": {
          "attributes": {
            "type": "QuoteLineItem",
            "method": "POST"
          },
          "QuoteId": "@{refQuote.id}",

            "method": "POST",
            "action": "GroupAll"
          },
          "Name": "From PST API Group",
          "QuoteId": "@{refQuote.id}"
        }
      }
    ]
  }
}
```

This is a sample request to ungroup a quote but retain the quote lines.

```
{
   "catalogRatesPref": "Skip",
   "pricingPref": "Force",
   "graph": {
      "graphId": "ungroupQuote",
      "records": [
         {
            "referenceId": "refQuote",
            "record": {
               "attributes": {
                  "type": "Quote",
                  "method": "PATCH",
                  "id":"0Q0xx0000004C99CAE"
               },
               "Name": "Grouped Quote with PST API"
            }
         },
         {
            "referenceId": "refQlg1",
            "record": {
               "attributes": {
                  "type": "QuoteLineGroup",
                  "method": "DELETE",
```

```
                    "id": "402xx000003KY5vJGH",
                    "action": "Ungroup"
                }
            }
        }
    ]
  }
}
```

This is a sample request to create a new group.

```
{
   "catalogRatesPref": "Skip",
   "pricingPref": "Force",
   "graph": {
      "graphId": "createGroup",
      "records": [
         {
            "referenceId": "refQuote",
            "record": {
               "attributes": {
                  "type": "Quote",
                  "method": "PATCH",
                  "id":"0Q0xx0000004C99CAE"
               },
               "Name": "Grouped Quote with PST API"
            }
         },
         {
            "referenceId": "refQlg1",
            "record": {
               "attributes": {
                  "type": "QuoteLineGroup",
                  "method": "POST"
               },
               "Name": "From PQ API Group",
               "QuoteId": "@{refQuote.id}"
            }
         }
      ]
   }
}
```

This example shows a sample request to delete a group.

```
{
   "catalogRatesPref": "Skip",
   "pricingPref": "Force",
   "graph": {
      "graphId": "deleteGroup",
      "records": [
         {
            "referenceId": "refQuote",
            "record": {
               "attributes": {
```

```
                    "type": "Quote",
                    "method": "PATCH",
                    "id":"0Q0xx0000004C99CAE"
                 },
                 "Name": "Grouped Quote with PST API"
              }
           },
           {
              "referenceId": "refQlg1",
              "record": {
                 "attributes": {
                    "type": "QuoteLineGroup",
                    "method": "DELETE",
                    "id": "402xx000003KY5vJGH",
                    "action": "DeleteGroup"
                 }
              }
           }
        ]
     }
}
```

This is a sample request to group order items based on criteria.

```
{
    "catalogRatesPref": "Skip",
    "pricingPref": "Force",
    "graph": {
        "graphId": "groupOrderItems",
        "records": [
            {
                "referenceId": "refOrder",
                "record": {
                    "attributes": {
                        "type": "Order",
                        "method": "PATCH",
                        "id": "0Q0xx0000004C99CAE"
                    }
                }
            },
            {

            "type": "Quote",
            "method": "PATCH",
            "id": "0Q0xx0000004DQ4CAM"
          }
        }
      }
    ]
  }
}
```

To see examples that specify actions to create ramp deals for groups, see Group Ramp Action Input on page 1491.

To see examples that apply to usage-based products, see Usage-Based Product Input on page 1502.

Properties

Name	Type	Description	Required or Optional	Available Version
catalogRates Pref	String	Rate card entries defined in the catalog that must be fetched for sales items with	Optional	63.0

Name	Type	Description	Required or Optional	Available Version
		usage-based pricing during the creation of the sales transaction. Valid values are: • `Fetch`—Retrieves the rate card entries defined in the catalog for sales items during the creation of the sales transaction. • `Skip`—Skips the retrieval of rate card entries for sales items during the creation of the sales transaction. The default value is `Skip`. This property is available when the Usage-Based Selling feature is enabled.		
`configurationPref`	Configurator Preference Input	Configuration preference during the quote process. These preferences ensure that quotes are defined as per the requirement.	Optional	63.0
`contextDetails`	Context Input	Context details that are created for a sales transaction.	Required if the `graph` property isn't specified.	63.0
`graph`	Object Graph Input	The sObject graph of the sales transaction to be ingested. You can perform create, update, or delete operations on objects from the Sales Transaction context definition by using this property. Additionally, perform create, update, or delete operations on custom objects and fields in your extended context definition. To create custom objects that are at the grandchildren level from a line item, you must create the hierarchy of objects until the grandchild object in the same request.	Required if the `contextDetails` property isn't specified.	63.0
`groupRampAction`	String	Specifies the action that you want to perform on group ramp segments. You can also convert a non-ramped group into a ramped group. Valid values are: • `AddProducts`—Adds rampable products to group ramp segments. • `DeleteProducts`—Deletes ramped products. • `EditGroup`—Converts a non-ramped group into a group ramp	Optional	65.0

Name	Type	Description	Required or Optional	Available Version
		segment, or edit group ramp segment attributes such as name and description, except the start and end dates. • `EditRampSchedule`—Edits details of the group ramp segments, including start and end dates. • `DeleteSegment`—Deletes the first or last segment in a group ramp schedule. • `ConvertToNonRampedGroup`—Converts the first or last group ramp segment into a non-ramped group. To add or delete ramped line items from multiple group ramp segments, specify the applicable values in the `graph` property. See Group Ramp Action Input on page 1491 to refer to examples.		
`pricingPref`	String	Pricing preference during the creation of a sales transaction. Valid values are: • `Force`—Enforces pricing during the creation of sales transactions. • `Skip`—Skips pricing during the creation of sales transactions. • `System`—Determines whether a pricing calculation is required. The default value is `System`.	Optional	63.0
`taxPref`	String	Specifies whether to execute or skip the tax calculation step for each sales transaction record. Valid value is `Skip`. If you don't specify this value, then tax calculation request is performed by default.	Optional	65.0

Group Ramp Action Input

Understand the sample request to specify group ramp actions during initial sale.

Group Ramp Action Input

Understand the sample request to specify group ramp actions during initial sale.

Keep these considerations in mind when you specify ramp actions.

- Use the Clone Sales Transaction API to clone a ramp segment, and specify the clone option.

- Use the Place Sales Transaction API to specify a group ramp action by using the `groupRampAction` property. You can refer to the sections in this topic for examples.

JSON example to edit a group

This is a sample request that creates the first ramp segment. This request accepts IDs of a quote and quote line group. Additionally, the request accepts attributes of quote line group such as `IsRamped`, `SegmentType`, `StartDate`, and `EndDate`. A ramp segment is created with a ramp identifier and segment identifier added to all the quote line items available in the ramp segment.

This process converts a group into a segment, which becomes the first segment in the ramp schedule. A quote can contain a single ramp schedule only. To create another segment in the ramp schedule, use the Clone Sales Transaction API.

```
{
  "groupRampAction": "EditGroup",
  "pricingPref": "System",
  "graph": {
    "graphId": "updateQuote",
    "records": [
      {
        "referenceId": "0Q0xx0000004CYqCAM",
        "record": {
          "attributes": {
            "type": "Quote",
            "method": "PATCH",
            "id": "0Q0xx0000004CYqCAM"
          }
        }
      },
      {
        "referenceId": "1C9xx0000004CVcCAM",

          "BillingFrequency": null,
          "PeriodBoundary": null,
          "QuoteLineGroupId": "1C9xx0000004CCGCAB"
        }
      }
    ]
  }
}
```

JSON example to delete a product

This is a sample request to delete a product from the current and subsequent ramp segments.

```
{
  "pricingPref": "System",
  "groupRampAction": "DeleteProducts",
  "graph": {
    "graphId": "updateQuote",
    "records": [
      {
        "referenceId": "0Q0SG000000L5r70AC",
        "record": {
          "attributes": {
            "type": "Quote",
            "method": "PATCH",
            "id": "0Q0SG000000L5r70AC"
          }
        }
      },
      {
        "referenceId": "0QLSG000000WuTh4AK",
        "record": {
          "attributes": {
            "type": "QuoteLineItem",
            "method": "DELETE",
```

```
            "id": "0QLSG000000WuTh4AK"
          }
        }
      },
      {
        "referenceId": "0QLSG000000WuTh4BK",
        "record": {
          "attributes": {
            "type": "QuoteLineItem",
            "method": "DELETE",
            "id": "0QLSG000000WuTh4AK"
          }
        }
      }
    ]
  }
}
```

JSON example to delete a segment

This is a sample request to delete the first and last segment in a ramp schedule. The API throws an error if the specified segment isn't the first and last segment, ensuring there are no gaps between quote line items in different ramp segments.

```
{
  "pricingPref": "System",
  "groupRampAction": "DeleteSegment",
  "graph": {
    "graphId": "updateQuote",
    "records": [
      {
        "referenceId": "0Q0xx0000004CfICAU",
        "record": {
          "attributes": {
            "type": "Quote",
            "method": "PATCH",
            "id": "0Q0xx0000004CfICAU"
          }
        }
      },
      {
        "referenceId": "1C9xx0000004FjcCAE",
        "record": {
          "attributes": {
            "type": "QuoteLineGroup",
            "method": "DELETE",
            "id": "1C9xx0000004FjcCAE",
            "action": "DeleteGroup"
          }
        }
      }
    ]
  }
}
```

JSON example to remove a segment from a ramp schedule

This is a sample request to remove the first or last ramp segment in a ramp schedule. This request removes the ramp-specific fields from a quote line group such as `IsRamped` and `SegmentType`. Additionally, this request removes the `RampIdentifier` and `SegmentIdentifier` fields from a quote line item.

```
{
  "pricingPref": "System",
  "groupRampAction": "ConvertToNonRampedGroup",
  "graph": {
    "graphId": "updateQuote",
    "records": [
      {
        "referenceId": "0Q0xx0000004CfICAU",
        "record": {
          "attributes": {
            "type": "Quote",
            "method": "PATCH",
            "id": "0Q0xx0000004CfICAU"
          }
        }
      },
      {
        "referenceId": "1C9xx0000004FjcCAE",
        "record": {
          "attributes": {
            "type": "QuoteLineGroup",
            "method": "PATCH",
            "id": "1C9xx0000004FjcCAE"
          }
        }
      }
    ]
  }
}
```

Sales Transaction Operand Input

Input representation of a filter operand for reading sales transaction context data.

JSON example

```
{
  "operands": [
    {
      "value": "Draft",
      "type": "STRING"
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`value`	String	Operand value used by the filter condition.	Required	67.0
`type`	String	Data type of the operand value. Valid values are: • `STRING` • `NUMBER` • `BOOLEAN` • `DATETIME` • `DATE`	Required	67.0

Supplemental Transaction Input

Input representation of the details of the request to create a supplemental order.

JSON example

This sample creates a supplemental order, which is a clone of the original order. The supplemental order is related to the original order.

```
{
  "relatedSalesTransactionId": "801S70000001VKgIAM"
}
```

This sample overrides a field value of an order line item to supplement the order item with ID value as `802SG000003vZ15YAE`.

```
{
    "relatedSalesTransactionId": "801S70000001VKgIAM",
    "pricingPref": "System",
    "supplementalGraph": {
        "graphId": "1",
        "records": [
            {
                "referenceId": "refOrder",
                "record": {
                    "attributes": {
                        "type": "Order",
                        "method": "PATCH",
                        "id": "801S70000001VKgIAM"
                    },
                    "EffectiveDate": "2025-03-01",
                    "QuoteId": "0Q0xx0000004DQ4CAM"
                }
            },
            {
                "referenceId": "refOrderItem",
                "record": {
                    "attributes": {
```

```
                    "type": "OrderItem",
                    "method": "PATCH",
                    "id": "802SG000003vZ15YAE"
                },
                "QuoteLineItemId": "0Q0xx0000004E2mYLK"
            }
        }
    ]
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`pricingPref`	String	Pricing preference for this supplemental transaction or order ingestion process. Valid values are: • `Force`—Enforces pricing during the creation of sales transactions. • `Skip`—Skips pricing during the creation of sales transactions. • `System`—Determines whether a pricing calculation is required. If `pricingPref` value is defined as either `Force` or `System`, the supplemental order can have a different pricing from the original order.	Optional	64.0
`relatedSalesTransactionId`	String	Related or the original sales transaction upon which a supplemental transaction is created.	Required	64.0
`supplementalGraph`	Object Graph Input	The sObject graph that represents a payload with the additional changes to be ingested. The attribute's HTTP method must be PATCH. The attribute ID must be the ID of the original order or order item that you want to supplement.	Optional	64.0

Swap Group Input

Input representation of the details of the swap groupings for swap operations.

JSON example

```
{
  "swapGroups": {
    "groups": [
      {
        "referenceId": "SWAP-001",
        "outGroup": {
          "swapAssets": [
            {
              "assetId": "02ixx0000004HOAAA2",
              "quantity": 1
            }
          ]
        },

              }
            }
          ]
        }
      }
    ]
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`inGroup`	Object	Products to include in the swap. These objects are supported. • QuoteLineItem • OrderItem	Required	66.0
`outGroup`	Swap Group[]	Assets to exclude from the swap. You can't use string values for properties, such as quantity and price.	Required	66.0

Name	Type	Description	Required or Optional	Available Version
`referenceId`	String	Reference ID of the operation.	Required	66.0

Update Ramp Deal Input

Input representation of the request to update a ramp deal.

JSON example

```
{
  "executionSettings": {
       "executePricing": true,
       "executeConfigRules": false
  },

}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`addedNodes`	Context Node Input[]	Details of the nodes to be added.	Required	62.0
`deletedNodes`	Context Node Input[]	Details of the nodes to be deleted.	Required	62.0
`execution Settings`	Execution Settings Input[]	Settings to run the pricing or configuration rules.	Optional	62.0
`updatedNodes`	Context Node Input[]	Details of the nodes to be updated.	Required	62.0

Usage-Based Product Input

Understand the sample request structure to specify and manage usage-based products within a sales transaction.

JSON example to create a quote record with default rates and default grants

The example shows a sample request to creates these records with these updates.

- `Quote`—Creates the main quote record with default rates and default grants.
- `Quote Line Item`—Adds a product to the quote.
- `Rate Card Entry`—Links default pricing from rate card. When `NegotiatedRate` property value is null, the rate card price is used.
- `Usage Grant`—Allocates all default grants.

```

          "RateCardEntryId": "1CJxx0000004CXEGA2",
          "NegotiatedRate": null,
          "QuoteLineItemId": "@{refQuoteLineItem.id}"
        }
      }
    ]
  }
}
```

JSON example to specify negotiated grants

This example shows a sample response to create a QuotLineItmUseRsrcGrant record that links a quote line item to a product usage grant for usage-based products. This request performs these updates.

- Associates a usage grant with a quote line item.
- Allocates a quantity of usage resources.
- Applies a usage policy that defines how the resources can be consumed.
- Links to a base product usage grant that defines the grant structure.

```
{
  "pricingPref": "system",
  "configurationPref": {
```

```
    "configurationMethod": "skip",
    "configurationOptions": {
      "validateProductCatalog": false,
      "validateAmendRenewCancel": false,
      "executeConfigurationRules": false,
      "addDefaultConfiguration": false
    }
  },
  "graph": {
    "graphId": "graphId",
    "records": [
      {
        "referenceId": "ref1CJxx0000004CXGGA2",
        "record": {
          "attributes": {
            "type": "QuotLineItmUseRsrcGrant",
            "method": "POST"
          },
          "GrantQuantity": 4,
          "ProductUsageResourcePolicyId": "7Suxx0000004C92CAE",
          "QuoteLineItemId": "0QLxx0000004CnMGAU",
          "ProductUsageGrantId": "1BXxx0000004C92GAE"
        }
      }
    ]
  }
}
```

This example shows a sample response to update the previously created QuotLineItmUseRsrcGrant record with additional units, which is specified by using the `GrantQuantity` property. The quote line item now has 97 units of usage resource allocation.

```
{
  "pricingPref": "system",
  "configurationPref": {
    "configurationMethod": "skip",
    "configurationOptions": {
      "validateProductCatalog": false,
      "validateAmendRenewCancel": false,
      "executeConfigurationRules": false,
      "addDefaultConfiguration": false
    }
  },
  "graph": {
    "graphId": "graphId",
    "records": [
      {
        "referenceId": "ref1X6xx000000003GCAQ",
        "record": {
          "attributes": {
            "method": "PATCH",
            "type": "QuotLineItmUseRsrcGrant",
            "id": "1X6xx000000003GCAQ"
          },
          "GrantQuantity": 97
        }
```

```
      }
    ]
  }
}
```

JSON example to specify tiered pricing and usage grants

This example shows a sample request to update an existing quote with tiered pricing and usage grants. This request sets up a multi-tier rate structure and updates a usage grant quantity along with these additional updates.

- Creates a base rate card entry with a negotiated rate of 10. Sets the base price for the quote line item.
- Creates a second rate card entry for tiered pricing without any negotiated rate. The default rate card is used. This rate card entry is the base for tier adjustments.
- Creates a tier adjustment for quantities 0 through 50 and adds $5 adjustment to the base rate.
- Creates a tier adjustment for quantities 50 through 100 and adds an adjustment of $10.
- Updates an existing usage resource grant record to set grant quantity to 150 units.

For example, if an order is placed for 75 units, the base rate is $10. As tier 2 is applicable for this order, an adjustment of $10 is applicable. The final price per unit is $20 with a total of $1500 for 75 units.

```

Response Bodies

Learn more about the available response bodies.

Amendment

Output representation of the details of an amendment record.

ARC Base Error

Output representation of the error response related to the amendment, renewal, or cancellation of assets.

Cancellation

Output representation of the details of a cancellation record.

Clone Sales Transaction

Output representation for the result of cloning records within a sales transaction.

Clone Sales Transaction Error Response

Output representation of the errors that occur during the clone sales transaction operation.

Eligible Promotions Response

Output representation of the details of the eligible promotions.

Initiate Downgrade Response

Output representation of the request to initiate a downgrade action.

Initiate Swap Response

Output representation of the request to initiate a swap action.

Initiate Upgrade Response

Output representation of the request to initiate an upgrade action.

Instant Pricing

Output representation containing the results of the instant pricing request.

Object Reference

Output representation of an sObject with a reference ID along with any potential error.

Place Order Error Response

Output representation of the error response for the place order request.

Place Order Response

Output representation of the request to create or update an order.

Place Quote Error Response

Output representation of the error responses of a place quote request.

Place Quote

Output representation of the request to create or update a quote.

Sales Transaction Async Error

Output representation of the details of errors encountered during the async processing of the Place Sales Transaction API request.

Promotion Coupon

Output representation of the details of a coupon that's eligible for the recommended promotion.

Promotion Coupon Availability

Output representation of the details of the coupon that's eligible for the promotion. Additionally, this representation specifies the reason for any coupon ineligibility.

Promotion Details Response

Output representation of the eligible promotion and its details. This representation includes details of any coupons, eligibility rules, and terms and conditions.

Promotion Limit

Output representation of the details of the promotion limit of an eligible promotion.

Promotion Reward Details

Output representation of the details of the rewards of an eligible promotion rule.

Promotion Rules List

Output representation of the details of the rules of an eligible promotion.

Ramp Deal Service Error Response

Output representation of the details of errors encountered during the processing of the API request.

Ramp Deal Service

Output representation of the details of a created, updated, or deleted ramp deal.

Read Sales Transaction

Output representation of the request to read a sales transaction.

Read Sales Transaction Records

Output representation of the details of a map of keys and associated values. The keys are record type names, such as a Quote or QuoteLineItem, and values are lists of records of that type.

Renewal

Output representation of the details of a renewal record.

Sales Transaction

Output representation of the request to create a sales transaction.

Sales Transaction Context

Output representation of the context details that are associated with a sales transaction.

Sales Transaction Error Response

Output representation of the error details associated with the API request.

Sales Transaction Record

Generic output representation for any sales transaction record type.

Supplemental Transaction Error Response

Output representation of the error details associated with the Place Supplemental Transaction API.

Supplemental Transaction

Output representation of the details of the created supplemental order.

Amendment

Output representation of the details of an amendment record.

JSON example

```
{
  "amendmenRecordId": "0Q0xx0000004NsSCAU",
  "errors": [
    {
      "errorCode": "REQUIRED_FIELD_MISSING",
      "errorMessage": "Specify a value for quantityChange, and try again."
    }
  ],
  "requestId": "16Pxx0000004NIy",
  "success": true
}
```

Properties

Property Name	Type	Description	Filter Group and Version	Available Version
amendment RecordId	String	ID of the amendment record that's created for a quote or an order.	Small, 62.0	62.0
errors	ARC Base Error on page 1509[]	Error responses if the creation of an amendment record fails.	Small, 62.0	62.0
requestId	String	Request ID that's used to track an async request.	Small, 62.0	62.0
success	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Small, 62.0	62.0

ARC Base Error

Output representation of the error response related to the amendment, renewal, or cancellation of assets.

```
  "errors": [
      {
          "errorCode": "REQUIRED_FIELD_MISSING",
          "errorMessage": "Specify a value for quantityChange, and try again."
      }
  ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
errorCode	String	Code for the resultant error.	Big, 62.0	62.0
errorMessage	String	Error message for the resultant error.	Big, 62.0	62.0

Cancellation

Output representation of the details of a cancellation record.

JSON example

```
{
  "cancellationRecordId": "0Q0xx0000004NsSCAU",
  "errors": [
    {
      "errorCode": "REQUIRED_FIELD_MISSING",
      "errorMessage": "Specify a value for quantityChange, and try again."
    }
  ],
  "requestId": "16Pxx0000004NIy",
  "success": true
}
```

Properties

Property Name	Type	Description	Filter Group and Version	Available Version
cancellationRecordId	String	ID of the cancellation record that's created for a quote or an order.	Small, 62.0	62.0
errors	ARC Base Error on page 1509[]	Error responses if the creation of a cancellation record fails.	Small, 62.0	62.0
requestId	String	Request ID that's used to track the async request.	Small, 62.0	62.0
success	Boolean	Indicates whether the API request is successful (true) or not (false).	Small, 62.0	62.0

Clone Sales Transaction

Output representation for the result of cloning records within a sales transaction.

JSON example

This example shows a sample of a successful response.

```
{
    "requestId": "9356bcbf04f06e22360a09807c13e1d4e395",
    "salesTransactionId": "0Q0SG000000ACxf0AG",
    "errors": [],
```

```
    "success": true
}
```

This example shows a sample error response.

```
{
    "requestId": "9356bcbf04f06e22360a09807c13e1d4e395",
    "salesTransactionId": "0Q0SG000000ACxf0AG",
    "errors": [
        {
            "errorCode": "INVALID_API_INPUT",
            "message": "Specify only one record",
            "referenceId": "0QLxx0000004CBYGA2"
        }
    ],
    "success": false
}
```

Properties

Name	Type	Description	Available Version
`requestId`	String	Request ID of the process that can be used to query the async status.	64.0
`salesTransactionId`	String	ID of the quote line item, order item, quote line group, or order item group record.	64.0
`success`	Boolean	Indicates whether the synchronous part of the processing is successful (`true`) or not (`false`).	64.0
`errors`	Clone Sales Transaction Error Response[]	List of errors encountered during synchronous processing.	64.0

Clone Sales Transaction Error Response

Output representation of the errors that occur during the clone sales transaction operation.

JSON example

```
{
  "errors": [
    {
      "errorCode": "INVALID_API_INPUT",
      "message": "Specify only one record",
      "referenceId": "0QLxx0000004CBYGA2"
    }
  ]
}
```

Properties

Name	Type	Description	Available Version
`errorCode`	String	Code associated with the error.	64.0

Name	Type	Description	Available Version
message	String	Message associated with the error.	64.0
referenceId	String	Reference ID associated with the error.	64.0

Eligible Promotions Response

Output representation of the details of the eligible promotions.

JSON example

```
{
  "eligiblePromotions": [
    {
      "additionalPromotionFields": {},
      "couponDetails": {
        "coupon": {

}
```

Property Name	Type	Description	Filter Group and Version	Available Version
eligiblePromotions	Promotion Details Response	List of eligible promotions for the specified line items.	Big, 66.0	66.0

Initiate Downgrade Response

Output representation of the request to initiate a downgrade action.

JSON example

```
{
  "salesTransactionId": "0Q09Q000005IkEPSA0"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
salesTransactionId	String	ID of the sales transaction that's created by the downgrade action.	Small, 66.0	66.0

Initiate Swap Response

Output representation of the request to initiate a swap action.

JSON example

```
{
  "salesTransactionId": "0Q09Q000005IkEPSA0"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
salesTransactionId	String	ID of the sales transaction that's created by the swap action.	Small, 66.0	66.0

Initiate Upgrade Response

Output representation of the request to initiate an upgrade action.

JSON example

```
{
  "salesTransactionId": "0Q09Q000005IkEPSA0"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
salesTransactionId	String	ID of the sales transaction that's created by the upgrade action.	Small, 66.0	66.0

Instant Pricing

Output representation containing the results of the instant pricing request.

Sample Response

```

      },
      "referenceId": "0Q0LT000000Q1LR0A0"
    }
  ],
  "success": true
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`contextId`	String	Context ID returned by the context service.	Small, 59.0	59.0
`correlationId`	String	Client-generated ID for tracking multiple related API calls.	Small, 59.0	59.0
`records`	Object Reference[]	List of records related to pricing results.	Small, 59.0	59.0
`success`	Boolean	Indicates whether the fetching of instant pricing is successful (`true`) or not (`false`).	Small, 59.0	59.0

Object Reference

Output representation of an sObject with a reference ID along with any potential error.

Sample Response

```
{
  "referenceid": "refQuote",
  "record": {
    "attributes": {
      "type": "Quote",
      "method": "POST"
    },
    "quantity": "2"
  },
  "error": {
    "errorCode": "INVALID_API_INPUT",
    "message": "Reference Id format is irrelevant."
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`referenceId`	String	ID that identifies the specific Salesforce object that's returned in the API response.	Small, 59.0	59.0
`record`	Map<String, Object>	The sObject record data represented as a map of attribute names to their values.	Small, 59.0	59.0
`error`	[illegible]	Detailed information about any error associated with the sObject in the response.	Small, 59.0	59.0

Place Order Error Response

Output representation of the error response for the place order request.

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Code representing the type of error encountered during the place order create request.	Small, 60.0	60.0
`message`	String	Message stating the reason for the error, if any.	Small, 60.0	60.0
`referenceId`	String	Reference ID associated with the specific error instance for tracking and reference purposes.	Small, 60.0	60.0

Place Order Response

Output representation of the request to create or update an order.

JSON example

```
{
  "requestId": "16PRM0000004DBq",
  "orderId": "801S70000001VKgIAM",
  "success": true,
  "errors": [],
  "statusURL": "/services/data/vXX.X/sobjects/AsyncOperationTracker/16PRM0000004DBq"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Place OrderError Response on page 1517[]	List of errors encountered during the synchronous processing.	Small, 60.0	60.0
`orderId`	String	ID of the order created after a successful request.	Small, 60.0	60.0
`requestId`	String	Request ID of the process to query asynchronous status of the place order API.	Small, 60.0	60.0
`statusURL`	String	Asynchronous status URL of the request, if available.	Small, 60.0	60.0
`success`	Boolean	Indicates whether the synchronous part of the processing is successful (`true`) or not (`false`).	Small, 60.0	60.0

Place Quote Error Response

Output representation of the error responses of a place quote request.

JSON Example

```
{
 "errorCode": "INVALID_API_INPUT",
 "message": "Include record type and method in the request and try again.",
 "referenceId": "refQuoteItem2"
 }
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Error code representing the type of error encountered in the create place quote request.	Small, 60.0	60.0
`message`	String	Message stating the reason for the error, if any.	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
`referenceId`	String	Reference ID associated with the specific error instance for tracking and reference purposes.	Small, 60.0	60.0

Place Quote

Output representation of the request to create or update a quote.

JSON Example

This example shows a sample response of the place quote request.

```
{
    "quoteId": "0Q0xx0000004E2mCAE",
    "requestIdentifier": "95Txx0000004Cx2",
    "responseError": [],
   "statusURL": "/services/data/v60.0/sobjects/RevenueAsyncOperation/95Txx0000004Cx2EAE",

    "success": true
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`quoteId`	String	ID of the quote created after a successful request.	Small, 60.0	60.0
`request Identifier`	String	Unique request identifier that can be used to poll the async request.	Big, 60.0	60.0
`responseError`	Place Quote Error Response []	List of errors encountered during the synchronous processing.	Small, 60.0	60.0
`statusURL`	String	Asynchronous status URL to track the operation, if available.	Big, 60.0	60.0
`success`	Boolean	Indicates whether the synchronous part of the processing is successful (`true`) or not (`false`).	Small, 60.0	60.0

Sales Transaction Async Error

Output representation of the details of errors encountered during the async processing of the Place Sales Transaction API request.

JSON example

```
{
  "errors": [
    {
      "errorCode": "FIELD_CUSTOM_VALIDATION_EXCEPTION",
      "message": "Quantity cannot exceed 10",
```

```
      "referenceId": "refQuoteLineItem2"
    }
  ],
  "jobStatus": "Completed",
  "retryablePayload": {
    "pricingPref": "System",
    "configurationPref": {
      "configurationMethod": "System",
      "configurationOptions": {
        "validateProductCatalog": true,
        "validateAmendRenewCancel": true,
        "executeConfigurationRules": true,
        "addDefaultConfiguration": true
      }
    },
    "graph": {
      "graphId": "1",
      "records": [
        {
          "referenceId": "refQuoteLineItem2",
          "record": {
            "attributes": {
              "type": "QuoteLineItem",
              "method": "POST"
            },
            "QuoteId": "000xx0000004CNYCA2",
            "PricebookEntryId": "01uxx0000009CL2",
            "Product2Id": "01txx0000006uu2",
            "Quantity": 15,
            "UnitPrice": 100
          }
        },
        {
          "referenceId": "refQuoteLineItem3",
          "record": {
            "attributes": {
              "type": "QuoteLineItem",
              "method": "POST"
            },
            "QuoteId": "000xx0000004CNYCA2",
            "PricebookEntryId": "01uxx0000009CL3",
            "Product2Id": "01txx0000006uu3",
            "Quantity": 20,
            "UnitPrice": 100
          }
        },
        {
          "referenceId": "refQuoteLinePriceAdjustment1",
          "record": {
            "attributes": {
              "type": "QuoteLinePriceAdjustment",
              "method": "POST"
            },
            "QuoteLineItemId": "@{refQuoteLineItem3.id}",
```

```
                "Name": "Some Promo",
                "Amount": -25
              }
            }
          ]
        }
      },
      "rolledBackReferenceIds": [
        "refQuoteLineItem3",
        "refQuoteLinePriceAdjustment1"
      ]
    }
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Place Sales Transaction Error[]	List of async errors from Place Sales Transaction API. The details include a reference ID for the failed subrequest, an error code, and a detailed message.	Small, 66.0	66.0
`jobStatus`	String	Status of the async tracker ID. Error results are returned after the job is in a `Completed` status.	Small, 66.0	66.0
`retryablePayload`	Sales Transaction Input	Subset of the original Place Sales Transaction API payload errors that can be used for retry attempts. Reference IDs that are saved are replaced by their corresponding record IDs.This property is included in the response only when the `includeRetryablePayload` query parameter is set to `true`.	Small, 66.0	66.0
`rolledBack ReferenceIds`	String[]	List of rolled-back reference IDs for subrequests due to failure of a subrequest in the same transaction.	Small, 66.0	66.0

Promotion Coupon

Output representation of the details of a coupon that's eligible for the recommended promotion.

JSON example

```
{
  "coupon": {
    "couponCode": "COUPON_002",
    "endDateTime": null,
    "startDateTime": "2025-10-08T19:00:00.000Z",
    "status": "Active"
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
couponCode	String	Unique code of the coupon.	Big, 66.0	66.0
endDateTime	String	End date and time of the coupon.	Big, 66.0	66.0
startDateTime	String	Start date and time of the coupon.	Big, 66.0	66.0
status	String	Status of the coupon.	Big, 66.0	66.0

Promotion Coupon Availability

Output representation of the details of the coupon that's eligible for the promotion. Additionally, this representation specifies the reason for any coupon ineligibility.

JSON example

```
{
  "couponDetails": {
    "coupon": {
      "couponCode": "COUPON_002",
      "endDateTime": null,
      "startDateTime": "2025-10-08T19:00:00.000Z",
      "status": "Active"
    },
    "couponAvailabilityMessage": null
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
coupon	Promotion Coupon[]	Coupon that's eligible for the customers' cart.	Big, 66.0	66.0
couponAvailability Message	String	Specifies the reason for coupon ineligibility for the promotion. Valid values are: • MultipleActiveCoupons • NoActiveCoupons • SingleActiveCouponLimitReached	Big, 66.0	66.0

Promotion Details Response

Output representation of the eligible promotion and its details. This representation includes details of any coupons, eligibility rules, and terms and conditions.

JSON example

```
{
  "eligiblePromotions": [
    {
```

```
      "additionalPromotionFields": {},
      "couponDetails": {
        "coupon": {
          "couponCode": "COUPON_002",
          "endDateTime": null,
          "startDateTime": "2025-10-08T19:00:00.000Z",
          "status": "Active"
        },
        "couponAvailabilityMessage": null
      },
      "currencyIsoCode": "USD",

    ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
additional PromotionFields	Map<String, Object>	Values of the additional promotion fields that are mapped in the context definition.	Big, 66.0	66.0
couponDetails	Promotion Coupon Availability[]	Specifies the details of the coupon eligible for the promotion or specifies the reason why there isn't an eligible coupon for the promotion.	Big, 66.0	66.0
currencyIso Code	String	Three-letter ISO 4217 code of the monetary currency associated with the promotion.	Big, 66.0	66.0
description	String	Description of the promotion.	Big, 66.0	66.0
displayName	String	Display name of the eligible promotion.	Big, 66.0	66.0
endDateTime	String	End date and time of the promotion in the ISO 8601 date format.	Big, 60.0	66.0
isAutomatic	Boolean	Indicates whether the promotion is automatically applied for eligible carts (`true`) or not (`false`).	Big, 66.0	66.0

Property Name	Type	Description	Filter Group and Version	Available Version
`priorityNumber`	Integer	Priority number of the eligible promotion for promotion ordering.	Big, 66.0	66.0
`promotionCode`	String	Code of the eligible promotion.	Big, 66.0	66.0
`promotionEligibleRules`	Promotion Rules List[]	List of promotion rules that are eligible for the customer's cart.	Big, 66.0	66.0
`promotionId`	String	ID of the eligible promotion.	Big, 66.0	66.0
`promotionLimits`	Promotion Limit[]	List of the promotion's cart level and cart item level limits.	Big, 66.0	66.0
`startDateTime`	String	Start date and time of the promotion in the ISO 8601 date format.	Big, 66.0	66.0
`termsAndCondition`	String	Terms and conditions of the promotion.	Big, 66.0	66.0

Promotion Limit

Output representation of the details of the promotion limit of an eligible promotion.

Property Name	Type	Description	Filter Group and Version	Available Version
`limitCurrentAttainment`	Double	Current attainment of the promotion's limit value.	Big, 66.0	66.0
`limitTarget`	Double	Value beyond which the promotion can't be applied to customer carts.	Big, 66.0	66.0
`limitType`	String	Limit type for the promotion. Valid values are: • `CartItemCount`—Specifes the limit type that represents the maximum number of cart items the promotion can applied for. • `OrderCount`—Specifies the limit type that represents the maximum number of carts the promotion can applied for.	Big, 66.0	66.0

Promotion Reward Details

Output representation of the details of the rewards of an eligible promotion rule.

JSON example

```
{
  "ruleRewards": [
    {
      "rewardDetails": {
        "discountLevel": "Line",
        "discountProduct": "Printer Paper",
        "discountType": "AmountOff",
        "discountValue": "2.0",
        "discountAppliedAt": "LineItem"
      },
      "rewardType": "ProvideDiscount"
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`rewardDetails`	Map<String, Object>	Details of the reward offered by the promotion rule.	Big, 66.0	66.0
`rewardType`	String	Reward type of the promotion. Valid values are: • `AssignBadge` • `AssignGame` • `CreditFixedPoints` • `CreditMultiplierPoints` • `GiveFreeProduct` • `IssueVoucher` • `ProvideDiscount`	Big, 66.0	66.0

Promotion Rules List

Output representation of the details of the rules of an eligible promotion.

JSON example

```
{
  "promotionEligibleRules": [
    {
      "ruleName": "Rule001",
      "rulePriority": 1,
      "ruleRewards": [
        {
          "rewardDetails": {
            "discountLevel": "Line",
            "discountProduct": "Printer Paper",
            "discountType": "AmountOff",
```

```
            "discountValue": "2.0",
            "discountAppliedAt": "LineItem"
          },
          "rewardType": "ProvideDiscount"
        }
      ]
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`ruleName`	String	Rule name in the promotion which is eligible for rewards.	Big, 66.0	66.0
`rulePriority`	Integer	Rule priority in the promotion which is eligible for rewards.	Big, 66.0	66.0
`ruleRewards`	Promotion Reward Details[]	Rewards associated with the eligible rule.	Big, 66.0	66.0

Ramp Deal Service Error Response

Output representation of the details of errors encountered during the processing of the API request.

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Error code from the API request. For example, `INVALID_INPUT_ERROR`.	Small, 62.0	62.0
`message`	String	Error message from the API request.	Small, 62.0	62.0

Ramp Deal Service

Output representation of the details of a created, updated, or deleted ramp deal.

JSON Example

This example shows the sample response for the create, update, or view ramp deal requests.

```

Property Name	Type	Description	Filter Group and Version	Available Version
`correlationId`	String	Resource ID to correlate the API request with the response.	Small, 62.0	62.0
`errors`	Ramp Deal Service Error Response[]	List of errors encountered during the processing of the API request.	Small, 62.0	62.0

Property Name	Type	Description	Filter Group and Version	Available Version
sales Transaction Context	Map<String, Object>	Context object for the sales transaction with updated segment details.	Small, 62.0	62.0
success	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Small, 62.0	62.0
transaction ContextId	String	ID of the sales transaction context record instance.	Small, 62.0	62.0

Read Sales Transaction

Output representation of the request to read a sales transaction.

JSON example

```
{
  "response": {
    "records": {
      "Quote": [
        {
          "data": {
            "Id": "0Q05g000000AJK954",
            "Name": "Sample Quote",
            "Status": "Draft",
            "TotalPrice": 1500
          }
        }
      ],
      "QuoteLineItem": [
        {
          "data": {
            "Id": "0QL5g000000DEF456",
            "Product2Id": "01t5g000000GUE752",
            "Quantity": 2,
            "UnitPrice": 750,
            "TotalPrice": 1500
          }
        }
      ]
    }
  },
  "isSuccess": true,
  "errorResponse": []
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Place Sales Transaction Error Response[]	List of errors encountered during the processing of the API request.	Small, 65.0	65.0
`isSuccess`	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Small, 65.0	65.0
`response`	Read Sales Transaction Records[]	Contains a map of keys and associated values. The keys are record type names, such as a Quote or QuoteLineItem, and values are lists of records of that type.	Small, 65.0	65.0

Read Sales Transaction Records

Output representation of the details of a map of keys and associated values. The keys are record type names, such as a Quote or QuoteLineItem, and values are lists of records of that type.

JSON example

```
{
  "response": {
    "records": {
      "Quote": [
        {
          "data": {
            "Id": "0Q05g000000AJK954",
            "Name": "Sample Quote",
            "Status": "Draft",
            "TotalPrice": 1500
          }
        }
      ],
      "QuoteLineItem": [
        {
          "data": {
            "Id": "0QL5g000000DEF456",
            "Product2Id": "01t5g000000GUE752",
            "Quantity": 2,
            "UnitPrice": 750,
            "TotalPrice": 1500
          }
        }
      ]
    }
  },
  "isSuccess": true,
  "errorResponse": []
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`records`	Map<String, Sales Transaction Record>>	Map of record type names to the list of records.	Small, 65.0	65.0

Renewal

Output representation of the details of a renewal record.

JSON example

```
{
  "renewalRecordId": "0Q0xx0000004NsSCAU",
  "errors": [
    {
      "errorCode": "REQUIRED_FIELD_MISSING",
      "errorMessage": "Specify a value for quantityChange, and try again."
    }
  ],
  "requestId": "16Pxx0000004NIy",
  "success": true
}
```

Properties

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	ARC Base Error on page 1509[]	Error responses if the creation of a renewal record fails.	Small, 62.0	62.0
`renewalRecordId`	String	ID of the renewal record that's created for the Quote or Order record.	Small, 62.0	62.0
`requestId`	String	Request ID that's used to track the async request.	Small, 62.0	62.0
`success`	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Small, 62.0	62.0

Sales Transaction

Output representation of the request to create a sales transaction.

JSON example

```
{
  "contextDetails": {
    "contextId": "e055bb18-d4e8-41c3-881e-0132b9561708",
    "isBuiltInTransaction": true
  },
  "errorResponse": {
```

```
    "errorCode": "INVALID_API_INPUT",
    "message": "Include record type and method in the request and try again.",
    "referenceId": "refQuoteItem2"
  },
  "isSuccess": true,
  "salesTransactionId": "0Q0xx0000004CNYCA2",
  "statusUrl": null,
  "trackerId": null
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`contextDetails`	Sales Transaction Context	Details of the context that's created for the sales transaction.	Small, 63.0	63.0
`errorResponse`	Sales Transaction Error Response[]	Details of the error if the operation fails.	Small, 63.0	63.0
`isSuccess`	Boolean	Indicates if the operation is successful (`true`) or not (`false`).	Small, 63.0	63.0
`salesTransactionId`	String	ID of the sales transaction, such as a quote or an order.	Small, 63.0	63.0
`statusUrl`	String	URL to check the status of the operation.	Small, 63.0	63.0
`trackerId`	String	Unique identifier assigned to a specific operation or request that's used for tracking and referencing the operation.	Small, 63.0	63.0

The **Calculation Status** field for a quote or an order shows an intermediate status as `Saving` during the creation of a sales transaction. If the pricing calculation fails, then the **Calculation Status** field shows the `Pricing Calculation Failed` status. See Quote standard object for a list of applicable calculation status values.

Sales Transaction Context

Output representation of the context details that are associated with a sales transaction.

JSON example

```
{
  "contextDetails": {
    "contextId": "e055bb18-d4e8-41c3-881e-0132b9561708",
    "isBuiltInTransaction": true
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`contextId`	String	ID of the context that's created for a session of the sales transaction.	Small, 63.0	63.0

Property Name	Type	Description	Filter Group and Version	Available Version
`isBuiltIn Transaction`	Boolean	Indicates whether a new context ID is created for the sales transaction (`true`) or not (`false`). If the `contextId` property isn't specified, the Place Sales Transaction API generates it.	Small, 63.0	63.0

Sales Transaction Error Response

Output representation of the error details associated with the API request.

JSON example

```
{
  "errorResponse": {
    "errorCode": "INVALID_API_INPUT",
    "message": "Include record type and method in the request and try again.",
    "referenceId": "refQuoteItem2"
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Code for the resultant error.	Small, 63.0	63.0
`message`	String	Error message for the resultant error.	Small, 63.0	63.0
`referenceId`	String	Unique ID that's associated with the specific error for tracking and reference purposes.	Small, 63.0	63.0

Sales Transaction Record

Generic output representation for any sales transaction record type.

JSON example

```
{
  "response": {
    "records": {
      "Quote": [
        {
          "data": {
            "Id": "0Q05g000000AJK954",
            "Name": "Sample Quote",
            "Status": "Draft",
            "TotalPrice": 1500
          }
        }
      ],
```

```
      "QuoteLineItem": [
        {
          "data": {
            "Id": "0QL5g000000DEF456",
            "Product2Id": "01t5g000000GUE752",
            "Quantity": 2,
            "UnitPrice": 750,
            "TotalPrice": 1500
          }
        }
      ]
    }
  },
  "isSuccess": true,
  "errorResponse": []
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
data	Map<String, Object>	Represents the data map for any sales transaction record.	Small, 65.0	65.0

Supplemental Transaction Error Response

Output representation of the error details associated with the Place Supplemental Transaction API.

Property Name	Type	Description	Filter Group and Version	Available Version
errorCode	String	Code for the resultant error.	Small, 64.0	64.0
message	String	Message stating the reason for error, if any.	Small, 64.0	64.0
referenceId	String	Unique ID that's associated with the specific error for tracking and reference purposes.	Small, 64.0	64.0

Supplemental Transaction

Output representation of the details of the created supplemental order.

JSON example

```
{
  "requestId": "16PRM0000004DBq",
  "statusURL": "/services/data/vXX.X/sobjects/AsyncOperationTracker/16PRM0000004DBq",
  "orderId": "801S70000001VKgIAM",
  "success": true,
  "errors": []
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Supplemental Transaction Error Response[]	List of errors encountered during synchronous processing.	Small, 64.0	64.0
`requestId`	String	Request ID of the process that can be used to query the async status.	Small, 64.0	64.0
`statusURL`	String	URL to check the status of the async operation, if available.	Small, 64.0	64.0
`success`	Boolean	Indicates whether the synchronous part of the processing is successful (`true`) or not (`false`).	Small, 64.0	64.0
`supplementalTransactionId`	String	ID of the created supplemental transaction.	Small, 64.0	64.0

Transaction Management Apex Reference

Use built-in Apex classes and interfaces grouped by namespace.

CommerceOrders Namespace
The `CommerceOrders` namespace provides classes and methods to place orders with integrated pricing, configuration, and validation.

ConnectApi Namespace
The `ConnectApi` namespace (also called Connect in Apex) provides an Apex class to specify details for asset transfer request from one account to another.

CommerceTax Namespace
Manage the communication between Salesforce and an external tax engine.

PlaceQuote Namespace
The `PlaceQuote` namespace provides classes and methods to create or update quotes with pricing preferences and configuration options.

renew_assets_summary Namespace
Retrieve details about renewable assets to create renewal opportunities.

RevSalesTrxn Namespace
Create a sales transaction, such as a quote or an order, with integrated pricing and configuration. Additionally, update an order or a quote, and insert and delete order or quote line items to calculate the estimated tax.

CommerceOrders Namespace

The `CommerceOrders` namespace provides classes and methods to place orders with integrated pricing, configuration, and validation.

Note: This namespace has been deprecated as of API version 63.0. In API version 63.0 and later, use the new RevSalesTrxn namespace.

The `CommerceOrders` namespace includes these classes.

CatalogRatesPreferenceEnum Enum
Specifies the rate card entries defined in the catalog that must be fetched for order items, with usage-based selling during the order creation process.

ConfigurationInputEnum Enum
Specifies the configuration input for the request to place an order.

ConfigurationOptionsInput Class
Contains methods and properties to set the configuration options for the input to the product configurator.

GraphRequest Class
Contains constructors and properties to set the graph ID and a list of records to be ingested. The list of records is specified in a key-value map format that contains the field values of an order.

PlaceOrderExecutor Class
Contains methods to place an order with details of the graph request, pricing preferences, and configuration options.

PlaceOrderResult Class
Contains properties to hold the response to the place order request.

PricingPreferenceEnum Enum
Specifies the pricing preference during the create order process.

RecordResource Class
Contains constructors and properties to create a record object from field values of an order.

RecordWithReferenceRequest Class
Contains constructors and properties to associate a record object with a reference identifier.

CatalogRatesPreferenceEnum Enum

Specifies the rate card entries defined in the catalog that must be fetched for order items, with usage-based selling during the order creation process.

Usage

This enum is available when the Usage-Based Selling feature is enabled.

Enum Values

The `commerceorders.CatalogRatesPreferenceEnum` enum includes these values.

Value	Description
`Fetch`	Retrieves the rate card entries defined in the catalog for order items during the order creation process.
`Skip`	Skips the retrieval of rate card entries for order items during the order creation process. The default value is `Skip`.

ConfigurationInputEnum Enum

Specifies the configuration input for the request to place an order.

Usage

Use these enum values for the `configurationInputEnum` property in the PlaceOrderExecutor Class

Enum Values

The `commerceorders.ConfigurationInputEnum` enum has these values.

Value	Description
`RunAndAllowErrors`	Run the configuration and proceed with order ingestion upon encountering any configuration errors.
`RunAndBlockErrors`	Run the configuration and block order ingestion upon encountering any configuration errors.
`Skip`	Skip the configuration execution.

ConfigurationOptionsInput Class

Contains methods and properties to set the configuration options for the input to the product configurator.

Namespace

CommerceOrders

Usage

This class holds the required details of the product configuration input. Set the class properties to enable default configuration, execution of configuration rules, and validation of the product catalog. Use these class properties as an input to the PlaceOrderExecutor Class method.

Example

```
CommerceOrders.ConfigurationOptionsInput configurationInput = new
CommerceOrders.ConfigurationOptionsInput();
configurationInput.validateProductCatalog = true;
configurationInput.validateAmendRenewCancel = true;
configurationInput.executeConfigurationRules = true;
configurationInput.addDefaultConfiguration = true;

CommerceOrders.GraphRequest graph = new CommerceOrders.GraphRequest('testGraph',
recordNodes);
CommerceOrders.PlaceOrderResult result = CommerceOrders.PlaceOrderExecutor.execute(graph,
 pricingPreference, configurationPreference, configurationInput);
```

ConfigurationOptionsInput Properties

Set the `ConfigurationOptionsInput` class properties to add default configuration, execute configuration rules, and validate the product catalog.

ConfigurationOptionsInput Methods

Learn more about the methods available with the `ConfigurationOptionsInput` class.

ConfigurationOptionsInput Properties

Set the `ConfigurationOptionsInput` class properties to add default configuration, execute configuration rules, and validate the product catalog.

The `ConfigurationOptionsInput` class includes these properties.

addDefaultConfiguration

Sets the default product configuration, such as bundle and product attributes, for an order request.

executeConfigurationRules

Sets the requirement for an order to adhere to the configuration rules.

validateAmendRenewCancel

Sets the requirement to run validations related to amend, renew, or cancel processes.

validateProductCatalog

Sets the requirement to validate an order against the product catalog.

addDefaultConfiguration

Sets the default product configuration, such as bundle and product attributes, for an order request.

Signature

```
public Boolean addDefaultConfiguration {get; set;}
```

Property Value

Type: Boolean

Indicates whether to automatically add default configuration to the order (`true`) or not (`false`).

executeConfigurationRules

Sets the requirement for an order to adhere to the configuration rules.

Signature

```
public Boolean executeConfigurationRules {get; set;}
```

Property Value

Type: Boolean

Indicates whether the order must adhere to configuration rules during processing (`true`) or bypass them (`false`).

`validateAmendRenewCancel`

Sets the requirement to run validations related to amend, renew, or cancel processes.

Signature

`public Boolean validateAmendRenewCancel {get; set;}`

Property Value

Type: Boolean

Indicates whether to run validations related to amend, renew, or cancel processes (`true`) or not (`false`).

`validateProductCatalog`

Sets the requirement to validate an order against the product catalog.

Signature

`public Boolean validateProductCatalog {get; set;}`

Property Value

Type: Boolean

Indicates whether the order must be validated against the product catalog (`true`) or not (`false`).

ConfigurationOptionsInput Methods

Learn more about the methods available with the `ConfigurationOptionsInput` class.

The `ConfigurationOptionsInput` class includes these methods.

- equals(obj)
  Determines the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.
- hashCode()
  Determines the uniqueness of the external object records in a list.
- toString()
  Converts a value to a string.

`equals(obj)`

Determines the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

Signature

`public Boolean equals(Object obj)`

Parameters

obj

Type: Object

Reference object that's used to compare with the class object.

Return Value

Type: Boolean

Indicates if the class object is same as the reference object (`true`) or not (`false`).

hashCode()

Determines the uniqueness of the external object records in a list.

Signature

`public Integer hashCode()`

Return Value

Type: Integer

Integer hash code that represents the value of the object. Equal objects as per the `equals()` method must return the same hash code.

toString()

Converts a value to a string.

Signature

`public String toString()`

Return Value

Type: String

GraphRequest Class

Contains constructors and properties to set the graph ID and a list of records to be ingested. The list of records is specified in a key-value map format that contains the field values of an order.

Namespace

CommerceOrders

Example

Create the list of records to be ingested by using these steps.

- Create the list of records by constructing the `Map<String, Object>` map of field values of an order.

```
List<CommerceOrders.RecordWithReferenceRequest> recordNodes = new
List<CommerceOrders.RecordWithReferenceRequest>();

// Prepare for the Order
Map<String,Object> orderFieldValues = new Map<String,Object>();
orderFieldValues.put('Pricebook2Id', '01sDU0000001EIYAY');
orderFieldValues.put('AccountId', '001DU000001nIPKYA2');
orderFieldValues.put('EffectiveDate', '2024-01-01');
```

- To create a record object from the field values, create an instance of the `RecordResource` class.

```
CommerceOrders.RecordResource orderRecord = new
CommerceOrders.RecordResource(Order.getSobjectType(), 'POST');
orderRecord.fieldValues = orderFieldValues;
```

- To associate the Record object with a reference identifier, create an instance of the `RecordWithReferenceRequest` class.

```
CommerceOrders.RecordWithReferenceRequest orderRecordNode = new
CommerceOrders.RecordWithReferenceRequest('refOrder', orderRecord);
recordNodes.add(orderRecordNode);

// Prepare for the App Usage Assignment
Map<String,Object> auaFieldValues = new Map<String,Object>();
auaFieldValues.put('AppUsageType', 'RevenueLifecycleManagement');
auaFieldValues.put('RecordId', '@{refOrder.id}');

CommerceOrders.RecordResource auaRecord = new
CommerceOrders.RecordResource(AppUsageAssignment.getSobjectType(), 'POST');
auaRecord.fieldValues = auaFieldValues;

CommerceOrders.RecordWithReferenceRequest auaRecordNode = new
CommerceOrders.RecordWithReferenceRequest('refAppTag', auaRecord);
recordNodes.add(auaRecordNode);

// Prepare for the Order Item
Map<String,Object> oiFieldValues = new Map<String,Object>();
oiFieldValues.put('OrderId', '@{refOrder.id}');
oiFieldValues.put('PricebookEntryId', '01uDU000000YPkIYAW');
oiFieldValues.put('Product2Id', '01tDU000000ESCSYA4');
oiFieldValues.put('Quantity', 2);
oiFieldValues.put('UnitPrice', 800);

CommerceOrders.RecordResource oiRecord = new
CommerceOrders.RecordResource(OrderItem.getSobjectType(), 'POST');
oiRecord.fieldValues = oiFieldValues;

CommerceOrders.RecordWithReferenceRequest oiRecordNode = new
CommerceOrders.RecordWithReferenceRequest('refOrderItem', oiRecord);
recordNodes.add(oiRecordNode);
```

- Invoke the Place Order Apex API.

Note: The `CatalogRatesPreferenceEnum` enum is available when the Usage-Based Selling feature is enabled.

```
// Invoke the Place Order Apex API
CommerceOrders.PricingPreferenceEnum pricingPreference =
CommerceOrders.PricingPreferenceEnum.System;
CommerceOrders.CatalogRatesPreferenceEnum catalogRatesPreference =
CommerceOrders.CatalogRatesPreferenceEnum.Fetch;
CommerceOrders.ConfigurationInputEnum configurationPreference =
CommerceOrders.ConfigurationInputEnum.RunAndAllowErrors;
CommerceOrders.ConfigurationOptionsInput configurationInput = new
CommerceOrders.ConfigurationOptionsInput();
configurationInput.validateProductCatalog = true;
configurationInput.validateAmendRenewCancel = true;
configurationInput.executeConfigurationRules = true;
configurationInput.addDefaultConfiguration = true;
```

- To contain all record objects, create an instance of the `GraphRequest` class.

```
CommerceOrders.GraphRequest graph = new CommerceOrders.GraphRequest('testGraph',
recordNodes);
CommerceOrders.PlaceOrderResult result = CommerceOrders.PlaceOrderExecutor.execute(graph,
 pricingPreference, catalogRatesPreference, configurationPreference, configurationInput);

// Process any error, if exists
if (!result.success) {
  List<ConnectApi.PlaceOrderErrorResponse> errors = result.responseError;
  for (ConnectApi.PlaceOrderErrorResponse error : errors) {
    System.debug(error.errorCode + ': ' + error.message);
  }
}
```

GraphRequest Constructors

Learn more about the available constructors with the `GraphRequest` class.

GraphRequest Properties

Learn more about the available properties with the `GraphRequest` class.

GraphRequest Constructors

Learn more about the available constructors with the `GraphRequest` class.

The `GraphRequest` class includes these constructors.

GraphRequest(graphId, records)

Creates an instance of the `GraphRequest` class to assign the graph ID and a list of records to be ingested.

`GraphRequest(graphId, records)`

Creates an instance of the `GraphRequest` class to assign the graph ID and a list of records to be ingested.

Signature

```
public GraphRequest(String graphId, List<commerceorders.RecordWithReferenceRequest>
records)
```

Parameters

graphId
Type: String

ID of the graph.

records
Type: List<commerceorders.RecordWithReferenceRequest>

List of records to be ingested.

GraphRequest Properties

Learn more about the available properties with the `GraphRequest` class.

The `GraphRequest` class includes these properties.

graphId
Set the `graphId` property to assign the ID value of the graph.

graphId

Set the `graphId` property to assign the ID value of the graph.

Signature

```
public String graphId {get; set;}
```

Property Value

Type: String

PlaceOrderExecutor Class

Contains methods to place an order with details of the graph request, pricing preferences, and configuration options.

Namespace

CommerceOrders

Example

```
CommerceOrders.PlaceOrderResult resp =
CommerceOrders.PlaceOrderExecutor.execute(graph,internalEnum,cEnum,cInput,catalogRatesPreference);
```

PlaceOrderExecutor Methods

Learn more about the methods available with the `PlaceOrderExecutor` class.

PlaceOrderExecutor Example Implementation

Place orders with integrated pricing, configuration, and validation, and manage them throughout their entire lifecycle. To place an order from Apex, refer to the example implementation of the `PlaceOrderExecutor` class.

PlaceOrderExecutor Methods

Learn more about the methods available with the `PlaceOrderExecutor` class.

The `PlaceOrderExecutor` class includes these methods.

execute(graphRequest, pricingPreferenceEnum, configurationInputEnum, configurationOptionsInput)

Use the method in the `PlaceOrderExecutor` class to execute the Place Order Apex API request by assigning the properties for graph request, pricing reference, and configuration options.

execute(graphRequest, pricingPreferenceEnum, catalogRatesPreference, configurationInputEnum, configurationOptionsInput)

Use the method in the `PlaceOrderExecutor` class to execute the Place Order Apex API request by assigning the properties for graph request, pricing reference, and configuration options. This method also includes the property to define fetching of rate card entries.

execute(graphRequest)

Use the method in the `PlaceOrderExecutor` class to execute the Place Order Apex API request by assigning the properties for graph request.

`execute(graphRequest, pricingPreferenceEnum, configurationInputEnum, configurationOptionsInput)`

Use the method in the `PlaceOrderExecutor` class to execute the Place Order Apex API request by assigning the properties for graph request, pricing reference, and configuration options.

Signature

```
public static commerceorders.PlaceOrderResult execute(commerceorders.GraphRequest
graphRequest, commerceorders.PricingPreferenceEnum pricingPreferenceEnum,
commerceorders.ConfigurationInputEnum configurationInputEnum,
commerceorders.ConfigurationOptionsInput configurationOptionsInput)
```

Parameters

graphRequest

Type: commerceorders.GraphRequest

The sObject graph values of the order payload to be ingested.

pricingPreferenceEnum

Type: commerceorders.PricingPreferenceEnum

Pricing preference during the order process.

configurationInputEnum

Type: commerceorders.ConfigurationInputEnum

Configuration input for the place order process.

configurationOptionsInput

Type: commerceorders.ConfigurationOptionsInput on page 1540

Configuration options during the ingestion process.

Return Value

Type: commerceorders.PlaceOrderResult

execute(graphRequest, pricingPreferenceEnum, catalogRatesPreference, configurationInputEnum, configurationOptionsInput)

Use the method in the `PlaceOrderExecutor` class to execute the Place Order Apex API request by assigning the properties for graph request, pricing reference, and configuration options. This method also includes the property to define fetching of rate card entries.

Signature

```
public static commerceorders.PlaceOrderResult execute(commerceorders.GraphRequest
graphRequest, commerceorders.PricingPreferenceEnum pricingPreferenceEnum,
commerceorders.CatalogRatesPreferenceEnum catalogRatesPreferenceEnum,
commerceorders.ConfigurationInputEnum configurationInputEnum,
commerceorders.ConfigurationOptionsInput configurationOptionsInput)
```

Parameters

graphRequest

Type: commerceorders.GraphRequest

The sObject graph values of the order payload to be ingested.

pricingPreferenceEnum

Type: commerceorders.PricingPreferenceEnum

Pricing preference during the order process.

catalogRatesPreference

Type: commerceorders.CatalogRatesPreferenceEnum

The rate card entries defined in the catalog that must be fetched for order items, with usage-based pricing during the order creation process. The `CatalogRatesPreferenceEnum` enum is available when the Usage-Based Selling feature is enabled.

configurationInputEnum

Type: commerceorders.ConfigurationInputEnum

Configuration input for the place order process.

configurationOptionsInput

Type: commerceorders.ConfigurationOptionsInput on page 1540

Configuration options during the ingestion process.

Return Value

Type: commerceorders.PlaceOrderResult

`execute(graphRequest)`

Use the method in the `PlaceOrderExecutor` class to execute the Place Order Apex API request by assigning the properties for graph request.

Signature

`public static commerceorders.PlaceOrderResult execute(commerceorders.GraphRequest graphRequest)`

Parameters

graphRequest
Type: commerceorders.GraphRequest

The sObject graph values of the order payload to be ingested.

Return Value

Type: commerceorders.PlaceOrderResult

PlaceOrderExecutor Example Implementation

Place orders with integrated pricing, configuration, and validation, and manage them throughout their entire lifecycle. To place an order from Apex, refer to the example implementation of the `PlaceOrderExecutor` class.

Namespace

commerceorders

Usage

Customize this example to suit your requirements. Create the list of records to be ingested by using these steps. Replace the respective IDs with the values that are present in your org. For example, replace the value of `${Pricebook2Id}` field with the price book ID that's present in the org.

Example:

- Create the list of records by constructing the `Map<String, Object>` map of field values of an order.

```
List<CommerceOrders.RecordWithReferenceRequest> recordNodes = new
List<CommerceOrders.RecordWithReferenceRequest>();

// Prepare for the Order
Map<String,Object> orderFieldValues = new Map<String,Object>();
orderFieldValues.put('Pricebook2Id', '01sDU0000001EIYAY');
orderFieldValues.put('AccountId', '001DU000001nIPKYA2');
orderFieldValues.put('EffectiveDate', '2024-01-01');
```

- To create a record object from the field values, create an instance of the `RecordResource` class.

```
CommerceOrders.RecordResource orderRecord = new
```

```
CommerceOrders.RecordResource(Order.getSobjectType(), 'POST');
orderRecord.fieldValues = orderFieldValues;
```

- To associate the Record object with a reference identifier, create an instance of the `RecordWithReferenceRequest` class.

```
CommerceOrders.RecordWithReferenceRequest orderRecordNode = new
CommerceOrders.RecordWithReferenceRequest('refOrder', orderRecord);
recordNodes.add(orderRecordNode);

// Prepare for the App Usage Assignment
Map<String,Object> auaFieldValues = new Map<String,Object>();
auaFieldValues.put('AppUsageType', 'RevenueLifecycleManagement');
auaFieldValues.put('RecordId', '@{refOrder.id}');

CommerceOrders.RecordResource auaRecord = new
CommerceOrders.RecordResource(AppUsageAssignment.getSobjectType(), 'POST');
auaRecord.fieldValues = auaFieldValues;

CommerceOrders.RecordWithReferenceRequest auaRecordNode = new
CommerceOrders.RecordWithReferenceRequest('refAppTag', auaRecord);
recordNodes.add(auaRecordNode);

// Prepare for the Order Item
Map<String,Object> oiFieldValues = new Map<String,Object>();
oiFieldValues.put('OrderId', '@{refOrder.id}');
oiFieldValues.put('PricebookEntryId', '01uDU000000YPkIYAW');
oiFieldValues.put('Product2Id', '01tDU000000ESCSYA4');
oiFieldValues.put('Quantity', 2);
oiFieldValues.put('UnitPrice', 800);

CommerceOrders.RecordResource oiRecord = new
CommerceOrders.RecordResource(OrderItem.getSobjectType(), 'POST');
oiRecord.fieldValues = oiFieldValues;

CommerceOrders.RecordWithReferenceRequest oiRecordNode = new
CommerceOrders.RecordWithReferenceRequest('refOrderItem', oiRecord);
recordNodes.add(oiRecordNode);
```

- Invoke the Place Order Apex API.

Note: The `CatalogRatesPreferenceEnum` enum is available when the Usage-Based Selling feature is enabled.

```
// Invoke the Place Order Apex API
CommerceOrders.PricingPreferenceEnum pricingPreference =
CommerceOrders.PricingPreferenceEnum.System;
CommerceOrders.CatalogRatesPreferenceEnum catalogRatesPreference =
CommerceOrders.CatalogRatesPreferenceEnum.Fetch;
CommerceOrders.ConfigurationInputEnum configurationPreference =
CommerceOrders.ConfigurationInputEnum.RunAndAllowErrors;
CommerceOrders.ConfigurationOptionsInput configurationInput = new
```

```
CommerceOrders.ConfigurationOptionsInput();
configurationInput.validateProductCatalog = true;
configurationInput.validateAmendRenewCancel = true;
configurationInput.executeConfigurationRules = true;
configurationInput.addDefaultConfiguration = true;
```

- To contain all record objects, create an instance of the `GraphRequest` class.

```
CommerceOrders.GraphRequest graph = new CommerceOrders.GraphRequest('testGraph',
recordNodes);
CommerceOrders.PlaceOrderResult result =
CommerceOrders.PlaceOrderExecutor.execute(graph, pricingPreference,
catalogRatesPreference, configurationPreference, configurationInput);

// Process any error, if exists
if (!result.success) {
  List<ConnectApi.PlaceOrderErrorResponse> errors = result.responseError;
  for (ConnectApi.PlaceOrderErrorResponse error : errors) {
    System.debug(error.errorCode + ': ' + error.message);
  }
}
```

PlaceOrderResult Class

Contains properties to hold the response to the place order request.

Namespace

CommerceOrders

Example

```
CommerceOrders.PlaceOrderResult resp =
CommerceOrders.PlaceOrderExecutor.execute(graph,internalEnum,cEnum,cInput,catalogRatesPreference);
```

PlaceOrderResult Properties

Learn more about the available properties with the `PlaceOrderResult` class.

PlaceOrderResult Properties

Learn more about the available properties with the `PlaceOrderResult` class.

The `PlaceOrderResult` class includes these properties.

orderId

Get the ID of the order that's created after a successful request.

requestIdentifier
Get the request ID of the process to query the asynchronous status of the Place Order Apex API.

responseError
Get the list of errors encountered during the synchronous processing of the API request.

statusURL
Get the asynchronous status URL of the request, if available.

success
Get the request status of the synchronous part of the processing.

orderId

Get the ID of the order that's created after a successful request.

Signature

`public String orderId {get; set;}`

Property Value

Type: String

requestIdentifier

Get the request ID of the process to query the asynchronous status of the Place Order Apex API.

Signature

`public String requestIdentifier {get; set;}`

Property Value

Type: String

responseError

Get the list of errors encountered during the synchronous processing of the API request.

Signature

`public List<commerceorders.PlaceOrderErrorResponse> responseError {get; set;}`

Property Value

Type: List<ConnectApi.PlaceOrderErrorResponse>

statusURL

Get the asynchronous status URL of the request, if available.

Signature

```
public String statusURL {get; set;}
```

Property Value

Type: String

success

Get the request status of the synchronous part of the processing.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

Indicates whether the synchronous part of the processing is successful (`true`) or not (`false`).

PricingPreferenceEnum Enum

Specifies the pricing preference during the create order process.

Usage

Used by the PlaceOrderExecutor class.

Enum Values

The `commerceorders.PricingPreferenceEnum` enum includes these values.

Value	Description
`Force`	Enforce pricing during the order ingestion process.
`Skip`	Skip pricing during the order ingestion process.
`System`	Determine whether a pricing calculation is required.

RecordResource Class

Contains constructors and properties to create a record object from field values of an order.

Namespace

CommerceOrders

Example

```
CommerceOrders.RecordResource orderRecord = new
CommerceOrders.RecordResource(Order.getSobjectType(), 'POST');
orderRecord.fieldValues = orderFieldValues;
```

RecordResource Constructors

Learn more about the available constructors with the `RecordResource` class.

RecordResource Properties

Learn more about the available properties with the `RecordResource` class.

RecordResource Constructors

Learn more about the available constructors with the `RecordResource` class.

The `RecordResource` class includes these constructors.

RecordResource(type, method, id)

Creates an instance of the `RecordResource` class to assign values to the fields of an order item by using the sObject type, API method, and order ID properties.

RecordResource(type, method)

Creates an instance of the `RecordResource` class to assign the values to the fields of an order item by using the sObject type and API method properties.

RecordResource(type, method, id)

Creates an instance of the `RecordResource` class to assign values to the fields of an order item by using the sObject type, API method, and order ID properties.

Signature

`public RecordResource(Schema.SObjectType type, String method, Id id)`

Parameters

type

Type: Schema.SObjectType

Object that's returned from the field describe result using the `getReferenceTo()` method or from the sObject describe result using the `getSObjectType()` method.

method

Type: String

Method for the API request, such as POST or PATCH.

id

Type: Id

ID of the order.

`RecordResource(type, method)`

Creates an instance of the `RecordResource` class to assign the values to the fields of an order item by using the sObject type and API method properties.

Signature

`public RecordResource(Schema.SObjectType type, String method)`

Parameters

`type`
Type: Schema.SObjectType

Object that's returned from the field describe result using the `getReferenceTo()` method or from the sObject describe result using the `getSObjectType()` method.

`method`
Type: String

Method for the API request, such as POST or PATCH.

RecordResource Properties

Learn more about the available properties with the `RecordResource` class.

The `RecordResource` class includes these properties.

fieldValues
Set the `fieldValues` property to assign values to the fields to update the order record.

id
Set the `id` property to assign the ID of the order record.

method
Set the `method` property to specify the API request method, such as POST or PATCH.

type
Set the `type` property to assign the object type that's returned from the field describe result using the `getReferenceTo()` method or from the sObject describe result using the `getSObjectType()` method.

`fieldValues`

Set the `fieldValues` property to assign values to the fields to update the order record.

Signature

`public Map<String,ANY> fieldValues {get; set;}`

Property Value

Type: List<Map<String,ANY>>

`id`

Set the `id` property to assign the ID of the order record.

Signature

`public String id {get; set;}`

Property Value

Type: String

`method`

Set the `method` property to specify the API request method, such as POST or PATCH.

Signature

`public String method {get; set;}`

Property Value

Type: String

`type`

Set the `type` property to assign the object type that's returned from the field describe result using the `getReferenceTo()` method or from the sObject describe result using the `getSObjectType()` method.

Signature

`public Schema.SObjectType type {get; set;}`

Property Value

Type: Schema.SObjectType

RecordWithReferenceRequest Class

Contains constructors and properties to associate a record object with a reference identifier.

Namespace

CommerceOrders

Example

```
CommerceOrders.RecordWithReferenceRequest orderRecordNode = new
CommerceOrders.RecordWithReferenceRequest('refOrder', orderRecord);
```

RecordWithReferenceRequest Constructors
Learn more about the available constructors with the `RecordWithReferenceRequest` class.

RecordWithReferenceRequest Properties
Learn more about the available properties with the `RecordWithReferenceRequest` class.

RecordWithReferenceRequest Constructors

Learn more about the available constructors with the `RecordWithReferenceRequest` class.

The `RecordWithReferenceRequest` class includes these constructors.

RecordWithReferenceRequest(referenceId, record)
Creates an instance of the `RecordWithReferenceRequest` class to associate a record object with a reference identifier by using the `referenceId` and `record` object properties.

`RecordWithReferenceRequest(referenceId, record)`

Creates an instance of the `RecordWithReferenceRequest` class to associate a record object with a reference identifier by using the `referenceId` and `record` object properties.

Signature

`public RecordWithReferenceRequest(String referenceId, commerceorders.RecordResource record)`

Parameters

`referenceId`
Type: String

Reference ID that maps to the subrequest response and can be used to reference the response in subsequent subrequests. You can reference the `referenceId` in either the body or URL of a subrequest. Use this syntax to include a reference: `@{referenceId.FieldName}`. See referenceId property of a composite subrequest.

`record`
Type: commerceorders.RecordResource

Record object that's defined using the `RecordResource` class.

RecordWithReferenceRequest Properties

Learn more about the available properties with the `RecordWithReferenceRequest` class.

The `RecordWithReferenceRequest` class includes these properties.

record
Set the `record` property to specify the record object that's defined by using the `RecordResource` class.

referenceId
Set the `referenceId` property to specify the reference ID that maps to the subrequest response. This reference ID can be used to reference the response in subsequent subrequests.

`record`

Set the `record` property to specify the record object that's defined by using the `RecordResource` class.

Signature

```
public commerceorders.RecordResource record {get; set;}
```

Property Value

Type: commerceorders.RecordResource

`referenceId`

Set the `referenceId` property to specify the reference ID that maps to the subrequest response. This reference ID can be used to reference the response in subsequent subrequests.

Signature

```
public String referenceId {get; set;}
```

Property Value

Type: String

`ConnectApi` Namespace

The `ConnectApi` namespace (also called Connect in Apex) provides an Apex class to specify details for asset transfer request from one account to another.

These classes are available in the `ConnectApi` namespace.

ConnectApi Input Classes
Transaction Management includes this Apex input class.

ConnectApi Input Classes

Transaction Management includes this Apex input class.

ConnectApi.RampOptionInputRepresentation
Input representation of the ramp option details during an asset renewal.

ConnectApi.TransferRecordInputRepresentation
Input representation of the details of the assets to be transferred.

ConnectApi.RampOptionInputRepresentation

Input representation of the ramp option details during an asset renewal.

This Apex class is used by the `rampOptionDetails` Apex-defined input variable. See Initiate Renewal Action.

Property	Type	Description	Required or Optional	Available Version
durationInMonths	Double	Maximum duration of all ramp segments.	Required	67.0
segmentCount	Double	Number of created ramp segments based on the specified duration.	Required if you specify Custom value for the segmentType property.	67.0
segmentType	ConnectApi.RampSegmentType	Type of ramp schedule. Valid values are: • Custom—Specifies the number of segments. The total duration is divided equally across segments. • Yearly—Creates 12-month segments. If the total duration isn't a multiple of 12, the last segment covers the remaining months. If the duration divided by the number of months has a remainder, that segment is listed first as a prorated segment.	Required	67.0

ConnectApi.TransferRecordInputRepresentation

Input representation of the details of the assets to be transferred.

This Apex class is used by the `transferRecords` apex-defined input variable. See Initiate Transfer Action on page 1758.

Property	Type	Description	Required or Optional	Available Version
assetId	String	ID of the asset to transfer.	Required	65.0
transferQuantity	Double	Transfer quantity for the request.	Required	65.0

CommerceTax Namespace

Manage the communication between Salesforce and an external tax engine.

The `CommerceTax` namespace includes these classes.

AbstractTransactionResponse Class
Abstract class that contains methods for setting tax fields based on the external tax provider's response. Response classes that extend `AbstractTransactionResponse` inherit these methods.

AddressesResponse Class
Sets the tax address fields based on a response from the external tax engine. Contains setter methods for the Ship From, Ship To, and Sold To addresses.

AddressResponse Class

Contains a location code sent from the external tax engine.

AmountDetailsResponse Class

Sets tax amount fields based on a response from the external tax engine.

CalculateTaxRequest Class

Represents a request to an external tax engine to calculate tax. Extends the TaxTransactionRequest class and is the top-level request class.

CalculateTaxResponse Class

Sets the values of the tax transaction following a response from the external tax engine. Extends the AbstractTransactionResponse class and is the top-level response class.

CalculateTaxType Enum

Shows whether a tax calculation request is for estimated or actual tax.

CustomTaxAttributesResponse Class

Sets additional data or custom attributes in the tax response.

ErrorResponse Class

Use to respond with an error after receiving errors from the PaymentGatewayAdapter methods of the CommercePayments namespace, such as request-forbidden responses, custom validation errors, or expired API tokens.

HeaderTaxAddressesRequest Class

Captures the address values that are applicable for the quote or order transaction.

ImpositionResponse Class

Stores details of tax impositions from the external tax engine.

JurisdictionResponse Class

Stores details from the external tax engine about the tax jurisdiction used in the tax calculation process. A tax jurisdiction represents a government entity that collects tax.

LineItemResponse Class

Response class that stores details of a list of one or more line items on which the tax engine has calculated tax.

LineTaxAddressesRequest Class

Stores details of the addresses applied per line item in a tax calculation request.

RequestType Enum

Shows the type of tax request made to the tax engine.

ResultCode Enum

Code that represents the results of a tax request made to the tax engine.

RuleDetailsResponse Class

Contains details about the tax rules used for tax calculation.

TaxAddressesRequest Class

Contains methods to get and set tax address values.

TaxAddressRequest Class

Contains address details used for tax calculation.

TaxApiException Class

Contains details about any exceptions during the tax calculation process. Extends the `ApexBaseException` class.

TaxCustomerDetailsRequest Class

Contains customer details used in tax calculation.

TaxDetailsResponse Class

Stores details of the tax values that an external tax engine calculates in response to a tax calculation request.

TaxEngineAdapter Interface

Retrieves information from the tax engine and evaluates the information to define tax details.

TaxEngineContext Class

Wrapper class that stores details about the type of a tax calculation request.

TaxLineItemRequest Class

Contains line item details of a tax request.

TaxSellerDetailsRequest Class

Contains tax code details used in the tax calculation request.

TaxTransactionRequest Class

Abstract class for storing customer details used in tax calculation and estimation requests.

TaxTransactionStatus Enum

Shows whether the tax transaction has been committed or uncommitted.

TaxTransactionType Enum

Shows whether the tax transaction is for a credit or debit transaction.

AbstractTransactionResponse Class

Abstract class that contains methods for setting tax fields based on the external tax provider's response. Response classes that extend `AbstractTransactionResponse` inherit these methods.

Namespace

CommerceTax

AbstractTransactionResponse Methods

Learn more about the methods for AbstractTransactionResponse class.

AbstractTransactionResponse Methods

Learn more about the methods for AbstractTransactionResponse class.

The `AbstractTransactionResponse` class includes these methods.

setAddresses(addresses)

Uses an instance of `AddressesResponse` to set the values of tax address fields.

setAmountDetails(amountDetails)

Uses an instance of `AmountDetailsResponse` to set tax amount fields such as exemption amount and tax amount.

setCurrencyIsoCode(currencyIsoCode)

Sets the currencyIsoCode field.

setCustomTaxAttributes(customTaxAttributes)
: Uses an instance of `CustomTaxAttributesResponse` class to include additional attributes in the tax response at the header level.

setDescription(dscptn)
: Sets the Description field.

setDocumentCode(documentCode)
: Sets the DocumentCode field. Document codes are often used to reference tax documents that the external tax engine uses in the tax calculation process. Document code acts as a unique link to chain-related transactions, such as amendment or refunds.

setEffectiveDate(effectiveDate)
: Sets the EffectiveDate field. Effective Date fields are optional fields that store the date that a transaction takes effect. We provide these fields only for recordkeeping purposes – for example, if you must report an effective date to an external general ledger system. Salesforce doesn't use them to calculate any tax or payment values.

setLineItems(lineItems)
: Uses an instance of the `LineItemResponse` class to set a list of line items. Each line item represents an item sent to an external tax engine for tax calculation.

setReferenceDocumentCode(referenceDocumentCode)
: Sets the ReferenceDocumentCode field. Use this field to store the code of an additional document used in the tax calculation process. For example, use this field in case of a refund for a previously taxed purchase.

setReferenceEntityId(referenceEntityId)
: Sets the ID of a reference entity. In Commerce Tax, a reference entity represents a record related to the items sent to the external tax engine for tax calculation. For example, if you sent order items for tax calculation, you could define the parent order as the reference entity.

setTaxTransactionId(taxTrxnId)
: Sets the TaxTransactionId field using the ID of a tax transaction record. In Commerce Tax, a tax transaction record stores information about a specific tax calculation process.

setTransactionDate(transactionDate)
: Sets the TransactionDate field.

`setAddresses(addresses)`

Uses an instance of `AddressesResponse` to set the values of tax address fields.

Signature

`global void setAddresses(commercetax.AddressesResponse addresses)`

Parameters

`addresses`
: Type: AddressesResponse

  Class that contains methods to set the Ship To, Ship From, and Sold To address information.

Return Value

Type: void

setAmountDetails(amountDetails)

Uses an instance of `AmountDetailsResponse` to set tax amount fields such as exemption amount and tax amount.

Signature

`global void setAmountDetails(commercetax.AmountDetailsResponse amountDetails)`

Parameters

amountDetails
Type: AmountDetailsResponse

Class that contains methods to set the tax exemption amount, tax amount, total amount, and total amount with tax.

Return Value

Type: void

setCurrencyIsoCode(currencyIsoCode)

Sets the currencyIsoCode field.

Signature

`global void setCurrencyIsoCode(String currencyIsoCode)`

Parameters

currencyIsoCode
Type: String

Three-letter ISO 4217 currency code associated with a tax object.

Return Value

Type: void

setCustomTaxAttributes(customTaxAttributes)

Uses an instance of `CustomTaxAttributesResponse` class to include additional attributes in the tax response at the header level.

Signature

`global void setCustomTaxAttributes(commercetax.CustomTaxAttributesResponse customTaxAttributes)`

Parameters

customTaxAttributes
Type: CustomTaxAttributesResponse

Additional data or custom attributes to include in the tax response.

Return Value

Type: void

setDescription(dscptn)

Sets the Description field.

Signature

`global void setDescription(String dscptn)`

Parameters

dscptn
Type: String

Optional field for providing additional information about a record.

Return Value

Type: void

setDocumentCode(documentCode)

Sets the DocumentCode field. Document codes are often used to reference tax documents that the external tax engine uses in the tax calculation process. Document code acts as a unique link to chain-related transactions, such as amendment or refunds.

Signature

`global void setDocumentCode(String documentCode)`

Parameters

documentCode
Type: String

Code for a tax document used in the tax calculation process.

Return Value

Type: void

setEffectiveDate(effectiveDate)

Sets the EffectiveDate field. Effective Date fields are optional fields that store the date that a transaction takes effect. We provide these fields only for recordkeeping purposes – for example, if you must report an effective date to an external general ledger system. Salesforce doesn't use them to calculate any tax or payment values.

Signature

```
global void setEffectiveDate(Datetime effectiveDate)
```

Parameters

effectiveDate
Type: Datetime

Optional field that stores the date that a transaction takes effect.

Return Value

Type: void

`setLineItems(lineItems)`

Uses an instance of the `LineItemResponse` class to set a list of line items. Each line item represents an item sent to an external tax engine for tax calculation.

Signature

```
global void setLineItems(List<commercetax.LineItemResponse> lineItems)
```

Parameters

lineItems
Type: List<LineItemResponse>

A list of line items sent to an external tax engine for tax calculation.

Return Value

Type: void

`setReferenceDocumentCode(referenceDocumentCode)`

Sets the ReferenceDocumentCode field. Use this field to store the code of an additional document used in the tax calculation process. For example, use this field in case of a refund for a previously taxed purchase.

Signature

```
global void setReferenceDocumentCode(String referenceDocumentCode)
```

Parameters

referenceDocumentCode
Type: String

The code for a document used in the tax calculation process.

Return Value

Type: void

`setReferenceEntityId(referenceEntityId)`

Sets the ID of a reference entity. In Commerce Tax, a reference entity represents a record related to the items sent to the external tax engine for tax calculation. For example, if you sent order items for tax calculation, you could define the parent order as the reference entity.

Signature

```
global void setReferenceEntityId(String referenceEntityId)
```

Parameters

referenceEntityId
Type: String

ID of a record related to the items sent for tax calculation.

Return Value

Type: void

`setTaxTransactionId(taxTrxnId)`

Sets the TaxTransactionId field using the ID of a tax transaction record. In Commerce Tax, a tax transaction record stores information about a specific tax calculation process.

Signature

```
global void setTaxTransactionId(String taxTrxnId)
```

Parameters

taxTrxnId
Type: String

The ID of a tax transaction record in Commerce Tax.

Return Value

Type: void

`setTransactionDate(transactionDate)`

Sets the TransactionDate field.

Signature

```
global void setTransactionDate(Datetime transactionDate)
```

Parameters

transactionDate
Type: Datetime

Date that a tax transaction occurred.

Return Value

Type: void

AddressesResponse Class

Sets the tax address fields based on a response from the external tax engine. Contains setter methods for the Ship From, Ship To, and Sold To addresses.

Namespace

CommerceTax

Usage

Because `AddressesResponse` contains multiple addresses, we recommend using multiple instances of `AddressResponse` to set unique values for each address.

Example

This code sample represents a portion of the code used in a mock tax adapter. In this example, you create three `AddressResponse` classes, set their location codes, and pass them to the `Ship To`, `Ship From`, and `Sold To` setter methods in `AddressesResponse`. In an actual implementation, your `AddressResponse` classes already have a location code based on the response from the external tax engine.

```
commercetax.AddressesResponse addressesRes = new commercetax.AddressesResponse();

//AddressResponse containing ShipTo information
commercetax.AddressResponse shipToAddress = new commercetax.AddressResponse();
shipToAddress.setLocationCode('1234567');

//AddressResponse containing ShipFrom information
commercetax.AddressResponse shipFromAddress = new commercetax.AddressResponse();
shipFromAddress.setLocationCode('84720385');

//AddressResponse containing Sold To information
commercetax.AddressResponse soldToAddress = new commercetax.AddressResponse();
soldToAddress.setLocationCode('92381749');

//set values of addressesRes
addressesRes.setShipFrom(shipFromAddress);
addressesRes.setShipTo(shipToAddress);
addressesRes.setSoldTo(soldToAddress);
```

AddressesResponse Methods

Learn more about the methods for AddressesResponse class.

AddressesResponse Methods

Learn more about the methods for AddressesResponse class.

The `AddressesResponse` class includes these methods.

setShipFrom(shipFrom)

Sets the value of a ShipFrom address field.

setShipTo(shipTo)

Sets the value of a ShipTo address field.

setSoldTo(soldTo)

Sets the value of a SoldTo address field.

setShipFrom(shipFrom)

Sets the value of a ShipFrom address field.

Signature

```
global void setShipFrom(commercetax.AddressResponse shipFrom)
```

Parameters

shipFrom

Type: AddressResponse

A single address. Use this generic address parameter to store any type of address, such as Ship From, Ship To, and Sold To details. Users set the specific address in an `AddressResponse` instance and then pass that instance to the `AddressesResponse`'s `setShipTo()`, `setShipFrom()`, and `setSoldTo()` methods as needed.

Return Value

Type: void

setShipTo(shipTo)

Sets the value of a ShipTo address field.

Signature

```
global void setShipTo(commercetax.AddressResponse shipTo)
```

Parameters

shipTo

Type: AddressResponse

Stores a single address. This is a generic address parameter and can be used to store any type of address, such as Ship From, Ship To, and Sold To details. Users set the specific address in an `AddressResponse` instance and then pass that instance to the `AddressesResponse`'s `setShipTo()`, `setShipFrom()`, and `setSoldTo()` methods as needed.

Return Value

Type: void

`setSoldTo(soldTo)`

Sets the value of a SoldTo address field.

Signature

`global void setSoldTo(commercetax.AddressResponse soldTo)`

Parameters

`soldTo`
Type: AddressResponse

Stores a single address. This is a generic address parameter and can be used to store any type of address, such as Ship From, Ship To, Sold To details. Users set the specific address in an AddressResponse instance and then pass that instance to the `AddressesResponse`'s `setShipTo()`, `setShipFrom()`, and `setSoldTo()` methods as needed.

Return Value

Type: void

AddressResponse Class

Contains a location code sent from the external tax engine.

Namespace

CommerceTax

Usage

Use the `AddressResponse` class to set unique values for each address.

```
commercetax.AddressesResponse addressesRes = new commercetax.AddressesResponse();

//AddressResponse containing ShipTo information
commercetax.AddressResponse shipToAddress = new commercetax.AddressResponse();
shipToAddress.setLocationCode('1234567');

//AddressResponse containing ShipFrom information
commercetax.AddressResponse shipFromAddress = new commercetax.AddressResponse();
shipFromAddress.setLocationCode('84720385');

//AddressResponse containing Sold To information
```

```
commercetax.AddressResponse soldToAddress = new commercetax.AddressResponse();
soldToAddress.setLocationCode('92381749');

//set values of addressesRes
addressesRes.setShipFrom(shipFromAddress);
addressesRes.setShipTo(shipToAddress);
addressesRes.setSoldTo(soldToAddress);
```

AddressResponse Methods

Learn more about the available methods with the `AddressResponse` class.

The `AddressResponse` class includes these methods.

`setLocationCode(locationCode)`

Sets the value of a LocationCode field.

Signature

`global void setLocationCode(String locationCode)`

Parameters

`locationCode`
Type: String

A code that contains address information. This value can be passed to a method that sets the value of an address field.

Return Value

Type: void

AmountDetailsResponse Class

Sets tax amount fields based on a response from the external tax engine.

Namespace

CommerceTax

Example

In this example, an instance of `AmountDetailsResponse` class in a mock adapter calculates several tax amount fields. The `totalTax` and `totalAmount` parameters were defined in an instance of `LineItemResponse` class. The adapter then assigns the instance to `lineItemResponse`.

```
commercetax.AmountDetailsResponse amountResponse = new commercetax.AmountDetailsResponse();
amountResponse.setTotalAmountWithTax(totalTax+totalAmount);
amountResponse.setExemptAmount(0);
amountResponse.setTotalAmount(totalAmount);
amountResponse.setTaxAmount(totalTax);
lineItemResponse.setAmountDetails(amountResponse);
```

AmountDetailsResponse Methods
: Learn more about the methods available from the `AmountDetailsResponse` class.

AmountDetailsResponse Methods

Learn more about the methods available from the `AmountDetailsResponse` class.

The following are methods for `AmountDetailsResponse`.

setExemptAmount(exemptAmount)
: Sets the value of the ExemptAmount field.

setTaxAmount(taxAmount)
: Sets the value of the TaxAmount field.

setTotalAmount(totalAmount)
: Sets the value of the TotalAmount field.

setTotalAmountWithTax(totalAmtWithTax)
: Sets the value of the TotalAmountWithTax field.

setExemptAmount(exemptAmount)

Sets the value of the ExemptAmount field.

Signature

`global void setExemptAmount(Double exemptAmount)`

Parameters

exemptAmount
: Type: Double
: The amount of a line item's total amount that's exempt from tax calculation.

Return Value

Type: void

setTaxAmount(taxAmount)

Sets the value of the TaxAmount field.

Signature

```
global void setTaxAmount(Double taxAmount)
```

Parameters

taxAmount
Type: Double

The calculated amount of tax for a line item.

Return Value

Type: void

setTotalAmount(totalAmount)

Sets the value of the TotalAmount field.

Signature

```
global void setTotalAmount(Double totalAmount)
```

Parameters

totalAmount
Type: Double

The total amount of a line item, excluding tax.

Return Value

Type: void

setTotalAmountWithTax(totalAmtWithTax)

Sets the value of the TotalAmountWithTax field.

Signature

```
global void setTotalAmountWithTax(Double totalAmtWithTax)
```

Parameters

totalAmtWithTax
Type: Double

The total amount of a line item combined with the calculated tax for that line item.

Return Value

Type: void

CalculateTaxRequest Class

Represents a request to an external tax engine to calculate tax. Extends the TaxTransactionRequest class and is the top-level request class.

Namespace

CommerceTax

Usage

Keep these considerations in mind when you use this class.

- If the `shouldVoidTax` property value is set to `true`, then the operation returns a response with `documentCode` property value updated to `referenceDocumentCode` property value that was originally sent in the request payload. The response also includes the `taxTransactionType` property value as `Void`. This indicates that the document specified in the `referenceDocumentCode` property value is voided.
- If document is locked or you can't void the tax transaction for any reason, then you can use the Tax Calculation request to perform another transaction such as a Credit Tax request. In this scenario, the response includes the `documentCode` property value that was sent in the request payload.
- If the document that's mentioned in the `referenceDocumentCode` property value isn't available in the tax engine, then an error response occurs with ResultCode on page 1607 value as `ReferenceDocumentCodeMissing`.

Example

See TaxEngineAdapter Example Implementation for more details on how to access information from the `CalculateTaxRequest` class.

CalculateTaxRequest Constructors

Learn more about the constructors that are available with the `CalculateTaxRequest` class. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

CalculateTaxRequest Properties

CalculateTaxRequest Methods

Learn more about the available methods with the `CalculateTaxRequest` class.

CalculateTaxRequest Constructors

Learn more about the constructors that are available with the `CalculateTaxRequest` class. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

The `CalculateTaxRequest` class includes these constructors.

CalculateTaxRequest(taxType)

This constructor is intended for test usage only and throws an exception if used outside of the Apex test context.

`CalculateTaxRequest(taxType)`

This constructor is intended for test usage only and throws an exception if used outside of the Apex test context.

Signature

```
global CalculateTaxRequest(commercetax.CalculateTaxType taxType)
```

Parameters

`taxType`

Type: CalculateTaxType

Indicates whether the tax calculation is for estimated tax or actual tax.

CalculateTaxRequest Properties

Learn more about the available properties with the `CalculateTaxRequest` class.

The `CalculateTaxRequest` class includes these properties.

isCommit

Indicates whether the tax calculation has to be committed or reported to government authorities.

isHeaderTaxRequested

Indicates whether header tax is enabled in the tax engine (`true`) or not (`false`).

shouldVoidTax

Indicates whether to void the tax transaction associated with a document that's mentioned in the `referenceDocumentCode` property value with `taxType` property value set to `Actual` and `isCommit` property value set to `true`.

taxTransactionType

Shows whether the tax transaction is for a credit or debit transaction.

taxType

Shows whether the tax calculation is for estimated or actual tax wherein only actual tax can be submitted.

`isCommit`

Indicates whether the tax calculation has to be committed or reported to government authorities.

Signature

```
global Boolean isCommit {get; set;}
```

Property Value

Type: Boolean

`isHeaderTaxRequested`

Indicates whether header tax is enabled in the tax engine (`true`) or not (`false`).

Signature

```
global Boolean isHeaderTaxRequested {get; set;}
```

Property Value

Type: Boolean

shouldVoidTax

Indicates whether to void the tax transaction associated with a document that's mentioned in the `referenceDocumentCode` property value with `taxType` property value set to `Actual` and `isCommit` property value set to `true`.

Signature

```
global commercetax.CalculateTaxType shouldVoidTax {get; set;}
```

Property Value

Type: Boolean

taxTransactionType

Shows whether the tax transaction is for a credit or debit transaction.

Signature

```
global commercetax.TaxTransactionType taxTransactionType {get; set;}
```

Property Value

Type: TaxTransactionType

taxType

Shows whether the tax calculation is for estimated or actual tax wherein only actual tax can be submitted.

Signature

```
global commercetax.CalculateTaxType taxType {get; set;}
```

Property Value

Type: CalculateTaxType

CalculateTaxRequest Methods

Learn more about the available methods with the `CalculateTaxRequest` class.

The `CalculateTaxRequest` class includes these methods.

equals(obj)
: Maintains the integrity of lists of type `CalculateTaxRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

hashCode()
: Maintains the integrity of lists of type `CalculateTaxRequest` by determining the uniqueness of the external object records in a list.

toString()
: Converts a value to a string.

equals(obj)

Maintains the integrity of lists of type `CalculateTaxRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

Signature

`global Boolean equals(Object obj)`

Parameters

obj
: Type: Object

  External object whose key is to be validated.

Return Value

Type: Boolean

hashCode()

Maintains the integrity of lists of type `CalculateTaxRequest` by determining the uniqueness of the external object records in a list.

Signature

`global Integer hashCode()`

Return Value

Type: Integer

toString()

Converts a value to a string.

Signature

`global String toString()`

Return Value

Type: String

CalculateTaxResponse Class

Sets the values of the tax transaction following a response from the external tax engine. Extends the AbstractTransactionResponse class and is the top-level response class.

Namespace

CommerceTax

Example

```
if(requestType == commercetax.RequestType.CalculateTax){
             commercetax.calculatetaxtype type = request.taxtype;
             String docCode='';
             if(request.DocumentCode == 'simulateEmptyDocumentCode')
                 docCode = '';
             else if(request.DocumentCode != null)
                 docCode =request.DocumentCode;
           else if(request.ReferenceEntityId != null) docCode = request.ReferenceEntityId;

             else docCode =  String.valueOf(getRandomInteger(0,2147483647));
             commercetax.CalculateTaxResponse response = new
commercetax.CalculateTaxResponse();
             if(request.isCommit == true) {
                 response.setStatus(commercetax.TaxTransactionStatus.Committed);
             } else {
                 response.setStatus(commercetax.TaxTransactionStatus.Uncommitted);
             }
             response.setDocumentCode(docCode);
             response.setReferenceDocumentCode(request.referenceDocumentCode);
             response.setTaxType(type);
             response.setStatusDescription('statusDescription');
             if(request.sellerDetails.code == 'testSellerCode') {
                 response.setDescription('SellerCode fetched from TaxEngine entity');
             }
             else {
                 response.setDescription('description');
             }
            response.setEffectiveDate(system.now());
            if(request.transactionDate == null) {
               response.setTransactionDate(system.now());
            } else {
               response.setTransactionDate(request.transactionDate);
            }
            if(request.taxTransactionType == null) {
                response.setTaxTransactionType(commercetax.TaxTransactionType.Debit);
            } else {
                response.setTaxTransactionType(request.taxTransactionType);
            }
```

```
            if(request.currencyIsoCode == null || request.currencyIsoCode == '') {
               response.setCurrencyIsoCode('USD');
            } else {
               response.setCurrencyIsoCode(request.currencyIsoCode);
            }
            response.setReferenceEntityId(request.ReferenceEntityId);
}
```

CalculateTaxResponse Methods
Learn more about the available methods with the `CalculateTaxResponse` class.

CalculateTaxResponse Methods

Learn more about the available methods with the `CalculateTaxResponse` class.

The `CalculateTaxResponse` class includes these methods.

setAddresses(addresses)
Sets the value of the Addresses field using the addresses contained in an instance of the AddressesResponse class.

setAmountDetails(amountDetails)
Sets the value of the AmountDetails field using an instance of `AmountDetailsResponse`.

setCurrencyIsoCode(currencyIsoCode)
Sets the value of the CurrencyIsoCode field of the `CalculateTaxResponse` object.

setDescription(dscptn)
Sets the value of the Description field of the `CalculateTaxResponse` object.

setDocumentCode(documentCode)
Sets the value of the DocumentCode field of the `CalculateTaxResponse` object.

setEffectiveDate(effectiveDate)
Sets the value of the EffectiveDate field of the `CalculateTaxResponse` object.

setLineItems(lineItems)
Sets the value of the LineItems field of the `CalculateTaxResponse` object.

setReferenceDocumentCode(referenceDocumentCode)
Sets the value of the ReferenceDocumentCode field of the `CalculateTaxResponse` object.

setReferenceEntityId(referenceEntityId)
Sets the value of the ReferenceEntityId field of the `CalculateTaxResponse` object.

setStatus(status)
Sets the value of the Status field of the `CalculateTaxResponse` object.

setStatusDescription(statusDescription)
Sets the value of the StatusDescription field of the `CalculateTaxResponse` object.

setTaxTransactionId(taxTrxnId)
Sets the value of the TaxTransactionId field of the `CalculateTaxResponse` object.

setTaxTransactionType(taxTransactionType)
Sets the value of the TaxTransactionType field of the `CalculateTaxResponse` object.

setTaxType(taxType)
Sets the value of the TaxType field of the `CalculateTaxResponse` object.

setTransactionDate(transactionDate)
Sets the value of the TransactionDate field of the `CalculateTaxResponse` object.

setAddresses(addresses)

Sets the value of the Addresses field using the addresses contained in an instance of the AddressesResponse class.

Signature

```
global void setAddresses(commercetax.AddressesResponse addresses)
```

Parameters

addresses
Type: AddressesResponse

Contains Ship To, Ship From, and Sold To addresses.

Return Value

Type: void

setAmountDetails(amountDetails)

Sets the value of the AmountDetails field using an instance of `AmountDetailsResponse`.

Signature

```
global void setAmountDetails(commercetax.AmountDetailsResponse amountDetails)
```

Parameters

amountDetails
Type: AmountDetailsResponse

The tax amount details for a line item on which tax was calculated.

Return Value

Type: void

setCurrencyIsoCode(currencyIsoCode)

Sets the value of the CurrencyIsoCode field of the `CalculateTaxResponse` object.

Signature

```
global void setCurrencyIsoCode(String currencyIsoCode)
```

Parameters

currencyIsoCode
Type: String

Three-letter ISO 4217 currency code associated with a tax object.

Return Value

Type: void

setDescription(dscptn)

Sets the value of the Description field of the `CalculateTaxResponse` object.

Signature

```
global void setDescription(String dscptn)
```

Parameters

dscptn
Type: String

Optional description for providing more information about the calculate tax response.

Return Value

Type: void

setDocumentCode(documentCode)

Sets the value of the DocumentCode field of the `CalculateTaxResponse` object.

Signature

```
global void setDocumentCode(String documentCode)
```

Parameters

documentCode
Type: String

Code for a tax document that's created by the tax engine for the calculation process.

Return Value

Type: void

setEffectiveDate(effectiveDate)

Sets the value of the EffectiveDate field of the `CalculateTaxResponse` object.

Signature

```
global void setEffectiveDate(Datetime effectiveDate)
```

Parameters

effectiveDate
Type: Datetime

The date a tax calculation action takes effect. This parameter is optional and is provided only for recordkeeping purpose. Additionally, this parameter is used to determine the tax rates or rules and overrides the transaction date. For example, if the tax calculation request is placed on January 3 and the transaction date is January 1, you can set the effective date as January 1.

Return Value

Type: void

setLineItems(lineItems)

Sets the value of the LineItems field of the `CalculateTaxResponse` object.

Signature

```
global void setLineItems(List<commercetax.LineItemResponse> lineItems)
```

Parameters

lineItems
Type: List<LineItemResponse>

Response object that the tax adapter populates from the response of the external tax engine.

Return Value

Type: void

setReferenceDocumentCode(referenceDocumentCode)

Sets the value of the ReferenceDocumentCode field of the `CalculateTaxResponse` object.

Signature

```
global void setReferenceDocumentCode(String referenceDocumentCode)
```

Parameters

referenceDocumentCode
Type: String

Code for a reference document used in the tax calculation process.

Return Value

Type: void

setReferenceEntityId(referenceEntityId)

Sets the value of the ReferenceEntityId field of the `CalculateTaxResponse` object.

Signature

```
global void setReferenceEntityId(String referenceEntityId)
```

Parameters

referenceEntityId
Type: String

ID of an entity related to the line items submitted for tax calculation. For example, if order items were sent for tax calculation, you could use the ID of their parent order.

Return Value

Type: void

setStatus(status)

Sets the value of the Status field of the `CalculateTaxResponse` object.

Signature

```
global void setStatus(commercetax.TaxTransactionStatus status)
```

Parameters

status
Type: TaxTransactionStatus

Indicates whether a tax transaction has been committed.

Return Value

Type: void

setStatusDescription(statusDescription)

Sets the value of the StatusDescription field of the `CalculateTaxResponse` object.

Signature

```
global void setStatusDescription(String statusDescription)
```

Parameters

statusDescription
Type: String

Optional value for providing more information about a tax transaction's status.

Return Value

Type: void

setTaxTransactionId(taxTrxnId)

Sets the value of the TaxTransactionId field of the `CalculateTaxResponse` object.

Signature

```
public void setTaxTransactionId(String taxTrxnId)
```

Parameters

taxTrxnId
Type: String

The ID of the Salesforce tax transaction entity that stores information about the tax calculation transaction.

Return Value

Type: void

setTaxTransactionType(taxTransactionType)

Sets the value of the TaxTransactionType field of the `CalculateTaxResponse` object.

Signature

```
global void setTaxTransactionType(commercetax.TaxTransactionType taxTransactionType)
```

Parameters

taxTransactionType
Type: TaxTransactionType

Whether the tax transaction was for a credit, debit, or voided transaction.

Return Value

Type: void

setTaxType(taxType)

Sets the value of the TaxType field of the `CalculateTaxResponse` object.

Signature

```
global void setTaxType(commercetax.CalculateTaxType taxType)
```

Parameters

taxType
Type: CalculateTaxType

Indicates whether a tax calculation request is for estimated or actual tax.

Return Value

Type: void

setTransactionDate(transactionDate)

Sets the value of the TransactionDate field of the `CalculateTaxResponse` object.

Signature

```
global void setTransactionDate(Datetime transactionDate)
```

Parameters

transactionDate
Type: Datetime

The date that the tax transaction occurred.

Return Value

Type: void

CalculateTaxType Enum

Shows whether a tax calculation request is for estimated or actual tax.

Usage

Used by the CalculateTaxRequest and CalculateTaxResponse class methods.

Enum Values

The `commercetax.CalculateTaxType` enum includes these values.

Value	Description
`Actual`	Specifies that the tax calculation service should calculate the finalized (actual) tax for the requested line items.
`Estimated`	Specifies that the tax calculation service should estimate the tax for the requested line items.

CustomTaxAttributesResponse Class

Sets additional data or custom attributes in the tax response.

Namespace

CommerceTax

CustomTaxAttributesResponse Constructors

Learn more about the available constructors with the `CustomTaxAttributesResponse` class.

CustomTaxAttributesResponse Methods

Learn more about the available methods with the `CustomTaxAttributesResponse` class.

CustomTaxAttributesResponse Constructors

Learn more about the available constructors with the `CustomTaxAttributesResponse` class.

The `CustomTaxAttributesResponse` class includes these constructors.

CustomTaxAttributesResponse()

Constructor to set additional data or custom attributes in the tax response.

`CustomTaxAttributesResponse()`

Constructor to set additional data or custom attributes in the tax response.

Signature

```
global CustomTaxAttributesResponse()
```

CustomTaxAttributesResponse Methods

Learn more about the available methods with the `CustomTaxAttributesResponse` class.

The `CustomTaxAttributesResponse` class includes these methods.

setData(data)

Sets additional data or custom attributes in the tax response.

`setData(data)`

Sets additional data or custom attributes in the tax response.

Signature

```
global void setData(Map<String, Object> data)
```

Parameters

data

Type: Map<String, Object>

Additional data or custom attributes to be included in the tax response.

Return Value

Type: void

ErrorResponse Class

Use to respond with an error after receiving errors from the PaymentGatewayAdapter methods of the CommercePayments namespace, such as request-forbidden responses, custom validation errors, or expired API tokens.

Namespace

CommerceTax

Example

This example snippet of a mock tax adapter shows a hypothetical scenario to demo an error response. The adapter receives request information from `TaxEngineContext` and stores it in an instance of `CalculateTaxRequest`. If the request's `documentCode` property is null or indicates an error, the adapter returns an error response with information about the error.

```
global virtual class MockAdapter implements commercetax.TaxEngineAdapter {

     global commercetax.TaxEngineResponse processRequest(commercetax.TaxEngineContext
taxEngineContext) {
          commercetax.RequestType requestType = taxEngineContext.getRequestType();
          commercetax.CalculateTaxRequest request =
(commercetax.CalculateTaxRequest)taxEngineContext.getRequest();

if(request.documentCode == null) {
              return new commercetax.ErrorResponse(commercetax.resultcode.TaxEngineError,
'404', 'documentCode  is mandatory');
          }
          if(request.documentCode == 'TaxEngineError') {
              return new commercetax.ErrorResponse(commercetax.resultcode.TaxEngineError,
'504', 'documentCode  - not supported');
          }
          if(request.documentCode == 'simulateValidationFailureInAdapter') {
              return new commercetax.ErrorResponse(commercetax.resultcode.TaxEngineError,
'400', 'validations for documentCode failed in adapter');
          }
          if(request.documentCode == 'simulateMalformedErrorInAdapter') {
                      return new
commercetax.ErrorResponse(commercetax.resultcode.TaxEngineError, null, 'malformed adapter
 error response');
          }
          if(request.documentCode == 'simulateTaxEngineProcessFailure') {
              return new commercetax.ErrorResponse(commercetax.resultcode.TaxEngineError,
```

```
'500', 'Tax Engine couldnt process your request');
         }
```

ErrorResponse Constructors
Learn more about the available constructors with the `ErrorResponse` class.

ErrorResponse Constructors

Learn more about the available constructors with the `ErrorResponse` class.

The `ErrorResponse` class includes these constructors.

ErrorResponse(resultCode, errorCode, errorMessage)
Constructor to initialize an `ErrorResponse` object from the result code, error code, and error message sent from the tax engine.

`ErrorResponse(resultCode, errorCode, errorMessage)`

Constructor to initialize an `ErrorResponse` object from the result code, error code, and error message sent from the tax engine.

Signature

```
global ErrorResponse(commercetax.ResultCode resultCode, String errorCode, String
errorMessage)
```

Parameters

resultCode
Type: ResultCode

Code for the type of result sent by the tax engine.

errorCode
Type: String

Code for the type of error sent by the tax engine.

Codes must match the HTTP status codes to be returned to the user. Here are a few examples:

- If the status code is for a bad request, set `errorCode` to `400`.
- If the status code is for a forbidden request, set `errorCode` to `403`.
- If `errorCode` isn't a valid HTTP status code, a 500 internal server error is returned.

errorMessage
Type: String

The error message sent by the tax engine.

HeaderTaxAddressesRequest Class

Captures the address values that are applicable for the quote or order transaction.

Namespace

CommerceTax

HeaderTaxAddressesRequest Constructors

HeaderTaxAddressesRequest Constructors

Learn more about the constructors available with the `HeaderTaxAddressesRequest` class.

The `HeaderTaxAddressesRequest` class includes these constructors.

HeaderTaxAddressesRequest(shipFrom, shipTo, soldTo, billTo, taxEngineAddress)

Constructor for initializing the required addresses of the tax addresses request such as the ship from, ship to, sold to, and bill to addresses. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

HeaderTaxAddressesRequest(shipFrom, shipTo, soldTo, billTo, taxEngineAddress)

Constructor for initializing the required addresses of the tax addresses request such as the ship from, ship to, sold to, and bill to addresses. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global HeaderTaxAddressesRequest(commercetax.TaxAddressRequest shipFrom,
commercetax.TaxAddressRequest shipTo, commercetax.TaxAddressRequest soldTo,
commercetax.TaxAddressRequest billTo, commercetax.TaxAddressRequest taxEngineAddress)
```

Parameters

shipFrom

Type: TaxAddressRequest

Address where a line item was shipped from.

shipTo

Type: TaxAddressRequest

Address where a line item was shipped to.

soldTo

Type: TaxAddressRequest

Address of the line item's buyer.

billTo

Type: TaxAddressRequest

Person or group who was billed for the line item.

taxEngineAddress

Type: TaxAddressRequest

Address that the tax engine uses to calculate tax.

HeaderTaxAddressesRequest Properties

Learn more about the available properties with the `HeaderTaxAddressesRequest` class.

The `HeaderTaxAddressesRequest` class includes these properties.

billTo
Specifies the billTo address for a line item on which tax was calculated.

shipFrom
Specifies the shipFrom address for a line item on which tax was calculated.

shipTo
Specifies the shipTo address for a line item on which tax was calculated.

soldTo
Specifies the soldTo address for a line item on which tax was calculated.

taxEngineAddress
Address used by the tax engine when calculating tax for a line item.

billTo

Specifies the billTo address for a line item on which tax was calculated.

Signature

```
global commercetax.TaxAddressRequest billTo {get; set;}
```

Property Value

Type: TaxAddressRequest

shipFrom

Specifies the shipFrom address for a line item on which tax was calculated.

Signature

```
global commercetax.TaxAddressRequest shipFrom {get; set;}
```

Property Value

Type: TaxAddressRequest

shipTo

Specifies the shipTo address for a line item on which tax was calculated.

Signature

```
global commercetax.TaxAddressRequest shipTo {get; set;}
```

Property Value

Type: TaxAddressRequest

soldTo

Specifies the soldTo address for a line item on which tax was calculated.

Signature

```
global commercetax.TaxAddressRequest soldTo {get; set;}
```

Property Value

Type: TaxAddressRequest

taxEngineAddress

Address used by the tax engine when calculating tax for a line item.

Signature

```
global commercetax.TaxAddressRequest taxEngineAddress {get; set;}
```

Property Value

Type: TaxAddressRequest

HeaderTaxAddressesRequest Methods

Learn more about the available methods with the `HeaderTaxAddressesRequest` class.

The `HeaderTaxAddressesRequest` class includes these methods.

equals(obj)
: Maintains the integrity of lists of type `HeaderTaxAddressesRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

hashCode()
: Maintains the integrity of lists of type `TaxAddressesRequest` by determining the uniqueness of the external objects in a list.

toString()
: Converts a value to a string.

equals(obj)

Maintains the integrity of lists of type `HeaderTaxAddressesRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

hashCode()

Maintains the integrity of lists of type `TaxAddressesRequest` by determining the uniqueness of the external objects in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

toString()

Converts a value to a string.

Signature

```
global String toString()
```

Return Value

Type: String

ImpositionResponse Class

Stores details of tax impositions from the external tax engine.

Namespace

CommerceTax

Example

In this mock adapter example, the adapter sets the `TaxDetailsResponse.setImposition()` method parameter to null if the request's document code indicates that the tax calculation didn't require any exceptions. Otherwise, it creates an instance of `ImpositionResponse` and sets its SubType and Type values, and then assigns it to `TaxDetailsResponse`.

```
if(request.DocumentCode == 'SetsNullForResponseWithoutException'){
  taxDetailsResponse.setImposition(null);
                     }else{
                        commercetax.ImpositionResponse imposition = new
commercetax.ImpositionResponse();
                        imposition.setSubType('subtype');
                        imposition.setType('type');
                        taxDetailsResponse.setImposition(imposition);
                   }
```

ImpositionResponse Methods
Learn more about the available methods with the `ImpositionResponse` class.

ImpositionResponse Methods

Learn more about the available methods with the `ImpositionResponse` class.

The `ImpositionResponse` class includes these methods.

setId(id)
Sets the ID field of the `ImpositionResponse` class.

setName(name)
Sets the Name field of the `ImpositionResponse` class.

setSubType(subType)
Sets the SubType field of the `ImpositionResponse` class.

setType(type)
Sets the Type field of the `ImpositionResponse` class.

`setId(id)`

Sets the ID field of the `ImpositionResponse` class.

Signature

`global void setId(String id)`

Parameters

`id`
Type: String
User-defined ID value used for referencing the tax imposition.

Return Value

Type: void

`setName(name)`

Sets the Name field of the `ImpositionResponse` class.

Signature

```
global void setName(String name)
```

Parameters

`name`
Type: String

Optional user-defined name for the tax imposition response.

Return Value

Type: void

`setSubType(subType)`

Sets the SubType field of the `ImpositionResponse` class.

Signature

```
global void setSubType(String subType)
```

Parameters

`subType`
Type: String

Many tax calculation organizations use types and subtypes to categorize their tax imposition procedures. If the tax engine you use follows this process, set the subtype with this parameter.

Return Value

Type: void

`setType(type)`

Sets the Type field of the `ImpositionResponse` class.

Signature

```
public void setType(String type)
```

Parameters

type

Type: String

Many tax calculation organizations use types and subtypes to categorize their tax imposition procedures. If the tax engine you use follows this process, set the type with this parameter.

Return Value

Type: void

JurisdictionResponse Class

Stores details from the external tax engine about the tax jurisdiction used in the tax calculation process. A tax jurisdiction represents a government entity that collects tax.

Namespace

CommerceTax

Example

In this mock adapter example, the adapter sets the `TaxDetailsResponse.setJurisdiction()` method parameter to null if the request's document code indicates that the tax calculation didn't require any exceptions. Otherwise, it creates an instance of `JurisdictionResponse` and sets its address values. Because this code represents a mock adapter, the example defines the address parameters directly. In a standard implementation, the jurisdiction's setters receive values passed from the eternal tax engine.

```
if(request.DocumentCode == 'SetsNullForResponseWithoutException'){
                        taxDetailsResponse.setJurisdiction(null);
                    }else{
                       commercetax.JurisdictionResponse jurisdiction = new
commercetax.JurisdictionResponse();
                       jurisdiction.setCountry('country');
                       jurisdiction.setRegion('region');
                       jurisdiction.setName('name');
                       jurisdiction.setStateAssignedNumber('stateAssignedNo');
                       jurisdiction.setId('id');
                       jurisdiction.setLevel('level');
                       taxDetailsResponse.setJurisdiction(jurisdiction);

}
```

JurisdictionResponse Methods

Learn more about the available methods with the `JurisdictionResponse` class.

JurisdictionResponse Methods

Learn more about the available methods with the `JurisdictionResponse` class.

The `JurisdictionResponse` class includes these methods.

[setCountry(country)](#)
Sets the Country field of the `JurisdictionResponse` class.

[setId(id)](#)
Sets the ID field of the `JurisdictionResponse` class.

[setLevel(level)](#)
Sets the Level field of the `JurisdictionResponse` class.

[setName(name)](#)
Sets the Name field of the `JurisdictionResponse` class.

[setRegion(region)](#)
Sets the Region value of the `JurisdictionResponse` class.

[setStateAssignedNumber(stateAssignedNo)](#)
Sets the StateAssignedNumber field of the `JurisdictionResponse` class.

setCountry(country)

Sets the Country field of the `JurisdictionResponse` class.

Signature

```
global void setCountry(String country)
```

Parameters

country
Type: String

The country of the tax jurisdiction entity's address.

Return Value

Type: void

setId(id)

Sets the ID field of the `JurisdictionResponse` class.

Signature

```
global void setId(String id)
```

Parameters

id
Type: String

User-defined Id value used to reference the jurisdiction response.

Return Value

Type: void

setLevel(level)

Sets the Level field of the `JurisdictionResponse` class.

Signature

```
global void setLevel(String level)
```

Parameters

level
Type: String

Level value used in the jurisdiction entity's address.

Return Value

Type: void

setName(name)

Sets the Name field of the `JurisdictionResponse` class.

Signature

```
global void setName(String name)
```

Parameters

name
Type: String

Optional user-defined name field for referencing the jurisdiction response.

Return Value

Type: void

setRegion(region)

Sets the Region value of the `JurisdictionResponse` class.

Signature

```
global void setRegion(String region)
```

Parameters

region
Type: String

Region value used in the tax jurisdiction entity's address.

Return Value

Type: void

setStateAssignedNumber(stateAssignedNo)

Sets the StateAssignedNumber field of the `JurisdictionResponse` class.

Signature

`global void setStateAssignedNumber(String stateAssignedNo)`

Parameters

stateAssignedNo
Type: String

State assigned number value of the tax jurisdiction entity's address.

Return Value

Type: void

LineItemResponse Class

Response class that stores details of a list of one or more line items on which the tax engine has calculated tax.

Namespace

CommerceTax

Example

This example uses a `LineItemResponse` list to store information about each line item that was processed as part of the request. For simplicity, the sample code uses a static value of 1 for the tax rate. However, most integrations typically have a more complex process for determining a tax rate. Most integrations also build a `TaxDetailsResponse` list to store the actual tax value information that they assign to each line item in the `LineItemResponse` list.

```
Double totalTax = 0.0;
             Double totalAmount = 0.0;
             List<commercetax.LineItemResponse> lineItemResponses = new
List<commercetax.LineItemResponse>();
             for(Commercetax.TaxLineItemRequest lineItem : request.lineItems){
                 commercetax.AddressesResponse addressesRes = new
commercetax.AddressesResponse();
                 if(request.DocumentCode == 'SetsNullForResponseWithoutException'){
```

```
                    addressesRes.setShipFrom(null);
                    addressesRes.setShipTO(null);
                    addressesRes.setSoldTo(null);
                }else{
                 commercetax.AddressResponse addRes = new commercetax.AddressResponse();

                    addRes.setLocationCode('locationCode');
                    addressesRes.setShipFrom(addRes);
                    addressesRes.setShipTO(addRes);
                    addressesRes.setSoldTo(addRes);
                }
                commercetax.LineItemResponse lineItemResponse = new
commercetax.LineItemResponse();
                Double totalLineTax = 0;
                List<commercetax.TaxDetailsResponse> taxDetailsResponses = new
List<commercetax.TaxDetailsResponse>();
                for(integer i =0;i<1;i++){
                    Integer rate  = 1;
                    Double taxableAmount = lineItem.amount;
                    commercetax.TaxDetailsResponse taxDetailsResponse = new
commercetax.TaxDetailsResponse();
                    taxDetailsResponse.setRate(Double.valueOf(rate));
                    taxDetailsResponse.setTaxableAmount(taxableAmount);
                    Double tax = taxableAmount*rate;
                    totalLineTax+=tax;
                    taxDetailsResponse.setTax(taxableAmount*rate);
                    taxDetailsResponse.setExemptAmount(0);
                    taxDetailsResponse.setExemptReason('exemptReason');
                    taxDetailsResponse.setTaxRegionId('taxRegionId');

taxDetailsResponse.setTaxId(String.valueOf(getRandomInteger(0,2323233)));
                    taxDetailsResponse.setSerCode('serCode');
                    taxDetailsResponse.setTaxAuthorityTypeId('taxAuthorityTypeId');
                    if(request.DocumentCode == 'SetsNullForResponseWithoutException'){
                        taxDetailsResponse.setImposition(null);
                    }else{
                        commercetax.ImpositionResponse imposition = new
commercetax.ImpositionResponse();
                        imposition.setSubType('subtype');
                        imposition.setType('type');
                        taxDetailsResponse.setImposition(imposition);
                    }

                    if(request.DocumentCode == 'SetsNullForResponseWithoutException'){
                        taxDetailsResponse.setJurisdiction(null);
                    }else{
                        commercetax.JurisdictionResponse jurisdiction = new
commercetax.JurisdictionResponse();
                        jurisdiction.setCountry('country');
                        jurisdiction.setRegion('region');
                        jurisdiction.setName('name');
                        jurisdiction.setStateAssignedNumber('stateAssignedNo');
                        jurisdiction.setId('id');
                        jurisdiction.setLevel('level');
```

```
                taxDetailsResponse.setJurisdiction(jurisdiction);
            }

            taxDetailsResponses.add(taxDetailsResponse);
        }
        lineItemResponse.setTaxes(taxDetailsResponses);
        totalTax +=totalLineTax;
        totalAmount+=lineItem.amount;
```

LineItemResponse Methods

Learn more about the available methods with the `LineItemResponse` class.

LineItemResponse Methods

Learn more about the available methods with the `LineItemResponse` class.

The `LineItemResponse` class includes these methods.

setAddresses(addresses)

Sets the Addresses field on the `LineItemResponse` using an instance of `AddressesResponse` class.

setAmountDetails(amountDetails)

Sets the Amount Details field on the `LineItemResponse` using an instance of `AmountDetails`.

setCustomTaxAttributes(customTaxAttributes)

Uses an instance of `CustomTaxAttributesResponse` class to include additional attributes in the tax response at line item level.

setEffectiveDate(effectiveDate)

Sets the EffectiveDate field on the `LineItemResponse` class. Effective Date fields are optional fields that store the date that a transaction takes effect. We provide these fields only for recordkeeping purposes – for example, if you must report an effective date to an external general ledger system. Salesforce doesn't use them to calculate any tax or payment values.

setIsTaxable(isTaxable)

Sets the IsTaxable field on the `LineItemResponse` class.

setLineNumber(lineNumber)

Sets the LineNumber field on the `LineItemResponse` class.

setProductCode(productCode)

Sets the ProductCode field on the `LineItemResponse` class.

setQuantity(quantity)

Sets the Quantity field on the `LineItemResponse` class.

setTaxCode(taxCode)

Sets the TaxCode field on the `LineItemResponse`.

setTaxes(taxes)

Sets the Taxes field on a `LineItemResponse`.

`setAddresses(addresses)`

Sets the Addresses field on the `LineItemResponse` using an instance of `AddressesResponse` class.

Signature

```
global void setAddresses(commercetax.AddressesResponse addresses)
```

Parameters

addresses
Type: AddressesResponse

Class that contains methods to set the Ship To, Ship From, and Sold To address information.

Return Value

Type: void

setAmountDetails(amountDetails)

Sets the Amount Details field on the `LineItemResponse` using an instance of `AmountDetails`.

Signature

```
global void setAmountDetails(commercetax.AmountDetailsResponse amountDetails)
```

Parameters

amountDetails
Type: AmountDetailsResponse

Class that contains methods to set the tax amount, total amount with tax, total amount, and exempt amount.

Return Value

Type: void

setCustomTaxAttributes(customTaxAttributes)

Uses an instance of `CustomTaxAttributesResponse` class to include additional attributes in the tax response at line item level.

Signature

```
global void setCustomTaxAttributes(commercetax.CustomTaxAttributesResponse
customTaxAttributes)
```

Parameters

customTaxAttributes
Type: CustomTaxAttributesResponse

Additional data or custom attributes to include in the tax response.

Return Value

Type: void

setEffectiveDate(effectiveDate)

Sets the EffectiveDate field on the `LineItemResponse` class. Effective Date fields are optional fields that store the date that a transaction takes effect. We provide these fields only for recordkeeping purposes – for example, if you must report an effective date to an external general ledger system. Salesforce doesn't use them to calculate any tax or payment values.

Signature

```
global void setEffectiveDate(Datetime effectiveDate)
```

Parameters

effectiveDate
: Type: Datetime

  Optional field that stores the date that a transaction takes effect.

Return Value

Type: void

setIsTaxable(isTaxable)

Sets the IsTaxable field on the `LineItemResponse` class.

Signature

```
global void setIsTaxable(Boolean isTaxable)
```

Parameters

isTaxable
: Type: Boolean

  Whether line items were taxed as part of the tax calculation request.

Return Value

Type: void

setLineNumber(lineNumber)

Sets the LineNumber field on the `LineItemResponse` class.

Signature

```
global void setLineNumber(String lineNumber)
```

Parameters

lineNumber
: Type: String

User-defined number used to identify a line item.

Return Value

Type: void

setProductCode(productCode)

Sets the ProductCode field on the `LineItemResponse` class.

Signature

`global void setProductCode(String productCode)`

Parameters

productCode
Type: String

Code for the product that a line item represents.

Return Value

Type: void

setQuantity(quantity)

Sets the Quantity field on the `LineItemResponse` class.

Signature

`global void setQuantity(Double quantity)`

Parameters

quantity
Type: Double

Quantity of a line item.

Return Value

Type: void

setTaxCode(taxCode)

Sets the TaxCode field on the `LineItemResponse`.

Signature

`global void setTaxCode(String taxCode)`

Parameters

taxCode

Type: String

Federal code that an individual or business uses to pay their taxes to a federal or state government. The tax engine uses this code during the tax calculation process.

Return Value

Type: void

setTaxes(taxes)

Sets the Taxes field on a `LineItemResponse`.

Signature

```
global void setTaxes(List<commercetax.TaxDetailsResponse> taxes)
```

Parameters

taxes

Type: List<TaxDetailsResponse>

Tax values applied to a line item in the `LineItemResponse` list. This information is stored in a list of `TaxDetailsResponses`, which contains values such as tax, taxable amount, and tax rate.

Return Value

Type: void

LineTaxAddressesRequest Class

Stores details of the addresses applied per line item in a tax calculation request.

Namespace

CommerceTax

LineTaxAddressesRequest Constructors

LineTaxAddressesRequest Methods
Learn more about the available methods with the `LineTaxAddressesRequest` class.

LineTaxAddressesRequest Constructors

Learn more about the constructors available with the `LineTaxAddressesRequest` class.

The `LineTaxAddressesRequest` class includes these constructors.

LineTaxAddressesRequest(shipFrom, shipTo, soldTo, billTo, taxEngineAddress)

Constructor for initializing the required addresses for a line item of the tax addresses request such as the ship to, ship from, and bill to addresses. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

LineTaxAddressesRequest(shipFrom, shipTo, soldTo, billTo, taxEngineAddress)

Constructor for initializing the required addresses for a line item of the tax addresses request such as the ship to, ship from, and bill to addresses. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global LineTaxAddressesRequest(commercetax.TaxAddressRequest shipFrom,
commercetax.TaxAddressRequest shipTo, commercetax.TaxAddressRequest soldTo,
commercetax.TaxAddressRequest billTo, commercetax.TaxAddressRequest taxEngineAddress)
```

Parameters

shipFrom
TaxAddressRequest

Address where a line item was shipped from.

shipTo
TaxAddressRequest

Address where a line item is shipped to.

soldTo
TaxAddressRequest

Address of the line item's buyer.

billTo
TaxAddressRequest

Person or group who was billed for the line item.

taxEngineAddress
TaxAddressRequest

Address that the tax engine uses to calculate tax.

LineTaxAddressesRequest Properties

Learn more about the available properties with the `LineTaxAddressesRequest` class.

The `LineTaxAddressesRequest` class includes these properties.

billTo

The Bill To address for a line item.

shipFrom

The Ship From address for a line item.

shipTo

The Ship To address for a line item.

soldTo

The Sold To address for a line item.

billTo

The Bill To address for a line item.

Signature

```
global commercetax.TaxAddressRequest billTo {get; set;}
```

Property Value

Type: TaxAddressRequest

shipFrom

The Ship From address for a line item.

Signature

```
global commercetax.TaxAddressRequest shipFrom {get; set;}
```

Property Value

Type: TaxAddressRequest

shipTo

The Ship To address for a line item.

Signature

```
global commercetax.TaxAddressRequest shipTo {get; set;}
```

Property Value

Type: TaxAddressRequest

soldTo

The Sold To address for a line item.

Signature

```
global commercetax.TaxAddressRequest soldTo {get; set;}
```

Property Value

Type: TaxAddressRequest

LineTaxAddressesRequest Methods

Learn more about the available methods with the `LineTaxAddressesRequest` class.

The `LineTaxAddressesRequest` class includes these methods.

equals(obj)
Maintains the integrity of lists of type `LineTaxAddressesRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

hashCode()
Maintains the integrity of lists of type `LineTaxAddressesRequest` by determining the uniquness of the external object records in a list.

toString()
Converts a value to a string.

`equals(obj)`

Maintains the integrity of lists of type `LineTaxAddressesRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

`obj`
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `LineTaxAddressesRequest` by determining the uniquness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

toString()

Converts a value to a string.

Signature

```
global String toString()
```

Return Value

Type: String

RequestType Enum

Shows the type of tax request made to the tax engine.

Usage

Used by the TaxEngineContext class method.

Enum Values

The `commercetax.RequestType` enum includes these values.

Value	Description
`CalculateTax`	Represents a request to calculate tax on a list of taxable line items.

ResultCode Enum

Code that represents the results of a tax request made to the tax engine.

Usage

Used by the ErrorResponse class method.

Enum Values

The `commercetax.ResultCode` enum includes these values.

Value	Description
`TaxEngineError`	Represents an error that occurred during the tax request process.
`ReferenceDocumentCodeMissing`	Specifies if the document mentioned as a `referenceDocumentCode` value isn't available in the tax engine.

RuleDetailsResponse Class

Contains details about the tax rules used for tax calculation.

Namespace

CommerceTax

RuleDetailsResponse Methods
Learn more about the available methods with the `RuleDetailsResponse` class.

RuleDetailsResponse Methods

Learn more about the available methods with the `RuleDetailsResponse` class.

The `RuleDetailsResponse` includes these methods.

RuleDetailsResponse()
Contains information about the tax rules used when calculating tax for line items.

setNonTaxableRuleId(nonTaxableRuleId)
Sets the NonTaxableRuleId field of the `RuleDetailsResponse`.

setNonTaxableType(nonTaxableType)
Sets the NonTaxableType field of the `RuleDetailsResponse`.

setRateRuleId(rateRuleId)
Sets the RateRuleId field of the `RuleDetailsResponse`.

setRateSourceId(rateSourceId)
Sets the RateSourceId field on the `RuleDetailsResponse`.

RuleDetailsResponse()

Contains information about the tax rules used when calculating tax for line items.

Signature

```
global void RuleDetailsResponse()
```

Return Value

Type: void

setNonTaxableRuleId(nonTaxableRuleId)

Sets the NonTaxableRuleId field of the `RuleDetailsResponse`.

Signature

```
global void setNonTaxableRuleId(String nonTaxableRuleId)
```

Parameters

nonTaxableRuleId
Type: String

ID of the tax rule applied to non-taxable line items.

Return Value

Type: void

`setNonTaxableType(nonTaxableType)`

Sets the NonTaxableType field of the `RuleDetailsResponse`.

Signature

```
global void setNonTaxableType(String nonTaxableType)
```

Parameters

`nonTaxableType`
Type: String

Reason (from several possible types) that a line item is non-taxable.

Return Value

Type: void

`setRateRuleId(rateRuleId)`

Sets the RateRuleId field of the `RuleDetailsResponse`.

Signature

```
global void setRateRuleId(String rateRuleId)
```

Parameters

`rateRuleId`
Type: String

ID of the tax rule used to determine a tax rate.

Return Value

Type: void

`setRateSourceId(rateSourceId)`

Sets the RateSourceId field on the `RuleDetailsResponse`.

Signature

```
global void setRateSourceId(String rateSourceId)
```

Parameters

rateSourceId
Type: String

ID of the source object used for calculating tax rate.

Return Value

Type: void

TaxAddressesRequest Class

Contains methods to get and set tax address values.

The `TaxAddressesRequest` class includes these constructors.

TaxAddressesRequest(shipFrom, shipTo, soldTo, billTo, taxEngineAddress)
Constructor for defining addresses for the tax addresses request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

TaxAddressesRequest(shipFrom, shipTo, soldTo, billTo, taxEngineAddress)

Constructor for defining addresses for the tax addresses request. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global TaxAddressesRequest(commercetax.TaxAddressRequest shipFrom,
commercetax.TaxAddressRequest shipTo, commercetax.TaxAddressRequest soldTo,
commercetax.TaxAddressRequest billTo, commercetax.TaxAddressRequest taxEngineAddress)
```

Parameters

shipFrom

TaxAddressRequest

The address where a line item was shipped from.

shipTo

TaxAddressRequest

The address where a line item is shipped to.

soldTo

TaxAddressRequest

The address of the line item's buyer.

billTo

TaxAddressRequest

The person or group who was billed for the line item.

taxEngineAddress

TaxAddressRequest

The address that the tax engine uses to calculate tax.

TaxAddressesRequest Properties

Learn more about the available properties with the `TaxAddressesRequest` class.

The `TaxAddressesRequest` class includes these properties.

billTo

The Bill To address for a line item.

shipFrom

The Ship From address for a line item.

shipTo

The Ship To address for a line item.

soldTo

The Sold To address for a line item.

taxEngineAddress

The Tax Engine Address for a line item.

billTo

The Bill To address for a line item.

Signature

```
global commercetax.TaxAddressRequest billTo {get; set;}
```

Property Value

TaxAddressRequest

shipFrom

The Ship From address for a line item.

Signature

```
global commercetax.TaxAddressRequest shipFrom {get; set;}
```

Property Value

TaxAddressRequest

shipTo

The Ship To address for a line item.

Signature

```
public commercetax.TaxAddressRequest shipTo {get; set;}
```

Property Value

TaxAddressRequest

soldTo

The Sold To address for a line item.

Signature

```
global commercetax.TaxAddressRequest soldTo {get; set;}
```

Property Value

TaxAddressRequest

taxEngineAddress

The Tax Engine Address for a line item.

Signature

```
global commercetax.TaxAddressRequest taxEngineAddress {get; set;}
```

Property Value

TaxAddressRequest

TaxAddressesRequest Methods

Learn more about the available methods with the `TaxAddressesRequest` class.

The `TaxAddressesRequest` class includes these methods.

[equals(obj)]
Maintains the integrity of lists of type `TaxAddressesRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

[hashCode()]
Maintains the integrity of lists of type `TaxAddressesRequest` by determining the uniqueness of the external object records in a list.

[toString()]
Converts a value to a string.

equals(obj)

Maintains the integrity of lists of type `TaxAddressesRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

hashCode()

Maintains the integrity of lists of type `TaxAddressesRequest` by determining the uniqueness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

toString()

Converts a value to a string.

Signature

```
global String toString()
```

Return Value

Type: String

The `TaxAddressRequest` class includes these constructors.

TaxAddressRequest(city, country, latitude, longitude, postalCode, state, street, locationCode)
Initializes the `TaxAddressRequest` object using address details. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`TaxAddressRequest(city, country, latitude, longitude, postalCode, state, street, locationCode)`

Initializes the `TaxAddressRequest` object using address details. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global TaxAddressRequest(String city, String country, Double latitude, Double longitude,
String postalCode, String state, String street, String locationCode)
```

Parameters

city
Type: String

City used in an address, which is required for tax calculation.

country

Type: String

Country used in an address, which is required for tax calculation.

latitude

Type: Double

Latitude used in an address, which is required for tax calculation.

longitude

Type: Double

Longitude used in an address, which is required for tax calculation.

postalCode

Type: String

Postal code used in an address, which is required for tax calculation.

state

Type: String

State used in an address, which is required for tax calculation.

street

Type: String

Street used in an address, which is required for tax calculation.

locationCode

Type: String

Location code used in an address, which is required for tax calculation.

TaxAddressRequest Properties

Learn more about the available properties with the `TaxAddressRequest` class.

The `TaxAddressRequest` class includes these properties.

city

City used in an address, which is required for tax calculation.

country

Country used in an address, which is required for tax calculation.

countryCode

Country code used in an address, which is required for tax calculation.

latitude

Latitude used in an address, which is required for tax calculation.

locationCode

Location code used in an address, which is required for tax calculation.

longitude

Longitude used in an address, which is required for tax calculation.

postalCode

Postal code used in an address, which is required for tax calculation.

state
State used in an address, which is required for tax calculation.

stateCode
State code used in an address, which is required for tax calculation.

street
Street used in an address, which is required for tax calculation.

city

City used in an address, which is required for tax calculation.

Signature

```
global String city {get; set;}
```

Property Value

Type: String

country

Country used in an address, which is required for tax calculation.

Signature

```
global String country {get; set;}
```

Property Value

Type: String

countryCode

Country code used in an address, which is required for tax calculation.

Signature

```
global String countryCode {get; set;}
```

Property Value

Type: String

latitude

Latitude used in an address, which is required for tax calculation.

Signature

```
global Double latitude {get; set;}
```

Property Value

Type: Double

locationCode

Location code used in an address, which is required for tax calculation.

Signature

```
global String locationCode {get; set;}
```

Property Value

Type: String

longitude

Longitude used in an address, which is required for tax calculation.

Signature

```
global Double longitude {get; set;}
```

Property Value

Type: Double

postalCode

Postal code used in an address, which is required for tax calculation.

Signature

```
global String postalCode {get; set;}
```

Property Value

Type: String

state

State used in an address, which is required for tax calculation.

Signature

```
global String state {get; set;}
```

Property Value

Type: String

`stateCode`

State code used in an address, which is required for tax calculation.

Signature

```
global String stateCode {get; set;}
```

Property Value

Type: String

`street`

Street used in an address, which is required for tax calculation.

Signature

```
global String street {get; set;}
```

Property Value

Type: String

TaxAddressRequest Methods

Learn more about the available methods with the `TaxAddressRequest` class.

The `TaxAddressRequest` class includes these methods.

- equals(obj)
  Maintains the integrity of lists of type TaxAddressRequest by determining the equality of external objects in a list. This method is dynamic and based on the `equals()` method in Java.
- hashCode()
  Maintains the integrity of lists of type `TaxAddressRequest` by determining the uniqueness of the external object in a list.
- toString()
  Converts a date to a string.

`equals(obj)`

Maintains the integrity of lists of type TaxAddressRequest by determining the equality of external objects in a list. This method is dynamic and based on the `equals()` method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

hashCode()

Maintains the integrity of lists of type `TaxAddressRequest` by determining the uniqueness of the external object in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

toString()

Converts a date to a string.

Signature

```
global String toString()
```

Return Value

Type: String

TaxApiException Class

Contains details about any exceptions during the tax calculation process. Extends the `ApexBaseException` class.

Namespace

CommerceTax

TaxApiException Constructors
Learn more about the available constructors with the `TaxApiException` class.

TaxApiException Constructors

Learn more about the available constructors with the `TaxApiException` class.

The `TaxApiException` class includes these constructors.

TaxApiException(var1, var2)

Initializes the `TaxApiException` class using an `Exception` and a string to provide more details about the exception. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

TaxApiException(var1)

Initializes the `TaxApiException` class using an `Exception`. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

TaxApiException()

Initializes the `TaxApiException` class without any initialized parameters. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

TaxApiException(var1, var2)

Initializes the `TaxApiException` class using an `Exception` and a string to provide more details about the exception. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global TaxApiException(String var1, Exception var2)
```

Parameters

var1

Type: String

Text that provides more information about the returned exception.

var2

Type: Exception

An exception denotes an error that disrupts the normal flow of code execution. You can use Apex built-in exceptions or create custom exceptions. All exceptions have common methods.

TaxApiException(var1)

Initializes the `TaxApiException` class using an `Exception`. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global TaxApiException(Exception var1)
```

Parameters

var1

Type: Exception

An exception denotes an error that disrupts the normal flow of code execution. You can use Apex built-in exceptions or create custom exceptions. All exceptions have common methods.

TaxApiException()

Initializes the `TaxApiException` class without any initialized parameters. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global TaxApiException()
```

TaxCustomerDetailsRequest Class

Contains customer details used in tax calculation.

Namespace

CommerceTax

TaxCustomerDetailsRequest(accountId, code, exemptionNo, exemptionReason)
Initializes the `TaxCustomerDetailsRequest` object. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

TaxCustomerDetailsRequest(accountId, code, exemptionNo, exemptionReason)

Initializes the `TaxCustomerDetailsRequest` object. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global TaxCustomerDetailsRequest(String accountId, String code, String exemptionNo,
String exemptionReason)
```

Parameters

accountId
Type: String

The customer account ID for the line items sent for tax calculation.

code

Type: String

The tax code used during tax calculation.

exemptionNo

Type: String

The exemption number applied to any tax exempt line items.

exemptionReason

Type: String

The reason that certain line items are tax exempt.

TaxCustomerDetailsRequest Properties

Learn more about the available properties with the `TaxCustomerDetailsRequest` class.

The `TaxCustomerDetailsRequest` class includes these properties.

accountId
Customer account that contains the line items sent for tax calculation.

code
Tax code used during tax calculation.

exemptionNo
Number used to qualify a line item for tax exemption.

exemptionReason
Reason why a line item qualifies for tax exemption.

taxCertificateId
ID of a tax certificate used for tax calculation.

accountId

Customer account that contains the line items sent for tax calculation.

Signature

```
global String accountId {get; set;}
```

Property Value

Type: String

code

Tax code used during tax calculation.

Signature

```
global String code {get; set;}
```

Property Value

Type: String

exemptionNo

Number used to qualify a line item for tax exemption.

Signature

```
global String exemptionNo {get; set;}
```

Property Value

Type: String

exemptionReason

Reason why a line item qualifies for tax exemption.

Signature

```
global String exemptionReason {get; set;}
```

Property Value

Type: String

taxCertificateId

ID of a tax certificate used for tax calculation.

Signature

```
global String taxCertificateId {get; set;}
```

Property Value

Type: String

TaxCustomerDetailsRequest Methods

Learn more about the available methods with the `TaxCustomerDetailsRequest` class.

The `TaxCustomerDetailsRequest` class includes these methods.

- equals(obj)
  Maintains the integrity of lists of type `TaxCustomerDetailsRequest` by determining the equality of external objects in a list. This method is dynamic and based on the `equals()` method in Java.

hashCode()

Maintains the integrity of lists of type `TaxCustomerDetailsRequest` by determining the uniqueness of the external objects in a list.

toString()

Converts a value to a string.

equals(obj)

Maintains the integrity of lists of type `TaxCustomerDetailsRequest` by determining the equality of external objects in a list. This method is dynamic and based on the `equals()` method in Java.

Signature

`global Boolean equals(Object obj)`

Parameters

obj

Type: Object

External object whose key is to be validated.

Return Value

Type: Boolean

hashCode()

Maintains the integrity of lists of type `TaxCustomerDetailsRequest` by determining the uniqueness of the external objects in a list.

Signature

`global Integer hashCode()`

Return Value

Type: Integer

toString()

Converts a value to a string.

Signature

`global String toString()`

Return Value

Type: String

TaxDetailsResponse Class

Stores details of the tax values that an external tax engine calculates in response to a tax calculation request.

Namespace

CommerceTax

Usage

If your tax calculation request contains multiple line items, we recommend building your adapter using a list of `TaxDetailsResponse` instances. Each instance represents the tax details calculated for a given line item.

Example

```
List<commercetax.TaxDetailsResponse> taxDetailsResponses = new
List<commercetax.TaxDetailsResponse>();
                 for(integer i =0;i<1;i++){
                     Integer rate  = 1;
                     Double taxableAmount = lineItem.amount;
                     commercetax.TaxDetailsResponse taxDetailsResponse = new
commercetax.TaxDetailsResponse();
                     taxDetailsResponse.setRate(Double.valueOf(rate));
                     taxDetailsResponse.setTaxableAmount(taxableAmount);
                     Double tax = taxableAmount*rate;
                     totalLineTax+=tax;
                     taxDetailsResponse.setTax(taxableAmount*rate);
                     taxDetailsResponse.setExemptAmount(0);
                     taxDetailsResponse.setExemptReason('exemptReason');
                     taxDetailsResponse.setTaxRegionId('taxRegionId');

taxDetailsResponse.setTaxId(String.valueOf(getRandomInteger(0,2323233)));
                     taxDetailsResponse.setSerCode('serCode');
                     taxDetailsResponse.setTaxAuthorityTypeId('taxAuthorityTypeId');
                     if(request.DocumentCode == 'SetsNullForResponseWithoutException'){
                         taxDetailsResponse.setImposition(null);
                     }else{
                         commercetax.ImpositionResponse imposition = new
commercetax.ImpositionResponse();
                         imposition.setSubType('subtype');
                         imposition.setType('type');
                         taxDetailsResponse.setImposition(imposition);
                     }

                     if(request.DocumentCode == 'SetsNullForResponseWithoutException'){
                         taxDetailsResponse.setJurisdiction(null);
                     }else{
                         commercetax.JurisdictionResponse jurisdiction = new
commercetax.JurisdictionResponse();
                         jurisdiction.setCountry('country');
                         jurisdiction.setRegion('region');
                         jurisdiction.setName('name');
                         jurisdiction.setStateAssignedNumber('stateAssignedNo');
```

```
                jurisdiction.setId('id');
                jurisdiction.setLevel('level');
                taxDetailsResponse.setJurisdiction(jurisdiction);
            }

            taxDetailsResponses.add(taxDetailsResponse);
        }
        lineItemResponse.setTaxes(taxDetailsResponses);
        totalTax +=totalLineTax;
        totalAmount+=lineItem.amount;
```

TaxDetailsResponse Methods

Learn more about the available methods with the `TaxDetailsResponse` class.

The `TaxDetailsResponse` class includes these methods.

[setTaxRuleDetails(taxRuleDetails)](#)
Sets the TaxRuleDetails field of the `TaxDetailsResponse` class.

[setTaxableAmount(taxableAmount)](#)
Sets the TaxableAmount field of the `TaxDetailsResponse class`.

setCustomTaxAttributes(customTaxAttributes)

Uses an instance of `CustomTaxAttributesResponse` class to include additional attributes in the tax response at the tax line item level.

Signature

```
global void setCustomTaxAttributes(commercetax.CustomTaxAttributesResponse
customTaxAttributes)
```

Parameters

customTaxAttributes
Type: CustomTaxAttributesResponse

Additional data or custom attributes to include in the tax response.

Return Value

Type: void

setExemptAmount(exemptAmount)

Sets the ExemptAmount field of the `TaxDetailsResponse` class.

Signature

```
global void setExemptAmount(Double exemptAmount)
```

Parameters

exemptAmount
Type: Double

Amount of tax on a line item that is exempt from tax calculation.

Return Value

Type: void

setExemptReason(reason)

Sets the ExemptReason field of the `TaxDetailsResponse` class.

Signature

```
global void setExemptReason(String reason)
```

Parameters

reason
Type: String

Optional user-defined information on why a tax exemption applies to a line item.

Return Value

Type: void

setImposition(imposition)

Sets the Imposition field of the `TaxDetailsResponse` class using an instance of the `ImpositionResponse` class.

Signature

```
global void setImposition(commercetax.ImpositionResponse imposition)
```

Parameters

imposition
Type: ImpositionResponse

Contains information about why tax was imposed on a line item.

Return Value

Type: void

setJurisdiction(jurisdiction)

Sets the Jurisdiction field of the `TaxDetailsResponse` using an instance of the `JurisdictionResponse` class.

Signature

```
global void setJurisdiction(commercetax.JurisdictionResponse jurisdiction)
```

Parameters

jurisdiction
Type: JurisdictionResponse

Contains address information about the tax jurisdiction used in the tax calculation process.

Return Value

Type: void

setRate(rate)

Sets the Rate field of the `TaxDetailsResponse` class.

Signature

```
global void setRate(Double rate)
```

Parameters

rate
: Type: Double

  Tax used during tax calculation. This value is often a decimal amount, such as 0.1 or 0.06, based on the applied tax percentage.

Return Value

Type: void

setSerCode(serCode)

Sets the Service Code field of the `TaxDetailsResponse` class.

Signature

```
global void setSerCode(String serCode)
```

Parameters

serCode
: Type: String

  Service code used in tax calculation.

Return Value

Type: void

setTax(tax)

Sets the Tax field of the `TaxDetailsResponse` class.

Signature

```
global void setTax(Double tax)
```

Parameters

tax
: Type: Double

  Amount of tax for a line item.

Return Value

Type: void

`setTaxAuthorityTypeId(taxAuthorityTypeId)`

Sets the TaxAuthorityTypeId field of the `TaxDetailsResponse` class.

Signature

`global void setTaxAuthorityTypeId(String taxAuthorityTypeId)`

Parameters

`taxAuthorityTypeId`
Type: String

ID of the organization that oversees tax collection.

Return Value

Type: void

`setTaxId(taxId)`

Sets the TaxId field of the `TaxDetailsResponse` class.

Signature

`global void setTaxId(String taxId)`

Parameters

`taxId`
Type: String

ID value used to determine the tax for an individual or business.

Return Value

Type: void

`setTaxRegionId(taxRegionId)`

Sets the TaxRegionId field on the `TaxDetailsResponse` class.

Signature

`global void setTaxRegionId(String taxRegionId)`

Parameters

`taxRegionId`
Type: String

ID of the tax region used in tax calculation. A tax region represents a geographical area where tax is applied.

Return Value

Type: void

`setTaxRuleDetails(taxRuleDetails)`

Sets the TaxRuleDetails field of the `TaxDetailsResponse` class.

Signature

```
global void setTaxRuleDetails(commercetax.RuleDetailsResponse taxRuleDetails)
```

Parameters

`taxRuleDetails`
Type: RuleDetailsResponse

Information about the Salesforce tax rules used during tax calculation.

Return Value

Type: void

`setTaxableAmount(taxableAmount)`

Sets the TaxableAmount field of the `TaxDetailsResponse class`.

Signature

```
global void setTaxableAmount(Double taxableAmount)
```

Parameters

`taxableAmount`
Type: Double

Amount that can be taxed on a line item.

Return Value

Type: void

TaxEngineAdapter Interface

Retrieves information from the tax engine and evaluates the information to define tax details.

Namespace

CommerceTax

TaxEngineAdapter Methods
Learn more about the available methods with the `TaxEngineAdapter` class.

TaxEngineAdapter Example Implementation

Refer to the example implementation of the `TaxEngineAdapter` interface to accept information from a tax engine and evaluate the information to define tax details.

Tax Mappings for Quotes and Orders

You can extend and customize the tax interface for quotes and orders by using custom metadata types and tax mappings. These customizations help you with unique business requirements such as the inclusion of specific data for accurate calculations and audits.

TaxEngineAdapter Methods

Learn more about the available methods with the `TaxEngineAdapter` class.

The `TaxEngineAdapter` class includes these methods.

processRequest(requestType)

The `processRequest` method takes an instance of `TaxEngineContext` class and returns a response with the calculated tax details through the `TaxDetailsResponse` class or an error response through the `ErrorResponse` class.

processRequest(requestType)

The `processRequest` method takes an instance of `TaxEngineContext` class and returns a response with the calculated tax details through the `TaxDetailsResponse` class or an error response through the `ErrorResponse` class.

Signature

```
global commercetax.TaxEngineResponse processRequest(commercetax.TaxEngineContext var1)
```

Parameters

var1

Type: TaxEngineContext

Wrapper class that stores information about the type of a tax calculation request.

Return Value

Type: TaxEngineResponse

Generic interface representing a response from a tax engine.

TaxEngineAdapter Example Implementation

Refer to the example implementation of the `TaxEngineAdapter` interface to accept information from a tax engine and evaluate the information to define tax details.

Namespace

commercetax

Usage

The `TaxEngineAdapter` interface accepts information from the tax engine through the `TaxEngineContext` class. The interface evaluates the information to define tax in the response with details, such as tax amount and addresses. The response is used to update and create entities in the Salesforce org.

Use these steps to build a sample tax adapter implementation. Each tax adapter implementation varies based on your implementation requirements. Customize this example to suit your business requirements.

Example:

- The custom adapter class implements the `TaxEngineAdapter` interface. The `processRequest` method takes an instance of `TaxEngineContext` class and returns a response with the calculated tax details through the `TaxDetailsResponse` class or an error response through the `ErrorResponse` class.

```
global virtual class AvalaraAdapter implements commercetax.TaxEngineAdapter {
    global commercetax.TaxEngineResponse processRequest(commercetax.TaxEngineContext
 taxEngineContext) {
            commercetax.RequestType requestType = taxEngineContext.getRequestType();
            if(requestType == commercetax.RequestType.CalculateTax){
                return CalculateTaxService.getTax(taxEngineContext);
            }
            else
                return null;
     }
}
```

- This example shows the `CalculateTaxService` class.

```
global class CalculateTaxService {
    // ============================================================================

     // CONSTANT
    // ============================================================================

Tax Mappings for Quotes and Orders

You can extend and customize the tax interface for quotes and orders by using custom metadata types and tax mappings. These customizations help you with unique business requirements such as the inclusion of specific data for accurate calculations and audits.

Tax callout extensions are supported for the Quote, QuoteLineItem, Order, and OrderItem objects to include additional fields to tax requests. You must manually write back tax response extensions to the objects. See custom metadata types to specify all your tax mapping definitions.

Request Mappings for Header Attributes

This table defines the request mappings between the header attributes of a tax callout and fields of applicable quote and order objects.

Header Attributes	Quote Mapping	Order Mapping
currencyIsoCode	If multi-currency is enabled, then this value is `Quote.CurrencyISOCode`. Otherwise, this value is NULL.	If multi-currency is enabled, then this value is `Order.CurrencyISOCode`. Otherwise, this value is NULL.
isCommit	`False`	`False`

Header Attributes	Quote Mapping	Order Mapping
referenceEntityId	Quote.ID	Order.ID
taxEngineId	TaxTreatment.TaxEngine.ID	TaxTreatment.TaxEngine.ID
transactionDate	Current System Date	System Date
sellerDetails	NULL	
code		TaxEngine.SellerCode
customerDetails		
accountId	Quote.AccountId	Order.AccountId
code	NULL	NULL
exemptionNo	NULL	NULL
exemptionReason	NULL	NULL
taxType	`Estimated`	`Estimated`
taxTransactionType	NULL	NULL
effectiveDate	NULL	NULL
addresses		
billTo	NULL	NULL
shipTo	NULL	NULL
shipFrom	NULL	NULL
soldTo	NULL	NULL
taxEngineAddress	TaxEngine.Address	TaxEngine.Address
referenceDocumentCode	NULL	NULL
description	NULL	NULL
documentCode	`Quote.ID-TaxEngineId`	`Order.ID-TaxEngineId`
shouldVoid	`FALSE`	`FALSE`
lineItems	Refer to the next line attributes section.	Refer to the next line attributes section.

Request Mappings for Line Attributes

This table defines the request mappings between the line attributes of a tax callout and fields of applicable quote line items and order products.

Line Attributes	Quote Line Item Mapping	Order Product Mapping
taxCode	TaxTreatment.TaxCode	TaxTreatment.TaxCode
productCode	TaxTreatment.ProductCode	TaxTreatment.ProductCode

Line Attributes	Quote Line Item Mapping	Order Product Mapping
productId	QuoteLineItem.Product2.Id	OrderItem.Product2.Id
amount	QuoteLineItem.TotalPrice	OrderItem.TotalPrice
effectiveDate	Current System Date	Current System Date
lineNumber	QuoteLineItem.Id	OrderItem.Id
description	NULL	NULL
quantity	QuoteLineItem.Quantity	OrderItem.Quantity
addresses		
billTo	Quote.BillingAddress. If Quote.BillingAddress is null, then this value is Quote.Account.BillingAddress.	Order.BillingAddress
shipTo	Quote.ShippingAddress. If Quote.ShippingAddress is null, then this value is Quote.Account.ShippingAddress.	Order.ShippingAddress
shipFrom	NULL	NULL
soldTo	NULL	NULL
productsku	QuoteLineItem.Product2.ProductCode	OrderItem.Product2.ProductCode
referenceDocumentCode	NULL	NULL

Response Mappings for Header Attributes

This table defines the response mappings between the header attributes of a tax callout and fields of applicable objects. Most response data is used for tax calculation and isn't persisted on quote or order records.

Header Attributes	Quote Mapping	Order Mapping
currencyIsoCode	Quote.CurrencyISOCode	Order.CurrencyISOCode
isCommit	Not returned.	Not returned.
referenceEntityId	Quote.ID	Order.ID
taxEngineId	TaxTreatment.TaxEngine.ID	TaxTreatment.TaxEngine.ID
transactionDate	System Date	System Date
sellerDetails	Not returned.	Not returned.
code	Not returned.	Not returned.
customerDetails	Not returned.	Not returned.
accountId	Not returned.	Not returned.
code	Not returned.	Not returned.

Header Attributes	Quote Mapping	Order Mapping
exemptionNo	Not returned.	Not returned.
exemptionReason	Not returned.	Not returned.
taxType	`Estimated`	`Estimated`
taxTransactionType	Not returned.	Not returned.
effectiveDate	System Date	System Date
addresses		
billTo	Not returned.	Not returned.
shipTo	locationCode -> locationCode	locationCode -> locationCode
shipFrom	Not returned.	Not returned.
soldTo	Not returned.	Not returned.
taxEngineAddress	Not returned.	Not returned.
referenceDocumentCode	Not returned.	Not returned.
description	Not returned.	Not returned.
documentCode	`Quote.ID-TaxEngineId`	`Order.ID-TaxEngineId`
status	`Uncommitted`	`Uncommitted`
taxEngineLogs	Not returned.	Not returned.
resultCode	Not returned.	Not returned.
transactionDate	System Date	System Date
amountDetails		
exemptAmount	Actual exemptAmount from response.	Actual exemptAmount from response.
taxAmount	Actual taxAmount from response.	Actual taxAmount from response.
totalAmount	Quote.Subtotal	Order.Subtotal
totalAmountWithTax	TaxAmount + TotalAmount	TaxAmount + TotalAmount
lineItems	Refer to the next line attributes section.	Refer to the next line attributes section.

Response Mappings for Line Attributes

This table defines the response mappings between the line attributes of a tax callout and fields of applicable objects.

Line Attributes	Quote Line Item Mapping	Order Product Mapping
taxCode	TaxTreatment.TaxCode	TaxTreatment.TaxCode
productCode	TaxTreatment.ProductCode	TaxTreatment.ProductCode

Line Attributes	Quote Line Item Mapping	Order Product Mapping
productId	Not returned.	Not returned.
amountDetails		
exemptAmount	Actual exemptAmount from response	Actual exemptAmount from response
taxAmount	Actual taxAmount from response	Actual taxAmount from response
totalAmount	QuoteLineItem.Subtotal	OrderItem.Subtotal
totalAmountWithTax	TaxAmount + TotalAmount	TaxAmount + TotalAmount
effectiveDate	System Date	System Date
lineNumber	QuoteLineItem.Id	OrderItem.Id
description	Not returned.	Not returned.
quantity	Not returned.	Not returned.
addresses		
billTo	Not persisted.	Not persisted.
shipTo	locationCode -> locationCode	locationCode -> locationCode
shipFrom	Not returned.	Not returned.
soldTo	Not returned.	Not returned.
productsku	Not returned.	Not returned.
referenceDocumentCode	Not returned.	Not returned.
taxes	Refer to the next tax attributes section.	Refer to the next tax attributes section.

Response Mappings for Tax Attributes

This table defines the response mappings between the tax attributes of a tax callout and fields of applicable objects.

Tax Attributes	Quote Mapping	Order Mapping
exemptAmount	Not returned.	Not returned.
exemptReason	Not returned.	Not returned.
imposition		
type	Not returned.	Not returned.
Name	Not returned.	Not returned.
jurisdiction		
country	Not returned.	Not returned.
id	Not returned.	Not returned.

Tax Attributes	Quote Mapping	Order Mapping
level	Not returned.	Not returned.
name	Not returned.	Not returned.
region	Not returned.	Not returned.
stateAssignedNo	Not returned.	Not returned.
rate	QuoteItemTaxItem.Rate	OrderItemTaxItem.Rate
tax	QuoteItemTaxItem.amount	OrderItemTaxItem.amount
taxId	Not returned.	Not returned.
taxableAmount	Not returned.	Not returned.

TaxEngineContext Class

Wrapper class that stores details about the type of a tax calculation request.

Namespace

CommerceTax

Example

At the beginning of a tax adapter, use `TaxEngineContext` class to pass the value of a request type to an instance of `RequestType`.

```
global virtual class MockAdapter implements commercetax.TaxEngineAdapter {

     global commercetax.TaxEngineResponse processRequest(commercetax.TaxEngineContext
taxEngineContext) {
         commercetax.RequestType requestType = taxEngineContext.getRequestType();
         commercetax.CalculateTaxRequest request =
(commercetax.CalculateTaxRequest)taxEngineContext.getRequest();
```

Build the rest of your adapter based on the type of request that you got from `TaxEngineContext` class.

```
if(requestType == commercetax.RequestType.CalculateTax){
             commercetax.calculatetaxtype type = request.taxtype;
             String docCode='';
             if(request.DocumentCode == 'simulateEmptyDocumentCode')
                 docCode = '';
             else if(request.DocumentCode != null)
                 docCode =request.DocumentCode;
           else if(request.ReferenceEntityId != null) docCode = request.ReferenceEntityId;

             else docCode =  String.valueOf(getRandomInteger(0,2147483647));
             commercetax.CalculateTaxResponse response = new
commercetax.CalculateTaxResponse();
             if(request.isCommit == true) {
                 response.setStatus(commercetax.TaxTransactionStatus.Committed);
             } else {
```

```
                response.setStatus(commercetax.TaxTransactionStatus.Uncommitted);
            }
}
```

TaxEngineContext Constructors

Learn more about the available constructors with the `TaxEngineContext` class.

TaxEngineContext Methods

Learn more about the available methods with the `TaxEngineContext` class.

TaxEngineContext Constructors

Learn more about the available constructors with the `TaxEngineContext` class.

The `TaxEngineContext` class includes these constructors.

TaxEngineContext(request, requestType, namedUri)

Initializes the `TaxEngineContext` object. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`TaxEngineContext(request, requestType, namedUri)`

Initializes the `TaxEngineContext` object. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

`TaxEngineContext(commercetax.TaxEngineRequest request, commercetax.RequestType requestType, String namedUri)`

Parameters

request
Type: TaxEngineRequest

Information about the request.

requestType
Type: RequestType

Whether the tax request is to calculate or estimate tax.

namedUri
Type: String

URI that was called as part of the tax calculation request.

TaxEngineContext Methods

Learn more about the available methods with the `TaxEngineContext` class.

The `TaxEngineContext` class includes these methods.

getNamedUri()
Retrieves the value of the NamedUri field of the `TaxEngineContext` class.

getRequest()
Gets the value of the `TaxEngineContext`'s Request field.

getRequestType()
Gets the value of the RequestType field of the `TaxEngineContext` class.

getNamedUri()

Retrieves the value of the NamedUri field of the `TaxEngineContext` class.

Signature

```
global String getNamedUri()
```

Return Value

Type: String

getRequest()

Gets the value of the `TaxEngineContext`'s Request field.

Signature

```
global commercetax.TaxEngineRequest getRequest()
```

Return Value

Type: TaxEngineRequest

An implemented instance of an external tax engine's interface for processing requests. We've provided the `TaxEngineRequest` interface for you to test within mock adapters with classes that implement it, such as CalculateTaxRequest. However, don't use it outside of a testing context.

getRequestType()

Gets the value of the RequestType field of the `TaxEngineContext` class.

Signature

```
global commercetax.RequestType getRequestType()
```

Return Value

Type: RequestType

Indicates whether the calculation request was for actual or calculated tax.

TaxLineItemRequest Class

Contains line item details of a tax request.

Namespace

CommerceTax

TaxLineItemRequest Constructors
Learn more about the constructors available with the `TaxLineItemRequest` class.

TaxLineItemRequest Properties
Learn more about the available properties with the `TaxLineItemRequest` class.

TaxLineItemRequest Methods
Learn more about the available methods with the `TaxLineItemRequest` class.

TaxLineItemRequest Constructors

Learn more about the constructors available with the `TaxLineItemRequest` class.

The `TaxLineItemRequest` class includes these constructors.

TaxLineItemRequest(addresses, amount, description, productCode, quantity, lineNumber, taxCode, effectiveDate)
Initializes the request for the tax line item. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`TaxLineItemRequest(addresses, amount, description, productCode, quantity, lineNumber, taxCode, effectiveDate)`

Initializes the request for the tax line item. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global TaxLineItemRequest(commercetax.LineTaxAddressesRequest addresses, Double amount,
String description, String productCode, Double quantity, String lineNumber, String
taxCode, Datetime effectiveDate)
```

```
commercetax.TaxLineItemRequest, newinstance, [commercetax.LineTaxAddressesRequest, Double,
 String, String, Double, String, String, Datetime], commercetax.TaxLineItemRequest
```

Parameters

addresses
Type: LineTaxAddressesRequest

Information about the addresses applied to each line item in a tax calculation request.

amount
Type: Double

Total amount (in a given currency) represented by a line item sent for tax calculation.

description

Type: String

User-defined description for a tax line item.

productCode

Type: String

Catalog code for the product represented by the tax line item.

quantity

Type: Double

Number of units of a given product that the tax line item represents.

lineNumber

Type: String

Unique number used to identify a tax line item.

taxCode

Type: String

Code used to identify how tax is calculated for a tax line item.

effectiveDate

Type: Datetime

This is a user-defined date used for reporting only. For negative invoice lines, this parameter represents the invoice date from the original invoice. In other cases, it represents the date when the tax transaction takes effect on the line item. The previous tax transaction type is always `Debit` for negative invoice lines.

TaxLineItemRequest Properties

Learn more about the available properties with the `TaxLineItemRequest` class.

The `TaxLineItemRequest` class includes these properties.

addresses

Contains the list of addresses of a line item.

amount

Total amount (in a given currency) represented by a line item sent for tax calculation.

customTaxAttributes

Customised tax contract to include additional attributes at the line item level.

description

User-defined description for a tax line item.

effectiveDate

The date that a tax transaction takes effect on a line item. This is a user-defined date used for reporting only.

lineNumber

Unique number used to identify a tax line item.

productCode

Catalog code for the product represented by the tax line item.

productSKU
Unique identifier of a product that can be used to identify products that are exempted from tax.

quantity
Number of units of a given product that the tax line item represents.

referenceDocumentCode
Identifier that combines the original invoice ID, previous tax transaction type, and tax engine ID, used in tax calculations for negative invoice lines.

taxCode
Code used to identify how tax is calculated for a tax line item.

addresses

Contains the list of addresses of a line item.

Signature

```
public commercetax.LineTaxAddressesRequest addresses {get; set;}
```

Property Value

Type: commercetax.LineTaxAddressesRequest

amount

Total amount (in a given currency) represented by a line item sent for tax calculation.

Signature

```
global Double amount {get; set;}
```

Property Value

Type: Double

customTaxAttributes

Customised tax contract to include additional attributes at the line item level.

Signature

```
global commercetax.TaxLineItemRequest customTaxAttributes {get; set;}
```

Property Value

Type: Map<String, Object>

description

User-defined description for a tax line item.

Signature

```
global String description {get; set;}
```

Property Value

Type: String

effectiveDate

The date that a tax transaction takes effect on a line item. This is a user-defined date used for reporting only.

Signature

```
global Datetime effectiveDate {get; set;}
```

Property Value

Type: Datetime

lineNumber

Unique number used to identify a tax line item.

Signature

```
global String lineNumber {get; set;}
```

Property Value

Type: String

productCode

Catalog code for the product represented by the tax line item.

Signature

```
global String productCode {get; set;}
```

Property Value

Type: String

productSKU

Unique identifier of a product that can be used to identify products that are exempted from tax.

Signature

```
global String productSKU {get; set;}
```

Property Value

Type: String

quantity

Number of units of a given product that the tax line item represents.

Signature

```
global Double quantity {get; set;}
```

Property Value

Type: Double

referenceDocumentCode

Identifier that combines the original invoice ID, previous tax transaction type, and tax engine ID, used in tax calculations for negative invoice lines.

For example, a referenceDocumentCode parameter value `3ttxx00000004Bh_Debit-4wAxx0000000001EAA` indicates `3ttxx00000004Bh` is the original invoice ID and `4wAxx0000000001EAA` is the tax engine ID. The previous tax transaction type is always `Debit` for negative invoice lines.

Signature

```
global String referenceDocumentCode {get; set;}
```

Property Value

Type: String

taxCode

Code used to identify how tax is calculated for a tax line item.

Signature

```
global String taxCode {get; set;}
```

Property Value

Type: String

TaxLineItemRequest Methods

Learn more about the available methods with the `TaxLineItemRequest` class.

The `TaxLineItemRequest` class includes these methods.

equals(obj)
: Maintains the integrity of lists of type `TaxLineItemRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

hashCode()
: Maintains the integrity of lists of type `TaxLineItemRequest` by determining the uniqueness of the external object records in a list.

toString()
: Converts a value to a string.

`equals(obj)`

Maintains the integrity of lists of type `TaxLineItemRequest` by determining the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
: Type: Object
: External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `TaxLineItemRequest` by determining the uniqueness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a value to a string.

Signature

```
global String toString()
```

Return Value

Type: String

TaxSellerDetailsRequest Class

Contains tax code details used in the tax calculation request.

Namespace

CommerceTax

TaxSellerDetailsRequest Constructors

TaxSellerDetailsRequest Constructors

Learn more about the available constructors with the `TaxSellerDetailsRequest` class.

The `TaxSellerDetailsRequest` class includes these constructors.

TaxSellerDetailsRequest(code)
Initializes the request for the tax seller details. This constructor is intended for test usage and throws an exception if used outside of the Apex test context

`TaxSellerDetailsRequest(code)`

Initializes the request for the tax seller details. This constructor is intended for test usage and throws an exception if used outside of the Apex test context

Signature

```
global TaxSellerDetailsRequest(String code)
```

Parameters

code
Type: String

Tax code used for tax calculation.

TaxSellerDetailsRequest Properties

Learn more about the available properties with the `TaxSellerDetailsRequest` class.

The `TaxSellerDetailsRequest` class includes these properties.

code
: Tax code used for tax calculation.

code

Tax code used for tax calculation.

Signature

```
global String code {get; set;}
```

Property Value

Type: String

TaxSellerDetailsRequest Methods

Learn more about the available methods with the `TaxSellerDetailsRequest` class.

The `TaxSellerDetailsRequest` class includes these methods.

equals(obj)
: Maintains the integrity of lists of type `TaxSellerDetailsRequest` by determining the equality of the external objects in a list. This method is dynamic and based on the `equals()` method in Java.

hashCode()
: Maintains the integrity of lists of type `TaxSellerDetailsRequest` by determining the uniqueness of the external objects in a list.

toString()
: Converts a value to a string.

equals(obj)

Maintains the integrity of lists of type `TaxSellerDetailsRequest` by determining the equality of the external objects in a list. This method is dynamic and based on the `equals()` method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
: Type: Object

  External object whose key is to be validated.

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `TaxSellerDetailsRequest` by determining the uniqueness of the external objects in a list.

Signature

`global Integer hashCode()`

Return Value

Type: Integer

`toString()`

Converts a value to a string.

Signature

`global String toString()`

Return Value

Type: String

TaxTransactionRequest Class

Abstract class for storing customer details used in tax calculation and estimation requests.

Namespace

CommerceTax

Usage

Specify the `CommerceTax` namespace when creating an instance of this class. The constructor of this class takes no arguments. For example, let's say you create an instance of `CalculateTaxRequest` class, which extends the `TaxTransactionRequest` class.

TaxTransactionRequest Constructors
Learn more about the available constructors with the `TaxTransactionRequest` class.

TaxTransactionRequest Properties
Learn more about the available properties with the `TaxTransactionRequest` class.

TaxTransactionRequest Methods

TaxTransactionRequest Constructors

Learn more about the available constructors with the `TaxTransactionRequest` class.

The `TaxTransactionRequest` class includes these constructors.

TaxTransactionRequest(addresses, currencyIsoCode, customerDetails, description, documentCode, referenceDocumentCode, transactionDate, effectiveDate, lineItems, referenceEntityId, sellerDetails, customTaxAttributes)

Initializes the request for the tax transaction. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

`TaxTransactionRequest(addresses, currencyIsoCode, customerDetails, description, documentCode, referenceDocumentCode, transactionDate, effectiveDate, lineItems, referenceEntityId, sellerDetails, customTaxAttributes)`

Initializes the request for the tax transaction. This constructor is intended for test usage and throws an exception if used outside of the Apex test context.

Signature

```
global TaxTransactionRequest(commercetax.HeaderTaxAddressesRequest addresses, String
currencyIsoCode, commercetax.TaxCustomerDetailsRequest customerDetails, String
description, String documentCode, String referenceDocumentCode, Datetime transactionDate,
Datetime effectiveDate, List<commercetax.TaxLineItemRequest> lineItems, String
referenceEntityId, commercetax.TaxSellerDetailsRequest sellerDetails,Map<String,Object>
customTaxAttributes)
```

Parameters

addresses

Type: HeaderTaxAddressesRequest

Tax addresses, such as Ship To and Bill From.

currencyIsoCode

Type: String

Three-letter ISO 4217 currency code associated with the `TaxTransactionRequest`.

customerDetails

Type: TaxCustomerDetailsRequest

Customer information used in tax calculation.

description

Type: String

Optional user-defined description for providing more information about the tax transaction request.

documentCode

Type: String

Code for documents that are used to provide more information in the tax calculation process.

referenceDocumentCode

Type: String

Identifier that combines the original invoice ID, previous tax transaction type, and tax engine ID, used in tax calculations for negative invoice lines. For example, a referenceDocumentCode parameter value `3ttxx00000004Bh_Debit-4wAxx0000000001EAA` indicates `3ttxx00000004Bh` is the original invoice ID and `4wAxx0000000001EAA` is the tax engine ID.

transactionDate

Type: Datetime

The date that the tax transaction occurred.

`effectiveDate`

Type: Datetime

The date that the tax transaction takes effect. User-defined and used only for reporting purposes.

`lineItems`

Type: List<TaxLineItemRequest>

A list of line items on which tax is calculated.

`referenceEntityId`

Type: String

ID of an object related to the line items sent for tax calculation.

`sellerDetails`

Type: TaxSellerDetailsRequest

Contains tax code information used in a tax calculation request.

`customTaxAttributes`

Type: Map<String, Object>

Customised tax contract to include additional attributes at the header level.

TaxTransactionRequest Properties

Learn more about the available properties with the `TaxTransactionRequest` class.

The `TaxTransactionRequest` class includes these properties.

addresses

A list of addresses (such as Ship To and Sold To) used as part of the tax transaction.

currencyIsoCode

Three-letter ISO 4217 currency code associated with the `TaxTransactionRequest`.

customerDetails

Customer information used in tax calculation.

customTaxAttributes

Customised tax contract to include additional attributes at the header level.

description

Optional user-defined description for providing more information about the tax transaction request.

documentCode

Code for documents used to provide more information in the tax calculation process.

effectiveDate

The date that the tax transaction takes effect. User-defined and used only for reporting purposes.

lineItems

A list of line items on which tax will be calculated.

referenceDocumentCode

Identifier that combines the original invoice ID, previous tax transaction type, and tax engine ID, used in tax calculations for negative invoice lines.

referenceEntityId

ID of an object related to the line items sent for tax calculation.

sellerDetails

Contains tax code information used in a tax calculation request.

transactionDate

The date that the tax transaction occurred.

addresses

A list of addresses (such as Ship To and Sold To) used as part of the tax transaction.

Signature

```
global commercetax.HeaderTaxAddressesRequest addresses {get; set;}
```

Property Value

Type: HeaderTaxAddressesRequest

currencyIsoCode

Three-letter ISO 4217 currency code associated with the `TaxTransactionRequest`.

Signature

```
global String currencyIsoCode {get; set;}
```

Property Value

Type: String

customerDetails

Customer information used in tax calculation.

Signature

```
global CommerceTax.TaxCustomerDetailsRequest customerDetails {get; set;}
```

Property Value

Type: TaxCustomerDetailsRequest

customTaxAttributes

Customised tax contract to include additional attributes at the header level.

Signature

```
global commercetax.TaxTransactionRequest customTaxAttributes {get; set;}
```

Property Value

Type: Map<String, Object>

description

Optional user-defined description for providing more information about the tax transaction request.

Signature

```
global String description {get; set;}
```

Property Value

Type: String

documentCode

Code for documents used to provide more information in the tax calculation process.

Signature

```
global String documentCode {get; set;}
```

Property Value

Type: String

effectiveDate

The date that the tax transaction takes effect. User-defined and used only for reporting purposes.

Signature

```
global Datetime effectiveDate {get; set;}
```

Property Value

Type: Datetime

lineItems

A list of line items on which tax will be calculated.

Signature

```
global List<CommerceTax.TaxLineItemRequest> lineItems {get; set;}
```

Property Value

Type: List<TaxLineItemRequest>

referenceDocumentCode

Identifier that combines the original invoice ID, previous tax transaction type, and tax engine ID, used in tax calculations for negative invoice lines.

For example, a referenceDocumentCode parameter value `3ttxx00000004Bh_Debit-4wAxx0000000001EAA` indicates `3ttxx00000004Bh` is the original invoice ID and `4wAxx0000000001EAA` is the tax engine ID.

Signature

```
global String referenceDocumentCode {get; set;}
```

Property Value

Type: String

referenceEntityId

ID of an object related to the line items sent for tax calculation.

Signature

```
global String referenceEntityId {get; set;}
```

Property Value

Type: String

sellerDetails

Contains tax code information used in a tax calculation request.

Signature

```
global commercetax.TaxSellerDetailsRequest sellerDetails {get; set;}
```

Property Value

Type: TaxSellerDetailsRequest

transactionDate

The date that the tax transaction occurred.

Signature

```
global Datetime transactionDate {get; set;}
```

Property Value

Type: Datetime

TaxTransactionRequest Methods

The following are methods for `TaxTransactionRequest`.

- equals(obj)
  Maintains the integrity of lists of type `TaxTransactionRequest` by determining the equality of external objects in a list. This method is dynamic and based on the `equals()` method in Java.
- hashCode()
  Maintains the integrity of lists of type `TaxTransactionRequest` by determining the uniqueness of the external object records in a list.
- toString()
  Converts a value to a string.

`equals(obj)`

Maintains the integrity of lists of type `TaxTransactionRequest` by determining the equality of external objects in a list. This method is dynamic and based on the `equals()` method in Java.

Signature

```
global Boolean equals(Object obj)
```

Parameters

obj
Type: Object

Return Value

Type: Boolean

`hashCode()`

Maintains the integrity of lists of type `TaxTransactionRequest` by determining the uniqueness of the external object records in a list.

Signature

```
global Integer hashCode()
```

Return Value

Type: Integer

`toString()`

Converts a value to a string.

Signature

```
global String toString()
```

Return Value

Type: String

TaxTransactionStatus Enum

Shows whether the tax transaction has been committed or uncommitted.

Usage

Used by the CalculateTaxResponse class method.

Enum Values

The `commercetax.TaxTransactionStatus` enum includes these values.

Value	Description
`Committed`	Tax has been calculated and committed.
`Uncommitted`	Tax has been calculated but hasn't been committed.

TaxTransactionType Enum

Shows whether the tax transaction is for a credit or debit transaction.

Usage

Used by the CalculateTaxResponse and CalculateTaxRequest class methods.

Enum Values

The `commercetax.TaxTransactionType` enum includes these values.

Value	Description
`Credit`	Represents a credit transaction.
`Debit`	Represents a debit transaction.
`Void`	Specifies that the tax engine has voided the document that's mentioned in the `referenceDocumentCode` property value.

PlaceQuote Namespace

The `PlaceQuote` namespace provides classes and methods to create or update quotes with pricing preferences and configuration options.

Note: This namespace has been deprecated as of API version 63.0. In API version 63.0 and later, use the new RevSalesTrxn namespace.

The `PlaceQuote` namespace includes these classes.

CatalogRatesPreferenceEnum Enum
Specifies the rate card entries defined in the catalog that must be fetched for quote line items, with usage-based selling during the quote creation process.

ConfigurationInputEnum Enum
Specifies the configuration input for the request to place a quote.

ConfigurationOptionsInput Class
Contains methods and properties to set the configuration options for the input to the product configurator.

GraphRequest Class
Contains constructors and properties to set the graph ID and a list of records to be ingested. The list of records is specified in a key-value map format that contains the field values of an order.

PlaceQuoteException Class
Contains methods to hold the exception details for the place quote request.

PlaceQuoteResponse Class
Contains properties to hold the response to the place quote request.

PlaceQuoteRLMApexProcessor Class
Contains methods to place a quote with details of the graph request, pricing preferences, and configuration options.

PricingPreferenceEnum Enum
Specifies the pricing preference during the create quote process.

RecordResource Class
Contains constructors and properties to create a record object from the field values of a quote.

RecordWithReferenceRequest Class
Contains constructors and properties to associate a record object with a reference identifier.

CatalogRatesPreferenceEnum Enum

Specifies the rate card entries defined in the catalog that must be fetched for quote line items, with usage-based selling during the quote creation process.

Usage

This enum is available when the Usage-Based Selling feature is enabled.

Enum Values

The `placequote.CatalogRatesPreferenceEnum` enum includes these values.

Value	Description
`Fetch`	Retrieves the rate card entries defined in the catalog for quote line items during the quote creation process.

Value	Description
`Skip`	Skips the retrieval of rate card entries for quote line items during the quote creation process. The default value is `Skip`.

ConfigurationInputEnum Enum

Specifies the configuration input for the request to place a quote.

Usage

Use these enum values for the `configurationInputEnum` property in the PlaceQuoteRLMApexProcessor class.

Enum Values

The `placequote.ConfigurationInputEnum` enum has these values.

Value	Description
`RunAndAllowErrors`	Run the configuration and proceed with order ingestion upon encountering any configuration errors.
`RunAndBlockErrors`	Run the configuration and block order ingestion upon encountering any configuration errors.
`Skip`	Skip the configuration execution.

ConfigurationOptionsInput Class

Contains methods and properties to set the configuration options for the input to the product configurator.

Namespace

PlaceQuote

Usage

This class holds the required details of the product configuration input. Set the class properties to enable default configuration, execution of configuration rules, and validation of the product catalog. Use these class properties as an input to the PlaceQuoteRLMApexProcessor class method.

Example

```
PlaceQuote.GraphRequest graph = new PlaceQuote.GraphRequest('test',listOfRecords);
    PlaceQuote.PricingPreferenceEnum pricingPreference =
PlaceQuote.PricingPreferenceEnum.System;
    PlaceQuote.ConfigurationInputEnum configurationPreference =
PlaceQuote.ConfigurationInputEnum.RunAndAllowErrors;
   PlaceQuote.ConfigurationOptionsInput cInput = new PlaceQuote.ConfigurationOptionsInput();
```

```
    cInput.addDefaultConfiguration = true;
    cInput.executeConfigurationRules = true;
    cInput.validateAmendRenewCancel = true;
    cInput.validateProductCatalog = true;
        //Place Quote Call
     PlaceQuote.PlaceQuoteResponse resp =
PlaceQuote.PlaceQuoteRLMApexProcessor.execute(pricingPreference,graph,configurationPreference,cInput);
```

ConfigurationOptionsInput Properties

Set the `ConfigurationOptionsInput` class properties to add default configuration, execute configuration rules, and validate the product catalog.

ConfigurationOptionsInput Methods

Learn more about the methods available with the `ConfigurationOptionsInput` class.

ConfigurationOptionsInput Properties

Set the `ConfigurationOptionsInput` class properties to add default configuration, execute configuration rules, and validate the product catalog.

The `ConfigurationOptionsInput` class includes these properties.

addDefaultConfiguration

Sets the default product configuration, such as bundle and product attributes, for a quote request.

executeConfigurationRules

Sets the requirement for a quote to adhere to the configuration rules.

validateAmendRenewCancel

Sets the requirement to run validations related to amend, renew, or cancel processes.

validateProductCatalog

Sets the requirement to validate a quote against the product catalog.

`addDefaultConfiguration`

Sets the default product configuration, such as bundle and product attributes, for a quote request.

Signature

`public Boolean addDefaultConfiguration {get; set;}`

Property Value

Type: Boolean

Indicates whether to automatically add default configuration to the order (`true`) or not (`false`).

`executeConfigurationRules`

Sets the requirement for a quote to adhere to the configuration rules.

Signature

```
public Boolean executeConfigurationRules {get; set;}
```

Property Value

Type: Boolean

Indicates whether the order must adhere to configuration rules during processing (`true`) or bypass them (`false`).

`validateAmendRenewCancel`

Sets the requirement to run validations related to amend, renew, or cancel processes.

Signature

```
public Boolean validateAmendRenewCancel {get; set;}
```

Property Value

Type: Boolean

Indicates whether to run validations related to amend, renew, or cancel processes (`true`) or not (`false`).

`validateProductCatalog`

Sets the requirement to validate a quote against the product catalog.

Signature

```
public Boolean validateProductCatalog {get; set;}
```

Property Value

Type: Boolean

Indicates whether the quote must be validated against the product catalog (`true`) or not (`false`).

ConfigurationOptionsInput Methods

Learn more about the methods available with the `ConfigurationOptionsInput` class.

The `ConfigurationOptionsInput` class includes these methods.

- equals(obj)
  Determines the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.
- hashCode()
  Determines the uniqueness of the external object records in a list.
- toString()
  Converts a value to a string.

equals(obj)

Determines the equality of external objects in a list. This method is dynamic and is based on the `equals()` method in Java.

Signature

`public Boolean equals(Object obj)`

Parameters

obj
Type: Object

Reference object that's used to compare with the class object.

Return Value

Type: Boolean

Indicates if the class object is same as the reference object (`true`) or not (`false`).

hashCode()

Determines the uniqueness of the external object records in a list.

Signature

`public Integer hashCode()`

Return Value

Type: Integer

Integer hash code that represents the value of the object. Equal objects as per the `equals()` method must return the same hash code.

toString()

Converts a value to a string.

Signature

`public String toString()`

Return Value

Type: String

GraphRequest Class

Contains constructors and properties to set the graph ID and a list of records to be ingested. The list of records is specified in a key-value map format that contains the field values of an order.

Namespace

PlaceQuote

Example

Invoke the Place Quote Apex API by using these steps.

- Set up a quote and quote line item. To associate the Record object with a reference identifier, create an instance of the `RecordWithReferenceRequest` class.

```
         //Quote Setup
    PlaceQuote.RecordResource quoteRecord = new
PlaceQuote.RecordResource(Quote.getSobjectType(),'POST');
    Map<String,Object> quoteFieldValues = new Map<String,Object>();
    quoteFieldValues.put('Name','q-ap12');
    quoteFieldValues.put('OpportunityId','006xx000001aBFcAAM');
    quoteFieldValues.put('Pricebook2Id','01sxx0000005pvRAAQ');
    quoteRecord.fieldValues = quoteFieldValues;

           //Quote Line Item Setup
    PlaceQuote.RecordResource quoteLineItemRecord1 = new
PlaceQuote.RecordResource(QuoteLineItem.getSobjectType(),'POST');
    Map<String,Object> quoteLineItemFieldValues = new Map<String,Object>();
    quoteLineItemFieldValues.put('Product2Id','01txx0000006ibwAAA');
    quoteLineItemFieldValues.put('PricebookEntryId','01uxx0000008zPqAAI');
    quoteLineItemFieldValues.put('Quantity','2.0');
    quoteLineItemFieldValues.put('UnitPrice','5.0');
    quoteLineItemFieldValues.put('StartDate','2023-03-15');
    quoteLineItemFieldValues.put('QuoteId','@{refQuote.id}');
    quoteLineItemRecord1.fieldValues = quoteLineItemFieldValues;
    PlaceQuote.RecordWithReferenceRequest quoteItemRecords = new
PlaceQuote.RecordWithReferenceRequest('refQuote',quoteRecord);
    PlaceQuote.RecordWithReferenceRequest quoteLineItemRecords1 = new
PlaceQuote.RecordWithReferenceRequest('refQuoteItem1',quoteLineItemRecord1);
```

- To create a quote line relationship, create an instance of the `RecordResource` class.

```
PlaceQuote.RecordResource quoteLineRelationship1 = new
PlaceQuote.RecordResource(QuoteLineRelationship.getSobjectType(),'POST');
    Map<String,Object> quoteLineRelationshipValues = new Map<String,Object>();
    quoteLineRelationshipValues.put('ProductRelationshipTypeId','0yoxx00000000JNAAY');
    quoteLineRelationshipValues.put('MainQuoteLineId','@{refQuoteItem2.id}');
    quoteLineRelationshipValues.put('AssociatedQuoteLineId','@{refQuoteItem1.id}');
   quoteLineRelationshipValues.put('AssociatedQuoteLinePricing','IncludedInBundlePrice');

    quoteLineRelationship1.fieldValues = quoteLineRelationshipValues;
```

- Create the list of records to be ingested.

```
    PlaceQuote.RecordWithReferenceRequest quoteLineRelationship = new
PlaceQuote.RecordWithReferenceRequest('QuoteLineRelationship',quoteLineRelationship1);
    List<PlaceQuote.RecordWithReferenceRequest> listOfRecords = new
```

```
List<PlaceQuote.RecordWithReferenceRequest>();
    listOfRecords.add(quoteItemRecords);
    listOfRecords.add(quoteLineItemRecords1);
    listOfRecords.add(quoteLineItemRecords2);
    listOfRecords.add(quoteLineRelationship);
```

- To contain all record objects, create an instance of the `GraphRequest` class.

  Note: The `CatalogRatesPreferenceEnum` enum is available when the Usage-Based Selling feature is enabled.

```
    PlaceQuote.GraphRequest graph = new PlaceQuote.GraphRequest('test',listOfRecords);
    PlaceQuote.ConfigurationOptionsInput cInput = new
PlaceQuote.ConfigurationOptionsInput();
    PlaceQuote.CatalogRatesPreferenceEnum catalogRatesPreference =
PlaceQuote.CatalogRatesPreferenceEnum.Fetch;
....PlaceQuote.ConfigurationInputEnum configurationPreference =
PlaceQuote.ConfigurationInputEnum.RunAndAllowErrors;
    PlaceQuote.PricingPreferenceEnum pricingPreference =
PlaceQuote.PricingPreferenceEnum.System;
    //System.debug(graph);

    //Place Quote Call
    PlaceQuote.PlaceQuoteResponse resp =
PlaceQuote.PlaceQuoteRLMApexProcessor.execute(pricingPreference, catalogRatesPreference,
 graph, configurationPreference, cInput);
    System.debug(resp);
```

GraphRequest Constructors
Learn more about the available constructors with the `GraphRequest` class.

GraphRequest Properties

GraphRequest Constructors

Learn more about the available constructors with the `GraphRequest` class.

The `GraphRequest` class includes these constructors.

GraphRequest(graphId, records)
Creates an instance of the `GraphRequest` class to assign the graph ID and a list of records to be ingested.

`GraphRequest(graphId, records)`

Creates an instance of the `GraphRequest` class to assign the graph ID and a list of records to be ingested.

Signature

`public GraphRequest(String graphId, List<placequote.RecordWithReferenceRequest> records)`

Parameters

graphId
Type: String

ID of the graph.

records
Type: List<placequote.RecordWithReferenceRequest on page 1693>

List of records to be ingested.

GraphRequest Properties

The following are properties for `GraphRequest`.

graphId
Set the `graphId` property to assign the ID value of the graph.

`graphId`

Set the `graphId` property to assign the ID value of the graph.

Signature

`public String graphId {get; set;}`

Property Value

Type: String

PlaceQuoteException Class

Contains methods to hold the exception details for the place quote request.

Namespace

PlaceQuote

PlaceQuoteException Methods
Learn more about the methods available with the `PlaceQuoteException` class.

PlaceQuoteException Methods

Learn more about the methods available with the `PlaceQuoteException` class.

The `PlaceQuoteException` class includes these methods.

getErrorCode()
Gets the error code that's associated to the place quote request.

getErrorCode()

Gets the error code that's associated to the place quote request.

Signature

`public String getErrorCode()`

Return Value

Type: String

PlaceQuoteResponse Class

Contains properties to hold the response to the place quote request.

Namespace

PlaceQuote

Example

```
PlaceQuote.PlaceQuoteResponse resp =
PlaceQuote.PlaceQuoteExecutor.execute(internalEnum,graph);
```

PlaceQuoteResponse Properties
Learn more about the available properties with the `PlaceQuoteResponse` class.

PlaceQuoteResponse Properties

Learn more about the available properties with the `PlaceQuoteResponse` class.

The `PlaceQuoteResponse` class includes these properties.

quoteId
Get the ID of the quote that's created after a successful request.

requestIdentifier
Get the request ID of the process to query the asynchronous status of the Place Quote Apex API.

responseError
Get the list of errors encountered during the synchronous processing of the API request.

statusURL
Get the asynchronous status URL of the request, if available.

success
Get the request status of the synchronous part of the processing.

quoteId

Get the ID of the quote that's created after a successful request.

Signature

```
public String quoteId {get; set;}
```

Property Value

Type: String

`requestIdentifier`

Get the request ID of the process to query the asynchronous status of the Place Quote Apex API.

Signature

```
public String requestIdentifier {get; set;}
```

Property Value

Type: String

`responseError`

Get the list of errors encountered during the synchronous processing of the API request.

Signature

```
public List<ConnectApi.PlaceQuoteErrorResponse> responseError {get; set;}
```

Property Value

Type: List<ConnectApi.PlaceQuoteErrorResponse>

`statusURL`

Get the asynchronous status URL of the request, if available.

Signature

```
public String statusURL {get; set;}
```

Property Value

Type: String

`success`

Get the request status of the synchronous part of the processing.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

Indicates whether the synchronous part of the processing is successful (`true`) or not (`false`).

PlaceQuoteRLMApexProcessor Class

Contains methods to place a quote with details of the graph request, pricing preferences, and configuration options.

Namespace

PlaceQuote

PlaceQuoteRLMApexProcessor Methods
Learn more about the methods available with the `PlaceQuoteRLMApexProcessor` class.

PlaceQuoteRLMApexProcessor Example Implementation
To place a quote from Apex, refer to the example implementation of the `PlaceQuoteRLMApexProcessor` class.

PlaceQuoteRLMApexProcessor Methods

Learn more about the methods available with the `PlaceQuoteRLMApexProcessor` class.

The `PlaceQuoteRLMApexProcessor` class includes these methods.

execute(pricingPreferenceEnum, graphRequest, configurationInputEnum, configurationOptionsInput)
Use the method in the `PlaceQuoteExecutor` class to execute the Place Quote Apex API request by assigning the properties for graph request, pricing references, and configuration options.

execute(pricingPreferenceEnum, catalogRatesPreference, graphRequest, configurationInputEnum, configurationOptionsInput)
Use the method in the `PlaceQuoteExecutor` class to execute the Place Quote Apex API request by assigning the properties for graph request, pricing references, and configuration options. This method also includes the property to define fetching of rate card entries.

execute(pricingPreferenceEnum, graphRequest, configurationInputEnum, configurationOptionsInput)

Use the method in the `PlaceQuoteExecutor` class to execute the Place Quote Apex API request by assigning the properties for graph request, pricing references, and configuration options.

Signature

```
public static placequote.PlaceQuoteResponse execute(placequote.PricingPreferenceEnum
pricingPreferenceEnum, placequote.GraphRequest graphRequest,
placequote.ConfigurationInputEnum configurationInputEnum,
placequote.ConfigurationOptionsInput configurationOptionsInput)
```

Parameters

pricingPreferenceEnum
Type: placequote.PricingPreferenceEnum

Pricing preference during the quote process.

graphRequest
Type: placequote.GraphRequest

The sObject graph values of the quote payload to be ingested.

configurationInputEnum
Type: placequote.ConfigurationInputEnum

Configuration input for the quote process.

configurationOptionsInput
Type: placequote.ConfigurationOptionsInput

Configuration options during the ingestion process.

Return Value

Type: placequote.PlaceQuoteResponse

execute(pricingPreferenceEnum, catalogRatesPreference, graphRequest, configurationInputEnum, configurationOptionsInput)

Use the method in the `PlaceQuoteExecutor` class to execute the Place Quote Apex API request by assigning the properties for graph request, pricing references, and configuration options. This method also includes the property to define fetching of rate card entries.

Signature

```
public static placequote.PlaceQuoteResponse execute(placequote.PricingPreferenceEnum
pricingPreferenceEnum, placequote.CatalogRatesPreferenceEnum catalogRatesPreference,
placequote.GraphRequest graphRequest, placequote.ConfigurationInputEnum
configurationInputEnum, placequote.ConfigurationOptionsInput configurationOptionsInput)
```

Parameters

pricingPreferenceEnum
Type: placequote.PricingPreferenceEnum

Pricing preference during the quote process.

catalogRatesPreference
Type: placequote.CatalogRatesPreferenceEnum

The rate card entries defined in the catalog that must be fetched for quote line items, with usage-based pricing during the quote creation process. The `CatalogRatesPreferenceEnum` enum is available when the Usage-Based Selling feature is enabled.

graphRequest
Type: placequote.GraphRequest

The sObject graph values of the quote payload to be ingested.

configurationInputEnum
Type: placequote.ConfigurationInputEnum

Configuration input for the quote process.

configurationOptionsInput
Type: placequote.ConfigurationOptionsInput

Configuration options during the ingestion process.

Return Value

Type: placequote.PlaceQuoteResponse

PlaceQuoteRLMApexProcessor Example Implementation

To place a quote from Apex, refer to the example implementation of the `PlaceQuoteRLMApexProcessor` class.

Namespace

PlaceQuote

Usage

Customize this example to suit your requirements. Create the list of records to be ingested by using these steps. Replace the respective IDs with the values that are present in your org. For example, replace the value of `${Pricebook2Id}` field with the price book ID that's present in the org.

Example:

- Set up a quote and quote line item. To associate the Record object with a reference identifier, create an instance of the `RecordWithReferenceRequest` class.

```
        //Quote Setup
    PlaceQuote.RecordResource quoteRecord = new
PlaceQuote.RecordResource(Quote.getSobjectType(),'POST');
    Map<String,Object> quoteFieldValues = new Map<String,Object>();
    quoteFieldValues.put('Name','q-ap12');
    quoteFieldValues.put('OpportunityId','006xx000001aBFcAAM');
    quoteFieldValues.put('Pricebook2Id','01sxx0000005pvRAAQ');
    quoteRecord.fieldValues = quoteFieldValues;

          //Quote Line Item Setup
    PlaceQuote.RecordResource quoteLineItemRecord1 = new
PlaceQuote.RecordResource(QuoteLineItem.getSobjectType(),'POST');
    Map<String,Object> quoteLineItemFieldValues = new Map<String,Object>();
    quoteLineItemFieldValues.put('Product2Id','01txx0000006ibwAAA');
    quoteLineItemFieldValues.put('PricebookEntryId','01uxx0000008zPqAAI');
    quoteLineItemFieldValues.put('Quantity','2.0');
    quoteLineItemFieldValues.put('UnitPrice','5.0');
    quoteLineItemFieldValues.put('StartDate','2023-03-15');
    quoteLineItemFieldValues.put('QuoteId','@{refQuote.id}');
    quoteLineItemRecord1.fieldValues = quoteLineItemFieldValues;
    PlaceQuote.RecordWithReferenceRequest quoteItemRecords = new
```

```
PlaceQuote.RecordWithReferenceRequest('refQuote',quoteRecord);
    PlaceQuote.RecordWithReferenceRequest quoteLineItemRecords1 = new
PlaceQuote.RecordWithReferenceRequest('refQuoteItem1',quoteLineItemRecord1);
```

- To create a quote line relationship, create an instance of the `RecordResource` class.

```
PlaceQuote.RecordResource quoteLineRelationship1 = new
PlaceQuote.RecordResource(QuoteLineRelationship.getSobjectType(),'POST');
    Map<String,Object> quoteLineRelationshipValues = new Map<String,Object>();
   quoteLineRelationshipValues.put('ProductRelationshipTypeId','0yoxx00000000JNAAY');

    quoteLineRelationshipValues.put('MainQuoteLineId','@{refQuoteItem2.id}');
   quoteLineRelationshipValues.put('AssociatedQuoteLineId','@{refQuoteItem1.id}');

quoteLineRelationshipValues.put('AssociatedQuoteLinePricing','IncludedInBundlePrice');

    quoteLineRelationship1.fieldValues = quoteLineRelationshipValues;
```

- Create the list of records to be ingested.

```

    PlaceQuote.RecordWithReferenceRequest quoteLineRelationship = new
PlaceQuote.RecordWithReferenceRequest('QuoteLineRelationship',quoteLineRelationship1);

    List<PlaceQuote.RecordWithReferenceRequest> listOfRecords = new
List<PlaceQuote.RecordWithReferenceRequest>();
    listOfRecords.add(quoteItemRecords);
    listOfRecords.add(quoteLineItemRecords1);
    listOfRecords.add(quoteLineItemRecords2);
    listOfRecords.add(quoteLineRelationship);
```

- To contain all record objects, create an instance of the `GraphRequest` class.

  Note: The `CatalogRatesPreferenceEnum` enum is available when the Usage-Based Selling feature is enabled.

```

   PlaceQuote.GraphRequest graph = new PlaceQuote.GraphRequest('test',listOfRecords);

    PlaceQuote.ConfigurationOptionsInput cInput = new
PlaceQuote.ConfigurationOptionsInput();
    PlaceQuote.CatalogRatesPreferenceEnum catalogRatesPreference =
PlaceQuote.CatalogRatesPreferenceEnum.Fetch;
....PlaceQuote.ConfigurationInputEnum configurationPreference =
PlaceQuote.ConfigurationInputEnum.RunAndAllowErrors;
    PlaceQuote.PricingPreferenceEnum pricingPreference =
PlaceQuote.PricingPreferenceEnum.System;
    //System.debug(graph);

    //Place Quote Call
    PlaceQuote.PlaceQuoteResponse resp =
PlaceQuote.PlaceQuoteRLMApexProcessor.execute(pricingPreference,
catalogRatesPreference, graph, configurationPreference, cInput);
    System.debug(resp);
```

PricingPreferenceEnum Enum

Specifies the pricing preference during the create quote process.

Usage

Used by the PlaceQuoteRLMApexProcessor class.

Enum Values

The `placequote.PricingPreferenceEnum` enum class includes these values.

Value	Description
`Force`	Enforce pricing during the quote ingestion process.
`Skip`	Skip pricing during the quote ingestion process.
`System`	Determine whether a pricing calculation is required.

RecordResource Class

Contains constructors and properties to create a record object from the field values of a quote.

Namespace

PlaceQuote

Example

```
PlaceQuote.RecordResource quoteLineRelationship1 = new
PlaceQuote.RecordResource(QuoteLineRelationship.getSobjectType(),'POST');
```

See PlaceQuoteRLMApexProcessor to refer to an example implementation.

RecordResource Constructors
Learn more about the available constructors with the `RecordResource` class.

RecordResource Properties
Learn more about the available properties with the `RecordResource` class.

RecordResource Constructors

Learn more about the available constructors with the `RecordResource` class.

The `RecordResource` class includes these constructors.

RecordResource(type, method, id)
Creates an instance of the `RecordResource` class to assign values to the fields of a quote item by using the sObject type, API method, and quote ID properties.

RecordResource(type, method)

Creates an instance of the `RecordResource` class to assign the values to the fields of a quote item by using the sObject type and API method properties.

`RecordResource(type, method, id)`

Creates an instance of the `RecordResource` class to assign values to the fields of a quote item by using the sObject type, API method, and quote ID properties.

Signature

`public RecordResource(Schema.SObjectType type, String method, Id id)`

Parameters

type
Type: Schema.SObjectType

Object that's returned from the field describe result using the `getReferenceTo()` method or from the sObject describe result using the `getSObjectType()` method.

method
Type: String

Method for the API request, such as POST or PATCH.

id
Type: Id

ID of the quote.

`RecordResource(type, method)`

Creates an instance of the `RecordResource` class to assign the values to the fields of a quote item by using the sObject type and API method properties.

Signature

`public RecordResource(Schema.SObjectType type, String method)`

Parameters

type
Type: Schema.SObjectType

Object that's returned from the field describe result using the `getReferenceTo()` method or from the sObject describe result using the `getSObjectType()` method.

method
Type: String

Method for the API request, such as POST or PATCH.

RecordResource Properties

Learn more about the available properties with the `RecordResource` class.

The `RecordResource` class includes these properties.

fieldValues
Set the `fieldValues` property to assign values to the fields to update the quote record.

id
Set the `id` property to assign the ID of the quote record.

method
Set the `method` property to specify the API request method, such as POST or PATCH.

type
Set the type property to assign the object type that's returned from the field describe result by using the `getReferenceTo()` method or from the sObject describe result by using the `getSObjectType()` method.

`fieldValues`

Set the `fieldValues` property to assign values to the fields to update the quote record.

Signature

```
public Map<String,ANY> fieldValues {get; set;}
```

Property Value

Type: List <Map<String,ANY>>

`id`

Set the `id` property to assign the ID of the quote record.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

`method`

Set the `method` property to specify the API request method, such as POST or PATCH.

Signature

```
public String method {get; set;}
```

Property Value

Type: String

type

Set the type property to assign the object type that's returned from the field describe result by using the `getReferenceTo()` method or from the sObject describe result by using the `getSObjectType()` method.

Signature

`public Schema.SObjectType type {get; set;}`

Property Value

Type: Schema.SObjectType

RecordWithReferenceRequest Class

Contains constructors and properties to associate a record object with a reference identifier.

Namespace

PlaceQuote

Example

```
PlaceQuote.RecordWithReferenceRequest quoteLineRelationship = new
PlaceQuote.RecordWithReferenceRequest('QuoteLineRelationship',quoteLineRelationship1);
```

See PlaceQuoteRLMApexProcessor to refer to an example implementation.

RecordWithReferenceRequest Constructors

Learn more about the available constructors with the `RecordWithReferenceRequest` class.

RecordWithReferenceRequest Properties

Learn more about the available properties with the `RecordWithReferenceRequest` class.

RecordWithReferenceRequest Constructors

Learn more about the available constructors with the `RecordWithReferenceRequest` class.

The `RecordWithReferenceRequest` class includes these constructors.

RecordWithReferenceRequest(referenceId, record)

Creates an instance of the `RecordWithReferenceRequest` class to associate a record object with a reference identifier by using the `referenceId` and `record` object properties.

`RecordWithReferenceRequest(referenceId, record)`

Creates an instance of the `RecordWithReferenceRequest` class to associate a record object with a reference identifier by using the `referenceId` and `record` object properties.

Signature

`public RecordWithReferenceRequest(String referenceId, placequote.RecordResource record)`

Parameters

`referenceId`
Type: String

Reference ID that maps to the subrequest response and can be used to reference the response in subsequent subrequests. You can reference the referenceId in either the body or URL of a subrequest. Use this syntax to include a reference: @{referenceId.FieldName}. See referenceId property of a composite subrequest.

`record`
Type: placequote.RecordResource

Record object that's defined using the `RecordResource` class.

RecordWithReferenceRequest Properties

Learn more about the available properties with the `RecordWithReferenceRequest` class.

The `RecordWithReferenceRequest` class includes these properties.

record
Set the `record` property to specify the record object that's defined by using the `RecordResource` class.

referenceId
Set the `referenceId` property to specify the reference ID that maps to the subrequest response. This reference ID can be used to reference the response in subsequent subrequests.

`record`

Set the `record` property to specify the record object that's defined by using the `RecordResource` class.

Signature

`public placequote.RecordResource record {get; set;}`

Property Value

Type: placequote.RecordResource

`referenceId`

Set the `referenceId` property to specify the reference ID that maps to the subrequest response. This reference ID can be used to reference the response in subsequent subrequests.

Signature

```
public String referenceId {get; set;}
```

Property Value

Type: String

renew_assets_summary Namespace

Retrieve details about renewable assets to create renewal opportunities.

The `renew_assets_summary` namespace includes these classes.

RenewalOpptyDetail Class

Contains asset details and renewal pricing information for creating renewal opportunities.

Namespace

renew_assets_summary on page 1695

RenewalOpptyDetail Constructors

Learn more about the constructors available with the RenewalOpptyDetail class.

The `RenewalOpptyDetail` class includes these constructors.

RenewalOpptyDetail(assetId, startDate, endDate, productId, account, priceBookId, priceBookEntryId, lastAssetActionSubtype, renewalPriceDetails, opportunityProductId, orderItem, rootAssetOpportunity, lastAssetAction, totalLineAmount)

Initializes the RenewalOpptyDetail class that contains asset details and renewal pricing information.

Signature

```
public RenewalOpptyDetail(String assetId, Date startDate, Date endDate, String productId,
String account, String priceBookId, String priceBookEntryId, String
lastAssetActionSubtype, List<renew_assets_summary.RenewalPriceDetail>
renewalPriceDetails, String opportunityProductId, String orderItem, String
rootAssetOpportunity, String lastAssetAction, Decimal totalLineAmount)
```

```
renew_assets_summary.RenewalOpptyDetail, newinstance, [String, Date, Date, String, String,
 String, String, String, List<renew_assets_summary.RenewalPriceDetail>, String, String,
String, String, Decimal], renew_assets_summary.RenewalOpptyDetail
```

Parameters

assetId

Type: String

The ID of the asset.

startDate

Type: Date

The start date of the asset.

endDate

Type: Date

The end date of the asset.

productId

Type: String

The ID of the product associated with the asset.

account

Type: String

The ID of the account.

priceBookId

Type: String

The ID of the price book.

priceBookEntryId

Type: String

The ID of the price book entry.

lastAssetActionSubtype

Type: String

The subtype of the last action performed on the asset. Valid value is `Start Date Adjustment`.

renewalPriceDetails

Type: List<renew_assets_summary.RenewalPriceDetail on page 1702 >

List of renewal price details for the asset.

opportunityProductId

Type: String

The ID of the associated opportunity product.

orderItem

Type: String

The ID of the associated order item.

rootAssetOpportunity

Type: String

The ID of the root asset opportunity.

lastAssetAction

Type: String

The last action performed on the asset.

- `Initial Sale`
- `Upsell`
- `Downsell`
- `Renewal`
- `Cancellation`

totalLineAmount

Type: Decimal

The total line amount for the asset.

RenewalOpptyDetail Properties

Learn more about the properties available with the RenewalOpptyDetail class.

The `RenewalOpptyDetail` class includes these properties.

account

Get or set the ID of the account.

assetId

Get or set the ID of the asset.

endDate

Get or set the end date of the asset.

lastAssetAction

Get or set the last action performed on the asset.

lastAssetActionSubtype

Get or set the subtype of the last action performed on the asset.

opportunityProductId

Get or set the ID of the associated opportunity product.

orderItem

Get or set the ID of the associated order item.

priceBookEntryId

Get or set the ID of the price book entry.

priceBookId

Get or set the ID of the price book.

productId
Get or set the ID of the product associated with the asset.

renewalPriceDetails
Get or set the list of renewal price details for the asset.

rootAssetOpportunity
Get or set the ID of the root asset opportunity.

startDate
Get or set the start date of the asset.

totalLineAmount
Get or set the total line amount for the asset.

account

Get or set the ID of the account.

Signature

`public String account {get; set;}`

```
renew_assets_summary.RenewalOpptyDetail, account
```

Property Value

Type: String

assetId

Get or set the ID of the asset.

Signature

`public String assetId {get; set;}`

```
renew_assets_summary.RenewalOpptyDetail, assetId
```

Property Value

Type: String

endDate

Get or set the end date of the asset.

Signature

`public Date endDate {get; set;}`

```
renew_assets_summary.RenewalOpptyDetail, endDate
```

Property Value

Type: Date

lastAssetAction

Get or set the last action performed on the asset.

Signature

`public String lastAssetAction {get; set;}`

```
renew_assets_summary.RenewalOpptyDetail, lastAssetAction
```

Property Value

Type: String

Valid values are:

- `Initial Sale`
- `Upsell`
- `Downsell`
- `Renewal`
- `Cancellation`

lastAssetActionSubtype

Get or set the subtype of the last action performed on the asset.

Signature

`public String lastAssetActionSubtype {get; set;}`

```
renew_assets_summary.RenewalOpptyDetail, lastAssetActionSubtype
```

Property Value

Type: String

Valid value is `Start Date Adjustment`.

opportunityProductId

Get or set the ID of the associated opportunity product.

Signature

`public String opportunityProductId {get; set;}`

```
renew_assets_summary.RenewalOpptyDetail, opportunityProductId
```

Property Value

Type: String

orderItem

Get or set the ID of the associated order item.

Signature

`public String orderItem {get; set;}`

```
renew_assets_summary.RenewalOpptyDetail, orderItem
```

Property Value

Type: String

priceBookEntryId

Get or set the ID of the price book entry.

Signature

`public String priceBookEntryId {get; set;}`

```
renew_assets_summary.RenewalOpptyDetail, priceBookEntryId
```

Property Value

Type: String

priceBookId

Get or set the ID of the price book.

Signature

`public String priceBookId {get; set;}`

```
renew_assets_summary.RenewalOpptyDetail, priceBookId
```

Property Value

Type: String

productId

Get or set the ID of the product associated with the asset.

Signature

`public String productId {get; set;}`

```
renew_assets_summary.RenewalOpptyDetail, productId
```

Property Value

Type: String

renewalPriceDetails

Get or set the list of renewal price details for the asset.

Signature

`public List<renew_assets_summary.RenewalPriceDetail> renewalPriceDetails {get; set;}`

```
renew_assets_summary.RenewalOpptyDetail, renewalPriceDetails
```

Property Value

Type: List<renew_assets_summary.RenewalPriceDetail on page 1702 >

rootAssetOpportunity

Get or set the ID of the root asset opportunity.

Signature

`public String rootAssetOpportunity {get; set;}`

```
renew_assets_summary.RenewalOpptyDetail, rootAssetOpportunity
```

Property Value

Type: String

startDate

Get or set the start date of the asset.

Signature

`public Date startDate {get; set;}`

```
renew_assets_summary.RenewalOpptyDetail, startDate
```

Property Value

Type: Date

totalLineAmount

Get or set the total line amount for the asset.

Signature

`public Decimal totalLineAmount {get; set;}`

```
renew_assets_summary.RenewalOpptyDetail, totalLineAmount
```

Property Value

Type: Decimal

RenewalPriceDetail Class

Contains net unit price and quantity details for an asset to set as sales price for renewal opportunities.

Namespace

renew_assets_summary on page 1695

RenewalPriceDetail Constructors

Learn more about the constructors available with the RenewalPriceDetail class.

The `RenewalPriceDetail` class includes these constructors.

RenewalPriceDetail(netUnitPrice, quantity)

Initializes the RenewalPriceDetail class that contains net unit price and quantity information.

Signature

`public RenewalPriceDetail(Decimal netUnitPrice, Decimal quantity)`

```
renew_assets_summary.RenewalPriceDetail, newinstance, [Decimal, Decimal],
renew_assets_summary.RenewalPriceDetail
```

Parameters

netUnitPrice
Type: Decimal

The net unit price of the asset.

quantity
Type: Decimal

The quantity of the asset.

RenewalPriceDetail Properties

Learn more about the properties available with the RenewalPriceDetail class.

The `RenewalPriceDetail` class includes these properties.

[netUnitPrice](#)
Get or set the net unit price of the asset.

[quantity](#)
Get or set the quantity of the asset.

netUnitPrice

Get or set the net unit price of the asset.

Signature

`public Decimal netUnitPrice {get; set;}`

```
renew_assets_summary.RenewalPriceDetail, netUnitPrice
```

Property Value

Type: Decimal

quantity

Get or set the quantity of the asset.

Signature

`public Decimal quantity {get; set;}`

```
renew_assets_summary.RenewalPriceDetail, quantity
```

Property Value

Type: Decimal

RevSalesTrxn Namespace

Create a sales transaction, such as a quote or an order, with integrated pricing and configuration. Additionally, update an order or a quote, and insert and delete order or quote line items to calculate the estimated tax.

The `RevSalesTrxn` namespace includes these classes.

CatalogRatesPreferenceEnum Enum

Specifies the rate card entries defined in the catalog that must be fetched for quote line items, with usage-based selling during the place sales transaction process.

Usage

This enum is available when Usage Selling is enabled.

Enum Values

The `RevSalesTrxn.CatalogRatesPreferenceEnum` enum includes these values.

Value	Description
`Fetch`	Retrieves the rate card entries defined in the catalog for quote line items during the quote creation process.
`Skip`	Skips the retrieval of rate card entries for quote line items during the quote creation process. The default value is `Skip`.

ConfigurationExecutionEnum Enum

Specifies the configuration method for the place sales transaction request.

Usage

Use these enum values for the `configurationExecutionEnum` property in the PlaceSalesTransactionExecutor class.

Enum Values

The `RevSalesTrxn.ConfigurationExecutionEnum` enum has these values.

Value	Description
`Force`	Specifies to enforce the predefined configuration process during the sales transaction process.
`Skip`	Specifies to skip the configuration process during the quote creation process. The default value is `Skip`.
`System`	Specifies the system to determine whether the configuration process is required.

ConfigurationOptionsInput Class

Contains methods and properties to set the configuration options for the input to the product configurator.

Namespace

RevSalesTrxn

Usage

This class holds the required details of the product configuration input. Set the class properties to enable default configuration, execution of configuration rules, and validation of the product catalog. Use these class properties as an input to the PlaceSalesTransactionExecutor class method.

Example

```
        RevSalesTrxn.GraphRequest graph = new RevSalesTrxn.GraphRequest('test',
listOfRecords);
    RevSalesTrxn.PricingPreferenceEnum pricingPrefEnum =
RevSalesTrxn.PricingPreferenceEnum.SYSTEM;
    RevSalesTrxn.ConfigurationExecutionEnum configurationExecutionEnum =
RevSalesTrxn.ConfigurationExecutionEnum.SYSTEM;
    RevSalesTrxn.ConfigurationOptionsInput cInput = new
RevSalesTrxn.ConfigurationOptionsInput();
    cInput.addDefaultConfiguration = true;
    cInput.executeConfigurationRules = true;
    cInput.validateAmendRenewCancel = true;
    cInput.validateProductCatalog = true;
        //Place Sales Transaction API Call
     RevSalesTrxn.PlaceSalesTransactionResponse resp =
PlaceQuote.PlaceSalesTransactionExecutor.execute(graph,pricingPrefEnum,configurationExecutionEnum,cInput,null);
```

ConfigurationOptionsInput Properties

Set the ConfigurationOptionsInput class properties to add default configuration, execute configuration rules, and validate the product catalog.

ConfigurationOptionsInput Methods

Learn more about the methods available with the ConfigurationOptionsInput class.

ConfigurationOptionsInput Properties

Set the ConfigurationOptionsInput class properties to add default configuration, execute configuration rules, and validate the product catalog.

The `ConfigurationOptionsInput` class includes these properties.

addDefaultConfiguration

Sets the default product configuration, such as bundle and product attributes, for a quote request.

executeConfigurationRules

Sets the requirement for a quote to adhere to the configuration rules.

validateAmendRenewCancel

Sets the requirement to run validations related to amend, renew, or cancel processes.

validateProductCatalog

Sets the requirement to validate a quote against the product catalog.

addDefaultConfiguration

Sets the default product configuration, such as bundle and product attributes, for a quote request.

Signature

`public Boolean addDefaultConfiguration {get; set;}`

Property Value

Type: Boolean

Indicates whether to automatically add default configuration to the order (`true`) or not (`false`).

`executeConfigurationRules`

Sets the requirement for a quote to adhere to the configuration rules.

Signature

```
public Boolean executeConfigurationRules {get; set;}
```

Property Value

Type: Boolean

Indicates whether the order must adhere to configuration rules during processing (`true`) or bypass them (`false`).

`validateAmendRenewCancel`

Sets the requirement to run validations related to amend, renew, or cancel processes.

Signature

```
public Boolean validateAmendRenewCancel {get; set;}
```

Property Value

Type: Boolean

Indicates whether to run validations related to amend, renew, or cancel processes (`true`) or not (`false`).

`validateProductCatalog`

Sets the requirement to validate a quote against the product catalog.

Signature

```
public Boolean validateProductCatalog {get; set;}
```

Property Value

Type: Boolean

Indicates whether the quote must be validated against the product catalog (`true`) or not (`false`).

ConfigurationOptionsInput Methods

Learn more about the methods available with the ConfigurationOptionsInput class.

The `ConfigurationOptionsInput` class includes these methods.

[equals(obj)](#)
Determines the equality of external objects in a list. This method is dynamic and is based on the equals() method in Java.

[hashCode()](#)
Determines the uniqueness of the external object records in a list.

[toString()](#)
Converts a value to a string.

`equals(obj)`

Determines the equality of external objects in a list. This method is dynamic and is based on the equals() method in Java.

Signature

`public Boolean equals(Object obj)`

Parameters

obj
Type: Object

Reference object that's used to compare with the class object.

Return Value

Type: Boolean

Indicates if the class object is same as the reference object (`true`) or not (`false`).

`hashCode()`

Determines the uniqueness of the external object records in a list.

Signature

`public Integer hashCode()`

Return Value

Type: Integer

Integer hash code that represents the value of the object. Equal objects as per the `equals()` method must return the same hash code.

`toString()`

Converts a value to a string.

Signature

`public String toString()`

Return Value

Type: String

GraphRequest Class

Contains constructors and properties to set the graph ID and a list of records to be ingested. The list of records is specified in a key-value map format that contains field values.

Namespace

RevSalesTrxn

GraphRequest Constructors
Learn more about the available constructors with the GraphRequest class.

GraphRequest Properties
Learn more about the available properties with the GraphRequest class.

GraphRequest Constructors

Learn more about the available constructors with the GraphRequest class.

The `GraphRequest` class includes these constructors.

GraphRequest(graphId, records)
Creates an instance of the GraphRequest class to assign the graph ID and a list of records to be ingested.

`GraphRequest(graphId, records)`

Creates an instance of the GraphRequest class to assign the graph ID and a list of records to be ingested.

Signature

```
public GraphRequest(String graphId, List<RevSalesTrxn.RecordWithReferenceRequest>
records)
```

Parameters

`graphId`
Type: String

ID of the graph.

`records`
Type: List<revsalestrxn.RecordWithReferenceRequest on page 1731 >

List of records to be ingested.

GraphRequest Properties

Learn more about the available properties with the GraphRequest class.

The `GraphRequest` class includes these properties.

graphId
Set the `graphId` property to assign the ID value of the graph.

graphId

Set the `graphId` property to assign the ID value of the graph.

Signature

```
public String graphId {get; set;}
```

Property Value

Type: String

GroupRampActionEnum Enum

Specifies the action that you want to perform on group ramp segments. Additionally, you can also convert a non-ramped group into a ramped group.

Enum Values

The `RevSalesTrxn.GroupRampActionEnum` enum includes these values.

Value	Description
`AddProducts`	Specifies to add rampable products to group ramp segments.
`DeleteProducts`	Specifies to delete ramped products.
`EditGroup`	Specifies to convert a non-ramped group into a group ramp segment, or edit group ramp segment attributes such as name and description, except the start and end dates.
`EditRampSchedule`	Specifies to edit details of the group ramp segments, including start and end dates.
`DeleteSegment`	Specifies to delete the first or last segment in a group ramp schedule.
`ConvertToNonRampedGroup`	Specifies to convert the first or last group ramp segment into a non-ramped group.

To add or delete ramped line items from multiple group ramp segments, pass all the applicable values in the `graph` request. To refer to Connect API examples that specify actions to create ramp deals for groups, see Group Ramp Action Input on page 1491.

PersistPreferenceEnum Enum

Specifies whether to persist pricing changes for each sales transaction record. Available in API version 65.0 and later.

Enum Values

The `RevSalesTrxn.PersistPreferenceEnum` enum includes this value.

Value	Description
`Skip`	Skips the persistence of pricing changes for each sales transaction record. To persist pricing changes, specify `null` as the value in the method signature. If this value isn't specified, then request to persist pricing changes is performed by default.

PlaceSalesTransactionException Class

Contains methods to hold the exception details for the place sales transaction request.

Namespace

RevSalesTrxn

PlaceSalesTransactionException Methods
Learn more about the methods available with the PlaceSalesTransactionException class.

PlaceSalesTransactionException Methods

Learn more about the methods available with the PlaceSalesTransactionException class.

The `PlaceSalesTransactionException` class includes these methods.

getErrorCode()
Gets the error code that's associated to the place sales transaction request.

`getErrorCode()`

Gets the error code that's associated to the place sales transaction request.

Signature

`public String getErrorCode()`

Return Value

Type: String

PlaceSalesTransactionExecutor Class

Contains methods to place a sales transaction with details of the graph request, pricing preferences, and configuration options.

Namespace

RevSalesTrxn

[PlaceSalesTransactionExecutor Methods](#)

Learn more about the methods available with the `PlaceSalesTransactionExecutor` class.

[PlaceSalesTransactionExecutor Example Implementation](#)

To place a sales transaction from Apex, refer to the example implementation of the `PlaceSalesTransactionExecutor` class.

PlaceSalesTransactionExecutor Methods

Learn more about the methods available with the `PlaceSalesTransactionExecutor` class.

The `PlaceSalesTransactionExecutor` class includes these methods.

[execute(graphRequest, pricingPreferenceEnum, configurationExecutionEnum, configuratorOptions, contextId)](#)

Use the method in the `PlaceSalesTransactionExecutor` class to execute the Place Sales Transaction Apex API request by assigning the properties for graph request, pricing references, and configurator options.

[execute(graphRequest, pricingPreferenceEnum, configurationExecutionEnum, configuratorOptions, contextId, catalogRatesPreferenceEnum)](#)

Use the method in the `PlaceSalesTransactionExecutor` class to execute the Place Sales Transaction Apex API request by assigning the properties for graph request, pricing references, configurator options, and catalog rates.

[execute(graphRequest, pricingPreferenceEnum, configurationExecutionEnum, configuratorOptions, contextId, catalogRatesPreferenceEnum, taxPreferenceEnum, persistPreferenceEnum)](#)

Use the method in the `PlaceSalesTransactionExecutor` class to execute the Place Sales Transaction Apex API request by assigning the properties for graph request, pricing and tax preferences, configurator options, and catalog rates.

[execute(graphRequest, pricingPreferenceEnum, configurationExecutionEnum, configuratorOptions, contextId, taxPreferenceEnum, persistPreferenceEnum, groupRampActionEnum)](#)

Use the method in the `PlaceSalesTransactionExecutor` class to execute the Place Sales Transaction Apex API request by assigning the properties for graph request, pricing and tax preferences, configurator options, persist preference, and group ramp action.

[execute(graphRequest, pricingPreferenceEnum, configurationExecutionEnum, configuratorOptions, contextId, catalogRatesPreferenceEnum, taxPreferenceEnum, persistPreferenceEnum, groupRampActionEnum)](#)

Use the method in the `PlaceSalesTransactionExecutor` class to execute the Place Sales Transaction Apex API request by assigning the properties for graph request, pricing and tax preferences, configurator options, catalog rates, persist preference, and group ramp action.

`execute(graphRequest, pricingPreferenceEnum, configurationExecutionEnum, configuratorOptions, contextId)`

Use the method in the `PlaceSalesTransactionExecutor` class to execute the Place Sales Transaction Apex API request by assigning the properties for graph request, pricing references, and configurator options.

Signature

```
public static revsalestrxn.PlaceSalesTransactionResponse
execute(revsalestrxn.GraphRequest graphRequest, revsalestrxn.PricingPreferenceEnum
pricingPreferenceEnum, revsalestrxn.ConfigurationExecutionEnum
configurationExecutionEnum, revsalestrxn.ConfiguratorOptions configuratorOptions,
revsalestrxn.ContextId contextId)
```

Parameters

graphRequest
Type: revsalestrxn.GraphRequest

The sObject graph values of the order payload to be ingested.

pricingPreferenceEnum
Type: revsalestrxn.PricingPreferenceEnum

Pricing preference during the sales transaction process.

configurationExecutionEnum
Type: revsalestrxn.ConfigurationExecutionEnum

Configuration method for the sales transaction request.

configuratorOptions
Type: revsalestrxn.ConfigurationOptionsInput

Configuration options during the creation of the sales transaction.

contextId
Type: String

Context ID to assign to the sales transaction.

Return Value

Type: revsalestrxn.PlaceSalesTransactionResponse

execute(graphRequest, pricingPreferenceEnum, configurationExecutionEnum, configuratorOptions, contextId, catalogRatesPreferenceEnum)

Use the method in the `PlaceSalesTransactionExecutor` class to execute the Place Sales Transaction Apex API request by assigning the properties for graph request, pricing references, configurator options, and catalog rates.

Signature

Usage Selling must be enabled to use this signature.

```
public static revsalestrxn.PlaceSalesTransactionResponse
execute(revsalestrxn.GraphRequest graphRequest, revsalestrxn.PricingPreferenceEnum
pricingPreferenceEnum, revsalestrxn.ConfigurationExecutionEnum
configurationExecutionEnum, revsalestrxn.ConfiguratorOptions configuratorOptions,
revsalestrxn.ContextId contextId, revsalestrxn.CatalogRatesPreferenceEnum
catalogRatesPreferenceEnum)
```

Parameters

graphRequest
Type: revsalestrxn.GraphRequest

The sObject graph values of the order payload to be ingested.

pricingPreferenceEnum
Type: revsalestrxn.PricingPreferenceEnum

Pricing preference during the sales transaction process.

configurationExecutionEnum
Type: revsalestrxn.ConfigurationExecutionEnum

Configuration method for the sales transaction request.

configuratorOptions
Type: revsalestrxn.ConfigurationOptionsInput

Configuration options during the creation of the sales transaction.

contextId
Type: String

Context ID to assign to the sales transaction.

catalogRatesPreferenceEnum
Type: revsalestrxn.CatalogRatesPreferenceEnum

Rate card entries defined in the catalog that must be fetched for quote line items, with usage-based selling during the place sales transaction process.

Return Value

Type: revsalestrxn.PlaceSalesTransactionResponse

execute(graphRequest, pricingPreferenceEnum, configurationExecutionEnum, configuratorOptions, contextId, catalogRatesPreferenceEnum, taxPreferenceEnum, persistPreferenceEnum)

Use the method in the `PlaceSalesTransactionExecutor` class to execute the Place Sales Transaction Apex API request by assigning the properties for graph request, pricing and tax preferences, configurator options, and catalog rates.

Signature

Usage Selling must be enabled to use this signature.

```
public static revsalestrxn.PlaceSalesTransactionResponse
execute(revsalestrxn.GraphRequest graphRequest, revsalestrxn.PricingPreferenceEnum
pricingPreferenceEnum, revsalestrxn.ConfigurationExecutionEnum
configurationExecutionEnum, revsalestrxn.ConfiguratorOptions configuratorOptions,
revsalestrxn.ContextId contextId, revsalestrxn.CatalogRatesPreferenceEnum
catalogRatesPreferenceEnum, revsalestrxn.TaxPreferenceEnum taxPreferenceEnum,
revsalestrxn.PersistPreferenceEnum persistPreferenceEnum)
```

Parameters

graphRequest
Type: revsalestrxn.GraphRequest

The sObject graph values of the order payload to be ingested.

pricingPreferenceEnum
Type: revsalestrxn.PricingPreferenceEnum

Pricing preference during the sales transaction process.

configurationExecutionEnum
Type: revsalestrxn.ConfigurationExecutionEnum

Configuration method for the sales transaction request.

configuratorOptions
Type: revsalestrxn.ConfigurationOptionsInput

Configuration options during the creation of the sales transaction.

contextId
Type: String

Context ID to assign to the sales transaction.

catalogRatesPreferenceEnum
Type: revsalestrxn.CatalogRatesPreferenceEnum

Rate card entries defined in the catalog that must be fetched for quote line items, with usage-based selling during the place sales transaction process.

taxPreferenceEnum
Type: revsalestrxn.taxPreferenceEnum

Tax preference during the sales transaction process. Available in API version 65.0 and later.

persistPreferenceEnum
Type: revsalestrxn.persistPreferenceEnum

Persist preference during the sales transaction process. Available in API version 65.0 and later.

Return Value

Type: revsalestrxn.PlaceSalesTransactionResponse

execute(graphRequest, pricingPreferenceEnum, configurationExecutionEnum, configuratorOptions, contextId, taxPreferenceEnum, persistPreferenceEnum, groupRampActionEnum)

Use the method in the `PlaceSalesTransactionExecutor` class to execute the Place Sales Transaction Apex API request by assigning the properties for graph request, pricing and tax preferences, configurator options, persist preference, and group ramp action.

Signature

```
public static revsalestrxn.PlaceSalesTransactionResponse
execute(revsalestrxn.GraphRequest graphRequest, revsalestrxn.PricingPreferenceEnum
pricingPreferenceEnum, revsalestrxn.ConfigurationExecutionEnum
configurationExecutionEnum, revsalestrxn.ConfiguratorOptions configuratorOptions,
revsalestrxn.ContextId contextId, revsalestrxn.TaxPreferenceEnum taxPreferenceEnum,
revsalestrxn.PersistPreferenceEnum persistPreferenceEnum,
revsalestrxn.GroupRampActionEnum groupRampActionEnum)
```

Parameters

graphRequest
Type: revsalestrxn.GraphRequest

The sObject graph values of the order payload to be ingested.

pricingPreferenceEnum

Type: revsalestrxn.PricingPreferenceEnum

Pricing preference during the sales transaction process.

configurationExecutionEnum

Type: revsalestrxn.ConfigurationExecutionEnum

Configuration method for the sales transaction request.

configuratorOptions

Type: revsalestrxn.ConfigurationOptionsInput

Configuration options during the creation of the sales transaction.

contextId

Type: String

Context ID to assign to the sales transaction.

taxPreferenceEnum

Type: revsalestrxn.taxPreferenceEnum

Tax preference during the sales transaction process. Available in API version 65.0 and later.

persistPreferenceEnum

Type: revsalestrxn.persistPreferenceEnum

Persist preference during the sales transaction process. Available in API version 65.0 and later.

groupRampActionEnum

Type: revsalestrxn.GroupRampActionEnum

Specifies the action that you want to perform on group ramp segments.

Return Value

Type: revsalestrxn.PlaceSalesTransactionResponse

execute(graphRequest, pricingPreferenceEnum, configurationExecutionEnum, configuratorOptions, contextId, catalogRatesPreferenceEnum, taxPreferenceEnum, persistPreferenceEnum, groupRampActionEnum)

Use the method in the `PlaceSalesTransactionExecutor` class to execute the Place Sales Transaction Apex API request by assigning the properties for graph request, pricing and tax preferences, configurator options, catalog rates, persist preference, and group ramp action.

Signature

Usage Selling must be enabled to use this signature.

```
public static revsalestrxn.PlaceSalesTransactionResponse
execute(revsalestrxn.GraphRequest graphRequest, revsalestrxn.PricingPreferenceEnum
pricingPreferenceEnum, revsalestrxn.ConfigurationExecutionEnum
configurationExecutionEnum, revsalestrxn.ConfiguratorOptions configuratorOptions,
revsalestrxn.ContextId contextId, revsalestrxn.CatalogRatesPreferenceEnum
catalogRatesPreferenceEnum, revsalestrxn.TaxPreferenceEnum taxPreferenceEnum,
```

```
revsalestrxn.PersistPreferenceEnum persistPreferenceEnum,
revsalestrxn.GroupRampActionEnum groupRampActionEnum)
```

Parameters

graphRequest
Type: revsalestrxn.GraphRequest

The sObject graph values of the order payload to be ingested.

pricingPreferenceEnum
Type: revsalestrxn.PricingPreferenceEnum

Pricing preference during the sales transaction process.

configurationExecutionEnum
Type: revsalestrxn.ConfigurationExecutionEnum

Configuration method for the sales transaction request.

configuratorOptions
Type: revsalestrxn.ConfigurationOptionsInput

Configuration options during the creation of the sales transaction.

contextId
Type: String

Context ID to assign to the sales transaction.

catalogRatesPreferenceEnum
Type: revsalestrxn.CatalogRatesPreferenceEnum

Rate card entries defined in the catalog that must be fetched for quote line items, with usage-based selling during the place sales transaction process.

taxPreferenceEnum
Type: revsalestrxn.taxPreferenceEnum

Tax preference during the sales transaction process. Available in API version 65.0 and later.

persistPreferenceEnum
Type: revsalestrxn.persistPreferenceEnum

Persist preference during the sales transaction process. Available in API version 65.0 and later.

groupRampActionEnum
Type: revsalestrxn.GroupRampActionEnum

Specifies the action that you want to perform on group ramp segments.

Return Value

Type: revsalestrxn.PlaceSalesTransactionResponse

PlaceSalesTransactionExecutor Example Implementation

To place a sales transaction from Apex, refer to the example implementation of the `PlaceSalesTransactionExecutor` class.

Namespace

RevSalesTrxn

Usage

Customize this example to suit your requirements. Create the list of records to be ingested by using these steps. Replace the respective IDs with the values that are present in your org. For example, replace the value of `${Pricebook2Id}` field with the price book ID that's present in the org.

Example: This example shows a sample request to create a sales transaction, update a quote with a quote line item, delete a quote line item, or skip or persist pricing changes. It includes these steps.

- Set up a quote and quote line item.
- To create a quote line relationship, create an instance of the `RecordResource` class. To create an object with its fields, specify the object that you want to create by using POST method. Create a map of the fields and its values by using put(key, value) operation. Assign this field map to the record object.
- To update an object's specific fields, specify the object you want to update by using the PATCH method along with the ID of the object. Create a map of the fields and its values by using put(key, value) operation. Only certain fields on an object can be updated. Add the fields that you want to update to the map. Assign this field map to the record object.
- To associate the Record object with a reference identifier, create an instance of the `RecordWithReferenceRequest` class.
- To contain all record objects, create an instance of the `GraphRequest` class.

```
public class PlaceSalesTransactionTest {
    public static void callPSTAPI_Post() {
        RevSalesTrxn.PricingPreferenceEnum pricingPrefEnum =
RevSalesTrxn.PricingPreferenceEnum.SYSTEM;

PlaceSalesTransactionResponse Class

Contains properties to hold the response to the place sales transaction request.

Namespace

RevSalesTrxn

Example

```
RevSalesTrxn.PlaceSalesTransactionResponse resp =
RevSalesTrxn.PlaceSalesTransactionExecutor.execute(graph, pricingPrefEnum,
configurationExecutionEnum, new RevSalesTrxn.ConfigurationOptionsInput(), null);
```

PlaceSalesTransactionResponse Properties
Learn more about the available properties with the PlaceSalesTransactionResponse class.

PlaceSalesTransactionResponse Properties

Learn more about the available properties with the PlaceSalesTransactionResponse class.

The `PlaceSalesTransactionResponse` class includes these properties.

contextDetails
Get the details of the context that’s created for the sales transaction.

errorResponse
Get the list of errors encountered during the synchronous processing of the API request.

isSuccess
Get the request status of the synchronous part of the processing.

salesTransactionId
Get the ID of the sales transaction, such as a quote or an order.

statusUrl
Get the asynchronous status URL of the request, if available.

trackerId
Get the unique identifier assigned to a specific operation or request that's used for tracking and referencing the operation.

contextDetails

Get the details of the context that's created for the sales transaction.

Signature

```
public ConnectApi.ContextDetails contextDetails {get; set;}
```

Property Value

Type: ConnectApi.ContextDetails

errorResponse

Get the list of errors encountered during the synchronous processing of the API request.

Signature

```
public List<ConnectApi.PlaceSalesTransactionErrorResponse> errorResponse {get; set;}
```

Property Value

Type: List<ConnectApi.PlaceSalesTransactionErrorResponse>

isSuccess

Get the request status of the synchronous part of the processing.

Signature

```
public Boolean isSuccess {get; set;}
```

Property Value

Type: Boolean

Indicates whether the synchronous part of the processing is successful (`true`) or not (`false`).

salesTransactionId

Get the ID of the sales transaction, such as a quote or an order.

Signature

```
public String salesTransactionId {get; set;}
```

Property Value

Type: String

statusUrl

Get the asynchronous status URL of the request, if available.

Signature

`public String statusUrl {get; set;}`

Property Value

Type: String

trackerId

Get the unique identifier assigned to a specific operation or request that's used for tracking and referencing the operation.

Signature

`public String trackerId {get; set;}`

Property Value

Type: String

PricingPreferenceEnum Enum

Specifies the pricing preference during the creation of a sales transaction.

Usage

Used by the PlaceSalesTransactionExecutor class.

Enum Values

The `RevSalesTrxn.PricingPreferenceEnum` enum includes these values.

Value	Description
`Force`	Specifies to enforce pricing during the creation of sales transactions.
`Skip`	Specifies to skip pricing during the creation of sales transactions.
`System`	Specifies the system to determine whether a pricing calculation is required. The default value is `System`.

RecordResource Class

Contains constructors and properties to create a record object from the field values of a sales transaction.

Namespace

RevSalesTrxn

Example

```
RevSalesTrxn.RecordResource quoteRecord = new
RevSalesTrxn.RecordResource(Quote.getSobjectType(),'POST');
```

RecordResource Constructors

Learn more about the available constructors with the RecordResource class.

RecordResource Properties

Learn more about the available properties with the RecordResource class.

RecordResource Constructors

Learn more about the available constructors with the RecordResource class.

The `RecordResource` class has these constructors.

RecordResource(type, method, groupAction, criteria)

Creates an instance of the RecordResource class to assign values to the fields of a sales transaction by using the sObject type, API method, and sales transaction ID properties. Additionally, you can group order or quote line items based on a criteria by using the groupAction and criteria properties.

RecordResource(type, method, id)

Creates an instance of the RecordResource class to assign values to the fields of a sales transaction by using the sObject type, API method, and sales transaction ID properties.

RecordResource(type, method)

Creates an instance of the RecordResource class to assign the values to the fields of a sales transaction by using the sObject type and API method properties.

`RecordResource(type, method, groupAction, criteria)`

Creates an instance of the RecordResource class to assign values to the fields of a sales transaction by using the sObject type, API method, and sales transaction ID properties. Additionally, you can group order or quote line items based on a criteria by using the groupAction and criteria properties.

Signature

`public RecordResource(Schema.SObjectType type, String method, String groupAction, Map<String,ANY> criteria)`

Parameters

`type`

Type: Schema.SObjectType

Object that's returned from the field describe result using the `getReferenceTo()` method or from the sObject describe result using the `getSObjectType()` method.

method

Type: String

Method for the API request, such as POST, PATCH, or DELETE.

groupAction

Type: String

Action to group order or quote line items. Valid values are:

- `GroupBy`
- `Group`
- `Ungroup`
- `GroupAll`
- `DeleteGroup`

criteria

Type: Map<String,ANY>

Criteria to group order or quote line items. For example, group order or quote line items based on a monthly billing frequency.

`RecordResource(type, method, id)`

Creates an instance of the RecordResource class to assign values to the fields of a sales transaction by using the sObject type, API method, and sales transaction ID properties.

Signature

`public RecordResource(Schema.SObjectType type, String method, Id id)`

Parameters

type

Type: Schema.SObjectType

Object that's returned from the field describe result using the `getReferenceTo()` method or from the sObject describe result using the `getSObjectType()` method.

method

Type: String

Method for the API request, such as POST, PATCH, or DELETE.

id

Type: Id

ID of the sales transaction, such as a quote or an order.

`RecordResource(type, method)`

Creates an instance of the RecordResource class to assign the values to the fields of a sales transaction by using the sObject type and API method properties.

Signature

`public RecordResource(Schema.SObjectType type, String method)`

Parameters

type

Type: Schema.SObjectType

Object that's returned from the field describe result using the `getReferenceTo()` method or from the sObject describe result using the `getSObjectType()` method.

method

Type: String

Method for the API request, such as POST, PATCH, or DELETE.

RecordResource Properties

Learn more about the available properties with the RecordResource class.

The `RecordResource` class includes these properties.

criteria

Set the criteria property to group order or quote line items. For example, group order or quote line items based on a monthly billing frequency.

fieldValues

Set the fieldValues property to assign values to the fields to update the sales transaction.

groupAction

Set the groupAction property to group order or quote line items.

id

Set the id property to assign the ID of the sales transaction record.

method

Set the method property to specify the API request method, such as POST, PATCH, or DELETE.

type

Set the type property to assign the object type that's returned from the field describe result by using the getReferenceTo() method or from the sObject describe result by using the getSObjectType() method.

`criteria`

Set the criteria property to group order or quote line items. For example, group order or quote line items based on a monthly billing frequency.

Signature

```
public Map<String,ANY> criteria {get; set;}
```

Property Value

Type: Map<String,ANY>

`fieldValues`

Set the fieldValues property to assign values to the fields to update the sales transaction.

Signature

```
public Map<String,ANY> fieldValues {get; set;}
```

Property Value

Type: ListMap<String,ANY>

groupAction

Set the groupAction property to group order or quote line items.

You can group order or quote line items based on location, work types, or departments, if groups are enabled for your org. Groups provide a visualization of the products to view large quotes.

Signature

```
public String groupAction {get; set;}
```

Property Value

Type: String

Valid values are:

- `GroupBy`
- `Group`
- `Ungroup`
- `GroupAll`
- `DeleteGroup`

id

Set the id property to assign the ID of the sales transaction record.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

method

Set the method property to specify the API request method, such as POST, PATCH, or DELETE.

Signature

```
public String method {get; set;}
```

Property Value

Type: String

type

Set the type property to assign the object type that's returned from the field describe result by using the getReferenceTo() method or from the sObject describe result by using the getSObjectType() method.

Signature

```
public Schema.SObjectType type {get; set;}
```

Property Value

Type: Schema.SObjectType

RecordWithReferenceRequest Class

Contains constructors and properties to associate a record object with a reference identifier.

Namespace

RevSalesTrxn

Example

```
RevSalesTrxn.RecordWithReferenceRequest quoteLineItemRecords = new
RevSalesTrxn.RecordWithReferenceRequest('refQuoteItem',quoteLineItemRecord);
```

RecordWithReferenceRequest Constructors
Learn more about the available constructors with the RecordWithReferenceRequest class.

RecordWithReferenceRequest Properties
Learn more about the available properties with the RecordWithReferenceRequest class.

RecordWithReferenceRequest Constructors

Learn more about the available constructors with the RecordWithReferenceRequest class.

The `RecordWithReferenceRequest` class includes these constructors.

RecordWithReferenceRequest(referenceId, record)
Creates an instance of the RecordWithReferenceRequest class to associate a record object with a reference identifier by using the referenceId and record object properties.

RecordWithReferenceRequest(referenceId, record)

Creates an instance of the RecordWithReferenceRequest class to associate a record object with a reference identifier by using the referenceId and record object properties.

Signature

```
public RecordWithReferenceRequest(String referenceId, RevSalesTrxn.RecordResource
record)
```

Parameters

referenceId
Type: String

Reference ID that maps to the subrequest response and can be used to reference the response in subsequent subrequests. You can reference the referenceId in either the body or URL of a subrequest. Use this syntax to include a reference: @{referenceId.FieldName}. See referenceId property of a composite subrequest.

record
Type: RevSalesTrxn.RecordResource

Record object that's defined using the `RecordResource` class.

RecordWithReferenceRequest Properties

Learn more about the available properties with the RecordWithReferenceRequest class.

The `RecordWithReferenceRequest` class has these properties.

record
Set the record property to specify the record object that's defined by using the RecordResource class.

referenceId
Set the referenceId property to specify the reference ID that maps to the subrequest response. This reference ID can be used to reference the response in subsequent subrequests.

record

Set the record property to specify the record object that's defined by using the RecordResource class.

Signature

```
public RevSalesTrxn.RecordResource record {get; set;}
```

Property Value

Type: RevSalesTrxn.RecordResource

referenceId

Set the referenceId property to specify the reference ID that maps to the subrequest response. This reference ID can be used to reference the response in subsequent subrequests.

Signature

```
public String referenceId {get; set;}
```

Property Value

Type: String

TaxPreferenceEnum Enum

Specifies whether to execute or skip the tax calculation step for each sales transaction record. Available in API version 65.0 and later.

Enum Values

The `RevSalesTrxn.TaxPreferenceEnum` enum includes this value.

Value	Description
`Skip`	Specifies to skip tax calculation request for each sales transaction record. If this value isn't specified, then tax calculation request is performed by default.

Transaction Management Standard Invocable Actions

Learn more about the standard invocable actions available with Transaction Management.

Create Contract Action

Create a contract from a specific quote record.

Create or Update Asset From Order Action

Create an asset for each order item in the specified order. New assets are created for a new order. Modify existing assets for change order requests, such as a renewal or a cancellation.

Create or Update Asset From Order Item Action

Create assets from individual order items within an order. Track assets after the individual line items of an order reach a certain stage in their lifecycle, such as submitted, fulfilled, or provisioned. If the order item is part of a renewal, an amendment, or a cancellation, existing assets are changed.

Create Order From Quote Action

Create an order from a quote record.

Create Orders From Quote Action

Create multiple orders from a single quote instead of a single order, ensuring easier order management and fulfillment operations.

Deep Clone Sales Transaction

Clone a quote or an order, including full object graph with related objects, selected lines, or selected groups.

Get Renewable Assets Summary Action

Retrieve details about renewable assets in a given order. You can use this information to create renewal opportunities.

Initiate Amendment Action

Initiate and execute the amendment of an asset.

Initiate Cancellation Action

Initiate and execute the cancellation of an asset.

Initiate Renewal Action

Initiate and execute the renewal of an asset.

[Initiate Rollback on Last Action](#)

Initiate the reversal of the last action on an asset to rectify any transactional errors or to meet changing business requirements.

[Initiate Transfer Action](#)

Transfer an asset or multiple assets from one account to another.

Actions Developer Guide: Overview

REST API Developer Guide: Invocable Actions Standard

Create Contract Action

Create a contract from a specific quote record.

This action is available in API version 60.0 and later.

Special Access Rules

The Create Contract action is available in Developer, Enterprise, and Unlimited Editions of Revenue Management.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/createContract`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer token`

Inputs

Input	Details
`contractPriceOption`	**Type** string **Description** Optional. Determines how the contract price is set for quote line items based on the selected value. Valid values are: • `CONTRACT_HEADER_ONLY`—Creates a contract with only the header information, without using net prices or discounts. • `NET_UNIT_PRICE_ONLY`—Creates a contract specifically for quote line items with a net unit price, saving all net unit prices of the quote as contract prices.

Input	Details
	• `DISCOUNT_ONLY`—Creates contract prices specifically for quote line items with discounts, saving all discounts of the quote as contract prices. The default value is `CONTRACT_HEADER_ONLY`.
`sourceId`	**Type** string **Description** Required. ID of the quote or order that you want to create a contract from.

Outputs

Output	Details
`contractId`	**Type** string **Description** ID of the contract created for the specified order or quote.

Example

POST

This sample request is for the Create Contract action.

```
{
  "inputs": [
    {
      "sourceId": "0Q0RO0000003LyU",
      "contractPriceOption": "NET_UNIT_PRICE_ONLY"
    }
  ]
}
```

This sample response is for the Create Contract action.

```
[
  {
    "actionName": "createContract",
    "errors": null,
    "isSuccess": true,
    "outputValues": {
      "contractId": "800XXX123456789"
    }
```

```
    }
]
```

Salesforce Help: Use a Custom Flow to Create Contracts

Create or Update Asset From Order Action

Create an asset for each order item in the specified order. New assets are created for a new order. Modify existing assets for change order requests, such as a renewal or a cancellation.

When the custom product name for an order line item has a value, the asset name is set to custom product name.

This action is available in API version 60.0 and later.

Special Access Rules

You need the Assetize Order permission set to use this invocable action.

Supported REST HTTP Methods

URI

`/services/data/v`***`67.0`***`/actions/standard/createOrUpdateAssetFromOrder`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer` ***`token`***

Inputs

Input	Details
`orderId`	**Type** string **Description** Required. ID of the order.

Outputs

Output	Details
`requestId`	**Type** string **Description** ID of the request to create an asset.

Example

POST

This sample request is for the Create or Update Asset From Order action.

```
{
  "inputs": [
    {
      "orderId": "801DE000000oJfAYAU"
    }
  ]
}
```

This sample response is for the Create or Update Asset From Order action.

```
[
    {
        "actionName": "createOrUpdateAssetFromOrder",
        "errors": null,
        "isSuccess": true,
        "outputValues": {
            "requestId": "3b89392d-6987-40d9-9190-d18fdb5cb849"
        }
    }
]
```

Create or Update Asset From Order Item Action

Create assets from individual order items within an order. Track assets after the individual line items of an order reach a certain stage in their lifecycle, such as submitted, fulfilled, or provisioned. If the order item is part of a renewal, an amendment, or a cancellation, existing assets are changed.

This action is available in API version 60.0 and later.

Special Access Rules

You need the Assetize Order permission set to use this invocable action.

Supported REST HTTP Methods

URI

/services/data/v*67.0*/actions/standard/createOrUpdateAssetFromOrderItem

Formats

JSON, XML

HTTP Methods

POST

Authentication

Authorization: Bearer ***token***

Inputs

Input	Details
orderId	**Type** string **Description** Required. ID of the order.

Outputs

Output	Details
requestId	**Type** string **Description** ID of the request to create an asset.

Example

POST

This sample request is for the Create or Update Asset From Order Item action.

```
{
    "inputs": [
        {
            "orderItemIds": ["802SG000002HixxYAC"]
        }
    ]
}
```

This sample response is for the Create or Update Asset From Order Item action.

```
{
  "actionName": "createOrUpdateAssetFromOrderItem",
  "errors": null,
  "isSuccess": true,
  "outputValues": {
    "requestId": "b2a2b4b9-845b-4078-980a-759308389604"
  },
  "version": 1
}
```

Create Order From Quote Action

Create an order from a quote record.

This action is available in API version 60.0 and later.

Special Access Rules

The Create Order From Quote action is available in Enterprise, Unlimited, and Developer Editions of Revenue Management.

Supported REST HTTP Methods

URI
`/services/data/v`***`67.0`***`/actions/standard/createOrderFromQuote`

Formats
JSON, XML

HTTP Methods
POST

Authentication
`Authorization: Bearer` ***`token`***

Inputs

Input	Details
`quoteRecordId`	**Type** datetime **Description** Required. ID of the quote record.

Outputs

Output	Details
`requestId`	**Type** string **Description** ID of the request.

Example

POST

This sample request is for the Create Order From Quote action.

```
{
    "inputs": [
        {
        "quoteRecordId": "0Q0D200000000DhKAI"
        }
    ]
}
```

This sample response is for the Create Order From Quote action.

```
[
  {
    "actionName": "createOrderFromQuote",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": {
      "orderNumber": "00000122",
      "orderId": "801oB000000DCrNQAW"
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Create Orders From Quote Action

Create multiple orders from a single quote instead of a single order, ensuring easier order management and fulfillment operations.

You can split a quote to create orders in these ways.

- You can create an order by selecting a subset of quote line items.
- You can split a quote into multiple orders based on quote line group.
- You can split a quote into multiple orders based on a quote line item field, such as Product2.

See Considerations for Creating Multiple Orders from a Quote. This action is available in API version 65.0 and later.

Special Access Rules

Ensure the **Advanced Order Creation From Quote** toggle from Revenue Settings from Setup is enabled to access this action.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/createOrdersFromQuote`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer token`

Inputs

Input	Details
`orderCreationMethod`	**Type** string **Description** If specified, represents the method used to create orders. Valid values are: • `CreateSingleOrder`—Creates a single order from a quote. This method creates the order header and order line items synchronously. • `CreateOrderByGroup`—Create multiple orders based on a quote line group. • `CreateOrderByField`—Create multiple orders based on a specified quote line item field. If you're creating multiple orders from a quote, the order header records are created synchronously and order line items are created asynchronously. If unspecified, the default value is `CreateSingleOrder`.
`orderCreationParameters`	**Type** Apex-defined **Description** An Apex `ConnectApi.OrderCreationParametersInputRepresentation` record that contains the additional parameters required by the specified order creation method.
`quoteId`	**Type** id **Description** Required. The ID of the source quote tied to the orders created.

Input	Details
`quoteLineItemIds`	**Type** id **Description** List of quote line item IDs to create the orders from. If specified, the orders are created for the list of provided quote line items. If unspecified, orders are created for all quote line items.

Outputs

Output	Details
`orderIds`	**Type** id **Description** List of the created order IDs.
`requestId`	**Type** string **Description** The request ID used to query the async status.
`statusUrl`	**Type** string **Description** The status URL that's used to track the async status.

Examples

Create a partial order from a quote

This example shows a sample request to create a partial order from a quote.

```
{
  "inputs": [
    {
      "quoteId": "0Q0DU0000005tJc0AI",
      "quoteLineItemIds": [
        "0QLDU000000ay2G4AQ",
        "0QLDU000000ay2n4AA"
      ],
      "orderCreationMethod": "CreateSingleOrder"
    }
  ]
}
```

This example shows a sample successful response.

```
{
    "actionName": "createOrdersFromQuote",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": {
      "requestId": null,
      "statusUrl": null,
      "orderIds": [
        "801DU000000EYySYAW"
      ]
    },
    "sortOrder": -1,
    "version": 1
  }
```

Create orders from a quote based on a quote line group

This example shows a sample request to create orders from a quote based on a quote line group.

```
{
  "inputs": [
    {
      "quoteId": "0Q0DU0000005tJk0AI",
      "orderCreationMethod": "CreateOrderByGroup"
    }
  ]
}
```

This example shows a sample successful response.

```
{
  "actionName": "createOrdersFromQuote",
  "errors": null,
  "invocationId": null,
  "isSuccess": true,
  "outcome": null,
  "outputValues": {
    "requestId": "16PRM0000004DBq",
    "orderIds": [
      "801S70000001VKgIAM"
    ],
    "success": true,
    "errors": [],
    "statusURL": "/services/data/v67.0/sobjects/AsyncOperationTracker/16PRM0000004DBq"
  },
  "sortOrder": -1,
  "version": 1
}
```

Create orders from a quote based on a quote line item field

This example shows a sample request to create orders from a quote based on a quote line item field

```
{
  "inputs": [
    {
      "quoteId": "0Q0DU0000005tJW0AY",
      "orderCreationMethod": "CreateOrderByField",
      "orderCreationParameters": {
        "splitFieldName": "Product2Id"
      }
    }
  ]
}
```

This example shows a sample successful response.

```
{
  "actionName": "createOrdersFromQuote",
  "errors": null,
  "invocationId": null,
  "isSuccess": true,
  "outcome": null,
  "outputValues": {
    "requestId": "16PRM0000004DBq",
    "orderIds": [
      "801S70000001VKgIAM",
      "801S70000001WKgIBN"
    ],
    "success": true,
    "errors": [],
    "statusURL": "/services/data/v67.0/sobjects/AsyncOperationTracker/16PRM0000004DBq"
  },
  "sortOrder": -1,
  "version": 1
}
```

Deep Clone Sales Transaction

Clone a quote or an order, including full object graph with related objects, selected lines, or selected groups.

This action is available in API version 67.0 and later.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/deepCloneSalesTransaction`

Formats

JSON, XML

HTTP Methods

POST

Authentication

```
Authorization: Bearer token
```

Inputs

Input	Details
options	**Type** Apex-defined **Description** Specifies options to clone a ramp segment within a sales transaction. You can clone only the last ramp segment. Valid values are: • `recordTypeId`—ID of the record type related to the record to clone. Optional. • `lineScope`—Specifies the scope for cloning a ramp segment. This property determines which line items must be cloned and added to the cloned segment. You can specify these options. – `AllLines`—Specifies whether all line items in a ramped group must be cloned. – `RampedLinesOnly`—Specifies whether only the ramped line items must be cloned. A segment identifier is created for the newly cloned line items, ensuring date continuity between the existing and cloned segment.
recordIds	**Type** List<String> **Description** Required. ID of the record to be cloned. You can specify a single record ID only.
salesTransactionId	**Type** String **Description** Required. ID of the sales transaction related to the record IDs to clone.

Outputs

Output	Details
newRecordId	**Type** String

Output	Details
	Description ID of the cloned sales transaction.

Example

POST

Here's a sample request for the Deep Clone Sales Transaction action.

```
{
  "inputs": [
    {
      "recordIds": ["0QLxx0000004CBYGA2"],
      "salesTransactionId": "0Q0xx0000004CE0CAM",
      "options": {
        "lineScope": "AllLines"
      }
    }
  ]
}
```

Here's a sample response for the Deep Clone Sales Transaction action.

```
{
  "actionName": "deepCloneSalesTransaction",
  "errors": null,
  "isSuccess": true,
  "outputValues": {
    "newRecordId": "0Q0SG000000ACxf0AG"
  }
}
```

Get Renewable Assets Summary Action

Retrieve details about renewable assets in a given order. You can use this information to create renewal opportunities.

This action gets pricing data from the OrderEntitiesMapping context mapping within the SalesTransactionContext context definition. Before you use this action, edit the context mapping to map the objects and fields used in your pricing procedure to the nodes and attributes in the context definition.

This action doesn't support providing a summary with procedure plans. As a result, renewal line items may return a price of zero.

Note: We recommend adding the same fields and mappings for the Quote and Order objects, and for the Quote Line Item and Order Product objects.

This action is available in API version 64.0 and later.

Supported REST HTTP Methods

URI

/services/data/v***67.0***/actions/standard/getRenewableAssetsSummary

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer` ***`token`***

Inputs

Input	Details
`orderId`	**Type** id **Description** Required. ID of the order related to the assets to check for renewal opportunities.

Outputs

Output	Details
`renewableAssetsSummary`	**Type** Apex-defined **Description** Summary of the assets associated with the order, including details about renewal opportunities such as renewal pricing information. See renew_assets_summary Apex Namespace.

Example

POST

Here's a sample request for the Get Renewable Assets Summary action.

```
{
  "inputs": [
    {
      "orderId": "801xx000003GZ39AAG"
    }
  ]
}
```

Here's a sample response for the Get Renewable Assets Summary action.

```
[
  {
```

```
    "actionName": "getRenewableAssetsSummary",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": {
      "renewableAssetsSummary": [
        {
          "startDate": "2025-07-22",
          "rootAssetOpportunity": null,
          "renewalPriceDetails": [
            {
              "quantity": 1,
              "netUnitPrice": 0
            }
          ],
          "productId": "01txx0000006i3DAAQ",
          "priceBookId": "01sxx0000005ptpAAA",
          "priceBookEntryId": "01uxx0000008yXCAAY",
          "orderItem": "802xx000001nb1LAAQ",

        }
      ]
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Initiate Amendment Action

Initiate and execute the amendment of an asset.

Specify the IDs of assets to amend, the amendment start date, and any quantity changes. You can choose whether the action creates an amendment quote or order.

Considerations

For usage products, creating an order directly by setting `amendOutputType` to `Order` is currently not supported. The direct-to-order flow can create Order Products without required related Rate Card Entry records, which can cause order activation to fail.

When you amend usage assets, use a two-step flow.

1. Create an amendment quote by calling `initiateAmendment` with `amendOutputType` set to `Quote`.
2. Create an order from that amendment quote.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/initiateAmendment`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer token`

Inputs

Input	Details
amendAssetIds	**Type** string **Description** Required. The IDs of the assets that you want to amend.
amendContractId	**Type** string **Description** The ID of the contract record to be synced with the amendment.
amendStartDate	**Type** datetime **Description** Required. Effective start date of the amendment.
amendOpportunityId	**Type** string **Description** The ID of the Opportunity record to be synced with the amendment quote.
amendOutputType	**Type** string **Description** Required. Type of amendment record to create such as a quote or an order.

Input	Details
	For usage products, set this value to `Quote`. The usage-related records (`QuoteLineItemUseResourceGrant`, `QuoteLineItemUsageResourcePolicy`, and `QuoteLineRateCardEntry`) are copied in the quote action flow, not in the amend order flow.
`quantityChange`	**Type** double **Description** Required. Quantity to add to or reduce from the asset's existing quantity.
`skipPricing`	**Type** boolean **Description** Indicates whether the pricing procedure must be skipped (`true`) or performed (`false`). Available in API version 64.0 and later.

Outputs

Output	Details
`amendRecordId`	**Type** string **Description** The ID of the amendment record that's created.
`requestIdentifier`	**Type** string **Description** Request ID that's used to track the async request.

Example

POST

This sample request is for the Initiate Amendment action.

```
{
    "inputs": [
        {
            "amendAssetIds": ["02iI8000000HPzXIAW"],
            "amendStartDate": "2023-10-21T00:00:00.000Z",
            "quantityChange": 5,
```

```
            "amendOutputType": "Quote",
            "amendContractId": "800DU0000000lZlYAI",
            "amendOpportunityId": "006DU0000025AanYAE",
            "skipPricing": false
        }
    ]
}
```

This sample response is for the Initiate Amendment action.

```
[
    {
        "actionName": "initiateAmendment",
        "errors": null,
        "isSuccess": true,
        "outputValues": {
            "record_id": "0Q0xx0000004NsSCAU",
            "requestIdentifier": "16Pxx0000004NIy"
        },
        "version": 1
    }
]
```

Initiate Cancellation Action

Initiate and execute the cancellation of an asset.

Specify the IDs of the assets that you want to add to cancel by specifying a start date. You can also specify the type of cancellation record that you want to create, such as a quote or an order.

This action is available in API version 60.0 and later.

Supported REST HTTP Methods

URI

`/services/data/v`***`67.0`***`/actions/standard/initiateCancellation`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer` ***`token`***

Inputs

Input	Details
`cancelAssetIds`	**Type** string

Input	Details
	Description Required. The IDs of the assets that you want to cancel. All assets in a request must belong to the same price book.
`cancelContractId`	**Type** string **Description** The ID of the contract record to sync with the cancellation.
`cancelOpportunityId`	**Type** string **Description** The ID of the Opportunity record to sync with the cancellation quote.
`cancelOutputType`	**Type** string **Description** Required. Type of cancellation record to create such as a quote or an order.
`cancelStartDate`	**Type** datetime **Description** Required. Effective date of the cancellation.
`skipPricing`	**Type** boolean **Description** Indicates whether the pricing procedure must be skipped (`true`) or performed (`false`). Available in API version 64.0 and later.

Outputs

Output	Details
`cancelRecordId`	**Type** string

Output	Details
	Description The ID of the cancellation record that's created.
`requestIdentifier`	**Type** string **Description** Request ID that's used to track the async request.

Example

POST

This sample request is for the Initiate Cancellation action.

```
{
    "inputs": [
        {
            "cancelAssetIds": [
                "02iI8000000Lc5fIAC"
            ],
            "cancelStartDate": "2023-11-09T00:00:00",
            "cancelOutputType": "Quote",
            "cancelContractId": "800DU000000lZlYAI",
            "cancelOpportunityId": "006DU0000025AanYAE",
            "skipPricing": false
        }
    ]
}
```

This sample response is for the Initiate Cancellation action.

```
[
    {
        "actionName": "initiateCancellation",
        "errors": null,
        "isSuccess": true,
        "outputValues": {
            "record_id": "0Q0xx0000004P32CAE",
            "requestIdentifier": "16Pxx0000004OTY"
        },
        "version": 1
    }
]
```

Initiate Renewal Action

Initiate and execute the renewal of an asset.

Specify the IDs of the assets that you want to add to renew by specifying a start date. You can also specify the type of renewal record that you want to create, such as a quote or an order.

This action is available in API version 60.0 and later.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/initiateRenewal`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer token`

Inputs

Input	Details
`rampOptionsDetails`	**Type** Apex-defined **Description** An Apex RampOptionInputRepresentation record that contains the details of ramp options. The details include segment type, duration, and segment count. Specify this property if you want to include assets in a group ramp with a ramp schedule. See RampOptionInputRepresentation on page 1558 to refer to the associated properties for ramp options. Available in API version 67.0 and later.
`renewAssetIds`	**Type** string **Description** Required. The IDs of the assets that you want to renew.
`renewContractId`	**Type** string **Description** ID of the contract record to sync with the renewal quote.
`renewEndDate`	**Type** datetime **Description** Effective end date of the renewal. Available in API version 62.0 and later.

Input	Details
renewOpportunityId	**Type** string **Description** ID of the Opportunity record to sync with the renewal quote.
renewOutputType	**Type** string **Description** Required. Type of renewal record to create such as a quote or an order.
renewStartDate	**Type** datetime **Description** Optional Effective start date of the renewal. Required for early asset renewals and renewing expired assets, by using today's date or a future date. Available in API version 62.0 and later.
skipPricing	**Type** boolean **Description** Indicates whether the pricing procedure must be skipped (`true`) or performed (`false`). Available in API version 64.0 and later.

Outputs

Output	Details
renewRecordId	**Type** string **Description** The ID of the amendment record that's created.
requestIdentifier	**Type** string **Description** Request ID that's used to track the async request.

Example

POST

This sample request is for the Initiate Renewal action.

```
{
  "inputs": [
    {
      "rampOptionsDetails": {
        "segmentType": "Custom",
        "duration": 40,
        "numberOfSegments": 10
      },
      "renewAssetIds": [
        "02ixx0000004LMwAAM"
      ],
      "renewOutputType": "Quote",
      "renewContractId": "800DU00000001ZlYAI",
      "renewOpportunityId": "006DU0000025AanYAE",
      "renewStartDate": "2023-10-21T00:00:00.000Z",
      "renewEndDate": "2024-10-21T00:00:00.000Z",
      "skipPricing": false
    }
  ]
}
```

This sample response is for the Initiate Renewal action.

```
[
    {
        "actionName": "initiateRenewal",
        "errors": null,
        "isSuccess": true,
        "outputValues": {
            "renewRecordId": "0Q0xx0000004P32CAE",
            "requestIdentifier": "16Pxx0000004OTY"
        },
        "version": 1
    }
]
```

Initiate Rollback on Last Action

Initiate the reversal of the last action on an asset to rectify any transactional errors or to meet changing business requirements.

Use this action to revert the last amendment or renewal on a particular asset, restoring the asset to its previous state. This action creates a quote or an order based on the specified output type. Use the created reversal quote to verify the reversal and convert the quote into an order.

Keep these considerations in mind when you use this action.

- You can roll back only future dated transactions.
- Rollback action isn't supported for legacy assets.
- The rollback operation is supported for amendment and renewal only.

This action is available in API version 65.0 and later.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/initiateRollBackLastAction`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearertoken`

Inputs

Input	Details
`assetIds`	**Type** string **Description** Required. List of asset IDs to include in the last action rollback.
`outputType`	**Type** string **Description** Required. The type of record to create for reversal. Valid values are: • `Quote`—Creates a reversal quote. • `Order`—Creates a reversal order.

Outputs

Output	Details
`recordId`	**Type** id **Description** The ID of the created quote or order.

Example

POST

This example shows a sample request that initiates the rollback action on an asset and converts it into a quote.

```
{
  "inputs": [
    {
      "assetIds": [
        "02iDU0000006UisYAE"
      ],
      "outputType": "Quote"
    }
  ]
}
```

This example shows a sample successful response.

```
{
  "actionName": "initiateRollBackLastAction",
  "errors": null,
  "isSuccess": true,
  "outputValues": {
    "recordId": "0Q0xx0000004NsSCAU"
  },
  "version": 1
}
```

Initiate Transfer Action

Transfer an asset or multiple assets from one account to another.

Keep these considerations in mind when you use this invocable action.

- This action generates 2 quotes or 2 orders.
- One transaction is considered the source, which is used to calculate the reduction amount of the transfer. The other transaction is the target, which is used to calculate the new amount on the target account.
- The quantity on the source is negative, which reduces the existing asset's quantity. The quantity on the target is positive, which creates a new asset on the target account.
- You can change the quantity on the source or the target, but the quantities must be equal and opposite. For example, the source quote line can have a quantity value as `-5`, and the target quote line can have a quantity value `5`. If you change the source value to `-10`, you must update the target value to `10`. You must update quotes or orders manually.
- The transfer is complete after the orders are assetized.

This action is available in API version 65.0 and later.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/initiateTransfer`

Formats

JSON, XML

HTTP Methods
POST

Authentication
`Authorization: Bearer`***token***

Inputs

Input	Details
`outputRecordType`	**Type** string **Description** Required. Specifies either a quote or order record type that's being transferred.
`shouldSkipPricing`	**Type** boolean **Description** Indicates whether to skip pricing at the time of asset transfer (`true`) or not (`false`).
`targetAccountId`	**Type** string **Description** Required. The ID of the target account where the asset is transferred.
`targetContractId`	**Type** string **Description** The ID of the target contract that's associated with the asset that's being transferred.
`transferDate`	**Type** datetime **Description** Required. The date of the asset transfer.
`transferRecords`	**Type** Apex-defined

Input	Details
	Description Required. A collection of Apex `connectapi__TransferRecordInputRepresentation` records that contain details about the assets to be transferred. See ConnectApi.TransferRecordInputRepresentation.

Outputs

Output	Details
`assetTransferSourceId`	**Type** id **Description** The ID of the quote or order that's related to the source account used to start the transfer.
`assetTransferTargetId`	**Type** id **Description** The ID of the quote or order that's related to the target account used to start the transfer.
`requestIdentifier`	**Type** id **Description** The request ID can be used to track the async request.

Example

POST

Here's a sample input to call this invocable action.

```
{
  "inputs": [
    {
      "transferRecords": [
        {
          "assetId": "02ixx0000004HZbAAM",
          "transferQuantity": 1
        }
      ],
      "transferDate": "2025-10-21T00:00:00.000Z",
      "targetAccountId": "001xx000003GbeXAAS",
      "targetContractId": "800DU0000000lZlYAI",
```

```
      "outputRecordType": "Quote"
    }
  ]
}
```

Here's a sample input to call this invocable action from Apex code.

```
ConnectApi.TransferRecordInputRepresentation transferRecord = new
ConnectApi.TransferRecordInputRepresentation();
transferRecord.assetId = '02ixx0000004HHjAAM';
transferRecord.transferQuantity = 1;
List<ConnectApi.TransferRecordInputRepresentation> transferRecords = new
List<ConnectApi.TransferRecordInputRepresentation>();
transferRecords.add(transferRecord);

Invocable.Action action = Invocable.Action.createStandardAction('initiateTransfer');
action.setInvocationParameter('transferRecords', transferRecords);
action.setInvocationParameter('targetAccountId', '001xx000003GYiHAAW');
action.setInvocationParameter('transferDate', '2025-03-01T00:00:00.000Z');
action.setInvocationParameter('outputRecordType', 'Quote');
List<Invocable.Action.Result> results = action.invoke();
System.assertEquals(true, results[0].isSuccess());
Assert.isNotNull(results[0].getOutputParameters().get('assetTransferSourceId'));
```

Here's a sample response when you call this action.

```
[
  {
    "actionName": "initiateTransfer",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": {
      "assetTransferSourceId": "0Q0DU0000006SYF0A2",
      "assetTransferTargetId": "0Q0DU0000006SYE0A2"
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Transaction Management Metadata API Types

Metadata API enables you to access some types and feature settings that you can customize in the user interface.

[Flow for Transaction Management](#)

The flow for Transaction Management represents the metadata associated with a flow. With Flow, you can create an application that takes users through a series of pages to query and update the records in the database. You can also run logic and provide branching capability based on user input to build dynamic applications.

SEE ALSO:

Metadata API Developer Guide: Understanding Metadata API

Flow for Transaction Management

The flow for Transaction Management represents the metadata associated with a flow. With Flow, you can create an application that takes users through a series of pages to query and update the records in the database. You can also run logic and provide branching capability based on user input to build dynamic applications.

FlowActionCall

Transaction Management exposes additional actionType values for the FlowActionCall metadata type.

Field Name	Field Type	Description
`actionType`	InvocableActionType (enumeration of type string)	Required. The action type. Additional valid values for Transaction Management are: • `createContract`—Create a contract from a specific quote record. • `createOrderFromQuote`—Create an order from a quote record. • `createServiceDocument`—Create service documents from work orders, work order line items, or service appointments. • `deepCloneSalesTransaction`—Clone a quote or an order, including full object graph with related objects, selected lines, or selected groups. Added in API version 67.0 and later. • `getRenewableAssetsSummary`—Retrieve details about renewable assets in a given order. You can use this information to create renewal opportunities. Added in API version 64.0 and later. • `createOrUpdateAssetFromOrder`—Create an asset for each order item in the specified order. New assets are created for a new order. Modify existing assets for change order requests, such as a renewal or a cancellation. • `createOrUpdateAssetFromOrderItem`—Create assets from individual order items within an order. Track assets after the individual line items of an order reach a certain stage in their lifecycle, such as submitted, fulfilled, or provisioned. If the order item is part of a renewal, an amendment, or a cancellation, existing assets are changed.

Field Name	Field Type	Description
		• `initiateAmendment`—Initiate and execute the amendment of an asset. • `initiateRenewal`—Initiate and execute the renewal of an asset. • `initiateCancellation`—Initiate and execute the cancellation of an asset. • `initiateRollBackLastAction`—Initiate the reversal of the last action on an asset to rectify any transactional errors or to meet changing business requirements. • `createOrdersFromQuote`—Create multiple orders from a single quote instead of a single order, ensuring easier order management and fulfillment operations. • `initiateTransfer`—Transfer an asset or multiple assets from one account to another.

/

CHAPTER 9 Advanced Approvals

In this chapter ...

Advanced Approvals feature provides invocable actions to streamline complex business processes. These actions automate and manage intricate parallel or sequential approval chains with detailed audit trails.

SEE ALSO:

Salesforce Help: Advanced Approvals

EDITIONS

Available in: Lightning Experience

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions of Revenue Management where Advanced Approvals is enabled

Advanced Approvals Fields on Standard Objects

Advanced Approvals adds standard and custom fields to some standard Salesforce objects. These fields are available only in Revenue Management orgs where Advanced Approvals is enabled.

ApprovalSubmission
Represents the instance of an approval request that's submitted for a record of the related object. This object is available in API version 62.0 and later.

Advanced Approvals Fields on Approval Work Item
Standard and custom fields extend the standard Approval Work Item object for use in Advanced Approvals.

ApprovalSubmission

Represents the instance of an approval request that's submitted for a record of the related object. This object is available in API version 62.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

This object is available in Enterprise, Unlimited, and Developer Editions of Revenue Management.

Fields

Field	Details
`Comments`	**Type** textarea **Properties** Nillable **Description** The comments about the request that's submitted for approval.
`DoesSendApprovalEmail`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Required. Indicates whether approval request emails are sent to approvers and delegates (`true`) or not (`false`). The default value is `false`.

Field	Details
FlowOrchestrationInstanceId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the flow orchestration instance record that's associated with the approval. This field is a relationship field. **Relationship Name** FlowOrchestrationInstance **Refers To** FlowOrchestrationInstance
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The auto-generated name for the approval submission.
OwnerId	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the user or the group that owns the approval submission record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
RelatedRecordId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Required. The ID of the related record that's submitted for approval. This field is a polymorphic relationship field. **Relationship Name** RelatedRecord

Field	Details
	Refers To Account, AdAvailabilityViewConfig, Address, AnalyticsUserAttrFuncTkn, ApprovalSubmission, ApprovalSubmissionDetail, ApprovalWorkItem, Asset, AssetAction, AssetActionSource, AssetContractRelationship, AssetRateAdjustment, AssetRateCardEntry, AssetRelationship, AssetStatePeriod, AssociatedLocation, AsyncOperationTracker, AttrPicklistExcludedValue, AttributeAdjustmentCondition, AttributeBasedAdjRule, AttributeBasedAdjustment, AttributeCategory, AttributeCategoryAttribute, AttributeDefinition, AttributePicklist, AttributePicklistValue, AuthorizationForm, AuthorizationFormConsent, AuthorizationFormDataUse, AuthorizationFormText, BatchJob, BatchJobPart, BatchJobPartFailedRecord, BundleBasedAdjustment, BusinessBrand, Case, CaseComment, ChannelProgram, ChannelProgramLevel, ChannelProgramMember, CollaborationGroup, CommSubscription, CommSubscriptionChannelType, CommSubscriptionConsent, CommSubscriptionTiming, Contact, ContactPointAddress, ContactPointConsent, ContactPointEmail, ContactPointPhone, ContactPointTypeConsent, ContactRequest, ContextDefinitionSync, Contract, ContractItemPrice, ContractItemPriceAdjTier, CostBook, CostBookEntry, Customer, DTRecordsetReplica, DataUseLegalBasis, DataUsePurpose, DecisionTblFileImportData, DelegatedAccount, DocGenerationQueryResult, DocTemplateSectionCondition, DocumentEnvelope, DocumentGenerationProcess, DocumentRecipient, DocumentTemplate, DocumentTemplateContentDoc, DocumentTemplateSection, DocumentTemplateToken, DuplicateRecordItem, DuplicateRecordSet, EmailMessage, EngagementChannelType, ExpressionSetConstraintObj, ExternalEventMapping, FlowOrchestrationInstance, FulfillmentOrder, FulfillmentOrderItemAdjustment, FulfillmentOrderItemTax, FulfillmentOrderLineItem, GeneratedDocument, GeneratedDocumentSection, Idea, Image, Individual, IntegrationProviderDcsnRqmt, IntegrationProviderExecution, Lead, Location, LocationTrustMeasure, ManagedContentVariant, ObjectStateDefinition, ObjectStateTransition, ObjectStateValue, Obligation, Opportunity, OpportunityRelatedDeleteLog, Order, OrderAction, OrderAdjustmentGroup, OrderDeliveryGroup, OrderDeliveryMethod, OrderItem, OrderItemAdjustmentLineItem, OrderItemDetail, OrderItemRateAdjustment, OrderItemRateCardEntry, OrderItemRecipient, OrderItemRelationship, OrderItemTaxLineItem, OrgMetricScanResult, OrgMetricScanSummary, Organization, PartnerFundAllocation, PartnerFundClaim, PartnerFundRequest, PartnerMarketingBudget, PartyConsent, PriceBookEntryDerivedPrice, PriceBookRateCard, PricingAdjBatchJob, PricingAdjBatchJobLog, PricingApiExecution, PricingProcessExecution, ProcessException, Product2, ProductAttributeDefinition, ProductCatalog, ProductCategory, ProductCategoryDisqual, ProductCategoryProduct, ProductCategoryQualification, ProductClassification, ProductClassificationAttr, ProductComponentGroup, ProductComponentGrpOverride, ProductConfigFlowAssignment, ProductConfigurationFlow, ProductConfigurationRule, ProductDisqualification, ProductPriceHistoryLog, ProductPriceRange, ProductQualification, ProductRampSegment, ProductRelComponentOverride, ProductUsageGrant, ProfileSkill, ProfileSkillEndorsement, ProfileSkillUser, PromptAction, PromptError, QuickText, QuickTextUsage, Quote, QuoteLineDetail, QuoteLineItem, QuoteLineItemRecipient, QuoteLineRateAdjustment, QuoteLineRateCardEntry, RateAdjustmentByAttribute, RateAdjustmentByTier, RateCard, RateCardEntry, RatingFrequencyPolicy, SalesTransactionType, Seller, Shipment, ShipmentItem, Site, SocialPersona, SocialPost, Solution, StreamingChannel, TableauHostMapping, Topic, UnitOfMeasure, UnitOfMeasureClass, UsageGrantRenewalPolicy, UsageGrantRolloverPolicy, UsageResource, UsageResourceBillingPolicy, User,

Field	Details
	UserEsignVendorIdentifier, UserLicense, UserLocalWebServerIdentity, UserProvisioningRequest, WorkBadge, WorkBadgeDefinition, WorkOrder, WorkOrderLineItem, WorkThanks
RelatedRecordObjectName	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Required. The type of record that was submitted for approval.
Status	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. The status of the approval. Valid values are: • Approved • Canceled • Errored • InProgress • Recalled • Rejected • Suspended
SubmittedById	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Required. The ID of the user who submitted the record for approval. This field is a relationship field. **Relationship Name** SubmittedBy **Refers To** User

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ApprovalSubmissionOwnerSharingRule on page 2875
Sharing rules are available for the object.

ApprovalSubmissionShare on page 2877
Sharing is available for the object.

Advanced Approvals Fields on Approval Work Item

Standard and custom fields extend the standard Approval Work Item object for use in Advanced Approvals.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Special Access Rules

This object is available in Enterprise, Performance, Unlimited, and Developer Editions for users with access to the Approval Submission object.

Fields

Field	Details
`ApprovalChainName`	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The name of the related approval chain. This field is populated when there are multiple approval chains that are run in parallel. This field is only available with Advanced Approvals enabled.
`CurrencyIsoCode`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization. Valid values are: • `AED`—UAE Dirham • `AUD`—Australian Dollar

Field	Details
	• BRL—Brazilian Real • CAD—Canadian Dollar • EUR—Euro • GBP—British Pound • INR—Indian Rupee • JPY—Japanese Yen • SEK—Swedish Krona • USD—U.S. Dollar The default value is USD.
IsAutoReviewed	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the approval work item is eligible for smart approval (true) or not (false). The default value is false.
IsEligibleForSmartApproval	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the approval work item is eligible for smart approval (true) or not (false). The default value is false.
SmartApprovalBasisWorkItemId	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The previous approval work item used as a reference for the auto-approval evaluation. This field is a relationship field. **Relationship Name** SmartApprovalBasisWorkItem **Refers To** ApprovalWorkItem

Advanced Approvals Standard Invocable Actions

Learn more about the standard invocable actions available with Advanced Approvals.

Cancel Approval Submission Action
: Cancels an approval submission and all child approval work items that haven't been completed. You can also add comments about why the approval admin made the cancellation.

Get Previous Related Record Details Action
: Get the related record details submitted for approval before the current approval submission. The details are required for approval steps that use custom logic for auto-approvals.

Override Approval Work Item Action
: Update an approval work item status with the approval admin decision and any comments that the approval admin added.

Reassign Approval Work Item Action
: Reassign an approval work item that hasn't been completed. You can also add comments about why the approval admin reassigned the approval work item.

Recall Approval Submission Action
: Recall an approval submission that isn't completed. You can also add comments that the submitter or approval admin made the recall.

Review Approval Work Item Action
: Update an approval work item status with the assignee or reviewer's decision and any comments that the assignee or reviewer added.

SEE ALSO:

Actions Developer Guide: Overview

REST API Developer Guide: Invocable Actions Standard

Cancel Approval Submission Action

Cancels an approval submission and all child approval work items that haven't been completed. You can also add comments about why the approval admin made the cancellation.

This action also validates if a user has required permissions to cancel an approval submission. Keep these considerations in mind when you use this invocable action.

- The user must have the Approval Admin user permission.
- The status of the approval submission must be in `In progress` or `Suspended` status.

This action is available in API version 62.0 and later.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/cancelApprovalSubmission`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer`***`token`***

Inputs

Input	Details
`approvalSubmissionId`	**Type** string **Description** Required. ID of the Approval Submission to be canceled.
`comments`	**Type** string **Description** Comments entered by the approval admin about why they canceled the Approval Submission.

Outputs

None.

Example

POST

Here's a sample request for the Cancel Approval Submission action.

```
{
  "inputs": [
    {
      "approvalSubmissionId": "9iPxx00000001lhEBA",
      "comments": "Cancellation comments."
    }
  ]
}
```

Here's a sample response for the Cancel Approval Submission action.

```
{
  "actionName": "cancelApprovalSubmission",
  "errors": null,
  "invocationId": null,
  "isSuccess": true,
  "outcome": null,
```

```
  "outputValues": null,
  "sortOrder": -1,
  "version": 1
}
```

Get Previous Related Record Details Action

Get the related record details submitted for approval before the current approval submission. The details are required for approval steps that use custom logic for auto-approvals.

This Apex action is available in API version 66.0 and later.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/getPreviousRelaRecDetails`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearertoken`

Inputs

Input	Details
flowOrchestrationInstanceId	**Type** string **Description** Required. The ID of the flow orchestration instance associated with the approval submission.
stepApiNamesList	**Type** string **Description** Required. The comma-delimited list of step API names to retrieve previous related record details for.

Outputs

Output	Details
previousRelatedRecordDetails	**Type** sObject **Description** The collection of previous related record details for approval steps that use custom logic for auto-approvals.

Usage

To use this Apex action in approval workflows, see Define Rules and Conditions for Auto-Approval Resubmissions.

Example

POST

Here's a sample request for the Get Previous Related Record Details action.

```
{
  "flowOrchestrationInstanceId": "0jEDU0000001zeN",
  "stepApiNameList": [
    "ManagerApprovalStep",
    "FinancialApprovalStep"
  ]
}
```

Override Approval Work Item Action

Update an approval work item status with the approval admin decision and any comments that the approval admin added.

This action also validates if a user has required permissions to override an approval work item and update its status. Keep these considerations in mind when you use this invocable action.

- The user must have the Approval Admin user permission.
- This action enables approval admins to interject the approval decision for any assignee.
- The status of the approval work item must be in `Assigned` status.

This action is available in API version 62.0 and later.

Supported REST HTTP Methods

URI

/services/data/v***67.0***/actions/standard/overrideApprovalWorkItem

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer`***`token`***

Inputs

Input	Details
`approvalDecision`	**Type** string **Description** Required. Action that the overriding approval admin made for the unreviewed approval work item. Valid values are: • `approve` • `reject`
`approvalWorkItemId`	**Type** string **Description** Required. ID of the unreviewed approval work item to be reviewed by an approval admin.
`channelType`	**Type** picklist **Description** Type of channel where the request to review the approval work item originated. Valid values are: • `InvocableAction` • `Slack` • `ApprovalRecord` The default value is `InvocableAction`. Available in API version 65.0 and later.
`comments`	**Type** string **Description** Comments entered by the approval admin about their decision to approve or reject an unreviewed approval work item.

Outputs

None.

Example

POST

Here's a sample request for the Override Approval Work Item action.

```
{
  "inputs": [
    {
      "approvalWorkItemId": "9jRxx00000001lhEAA",
      "approvalDecision": "Reject",
      "channelType": "InvocableAction",
      "comments": "Needs to be reviewed."
    }
  ]
}
```

Here's a sample response for the Override Approval Work Item action.

```
{
  "actionName": "overrideApprovalWorkItem",
  "errors": null,
  "invocationId": null,
  "isSuccess": true,
  "outcome": null,
  "outputValues": null,
  "sortOrder": -1,
  "version": 1
}
```

Reassign Approval Work Item Action

Reassign an approval work item that hasn't been completed. You can also add comments about why the approval admin reassigned the approval work item.

This action also validates if a user has required permissions to reassign an approval work item and update the assignee. Keep these considerations in mind when you use this invocable action.

- The user must have the Approval Admin user permission.
- The status of the approval work item must be in `Assigned` status.

This action is available in API version 62.0 and later.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/reassignApprovalWorkItem`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer`***`token`***

Inputs

Input	Details
`approvalWorkItemId`	**Type** string **Description** Required. ID of the approval work item to be reassigned.
`assigneeId`	**Type** string **Description** Required. ID of the user, group, or queue to reassign the approval work item to.
`comments`	**Type** string **Description** Comments entered by the approval admin about why they reassigned the approval work item.

Outputs

None.

Example

POST

Here's a sample request for the Reassign Approval Work Item action.

```
{
  "inputs": [
    {
      "approvalWorkItemId": "9jRDU00000015C22AI",
      "assigneeId": "005DU000000I3zHYAS",
      "comments": "Needs to be reviewed."
    }
```

```
  ]
}
```

Here's a sample response for the Reassign Approval Work Item action.

```
{
  "actionName": "reassignApprovalWorkItem",
  "errors": null,
  "invocationId": null,
  "isSuccess": true,
  "outcome": null,
  "outputValues": null,
  "sortOrder": -1,
  "version": 1
}
```

Recall Approval Submission Action

Recall an approval submission that isn't completed. You can also add comments that the submitter or approval admin made the recall.

This action also validates if a user has required permissions to recall an approval submission. Keep these considerations in mind when you use this invocable action.

- The user must have the Approval Admin user permission.
- The user must also be a submitter of this approval submission.
- The status of the approval submission must be in `In progress` or `Suspended` status.

This action is available in API version 62.0 and later.

Supported REST HTTP Methods

URI
`/services/data/v67.0/actions/standard/recallApprovalSubmission`

Formats
JSON, XML

HTTP Methods
POST

Authentication
`Authorization: Bearer token`

Inputs

Input	Details
`approvalSubmissionId`	**Type** string **Description** Required.

Input	Details
	ID of the approval submission to be recalled.
comments	**Type** string **Description** Comments entered by the approval admin or approval submitter about why they recalled the approval submission.

Outputs

None.

Example

POST

Here's a sample request for the Recall Approval Submission action.

```
{
  "inputs": [
    {
      "approvalSubmissionId": "9iPxx0000000llhEBA",
      "comments": "Recall comments."
    }
  ]
}
```

Here's a sample response for the Recall Approval Submission action.

```
{
  "actionName": "recallApprovalSubmission",
  "errors": null,
  "invocationId": null,
  "isSuccess": true,
  "outcome": null,
  "outputValues": null,
  "sortOrder": -1,
  "version": 1
}
```

Review Approval Work Item Action

Update an approval work item status with the assignee or reviewer's decision and any comments that the assignee or reviewer added.

Keep these considerations in mind when you use this invocable action.

- The user must be an assignee of the approval work item or be a member of a group or queue if the approval work item is assigned to the group or queue. Additionally, a user has access to Approval Submissions if they're a delegate of the assignee or has a role higher than the assignee.

- The status of the approval work item must be in `Assigned` status.
- The user can also use this action if inherited access to group or queue membership, nested group membership, roles hierarchy, or delegates is available. See Public Group Considerations.

This action is available in API version 62.0 and later.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/reviewApprovalWorkItem`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer token`

Inputs

Input	Details
`approvalDecision`	**Type** string **Description** Required. Action that the assigned approver made for the approval work item. Valid values are: • `approve` • `reject`
`approvalWorkItemId`	**Type** string **Description** Required. ID of the approval work item to be reviewed by the assigned approver.
`channelType`	**Type** picklist **Description** Type of channel where the request to review the approval work item originated. Valid values are: • `InvocableAction` • `Slack`

Input	Details
	• `ApprovalRecord` The default value is `InvocableAction`. Available in API version 65.0 and later.
`comments`	**Type** string **Description** Approval comments for the decision.

Outputs

None.

Example

POST

Here's a sample request for the Review Approval Work Item action.

```
{
  "inputs": [
    {
      "approvalWorkItemId": "9jRxx00000001lhEAA",
      "approvalDecision": "Approve",
      "channelType": "InvocableAction",
      "comments": "Looks good."
    }
  ]
}
```

Here's a sample response for the Review Approval Work Item action.

```
{
  "actionName": "reviewApprovalWorkItem",
  "errors": null,
  "invocationId": null,
  "isSuccess": true,
  "outcome": null,
  "outputValues": null,
  "sortOrder": -1,
  "version": 1
}
```

Advanced Approvals Business APIs

Use the Advanced Approvals Business APIs to preview approval levels and related details before you submit a record for approval.

This table lists the available Advanced Approvals resources.

Resource	Description
/connect/advanced-approvals/approval-submission/preview (POST)	Preview the approval levels of a record and associated level details, approval chains, approvers, and conditions before you submit the record for an approval.

Resources
Learn more about the available Advanced Approvals resources.

Request Bodies
Learn more about the available request bodies.

Response Bodies
Learn more about the available response bodies.

Resources

Learn more about the available Advanced Approvals resources.

Preview Approval (POST)
Preview the approval levels of a record and associated level details, approval chains, approvers, and conditions before you submit the record for an approval.

Preview Approval (POST)

Preview the approval levels of a record and associated level details, approval chains, approvers, and conditions before you submit the record for an approval.

For example, a sales rep working on a quote can preview the approval levels for a quote before submitting the quote for approval.

Resource

```
/connect/advanced-approvals/approval-submission/preview
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/advanced-approvals/approval-submission/preview
```

Available version

65.0

HTTP methods

POST

Request body for POST

JSON example

```
{
  "flowApiName": "QuoteApprovals",
  "objectApiName": "Quote",
```

```
  "recordId": "0Q0DU0000005HZC0A2",
  "inputParameters": {
    "approverComments": "Submitted for approval",
    "requestType": "Standard"
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`flowApiName`	String	API name of the auto-launched flow.	Required	65.0
`objectApiName`	String	API name of the object to preview the approvals for.	Required	65.0
`recordId`	String	ID of the record to preview the approvals for.	Required	65.0
`inputParameters`	Map<String, Object>	List of input parameters to preview.	Optional	67.0

Response body for POST

Preview Approval

Request Bodies

Learn more about the available request bodies.

Preview Approval Input

Input representation of the details of the request to preview an approval.

Preview Approval Input

Input representation of the details of the request to preview an approval.

JSON example

```
{
  "flowApiName": "QuoteApprovals",
  "objectApiName": "Quote",
  "recordId": "0Q0DU0000005HZC0A2",
  "inputParameters": {
    "approverComments": "Submitted for approval",
    "requestType": "Standard"
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`flowApiName`	String	API name of the auto-launched flow.	Required	65.0
`objectApiName`	String	API name of the object to preview the approvals for.	Required	65.0
`recordId`	String	ID of the record to preview the approvals for.	Required	65.0
`inputParameters`	Map<String, Object>	List of input parameters to preview.	Optional	67.0

Response Bodies

Learn more about the available response bodies.

Preview Approval
Output representation of the details of a preview approval request.

Preview Approval Chain Item
Output representation of the details of an approval chain item for a specific group.

Preview Approval Error
Output representation of the error details associated with the Preview Approval API.

Preview Approval Item
Output representation of the details of a specific approval item with an approval chain.

Preview Approval

Output representation of the details of a preview approval request.

JSON example

```
{
  "approvalChainItems": [
    {

            "isAutoReviewed": false
          }
        }
      ]
    }
  ],
  "flowOrchestrationDefinitionVersionId": "0jEDU0000001nZm",
  "status": "Success"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
approvalChainName	String	Name of the approval chain.	Small, 65.0	65.0
approvalItems	Preview Approval Item[]	Details of the approval items.	Small, 65.0	65.0

Preview Approval Error

Output representation of the error details associated with the Preview Approval API.

JSON example

This example shows a sample error scenario.

```
{
  "approvalChainItems": [],
  "error": {
    "correlationId": "0Q0DU0000005HZC0A2",
    "errorCode": "[xmlrpc=-1, statusCode=INVALID_API_INPUT, exceptionCode=null,
scope=PublicApi, http=400]",
    "errorMessage": "Looks like the flow associated with this approval workflow for the
 current record isn't active. Activate the flow and try again.",
    "source": "PreviewApprovalDataProcessingException"
  },
  "status": "Failure"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
correlationId	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Small, 65.0	65.0
errorCode	String	Code for the resultant error.	Small, 65.0	65.0
errorMessage	String	Error message for the resultant error.	Small, 65.0	65.0
source	String	Details about the source of the error.	Small, 65.0	65.0

Preview Approval Item

Output representation of the details of a specific approval item with an approval chain.

JSON example

```
{
  "approvalChainItems": [
    {
```

```
    "approvalChainName": "FINANCE",
    "approvalItems": [
      {
        "stepApiName": "CPIFC",
        "approvalConditionName": "Payment Term Greater Than 90 Days",
        "assignedTo": "005XX000001ABCQYA4",
        "assigneeType": "User",
        "assigneeDetails": {
          "id": "005XX000001ABCQYA4",

Property Name	Type	Description	Filter Group and Version	Available Version
additional Fields	Map<String, String>	Details of any additional fields in the approval workflow.	Small, 65.0	65.0
approval ConditionName	String	Details of the configured conditions in the approval workflow.	Small, 65.0	65.0
assignedTo	String	Name of the assignee that the approval request is assigned to.	Small, 65.0	65.0
assigneeType	String	Type of assignee.	Small, 65.0	65.0
assigneeDetails	Map<String, Object>	Includes the details of an assignee, such as ID, name, type, API name, and email.	Small, 65.0	65.0
dependencies	String[]	Specifies dependencies among approval steps, which are entry conditions based on the status of a previous step within the same stage.	Small, 65.0	65.0
level	Integer	Hierarchy level of the approval item.	Small, 65.0	65.0
objectApiName	String	API name of the object to preview the approval for.	Small, 65.0	65.0
objectId	String	ID of the object to preview the approval for.	Small, 65.0	65.0
parents	String[]	Details of the parent step.	Small, 65.0	65.0
stage	Map<String, String>	Includes the API name and label.	Small, 65.0	65.0
status	String	Status of the approval request.	Small, 65.0	65.0
stepApiName	String	API name of the step.	Small, 65.0	65.0

Advanced Approvals Metadata API Types

Metadata API enables you to access some types and feature settings that you can customize in the user interface.

Flow for Advanced Approvals
The flow for Advanced Approvals represents the metadata associated with a flow. With Flow, you can create an application that takes users through a series of pages to query and update the records in the database. You can also run logic and provide branching capability based on user input to build dynamic applications.

SEE ALSO:

Metadata API Developer Guide: Understanding Metadata API

Flow for Advanced Approvals

The flow for Advanced Approvals represents the metadata associated with a flow. With Flow, you can create an application that takes users through a series of pages to query and update the records in the database. You can also run logic and provide branching capability based on user input to build dynamic applications.

FlowActionCall

Advanced Approvals exposes additional actionType values for the FlowActionCall metadata type.

Field Name	Field Type	Description
`actionType`	InvocableActionType (enumeration of type string)	Required. The action type. Additional valid values for Advanced Approvals are: • `cancelApprovalSubmission`—Cancels an approval submission and all child approval work items that haven't been completed. You can also add comments about why the approval admin made the cancellation. Added in API version 62.0 and later. • `overrideApprovalWorkItem`—Update an approval work item status with the approval admin decision and any comments that the approval admin added. Added in API version 62.0 and later. • `reassignApprovalWorkItem`—Reassign an approval work item that hasn't been completed. You can also add comments about why the approval admin reassigned the approval work item. Added in API version 62.0 and later. • `recallApprovalSubmission`—Recall an approval submission that isn't completed. You can also add comments that the submitter or approval admin made the recall. Added in API version 62.0 and later. • `reviewApprovalWorkItem`—Update an approval work item status with the assignee or reviewer's decision and any comments that the assignee or reviewer added. Added in API version 62.0 and later.

Field Name	Field Type	Description
		• `getPreviousRelaRecDetails`—Get the related record details submitted for approval before the current approval submission. The details are required for approval steps that use custom logic for auto-approvals. Added in API version 66.0 and later.

/

CHAPTER 10 Dynamic Revenue Orchestrator

In this chapter ...

Get visibility into a product's fulfillment journey. Also, get a complete view of the entire fulfillment design that includes processes such as order decomposition, fulfillment plans, and jeopardy management.

EDITIONS

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Dynamic Revenue Orchestrator Standard Objects

The Dynamic Revenue Orchestrator data model provides objects and fields to manage details of a product's fulfillment.

AssetFulfillmentDecomp

Represents the relationship between an ordered asset and its corresponding fulfillment asset. This object is available in API version 62.0 and later.

FulfillmentAsset

Represents an instance of a technical product used to provide a customer asset. This object is available in API version 61.0 and later.

FulfillmentAssetAttribute

Represents an attribute of a fulfillment asset. This object is available in API version 61.0 and later.

FulfillmentAssetRelationship

Represents a relationship between two fulfillment assets. This object is available in API version 61.0 and later.

FulfillmentAssetStatePeriod

Represents the period during which the fulfillment asset configuration is applicable. This object is available in API version 67.0 and later.

FulfmtAssetStatePeriodAttr

Represents the key-value pair of a fulfillment asset attribute applicable during a specific asset state period. This object is available in API version 67.0 and later.

FulfillmentFalloutRule

Represents the fulfillment fallout handling rule. This object is available in API version 61.0 and later.

FulfillmentLineAttribute

Represents an attribute of a fulfillment order line. This object is available in API version 61.0 and later.

FulfillmentLineRel

Represents a relationship between two fulfillment order lines. This object is available in API version 61.0 and later.

FulfillmentLineSourceRel

Represents the relationship between a fulfillment order line and its decomposition source. This object is available in API version 61.0 and later.

FulfillmentPlan

Represents a set of steps to be created to fulfill the order. This object is available in API version 61.0 and later.

FulfillmentStep

Represents a task that's required to perform a certain action as part of order fulfillment. This task can be manual or automated. This object is available in API version 61.0 and later.

FulfillmentStepDefinition

Represents a definition of a step that must be executed during fulfillment orchestration. This object is available in API version 61.0 and later.

FulfillmentStepDefinitionGroup

Represents a set of fulfillment step definitions. This object is available in API version 61.0 and later.

FulfillmentStepDependency

Represents a dependency between tasks by defining the order between a task and one that depends on it. This object is available in API version 61.0 and later.

FulfillmentStepDependencyDef

Represents a dependency that must be created between two fulfillment step records. This object is available in API version 62.0 and later.

FulfillmentStepJeopardyRule

Represents the duration and tolerance for the step in the fulfillment process to allow the overall tracking of rules and risks. This object is available in API version 61.0 and later.

FulfillmentStepSource

Represents a link between a fulfillment step and the corresponding order lines. This object is available in API version 61.0 and later.

FulfillmentTaskAssignmentRule

Represents a set of actions that assign a task to a user or queue. This object is available in API version 63.0 and later.

FulfillmentWorkspace

Represents a visual designer for fulfillment plans that can have multiple step groups and their dependencies. This object is available in API version 61.0 and later.

FulfillmentWorkspaceItem

Represents information about the attributes that are used in the definition for a fulfillment step group. This object is available in API version 61.0 and later.

ProductDecompEnrichmentRule

Represents mappings between fields and attributes. Enrichment rules are part of a decomposition rule, and are used to propagate data to fulfillment order lines. This object is available in API version 61.0 and later.

ProdtDecompEnrchVarMap

Represents the mapping of a field context tag or an attribute to a variable within an expression set. This object is available in API version 64.0 and later.

ProductFulfillmentDecompRule

Represents a rule that determines how an order is broken into sub-orders with specific technical details that help in order fulfillment. It can be applied to a commercial or a technical product. This object is available in API version 61.0 and later.

ProductFulfillmentScenario

Represents a link between a product and the corresponding group of fulfillment steps that's necessary to fulfill that product. This object is available in API version 61.0 and later.

SalesTrxnDeleteEvent

Represents the platform event that triggers the deletion of sales transaction fulfillment request records when the corresponding reference records are deleted. This object is available in API version 64.0 and later.

SalesTransactionFulfillReq

Represents the statuses of all the sub-orders that belong to the selected commercial or technical product. This object is available in API version 62.0 and later.

ValTfrm

Represents mappings between fields and attributes. Enrichment rules are part of a decomposition rule, and are used to propagate data to fulfillment order lines. This object is available in API version 61.0 and later.

ValTfrmGrp
Represents a rule that determines how an order is broken into sub-orders with specific technical details that help in order fulfillment. The rule can be applied to a commercial or a technical product. This object is available in API version 61.0 and later.

SOAP API Developer Guide: Introduction to SOAP API

AssetFulfillmentDecomp

Represents the relationship between an ordered asset and its corresponding fulfillment asset. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`FulfillmentSourceAssetId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The identifier of the relationship between an asset and a fulfillment asset. This field is a polymorphic relationship field. **Relationship Name** FulfillmentSourceAsset **Refers To** Asset, FulfillmentAsset
`FulfillmentTargetAssetId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The identifier of the target asset that's being fulfilled. This field is a relationship field. **Relationship Name** FulfillmentTargetAsset

Field	Details
	Refers To FulfillmentAsset
IsUsedForFulfmtAssetActivation	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates if internal jobs are allowed to activate the related fulfillment asset. The default value is true. This field is available in API version 6.0 and later.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the asset that's being fulfilled.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who created the request record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
RelationshipType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of relationship between an asset and a fulfillment asset. Valid values are: • SourceBundleRoot • SourceLineItem

Field	Details
SegmentIdentifier	**Type** string **Properties** Create, Group, Nillable, Sort, **Description** The ID of the ramp segment associated with the asset state period. This field is available in API version 63.0 and later in orgs that have Revenue Management when the Ramp Deals setting is enabled.
Status	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The status of the fulfillment asset. Valid values are: • Active • Inactive

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AssetFulfillmentDecompHistory on page 2873
History is available for tracked fields of the object starting API version 65.0.

AssetFulfillmentDecompShare on page 2877
Sharing is available for the object.

FulfillmentAsset

Represents an instance of a technical product used to provide a customer asset. This object is available in API version 61.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AccountId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The identifier of the account. This field is a relationship field. **Relationship Name** Account **Relationship Type** Lookup **Refers To** Account
IsTimeAware	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates if the fulfillment asset's configuration data is tracked in a time-aware or time-agnostic manner. Available in API version 67.0 and later. The default value is `false`.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **For internal use only.**
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **For internal use only.**
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update

Field	Details
	Description The name of the fulfillment asset.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** For internal use only. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User
ProductId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The identifier of the corresponding product. This field is a relationship field. **Relationship Name** Product **Relationship Type** Lookup **Refers To** Product2
Quantity	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** For internal use only.
ScopeIdentifierText	**Type** string

Field	Details
	Properties Create, Filter, Group, idLookup, Nillable, Sort **Description** The scope in which this fulfillment asset record is created. This field is available in API version 65.0 and later.
`StateEndTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Represents the end time of the current fulfillment asset state period. Available in API version 67.0 and later.
`StateStartTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Represents the start time of the current fulfillment asset state period. Available in API version 67.0 and later.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The status of the fulfillment asset. Valid values are: • `Active` • `InActive`
`UnitOfMeasureId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The unit of measure for the asset quantity such as, unit, gallon, ton, or case. This field is available in API version 63.0 and later. This field is a relationship field.

Field	Details
	Relationship Name UnitOfMeasure **Refers To** UnitOfMeasure

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

FulfillmentAssetHistory on page 2873
History is available for tracked fields of the object starting API version 65.0.

FulfillmentAssetShare on page 2877
Sharing is available for the object.

FulfillmentAssetAttribute

Represents an attribute of a fulfillment asset. This object is available in API version 61.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `update()`, `upsert()`

Fields

Field	Details
`AttributeDefinitionId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The attribute definition in the catalog. This field is a relationship field. **Relationship Name** AttributeDefinition **Relationship Type** Lookup **Refers To** AttributeDefinition

Field	Details
AttributeName	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** The name of the attribute.
AttributePicklistValueId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** For internal use only. This field is a relationship field. **Relationship Name** AttributePicklistValue **Relationship Type** Lookup **Refers To** AttributePicklistValue
AttributeValue	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The value of the attribute.
ExternalId	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** For internal use only.
FulfillmentAssetId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The identifier of the fulfillment asset.

Field	Details
	This field is a relationship field. **Relationship Name** FulfillmentAsset **Relationship Type** Master-detail **Refers To** FulfillmentAsset (the master object)

FulfillmentAssetRelationship

Represents a relationship between two fulfillment assets. This object is available in API version 61.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AssociatedFulfillAssetRole	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The role of the associated fulfillment asset. Valid values are: • `BundleComponent` • `ClassificationComponent`—Product Classification Component
AssociatedFulfillmentAssetId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The name of the associated fulfillment asset. This field is a relationship field.

Field	Details
	Relationship Name AssociatedFulfillmentAsset **Refers To** FulfillmentAsset
EndTime	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The time until when this asset relationship is valid.
MainFulfillmentAssetId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The name of the primary fulfillment asset. This field is a relationship field. **Relationship Name** MainFulfillmentAsset **Relationship Type** Master-detail **Refers To** FulfillmentAsset (the master object)
MainFulfillmentAssetRole	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The role of the primary fulfillment asset. Valid value is `Bundle Parent`.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the fulfillment asset relationship.

Field	Details
ProductRelationshipTypeId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The type of relationship between two assets. This field is a relationship field. **Relationship Name** ProductRelationshipType **Refers To** ProductRelationshipType
StartTime	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The time from when this asset relationship is valid.

FulfillmentAssetStatePeriod

Represents the period during which the fulfillment asset configuration is applicable. This object is available in API version 67.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Fields

Field	Details
CurrencyIsoCode	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Possible values are:

Field	Details
	• `EUR`—Euro • `INR`—Indian Rupee • `USD`—U.S. Dollar The default value is `USD`.
`EndTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Represents the end time of the state period. If null, the configuration is effective from Start Time. If Start Time is also null, the configuration is effective at all times.
`FulfillmentAssetId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Represents the fulfillment asset to which this fulfillment asset state period applies. This field is a relationship field. **Relationship Name** FulfillmentAsset **Relationship Type** Master-detail **Refers To** FulfillmentAsset (the master object)
`IsSuperseded`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates if the state period is superseded and the record is replaced by a newer version due to updates by the fulfillment process. The default value is `false`.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort

Field	Details
	Description The name of the fulfillment asset state period.
`Quantity`	**Type** double **Properties** Create, Filter, Sort, Update **Description** Represents the fulfillment product quantity applicable for the state period.
`StartTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Represents the start time of the state period. If null, the configuration is effective until End Time. If End Time is also null, the configuration is effective at all times.

FulfmtAssetStatePeriodAttr

Represents the key-value pair of a fulfillment asset attribute applicable during a specific asset state period. This object is available in API version 67.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Fields

Field	Details
`AttributeDefinitionId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Represents the definition of the fulfillment asset state period attribute. This field is a relationship field.

Field	Details
	Relationship Name AttributeDefinition **Refers To** AttributeDefinition
AttributeName	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** Represents the name of the fulfillment asset state period attribute.
AttributePicklistValueId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Represents the reference identifier of the selected picklist value. This field is a relationship field. **Relationship Name** AttributePicklistValue **Refers To** AttributePicklistValue
AttributeValue	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Represents the value of the fulfillment asset state period attribute.
ExternalId	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Represents the external ID of the fulfillment asset state period attribute.
FulfillmentAssetStatePeriodId	**Type** reference

Field	Details
	Properties Create, Filter, Group, Sort **Description** Represents the fulfillment asset period applicable to the object. This field is a relationship field. **Relationship Name** FulfillmentAssetStatePeriod **Relationship Type** Master-detail **Refers To** FulfillmentAssetStatePeriod (the master object)

FulfillmentFalloutRule

Represents the fulfillment fallout handling rule. This object is available in API version 61.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`ErrorCode`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The failure error code of the fulfillment step that's associated with the rule.
`FalloutQueueId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The fallout queue that's associated with the fallout task. This field is available in API version 62.0 and later. This field is a relationship field.

Field	Details
	Relationship Name FalloutQueue **Refers To** Group
FlowDefinitionName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The name of the flow definition that's associated with the `AutoTask` type of fulfillment step.
IntegrationDefinitionId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The integration definition that's associated with the `Callout` type of fulfillment step. This field is a relationship field. **Relationship Name** IntegrationDefinition **Relationship Type** Lookup **Refers To** IntegrationProviderDef
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date when a user referenced this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date when a user viewed this record.

Field	Details
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the flow definition that's associated with the `AutoTask` type of fulfillment step.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who created the fulfillment record. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User
RetriesAllowed	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The maximum number of times a retry policy is run before the fulfillment step is considered failed.
RetryIntervals	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The interval after which the selected retry policy is run when the fulfillment step fails. This field is available in API version 62.0 and later.
RetryPolicy	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies the retry policy used when the fulfillment step fails. Valid value is: • `Immediate` • `Monotonous` • `Staggered`
`StepType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies the type of fulfillment step associated with the fallout rule. Valid values are: • `AutoTask` • `Callout` • `ManualTask` • `Milestone` • `Pause`

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

FulfillmentFalloutRuleHistory on page 2873
History is available for tracked fields of the object.

FulfillmentFalloutRuleShare on page 2877
Sharing is available for the object.

FulfillmentLineAttribute

Represents an attribute of a fulfillment order line. This object is available in API version 61.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `update()`, `upsert()`

Fields

Field	Details
AttributeDefinitionId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** A unique identifier for the attribute definition in the catalog. This field is a relationship field. **Relationship Name** AttributeDefinition **Refers To** AttributeDefinition
AttributeName	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** The name of the attribute.
AttributePicklistValueId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** For internal use only. This field is a relationship field. **Relationship Name** AttributePicklistValue **Refers To** AttributePicklistValue
AttributeValue	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The value of the attribute.

Field	Details
`ExternalId`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID that uniquely identifies the relationship in an external data source.
`FulfillmentOrderLineItemId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** A unique identifier for the fulfillment order line item. This field is a relationship field. **Relationship Name** FulfillmentOrderLineItem **Relationship Type** Master-detail **Refers To** FulfillmentOrderLineItem (the master object)

FulfillmentLineRel

Represents a relationship between two fulfillment order lines. This object is available in API version 61.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AssociatedFoItemInventory`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort

Field	Details
	Description Inventory level for the associated fulfillment order item. Valid values are: • `Included in Main Inventory` • `Not Included in Main Inventory` This field is available in API version 63.0 and later.
`AssociatedFulfillOrderItemId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The identifier of the associated fulfillment order line item. This field is a relationship field. **Relationship Name** AssociatedFulfillOrderItem **Refers To** FulfillmentOrderLineItem
`AssociatedLineRole`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The role of the associated fulfillment order line item. Valid values are: • `BundleComponent` • `ClassificationComponent`—Product Classification Component
`AssociatedQuanScaleMethod`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Method used to scale the quantity of the associated order item summary relative to the main fulfillment order item. Valid values are: • `Constant` • `Proportional`

Field	Details
	The default value is `Proportional`. This field is available in API version 63.0 and later.
`FulfillmentOrderId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The ID of the parent fulfillment order. This field is a relationship field. **Relationship Name** FulfillmentOrder **Refers To** FulfillmentOrder
`MainFulfillOrderItemRole`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The role of the primary fulfillment order line item. Valid value is `Bundle`.
`MainFulfillmentOrderItemId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the associated fulfillment order line item. This field is a relationship field. **Relationship Name** MainFulfillmentOrderItem **Relationship Type** Master-detail **Refers To** FulfillmentOrderLineItem (the master object)
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort

Field	Details
	Description The name of the fulfillment order line relationship.
`ProductRelationshipTypeId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The type of relationship between two assets. This field is a relationship field. **Relationship Name** ProductRelationshipType **Refers To** ProductRelationshipType

FulfillmentLineSourceRel

Represents the relationship between a fulfillment order line and its decomposition source. This object is available in API version 61.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`Action`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies the action to be performed on the asset fulfillment decomposition record. This field is available in API version 66.0 and later. Possible values are: • `Add` • `Cancel` • `NoChange`—No Change

Field	Details
FulfilmentOrderLineId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The ID of the fulfillment order line. This field is a relationship field. **Relationship Name** FulfilmentOrderLine **Refers To** FulfillmentOrderLineItem
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The relation between the two order line sources.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who created the relationship record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
SourceItemIdentifier	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update **Description** The ID of the decomposition source that's related to the fulfilment order line. This field is available in API version 64.0 and later.
SourceLineItemId	**Type** reference

Field	Details
	Properties Create, Filter, Group, Sort, Update **Description** The ID of the source line item. This field is a polymorphic relationship field. **Relationship Name** SourceLineItem **Refers To** FulfillmentOrderLineItem, OrderItem
`SourceType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of source for the line item. Valid values are: • `SourceBundleRoot` • `SourceLineItem`
`SupplementalAction`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** The supplemental action that's applied to the line item based on the run-time changes made to the original fulfillment request. This field is available in API version 62.0 and later. Valid values are: • `Add` • `Amend` • `Cancel` • `NoChange`
`UniqueIdentifier`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort **Description** For internal use only.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

FulfillmentLineSourceRelShare on page 2877
Sharing is available for the object.

FulfillmentPlan

Represents a set of steps to be created to fulfill the order. This object is available in API version 61.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
ExecutionUserId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** For internal use only. **Relationship Name** ExecutionUser **Refers To** User
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date when a user referenced this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date when a user viewed this record.

Field	Details
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the fulfillment plan.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who created the record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
Priority	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The priority of the fulfillment plan execution. This field is available in API version 63.0 and later. Valid values are: • Default • High • Bulk
SourceIdentifier	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update, idLookup (Available in API version 64.0 and later) **Description** For internal use only.
SourceType	**Type** string

Field	Details
	Properties Create, Filter, Group, Nillable, Sort **Description** The type of source for the fulfillment plan. This field is available in API version 62.0 and later.
State	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of the fulfillment plan. Valid values are: • `Completed` • `InProgress` • `NotStarted`
UsageType	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The business that uses Fulfillment Orchestration. Valid values are: • `IntegrationOrchestrator` • `Generic` • `StageManagement`

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

FulfillmentPlanChangeEvent on page 2864
Change events are available for the object.

FulfillmentPlanHistory on page 2873
History is available for tracked fields of the object starting API version 65.0.

FulfillmentPlanShare on page 2877
Sharing is available for the object.

FulfillmentStep

Represents a task that's required to perform a certain action as part of order fulfillment. This task can be manual or automated. This object is available in API version 61.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`ActualCompletionDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time when the fulfillment step state changed to `Completed` or `Skipped`.
`ActualStartDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time when the fulfillment step state changed to `Ready`.
`AssignedToId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The user or queue associated with the fulfillment step. This field is a polymorphic relationship field. **Relationship Name** AssignedTo **Relationship Type** Lookup **Refers To** Queue, User
`CustomConfigParameter`	**Type** string

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** Represents the custom configuration context set by the designer in the Fulfillment Step Definition record. This context is passed to fulfillment steps during execution to enable flow reusability.
`CompensatedStepId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The alternative step that's executed when a particular step in the fulfillment plan is amended or canceled. This field is a relationship field. This field is available in API version 62.0 and later. **Relationship Name** CompensatedStep **Refers To** FulfillmentStep
`DelayOf`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The value of the delay. This field is available in API version 63.0 and later.
`DelayUnit`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The unit for the delay of the fulfillment step. This field is available in API version 63.0 and later. Valid values are: • `Days` • `Hours` • `Minutes`
`ExecuteOn`	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies when to execute the fulfillment step. This field is available in API version 63.0 and later. Valid values are: • `PreviousStepExecutionDate` • `SourceLineStartDate`
`ExecuteOnRuleId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The name of the expression set. The fulfillment step is executed only when its corresponding expression set returns the value `true`. This field is a polymorphic relationship field. **Relationship Name** ExecuteOnRule **Relationship Type** Lookup **Refers To** ExpressionSet
`ExecutionMessage`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** For internal use only.
`FalloutQueueId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The fallout queue that's associated with the fallout task. This field is available in API version 62.0 and later. This field is a relationship field. **Relationship Name** FalloutQueue

Field	Details
	Refers To Group
FlowDefinitionName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The name of the flow definition that's associated with the `AutoTask` type of fulfillment step. This field is available in API version 62.0 and later.
FlowInterviewId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The flow interview associated with the fulfillment step. This field is a relationship field. **Relationship Name** FlowInterview **Relationship Type** Lookup **Refers To** FlowInterview
ForcePlanFreezeDuringExecution	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies whether to freeze the plan while the step is in progress. If enabled, specifies how to complete the step before resuming the plan. This field is available in API version 63.0 and later. Valid values are: • `Never` • `YesButWaitForStepCompletion` The default value is `Never`.
FulfillmentPlanId	**Type** reference

Field	Details
	Properties Create, Filter, Group, Sort, Update **Description** The fulfillment plan associated with the fulfillment step. This field is a relationship field. **Relationship Name** FulfillmentPlan **Relationship Type** Lookup **Refers To** FulfillmentPlan
`FulfillmentStepDefinitionId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The fulfillment step definition associated with the fulfillment step. This field is a relationship field. **Relationship Name** FulfillmentStepDefinition **Relationship Type** Lookup **Refers To** FulfillmentStepDefinition
`IntegrationDefinitionNameId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** For internal use only. This field is a relationship field. **Relationship Name** IntegrationDefinitionName **Relationship Type** Lookup **Refers To** IntegrationProviderDef

Field	Details
IsSkipBranch	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the remaining steps in the fulfillment step group are skipped from execution when the Execute On Rule condition is set (`true`) or not (`false`). This field is available in API version 62.0 and later. The default value is `false`.
JeopardyStatus	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The jeopardy status of the fulfillment step. This field is a calculated field.
JeopardyThreshold	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The number of days, hours, minutes, or seconds, counting back from the expected duration, before a fulfillment step is in jeopardy.
JeopardyThresholdUnit	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The time unit of the jeopardy threshold. Valid values are: • `Days` • `Hours` • `Minutes` • `Seconds` The default value is `Minutes`.
LastReferencedDate	**Type** dateTime

Field	Details
	Properties Filter, Nillable, Sort **Description** The most recent date when a user referenced this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date when a user viewed this record.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the fulfillment step.
NextEarliestRunTime	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The next available time for the process execution. This field is available in API version 62.0 and later.
OmniscriptName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** For inyternal use only.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who created the record. This field is a polymorphic relationship field.

Field	Details
	Relationship Name Owner **Relationship Type** Lookup **Refers To** Group, User
`PlannedCompletionDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time Dynamic Revenue Orchestrator estimates that the fulfillment step will complete.
`PlannedStartDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time when the Dynamic Revenue Orchestrator calculates the fulfillment step state change to `Ready`.
`PointOfNoReturn`	**Type** multipicklist **Properties** Create, Filter, Nillable **Description** The type of source change applied to the line item. This field is available in API version 62.0 and later. Valid value is: • `Changes Denied`
`RequestedCompletionDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The planned completion date and time of the fulfillment step.

Field	Details
`RequestedStartDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The planned start date and time of the fulfillment step.
`ResumeOnRuleId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The rule set or expression set for the fulfillment step. The step is completed only when the corresponding expression set returns the `isExecuteStep` output as `true`. This field is a polymorphic relationship field. **Relationship Name** ResumeOnRule **Relationship Type** Lookup **Refers To** ExpressionSet
`RetryAttempts`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The number of attempts allowed for retry as set up in the Fallout Qualification Rule table.
`RunAsUserId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Overrides user context for an automated step. The default user context is AutomatedProc user. This field is a relationship field. **Relationship Name** RunAsUser **Relationship Type** Lookup

Field	Details
	Refers To User
`State`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The state of the fulfillment step. For example, `In Progress` or `Completed`. Valid values are: • `Completed` • `Failed` • `FatallyFailed` • `InProgress` • `Pending` • `Ready` • `Scheduled` • `Skipped`
`StepType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The fulfillment step type associated with the fulfillment step. Valid values are: • `AutoTask` • `Callout` • `ManualTask` • `Milestone` • `Pause` • `StagedAssetize`—Available in API version 63.0 and later.
`TaskAllocationType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The method of assigning the manual step. This field is available in API version 63.0 and later.

Field	Details
	Valid values are: • `ContextBased` • `LeastLoaded` • `RoundRobin`
`TaskId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the task assigned to a user or queue. This field is available in API version 63.0 and later. This field is a relationship field. **Relationship Name** Task **Refers To** Task
`UsageType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The details about the business that uses Fulfillment Orchestration. Some examples of UsageBy include Financial Services Cloud and CPQ. Valid values are: • `Fulfillment` • `InsuranceRuleAction` • `IntegrationOrchestrator` • `OrderFulfillment`

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

FulfillmentStepChangeEvent on page 2864
Change events are available for the object.

FulfillmentStepHistory on page 2873
History is available for tracked fields of the object.

FulfillmentStepShare on page 2877
Sharing is available for the object.

FulfillmentStepDefinition

Represents a definition of a step that must be executed during fulfillment orchestration. This object is available in API version 61.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AmendGroupId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The fulfillment step group that's added to the fulfillment plan when the step is amended. This field is available in API version 62.0 and later. This field is a relationship field. **Relationship Name** AmendGroup **Refers To** FulfillmentStepDefinitionGroup
`AssignedToId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The user or queue associated with the fulfillment step definition. This field is a polymorphic relationship field. **Relationship Name** AssignedTo **Relationship Type** Lookup

Field	Details
	Refers To Queue, User
CancelledGroupId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The fulfillment step group that's added to the fulfillment plan when the step is canceled. This field is available in API version 62.0 and later. This field is a relationship field. **Relationship Name** CancelledGroup **Refers To** FulfillmentStepDefinitionGroup
CustomBaseExecutionDate	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The context tag containing a custom date that's used to calculate the execution time for a future-dated step. This field is available in API version 65.0 and later.
CustomConfigParameter	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Represents the custom configuration context given by the designer. This context is passed to fulfillment steps during execution to support flow reusability.
CustomFulfillmentScope	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The custom scope to use during order fulfillment. This field is available in API version 65.0 and later.
DelayOf	**Type** int

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The value of the delay. This field is available in API version 63.0 and later.
`DelayUnit`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The unit for the delay of the fulfillment step. This field is available in API version 63.0 and later. Valid values are: • `Days` • `Hours` • `Minutes`
`ExecuteOn`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies when to execute the fulfillment step. This field is available in API version 63.0 and later. Valid values are: • `PreviousStepsStartDate` • `SourceLineStartDate`
`ExecuteOnConditionData`	**Type** textarea **Properties** Create, Nillable, Update **Description** The condition for executing the fulfillment step. The condition is defined as a rule or a set of rules in JSON format. This field is available in API version 66.0 and later.
`ExecuteOnRuleId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The expression set for the fulfillment step. The step is executed only when the corresponding expression set is `true`. This field is a polymorphic relationship field. **Relationship Name** ExecuteOnRule **Relationship Type** Lookup **Refers To** ExpressionSet
`FlowDefinitionName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The name of the associated flow.
`ForcePlanFreezeDuringExecution`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies whether to freeze the plan while the step is in progress. If enabled, specifies how to complete the step before resuming the plan. This field is available in API version 63.0 and later. Valid values are: • `Never` • `YesButForcefullyCompleteStep` The default value is `Never`.
`IntegrationDefinitionNameId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The name of the integration definition that's used to set up communication with an external endpoint. This field is a relationship field. **Relationship Name** IntegrationDefinitionName

Field	Details
	Relationship Type Lookup **Refers To** IntegrationProviderDef
`IsSkipBranch`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the remaining steps in the fulfillment step group are skipped from execution when the Execute On Rule condition is set. This field is available in API version 62.0 and later. The default value is `false`.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date when a user referenced this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date when a user viewed this record.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the fulfillment step definition.
`OmniscriptName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** For internal use only.

Field	Details
`PointOfNoReturn`	**Type** multipicklist **Properties** Create, Filter, Nillable, Update **Description** The type of source change applied to the line item. This field is available in API version 62.0 and later. Valid value is: • `Changes Denied`
`ResumeOnConditionData`	**Type** textarea **Properties** Create, Nillable, Update **Description** The condition for resuming the paused fulfillment step. The condition is defined as a rule or a set of rules in JSON format. This field is available in API version 66.0 and later.
`ResumeOnRuleId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The expression set for the fulfillment step definition. The step is completed when the expression set is `true`. This field is a polymorphic relationship field. **Relationship Name** ResumeOnRule **Relationship Type** Lookup **Refers To** ExpressionSet
`RunAsUserId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The user context to run a fulfillment step when the fulfillment operator wants to override the default autoproc user. This field is a relationship field.

Field	Details
	Relationship Name RunAsUser **Relationship Type** Lookup **Refers To** User
Scope	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The scope of the fulfillment step definition. For example, `Bundle` or `Order`. Valid values are: • `Bundle` • `CrossPlan` • `LineItem` • `Plan` The default value is `Plan`.
StepDefinitionGroupId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** For internal use only. This field is a relationship field. **Relationship Name** StepDefinitionGroup **Relationship Type** Master-detail **Refers To** FulfillmentStepDefinitionGroup (the master object)
StepType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** For internal use only.

Field	Details
	Valid values are: • `AutoTask` • `Callout` • `ManualTask` • `Milestone` • `Pause` • `StagedAssetize`
`TaskAllocationType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The method of assigning the manual step. This field is available in API version 62.0 and later. Valid value is: • `RoundRobin` • `LeastLoaded` • `ContextBased`
`UsageType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The business vertical that uses fulfillment orchestration. For example, Financial Services Cloud. Valid values are: • `IntegrationOrchestrator` • `OrderFulfillment`

FulfillmentStepDefinitionGroup

Represents a set of fulfillment step definitions. This object is available in API version 61.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date when a user referenced this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date when a user viewed this record.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the fulfillment step definition group.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who created the record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
UsageType	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The business that uses Fulfillment Orchestration.

Field	Details
	Possible values are: • `IntegrationOrchestrator` • `Generic` • `InsuranceRuleAction`

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

FulfillmentStepDefinitionGroupHistory on page 2873

History is available for tracked fields of the object.

FulfillmentStepDefinitionGroupShare on page 2877

Sharing is available for the object.

FulfillmentStepDependency

Represents a dependency between tasks by defining the order between a task and one that depends on it. This object is available in API version 61.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`DependencyDefinitionId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The name of the fulfillment step dependency definition. This field is a relationship field. **Relationship Name** DependencyDefinition **Refers To** FulfillmentStepDependencyDef

Field	Details
`DependentStepId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The name of a fulfillment step that depends on this step. This field is a relationship field. **Relationship Name** DependentStep **Relationship Type** Master-detail **Refers To** FulfillmentStep
`DependsOnStepId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The name of the fulfillment step that this step depends on. That is, the name of the step that must be executed before this one can run. This field is a relationship field. **Relationship Name** DependsOnStep **Refers To** FulfillmentStep
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** An automatically generated name for the fulfillment step dependency.

FulfillmentStepDependencyDef

Represents a dependency that must be created between two fulfillment step records. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`DependencyScope`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The scope of the fulfillment step dependency definition. For example, Order or Order Item. Valid values are: • `Bundle` • `LineItem` • `Plan` • `CrossPlan` • `Custom` The default value is `Plan`.
`DependsOnStepDefinitionId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The fulfillment step definition that must be executed before this step. This field is a relationship field. **Relationship Name** DependsOnStepDefinition **Refers To** FulfillmentStepDefinition
`FulfillmentStepDefinitionId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The identifier of the fulfillment step definition. This field is a relationship field.

Field	Details
	Relationship Name FulfillmentStepDefinition **Relationship Type** Master-detail **Refers To** FulfillmentStepDefinition (the master object)
IsCompensateInReverse	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the order to insert the compensated group steps is reversed when a fulfillment step is canceled (`true`) or not (`false`). The default value is `false`. This field is available in API version 63.0 and later.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the fulfillment step dependency definition.
PropagateStateToDependentStep	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The state that's propagated to the dependent fulfillment step when the source fulfillment step is amended or canceled in the fulfillment plan. Valid values are: • `Amended` • `Both` • `Canceled` • `None` This field is available in API version 63.0 and later.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

FulfillmentStepDependencyDefChangeEvent on page 2864
Change events are available for the object.

FulfillmentStepDependencyDefFeed on page 2866
Feed tracking is available for the object.

FulfillmentStepDependencyDefHistory on page 2873
History is available for tracked fields of the object.

FulfillmentStepDependencyDefOwnerSharingRule on page 2875
Sharing rules are available for the object.

FulfillmentStepDependencyDefShare on page 2877
Sharing is available for the object.

FulfillmentStepJeopardyRule

Represents the duration and tolerance for the step in the fulfillment process to allow the overall tracking of rules and risks. This object is available in API version 61.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`EstimatedDuration`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The estimated time to complete the fulfillment step.
`EstimatedDurationUnit`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The unit of measurement that applies to the estimated time to complete the fulfillment step. Valid values are: • `Days`

Field	Details
	• `Hours` • `Minutes` • `Seconds` The default value is `Minutes`.
`FlowDefinition`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The flow definition that's associated with the `AutoTask` type of the fulfillment step.
`IntegrationDefinitionId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The integration definition that's associated with the `Callout` type of the fulfillment step. This field is a relationship field. **Relationship Name** IntegrationDefinition **Relationship Type** Lookup **Refers To** IntegrationProviderDef
`JeopardyThreshold`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The value indicating the threshold after which the fulfillment step is in jeopardy.
`JeopardyThresholdUnit`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The unit of measurement that applies to the jeopardy threshold value. Valid values are:

Field	Details
	• `Days` • `Hours` • `Minutes` • `Seconds` The default value is `Minutes`.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** For internal use only.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** For internal use only.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** For internal use only.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** For internal use only. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User

Field	Details
StepType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of fulfillment step that's affected by the jeopardy rule. Valid values are: • `AutoTask` • `Callout` • `ManualTask` • `Milestone` • `Pause`

FulfillmentStepSource

Represents a link between a fulfillment step and the corresponding order lines. This object is available in API version 61.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** An automatically generated name for the fulfillment step source.
SourceIdentifier	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The identifier of the source order line item (order item or fulfillment order line).
`SourceLineItemId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** For internal use only. This field is a polymorphic relationship field. **Relationship Name** SourceLineItem **Refers To** FulfillmentOrderLineItem, OrderItem
`StepId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The identifier of the fulfillment step. This field is a relationship field. **Relationship Name** Step **Relationship Type** Master-detail **Refers To** FulfillmentStep (the master object)
`VersionGroupIdentifier`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the version group that's assigned to the fulfillment step source item. This field is available in API version 64.0 and later.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

FulfillmentStepSourceChangeEvent on page 2864
Change events are available for the object.

FulfillmentTaskAssignmentRule

Represents a set of actions that assign a task to a user or queue. This object is available in API version 63.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`ConditionData`	**Type** textarea **Properties** Create, Nillable, Update **Description** The condition for executing the fulfillment task assignment rule. The condition is defined as a rule or a set of rules in JSON format. This field is available in API version 66.0 and later.
`ConditionId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Condition ID that's used to determine the task assignment. This field is a polymorphic relationship field. **Relationship Name** Condition **Refers To** ExpressionSet
`DestinationId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Destination ID of the task assignment such as, Queue or User. This field is a polymorphic relationship field.

Field	Details
	Relationship Name Destination **Refers To** Group, User
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date when a user referenced this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date when a user viewed this record.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the object that specifies the condition used to determine the task assignment.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who created the task assignment rule record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
`Priority`	**Type** int

Field	Details
	Properties Create, Filter, Group, Sort, Update **Description** The priority of the rule for execution.
`SourceId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Source ID of the task assignment such as Queue. This field is a relationship field. **Relationship Name** Source **Refers To** Group
`TaskAllocationType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The method of assigning the manual step. Valid values are: • `ContextBased` • `LeastLoaded` • `RoundRobin`
`UsageType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Name of the usage type. Possible values are: • `Fulfillment` • `Generic` • `InsuranceRuleAction`—Insurance Rule Action • `IntegrationOrchestrator`—Integration Orchestrator The default value is `Fulfillment`.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

FulfillmentTaskAssignmentRuleFeed
Feed tracking is available for the object.

FulfillmentTaskAssignmentRuleHistory
History is available for tracked fields of the object.

FulfillmentTaskAssignmentRuleShare
Sharing is available for the object.

FulfillmentWorkspace

Represents a visual designer for fulfillment plans that can have multiple step groups and their dependencies. This object is available in API version 61.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`Description`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The description of the fulfillment workspace.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date when a user referenced this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date when a user viewed this record.

Field	Details
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the fulfillment workspace.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who owns this record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

FulfillmentWorkspaceHistory on page 2873
History is available for tracked fields of the object starting API version 65.0.

FulfillmentWorkspaceShare on page 2877
Sharing is available for the object.

FulfillmentWorkspaceItem

Represents information about the attributes that are used in the definition for a fulfillment step group. This object is available in API version 61.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
FulfillmentStepDefinitionGroupId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** For internal use only. This field is a relationship field. **Relationship Name** FulfillmentStepDefinitionGroup **Relationship Type** Master-detail **Refers To** FulfillmentStepDefinitionGroup (the detail object)
FulfillmentWorkspaceId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the parent fulfillment workspace that's related to this record. This field is a relationship field. **Relationship Name** FulfillmentWorkspace **Relationship Type** Master-detail **Refers To** FulfillmentWorkspace (the master object)
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the fulfillment workspace item.
ShowOrder	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The display sequence value of the fulfillment workspace item.

ProductDecompEnrichmentRule

Represents mappings between fields and attributes. Enrichment rules are part of a decomposition rule, and are used to propagate data to fulfillment order lines. This object is available in API version 61.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`CalculationDefinitionId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An expression set or a decision matrix that calculates the destination value. This field is a polymorphic relationship field. **Relationship Name** CalculationDefinition **Refers To** DecisionMatrixDefinition, ExpressionSet
`CalculationMethod`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of enrichment rule. Valid values are: • `Ad-verbatim`—As Is • `Static-Lookup`—List Lookup

Field	Details
	• `Expression-Set`—Available in API version 64.0 and later
`DecompositionRuleId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The identifier of the decomposition rule. This field is a relationship field. **Relationship Name** DecompositionRule **Relationship Type** Parent-child **Refers To** ProductFulfillmentDecompRule (the master object)
`DestinationApiName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The API name of the destination field or attribute code of an attribute.
`DestinationAttributeDefinitionId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** For internal use only. This field is a relationship field. **Relationship Name** DestinationAttributeDefinition **Refers To** AttributeDefinition
`DestinationAttributeIdentifier`	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update

Field	Details
	Description The destination entity attribute that is mapped from the source entity attribute. This field can store a Salesforce AttributeDefinition ID or an external identifier. This field is available in API version 65.0 and later.
DestinationContextTag	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The name of the destination context definition.
DestinationType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The destination type for mapping. Valid values are: • `Attribute` • `Field`
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date when a user referenced this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date when a user viewed this record
ListMappingGroupId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description For internal use only. This field is a relationship field. **Relationship Name** ListMappingGroup **Refers To** ValTfrmGrp
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the decomposition rule.
`RuleEnforcement`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies whether the rule applies to all fulfillment requests or only to specific ones. Valid values are: • `AllFulfillmentRequests` • `InitialFulfillmentRequest` This field is available in API version 63.0 and later.
`SourceApiName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The API name of the source field or attribute code of an attribute.
`SourceAttributeDefinitionId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** For internal use only. This field is a relationship field.

Field	Details
	Relationship Name SourceAttributeDefinition **Refers To** AttributeDefinition
SourceAttributeIdentifier	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update **Description** The source entity attribute that is mapped to the destination entity attribute. This field can store a Salesforce AttributeDefinition ID or an external identifier. This field is available in API version 65.0 and later.
SourceContextTag	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The source type for the context definition.
SourceType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The source type for mapping. Valid values are: • `Attribute` • `Field`

ProdtDecompEnrchVarMap

Represents the mapping of a field context tag or an attribute to a variable within an expression set. This object is available in API version 64.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`,

Fields

Field	Details
`AttributeDefinitionId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The attribute definition the expression set variable is mapped to when creating the enrichment rule. This field is a relationship field. **Relationship Name** AttributeDefinition **Refers To** AttributeDefinition
`ExpressionSetVarName`	**Type** string **Properties** Filter, Group, Sort **Description** The name of the variable that's mapped to the expression set defined in the enrichment rule.
`FieldContextTagName`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The name of the field context tag to which the expression set variable is mapped when creating the enrichment rule.
`ProductAttributeIdentifier`	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update **Description** The product attribute from an internal or external catalog, used by DRO to copy data during the enrichment process. This field is available in API version 65.0 and later.
`ProductDecompEnrichmentRuleId`	**Type** reference

Field	Details
	Properties Filter, Group, Sort **Description** The rule that contains the mappings between the fields and attributes for the decomposing product. This field is a relationship field. **Relationship Name** ProductDecompEnrichmentRule **Relationship Type** Master-detail **Refers To** ProductDecompEnrichmentRule (the master object)
`VariableType`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Specifies whether the expression set variable is an input or output variable. Valid values are: • `Input` • `Output` The default value is `Input`.

ProductFulfillmentDecompRule

Represents a rule that determines how an order is broken into sub-orders with specific technical details that help in order fulfillment. It can be applied to a commercial or a technical product. This object is available in API version 61.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`ConditionData`	**Type** textarea

Field	Details
	Properties Create, Nillable, Update **Description** The condition for executing the product fulfillment decomposition. The condition is defined as a rule or a set of rules in JSON format. This field is available in API version 66.0 and later.
`DestinationProductId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The destination product for the decomposition rule. This field is a relationship field. **Relationship Name** DestinationProduct **Relationship Type** Lookup **Refers To** Product2
`DestinationIdentifier`	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update **Description** The destination entity in the product fulfillment decomposition rule. This field can store a Salesforce product ID or an external identifier. This field is available in API version 65.0 and later.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date when a user referenced this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The most recent date when a user viewed this record.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the decomposition rule.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who created the record. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User
Priority	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The priority of the decomposition rule. Decomposition rules are executed in order of priority.
SourceProductClassificationId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The classification of the source product that's used for decomposition. This field is available in API version 62.0 and later. This field is a relationship field. **Relationship Name** SourceProductClassification

Field	Details
	Refers To ProductClassification
SourceClassIdentifier	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update **Description** The source classification entity in the product fulfillment decomposition rule. This field can store a Salesforce product ID or an external identifier. This field is available in API version 65.0 and later.
SourceIdentifier	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update **Description** The source entity in the product fulfillment decomposition rule. This field can store a Salesforce product ID or an external identifier. This field is available in API version 65.0 and later.
SourceProductId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Source product for the decomposition rule. This field is a relationship field. **Relationship Name** SourceProduct **Relationship Type** Lookup **Refers To** Product2

Associated Objects

ProductFulfillmentDecompRuleShare on page 2877

Sharing is available for the object.

ProductFulfillmentScenario

Represents a link between a product and the corresponding group of fulfillment steps that's necessary to fulfill that product. This object is available in API version 61.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`Action`	**Type** multipicklist **Properties** Create, Filter, Nillable, Update **Description** For internal use only. Valid values are: • `Add` • `Amend` • `Cancel` • `NoChange` • `Renew`
`ConditionData`	**Type** textarea **Properties** Create, Nillable, Update **Description** The condition for executing the product fulfillment scenario. The condition is defined as a rule or a set of rules in JSON format. This field is available in API version 66.0 and later.
`FulfillmentStepDefnGroupId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The fulfillment step definition group associated with the product fulfillment scenario. This field is a relationship field.

Field	Details
	Relationship Name FulfillmentStepDefnGroup **Relationship Type** Lookup **Refers To** FulfillmentStepDefinitionGroup
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** For internal use only.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** For internal use only.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the product fulfillment scenario.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** For internal use only. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User

Field	Details
ProductClassificationId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The product classification associated with the product fulfillment scenario. This field is a relationship field. **Relationship Name** ProductClassification **Relationship Type** Lookup **Refers To** ProductClassification
ProductId	**Type** reference **Properties** Create, Filter, Group, Sort, Update, Nillable (Available in API version 64.0 and later) **Description** The product associated with the product fulfillment scenario. This field is a relationship field. **Relationship Name** Product **Relationship Type** Lookup **Refers To** Product2
SourceClassIdentifier	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update **Description** The source classification entity in the product fulfillment scenario. This field can store a Salesforce Product Class ID or an external identifier. This field is available in API version 65.0 and later.
SourceIdentifier	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update

Field	Details
	Description The source entity in the product fulfillment scenario. This field can store a Salesforce product ID or an external identifier. This field is available in API version 65.0 and later.
UsageType	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Name of the usage type. This field is available in API version 66.0 and later. Possible values are: • `Fulfillment` • `Generic` • `InsuranceRuleAction`—Insurance Rule Action • `IntegrationOrchestrator`—Integration Orchestrator • `StageManagement`—Stage Management The default value is `Fulfillment`.

Associated Objects

ProductFulfillmentScenarioShare on page 2877
Sharing is available for the object.

SalesTrxnDeleteEvent

Represents the platform event that triggers the deletion of sales transaction fulfillment request records when the corresponding reference records are deleted. This object is available in API version 64.0 and later.

Supported Calls

`create()`, `describeSObjects()`

Fields

Field	Details
ReferenceObjectIdentifier	**Type** string

Field	Details
	Properties Create, Nillable **Description** Object identifier for the sales transaction fulfillment request to be deleted.

SalesTransactionFulfillReq

Represents the statuses of all the sub-orders that belong to the selected commercial or technical product. This object is available in API version 62.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
`AssetizationStatus`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Specifies the status of the assetization. Valid values are: • `Completed` • `Failed` • `InProgress` • `NotStarted` • `Rejected` • `NotApplicable`- Available in API version 64.0 and later.
`DecompositionStatus`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Specifies the status of the decomposition. Valid values are: • `Completed`

Field	Details
	• `Failed` • `InProgress` • `NotStarted` • `Rejected` • `NotApplicable`- Available in API version 64.0 and later.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the sales transaction fulfillment request.
`OrchestrationGroupKey`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The identifier of the group of sales transactions that require synchronization before processing. This field is available in API version 63.0 and later.
`OwnerId`	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the user who created the request record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
`PlanCompositionStatus`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** For internal use only. Valid values are:

Field	Details
	• `Completed` • `Failed` • `InProgress` • `NotStarted` • `Rejected` • `NotApplicable` - Available in API version 64.0 and later.
`PlanExecutionStatus`	**Type** picklist **Properties** Filter, Group, Nillable, Sort **Description** Specifies the status of the plan execution. Valid values are: • `InProgress` • `Frozen` • `Freezing`
`PlanId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The identifier of the plan. This field is a relationship field. **Relationship Name** Plan **Refers To** FulfillmentPlan
`PreviousRequestId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The identifier of the previous fulfillment request. This field is a relationship field. **Relationship Name** PreviousRequest

Field	Details
	Refers To SalesTransactionFulfillReq
ReferenceObjectIdentifier	**Type** reference **Properties** Filter, Group, idLookup, Nillable, Sort **Description** The ID of the sales transaction record. This field is available in API version 64.0 and later.
SalesTransactionType	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Specifies the type of sales transaction that's processed by the fulfillment request. Valid values are: • StandardOrder • GenericAdapter—Available in API version 64.0 and later.
Status	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Specifies the overall status of the fulfillment. Valid values are: • Created • Freezing • Frozen • Fulfilled • Fulfilling • Rejected • Superseded

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

SalesTransactionFulfillReqShare on page 2877
Sharing is available for the object.

ValTfrm

Represents mappings between fields and attributes. Enrichment rules are part of a decomposition rule, and are used to propagate data to fulfillment order lines. This object is available in API version 61.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`InputDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date of value entry.
`InputDatetime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The time of value entry.
`InputNumber`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The value of input number.
`InputPicklistValueId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The identifier of the input list of values. This field is a relationship field. **Relationship Name** InputPicklistValue **Refers To** AttributePicklistValue
`InputString`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The value of input text.
`IsInputBoolean`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates if a value was entered (`true`) or not (`false`). The default value is `false`.
`IsOutputBoolean`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates if there was an output value (`true`) or not (`false`). The default value is `false`.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the related transformation group.
`OutputDate`	**Type** date

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The date of matched output.
`OutputDatetime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The time of matched output.
`OutputNumber`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The value of output number.
`OutputPicklistValueId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The identifier of the output list of values. This field is a relationship field. **Relationship Name** OutputPicklistValue **Refers To** AttributePicklistValue
`OutputString`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The value of output text.
`ValueTransformGroupId`	**Type** reference

Field	Details
	Properties Create, Filter, Group, Sort **Description** The identifier of the related transformation group. This field is a relationship field. **Relationship Name** ValueTransformGroup **Relationship Type** Master-detail **Refers To** ValTfrmGrp (the master object)

ValTfrmGrp

Represents a rule that determines how an order is broken into sub-orders with specific technical details that help in order fulfillment. The rule can be applied to a commercial or a technical product. This object is available in API version 61.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`DestinationPrimitiveType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The data type of the output value. Valid values are: • `Boolean` • `Currency` • `Date` • `Datetime` • `Number` • `Percent`—Picklist Value • `Text`

Field	Details
IsDestinationEnumerated	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the output is a list of values (`true`) or not (`false`). The default value is `false`.
IsSourceEnumerated	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the input is from a list of values (`true`) or not (`false`). The default value is `false`.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date when a user referenced this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date when a user viewed this record.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the list mapping.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description The ID of the user who owns this record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
SourcePrimitiveType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The data type of the input value. Valid values are: • Boolean • Currency • Date • Datetime • Number • Percent—Picklist Value • Text
UsageType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The data mapping feature that uses this value transformation group. Valid value is DFOListMapping

Dynamic Revenue Orchestrator Standard Invocable Actions

Use standard invocable actions to submit an order or a sales transaction to Dynamic Revenue Orchestrator (DRO) for fulfillment.

Decompose Sales Transaction Action

Decompose a sales transaction, such as a quote, order, or order summary.

Freeze Sales Transaction Action

Freeze a sales transaction to disable the modification of a line item.

Get Point Of No Return Action

Get details about the point of no return milestone for each line item in a sales transaction.

Orchestrate Sales Transaction Action

Initiate the orchestration process for a sales transaction. This action executes only the plan composition and orchestration phases, without performing decomposition.

Orchestrate Transaction Action

Orchestrate a transaction for any domain-specific object, such as a collection plan for Revenue billing, that requires the composition and execution of a fulfillment plan.

Submit Order Action

Submit an order to Dynamic Revenue Orchestrator (DRO) for fulfillment.

Submit Sales Transaction Action

Initiate the fulfillment process of any sales transaction, such as a quote, an order, or an order summary.

Unfreeze Sales Transaction Action

Unfreeze a sales transaction to enable the modification of a line item.

SEE ALSO:

Actions Developer Guide: Overview

REST API Developer Guide: Invocable Actions Standard

Decompose Sales Transaction Action

Decompose a sales transaction, such as a quote, order, or order summary.

Specify the ID of the sales transaction to decompose. The decomposition process includes these steps.

- Intake process
- Sales transaction decomposition

The intake process occurs synchronously or asynchronously, as specified with the `intakeRequestType` input parameter. You can also specify the decomposition priority using the `fulfillmentPriority` parameter.

This action executes only the decomposition process and stops before orchestration. You can execute custom logic in between the decomposition and orchestration processes.

This action is available in API version 67.0 and later.

Special Access Rules

The Decompose Sales Transaction action is available in Enterprise, Unlimited, and Developer Editions of Revenue Management. See the required permissions to access and call this invocable action.

Supported REST HTTP Methods

URI

`/services/data/v`***`66.0`***`/actions/standard/decomposeSalesTransaction`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer`***`token`***

Inputs

Input	Details
`allowOverrideOfPointOfNoReturn`	**Type** boolean **Description** Indicates whether to override the point of no return setting for the fulfillment step (`true`) or not (`false`). The default value is `false`.
`fulfillmentAdapter`	**Type** string **Description** Required. Type of fulfillment adapter. Valid values are: • `StandardOrder` • `GenericAdapter`
`fulfillmentPriority`	**Type** string **Description** Priority to fulfill the sales transaction. Valid values are: • `High` • `Bulk` • `Default`

Input	Details
`hydratedContextId`	**Type** string **Description** ID of the hydrated context.
`intakeRequestType`	**Type** string **Description** Type of request to process the intake. Valid values are: • `Synchronous` • `Asynchronous`
`priorityLimitAction`	**Type** string **Description** Type of action to perform when the priority limit is reached. Valid values are: • `Reject` • `Downgrade` This parameter is applicable only when you specify the `fulfillmentPriority` parameter.
`salesTransactionId`	**Type** id **Description** Required. ID of the sales transaction to submit.

Outputs

Output	Details
`errorCode`	**Type** string **Description** Code that corresponds to the type of error encountered.
`requested FulfillmentPriority`	**Type** string

Output	Details
	Description Priority to fulfill the sales transaction. Valid values are: • `High` • `Bulk` • `Default`
`requestId`	**Type** string **Description** Request ID of the invocation.
`resolved FulfillmentPriority`	**Type** string **Description** Resolved priority to fulfill the sales transaction. Valid values are: • `High` • `Bulk` • `Default`
`submitStatus`	**Type** string **Description** Submission status of the sales transaction for decomposition. Valid values are: • `Success` • `Error` • `Submitted` • `Rejected`
`usedContextId`	**Type** string **Description** ID of the used context that updates the decomposition process.

Example

POST

This sample request is for the Decompose Sales Transaction action.

```
{
  "inputs": [
    {
      "fulfillmentAdapter": "StandardOrder",
      "intakeRequestType": "Synchronous",
      "salesTransactionId": "801xx000003GYexAAG"
    }
  ]
}
```

This sample response is for the Decompose Sales Transaction action.

```
[
  {

  }
]
```

Freeze Sales Transaction Action

Freeze a sales transaction to disable the modification of a line item.

A line item can reach a milestone in the fulfillment process, which is known as a point of no return, where the line item can't accept modifications. Get details about the point of no return for each line item of a sales transaction.

This action is available in API version 64.0 and later.

Special Access Rules

The Freeze Sales Transaction action is available in Enterprise, Unlimited, and Developer Editions of Revenue Cloud. See the required permissions to access and call this invocable action.

```

Orchestrate Sales Transaction Action

Initiate the orchestration process for a sales transaction. This action executes only the plan composition and orchestration phases, without performing decomposition.

Specify the ID of the sales transaction to orchestrate. The decomposition process includes these steps.

- Intake process
- Fulfillment orchestration

The intake process occurs synchronously or asynchronously, as specified with the `intakeRequestType` input parameter. You can also specify the orchestration priority using the `fulfillmentPriority` parameter.

Use this action when the sales transaction is decomposed either by a previous decomposition action or by custom logic before orchestrating the fulfillment plan.

This action is available in API version 67.0 and later.

Special Access Rules

The Orchestrate Sales Transaction action is available in Enterprise, Unlimited, and Developer Editions of Revenue Management. See the required permissions to access and call this invocable action.

Outputs

Output	Details
`errorCode`	**Type** string **Description** Code indicating the type of error.
`fulfillmentPlanId`	**Type** id **Description** ID of the composed fulfillment plan.
`requestedFulfillmentPriority`	**Type** string **Description** Priority to fulfill the sales transaction. Valid values are: • `High` • `Bulk`

Output	Details
	• `Default`
`requestId`	**Type** string **Description** Request ID of the invocation.
`resolved FulfillmentPriority`	**Type** string **Description** Resolved priority to fulfill the sales transaction. Valid values are: • `High` • `Bulk` • `Default`
`submitStatus`	**Type** string **Description** Submission status of the sales transaction for orchestration. Valid values are: • `SUCCESS` • `ERROR` • `SUBMITTED` • `REJECTED`
`usedContextId`	**Type** string **Description** ID of the context that updates the orchestration process.

Example

POST

This sample request is for the Orchestrate Sales Transaction action.

```
{
    "inputs": [
        {
            "fulfillmentAdapter": "StandardOrder",
            "intakeRequestType": "Synchronous",
            "salesTransactionId": "801xx000003GYgZAAW"
        }
```

```
    ]
}
```

This sample response is for the Orchestrate Sales Transaction action.

```
[
  {
    "actionName": "orchestrateSalesTransaction",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": {
     "usedContextId": "0000000s21to18g00091764134566956e2100424de0d4af8869669df515e24cb",

      "requestId": "ac2a9d18-c702-43ee-bc08-1c03061b549c",
      "fulfillmentPlanId": "13Vxx0000004CFUEA2",
      "submitStatus": "SUCCESS",
      "resolvedFulfillmentPriority": "Default",
      "requestedFulfillmentPriority": "Default"
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Orchestrate Transaction Action

Orchestrate a transaction for any domain-specific object, such as a collection plan for Revenue billing, that requires the composition and execution of a fulfillment plan.

Specify the ID of the transaction to orchestrate and the orchestration type. The orchestration process includes:

- Composition of the orchestration plan
- Execution of the fulfillment plan

This action is available in API version 66.0 and later.

Special Access Rules

The Orchestrate Transaction action is available in Enterprise, Unlimited, and Developer Editions of Revenue Management. See the required permissions to access and call this invocable action.

Supported REST HTTP Methods

URI

/services/data/v***67.0***/actions/standard/orchestrateTransaction

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer`***`token`***

Inputs

Input	Details
`transactionId`	**Type** string **Description** Required. ID of the business object or domain object to be orchestrated, such as a Collection Plan ID.
`orchestrationType`	**Type** string **Description** Required. Type of orchestration that's used to orchestrate the transaction. Valid values are: • `Generic` • `Fulfillment` • `Billing`

Outputs

Output	Details
`requestId`	**Type** string **Description** Request ID of the invocation.
`errorCode`	**Type** string **Description** Code that corresponds to the type of encountered error.
`fulfillmentPlanId`	**Type** string **Description** ID of the composed fulfillment plan.

Output	Details
`submitStatus`	**Type** string **Description** Submission status of the transaction that's orchestrated. Valid values are: • `Success` • `Error`

Example

POST

This sample request is for the Orchestrate Transaction action.

```
{
  "inputs": [
    {
      "transactionId": "801xx000003GYexAAG",
      "orchestrationType": "Fulfillment"
    }
  ]
}
```

This sample response is for the Orchestrate Transaction action.

```
[
  {
    "actionName": "orchestrateTransaction",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": {
      "requestId": "a1b2c3d4-e5f6-7890-abcd-ef1234567890",
      "fulfillmentPlanId":
"0000000s21to18g000917641279695318 0a8259def914e1abbd863dde076b71f",
      "submitStatus": "SUCCESS"
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Submit Order Action

Submit an order to Dynamic Revenue Orchestrator (DRO) for fulfillment.

By using the Submit Order action, you can perform:

- Order decomposition

- Fulfillment orchestration that's driven through message queues
- Dynamic plan composition that's based on the incoming order

This action is available in API version 61.0 and later.

Special Access Rules

The Submit Order action is available in Enterprise, Unlimited, and Developer Editions of Revenue Cloud. See the required permissions to access and call this invocable action.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/submitOrder`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer token`

Inputs

Input	Details
`orderId`	**Type** string **Description** Required. ID of the order to submit to DRO.
`callType`	**Type** string **Description** Optional. Mode that the order intake must be processed in. Valid values are: • `Synchronous` • `Asynchronous` The default value is `Asynchronous`.
`contextId`	**Type** string

Input	Details
	Description Optional. ID of the hydrated context. See Context Service.

Outputs

Output	Details
`errorCode`	**Type** string **Description** Error code for the failed request, if any.
`fulfillmentPlanId`	**Type** string **Description** ID of the orchestrated fulfillment plan that's generated. Returned only if the `callType` value is `Synchronous`.
`requestId`	**Type** string **Description** Unique ID of the invocation request that helps identify a single request.
`submitStatus`	**Type** string **Description** Submit status of the invocation request. Valid values are: • `SUCCESS` • `ERROR` • `SUBMITTED` • `REJECTED`
`usedContextId`	**Type** string **Description** Hydrated context ID that's used in this request, which can be different from the `contextId` input.

Example

POST

This example shows a sample request.

```
{
    "inputs": [
        {
            "orderId": "801RM0000007yGaYAI",
            "callType": "Synchronous"
        }
    ]
}
```

This example shows a sample response when the call type is synchronous.

```
[
    {
   "actionName":"submitOrder"
   "errors":NULL
   "invocationId":NULL
   "isSuccess":true
   "outputValues":{
   "requestId":"a161cfda-868c-41d2-b589-7c7d7ff2d4c1"
   "submitStatus":"SUCCESS"
   "usedContextId":"e275e930923106ee7e39cbfa232e38252bd4d63f4ea2dd956b7301e243554134"
   "fulfillmentPlanId":"13VZM00000000062AA"
}
]
```

This example shows a sample response when the call type is asynchronous or isn't specified.

```
[
{
    "actionName": "submitOrder",
    "errors": null,
    "isSuccess": true,
    "outputValues": {
    "submitStatus": "SUBMITTED"
    "requestId": "a161cfda-868c-41d2-b589-7c7d7ff2d4c1"
}
}
]
```

This example shows a sample response when a validation error occurs.

```
[
    {
    "actionName": "submitOrder",
    "errors": [
    {
        "statusCode": "UNKNOWN_EXCEPTION",
        "message": "Missing required input parameter: orderId",
        "fields": []
     }
  ],
```

```
        "invocationId": null,
        "isSuccess": false,
        "outputValues": {
          "requestId": "4c7d8ebb-6b0b-4852-a8a0-b67e0d36a73e",
          "errorCode": "DRO_INTERNAL_ERROR"
        },
    }
]
```

Explainability Action Logs

To troubleshoot or debug errors, retrieve a list of explainability action logs. See Action Logs.

Get logs for order intake

This resource example includes sample query parameters to retrieve the action logs for an order intake.

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/decision-explainer/action-logs?applicationSubType=DroSubmit&applicationType=7&processType=DroSubmit&primaryFilter=801xx000003GYzAAG
```

This example shows the sample response. The `actionLog` property contains the action logs.

```
{

Get logs for decomposition enrichment

This resource example includes sample query parameters to retrieve the logs for decomposition enrichment tasks. For example, conversion of order items to fulfillment order line items.

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/decision-explainer/action-logs?applicationSubType=DroDcmp&applicationType=7&processType=DcmpEnrich&primaryFilter=801xx000003YzAAG&secondaryFilter=9xQ2B4OOXkuG
```

The `secondaryFilter` property is optional. If this property is specified, the API returns the enrichment rule details for a decomposition rule. If this property is unspecified, the API returns all enrichment rule details for the order.

This example shows the sample response. The `actionLog` property contains the action logs.

```

Submit Sales Transaction Action

Initiate the fulfillment process of any sales transaction, such as a quote, an order, or an order summary.

Specify the ID of the sales transaction to be fulfilled. The fulfillment process includes these steps.

- Intake process
- Fulfillment orchestration

The intake process happens synchronously or asynchronously, which is specified by using the `intakeRequestType` input parameter. You can also specify the priority for the execution of the fulfillment process, which is specified by using the `fulfillmentPriority` parameter.

This action is available in API version 63.0 and later.

Special Access Rules

The Submit Sales Transaction action is available in Enterprise, Unlimited, and Developer Editions of Revenue Management. See the required permissions to access and call this invocable action.

Supported REST HTTP Methods

URI
`/services/data/v67.0/actions/standard/submitSalesTransaction`

Formats
JSON, XML

HTTP Methods
POST

Authentication
`Authorization: Bearer token`

Inputs

Input	Details
`allowOverrideOfPointOfNoReturn`	**Type** boolean **Description** Indicates whether to override the point of no return setting for the fulfillment step (`true`) or not (`false`). The default value is `false`. Available in API version 64.0 and later.
`fulfillmentAdapter`	**Type** string **Description** Type of fulfillment adapter. Valid values are: • `StandardOrder` • `GenericAdapter`—Available in API version 64.0 and later.

Input	Details
`fulfillmentPriority`	**Type** string **Description** Priority to fulfill the sales transaction. Valid values are: • `High` • `Bulk` • `Default`
`hydratedContextId`	**Type** string **Description** ID of the hydrated context.
`intakeRequestType`	**Type** string **Description** Type of request to process the intake. Valid values are: • `Synchronous` • `Asynchronous`
`priorityLimitAction`	**Type** string **Description** Type of action to perform when the priority limit is reached. Valid values are: • `Reject` • `Downgrade` This parameter is applicable only when you specify the `fulfillmentPriority` parameter.
`salesTransactionId`	**Type** id **Description** Required. ID of the sales transaction to submit.

Outputs

Output	Details
errorCode	**Type** string **Description** Code indicating the type of error.
fulfillmentPlanId	**Type** id **Description** ID of the composed fulfillment plan.
requestedFulfillmentPriority	**Type** string **Description** Priority to fulfill the sales transaction. Valid values are: • High • Bulk • Default
requestId	**Type** string **Description** Request ID of the invocation.
resolvedFulfillmentPriority	**Type** string **Description** Resolved priority to fulfill the sales transaction.
submitStatus	**Type** string **Description** Submit status of the invocation.
usedContextId	**Type** string **Description** ID of the used context that updates the decomposition process.

Example

POST

This sample request is for the Submit Sales Transaction action.

```
{
  "inputs": [
    {
      "allowOverrideOfPointOfNoReturn": false,
      "salesTransactionId": "801DV000000CbIPYA0",
      "intakeRequestType": "Synchronous",
      "fulfillmentAdapter": "StandardOrder",
      "fulfillmentPriority": "Default",
      "priorityLimitAction": "Reject"
    }
  ]
}
```

This sample response is for the Submit Sales Transaction action.

```
[
  {
    "actionName": "submitSalesTransaction",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": {
      "submitStatus": "SUCCESS",
      "resolvedFulfillmentPriority": "Default",
      "requestedFulfillmentPriority": "Default",
     "usedContextId": "0abc8db32b30d09c5051e4561f0b39d938a3bd8db4ccb13e04d41019e427211d",

      "fulfillmentPlanId": "13VDV00000008M92AI"
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Unfreeze Sales Transaction Action

Unfreeze a sales transaction to enable the modification of a line item.

A line item can reach a milestone in the fulfillment process, which is known as a point of no return, where the line item can't accept modifications. Get details about the point of no return for each line item of a sales transaction.

This action is available in API version 64.0 and later.

Special Access Rules

The Unfreeze Sales Transaction action is available in Enterprise, Unlimited, and Developer Editions of Revenue Management. See the required permissions to access and call this invocable action.

Supported REST HTTP Methods

URI
`/services/data/v67.0/actions/standard/unfreezeSalesTransaction`

Formats
JSON, XML

HTTP Methods
POST

Authentication
`Authorization: Bearer`***token***

Inputs

Input	Details
`salesTransactionId`	**Type** id **Description** Required. ID of the sales transaction that's submitted to the Dynamic Revenue Orchestrator.

Outputs

Output	Details
`errorCode`	**Type** string **Description** Code indicating the type of error.
`orchestrationPlanId`	**Type** id **Description** ID of the created orchestration plan.
`planState`	**Type** string **Description** Status of the created orchestration plan. Valid values are: • `FAILURE` • `NOTSTARTED` • `PENDING`

Output	Details
	• `COMPLETED` • `FROZEN` • `INPROGRESS`
`requestId`	**Type** string **Description** ID of the request to get the point of no return details.
`salesTransactionId`	**Type** string **Description** ID of the sales transaction that's submitted to the Dynamic Revenue Orchestrator.

Example

POST

This sample request is for the Unfreeze Sales Transaction action.

```
{
  "inputs": [
    {
      "salesTransactionId": "801SG00000jQO1ZYAW"
    }
  ]
}
```

This sample response is for the Unfreeze Sales Transaction action.

```
[
  {
    "actionName": "unfreezeSalesTransaction",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": {
      "orchestrationPlanId": "13VSG00000229Z72AI",
      "salesTransactionId": "801SG00000jQO1ZYAW",
      "planState": "InProgress",
      "requestId": "e9f2d961-b218-4911-8fee-8de31937850d"
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Dynamic Revenue Orchestrator Metadata API Types

Metadata API enables you to access some types and feature settings that you can customize in the user interface.

Flow for Dynamic Revenue Orchestrator
Represents the metadata associated with a flow. With Flow, you can create an application that navigates users through a series of screens to query and update records in the database. You can also execute logic and provide branching capability based on user input to build dynamic applications.

DynamicFulfillmentOrchestratorSettings
Represents the settings for Dynamic Revenue Orchestrator.

OrchestrationPlanCtxMapping
Represents the context mapping that Dynamic Revenue Orchestrator (DRO) uses to generate and orchestrate a plan for an object, such as a non-sales transaction for billing or another generic business process.

SEE ALSO:

Metadata API Developer Guide: Understanding Metadata API

Flow for Dynamic Revenue Orchestrator

Represents the metadata associated with a flow. With Flow, you can create an application that navigates users through a series of screens to query and update records in the database. You can also execute logic and provide branching capability based on user input to build dynamic applications.

FlowActionCall

Dynamic Revenue Orchestrator exposes additional actionType values for the FlowActionCall Metadata type.

Field Name	Field Type	Description
`actionType`	InvocableActionType (enumeration of type string)	Required. The action type. Additional valid values only for Dynamic Revenue Orchestrator include: • `decomposeSalesTransaction`—Decompose a sales transaction, such as a quote, order, or order summary. • `freezeSalesTransaction`—Freeze a sales transaction to disable the modification of a line item. • `getPointOfNoReturn`—Get details about the point of no return milestone for each line item in a sales transaction. • `orchestrateSalesTransaction`—Initiate the orchestration process for a sales transaction. • `orchestrateTransaction`—Orchestrate a transaction for any domain-specific object, such as a collection plan for Revenue billing, that requires the composition and execution of a fulfillment plan.

Field Name	Field Type	Description
		• `submitOrder`—Submit an order to Dynamic Revenue Orchestrator (DRO) for fulfillment. • `submitSalesTransaction`—Initiate the fulfillment process of any sales transaction, such as a quote, an order, or an order summary. • `unfreezeSalesTransaction`—Unfreeze a sales transaction to enable the modification of a line item.

DynamicFulfillmentOrchestratorSettings

Represents the settings for Dynamic Revenue Orchestrator.

Parent Type and Manifest Access

This type extends the Metadata metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See Settings for more details.

File Suffix and Directory Location

`DynamicFulfillmentOrchestratorSettings` values are stored in the `DynamicFulfillmentOrchestratorSettings.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there is only one settings file for each settings component.

Version

DynamicFulfillmentOrchestratorSettings components are available in API version 61.0 and later.

Fields

Field Name	Description
`enableDFOFallout`	**Field Type** boolean **Description** Indicates whether to enable fallout management to handle fallouts and retry policies (`true`) or not (`false`). The default value is `false`. See Turn On Feature to Manage Fallout.
`enableDFOJeopardy`	**Field Type** boolean

Field Name	Description
	Description Indicates whether to enable management of Service Level Agreements (`true`) or not (`false`). The default value is `false`. See Turn On Feature to Manage Service Level Agreements.
`enableDFOPref`	**Field Type** boolean **Description** Indicates whether to enable features of Dynamic Revenue Orchestrator (`true`) or not (`false`). The default value is `false`. See Turn On Dynamic Revenue Orchestrator.
`enableDROFutureDatedTasks`	**Field Type** boolean **Description** Indicates whether to enable the Future Dated Steps feature (`true`) or not (`false`). The default value is `false`. See Enable Future Dated Steps. Available in API version 63.0 and later.
`enableDROInflightRequest`	**Field Type** boolean **Description** Indicates whether to allow changes to fulfillment requests that are in progress (`true`) or not (`false`). The default value is `false`. Available in API version 64.0 and later.
`enableDROTaskSource`	**Field Type** boolean **Description** Indicates whether to link a Salesforce manual task to a fulfillment step source (`true`) or not (`false`). The default value is `false`. See Enable the Linking of Task to Step Source. Available in API version 63.0 and later.

Declarative Metadata Sample Definition

The following is an example of a DynamicFulfillmentOrchestratorSettings component.

```
<DynamicFulfillmentOrchestratorSettings xmlns="http://soap.sforce.com/2006/04/metadata">
     <enableDFOPref>true</enableDFOPref>
     <enableDFOFallout>true</enableDFOFallout>
     <enableDFOJeopardy>true</enableDFOJeopardy>
     <enableDROFutureDatedTasks>true</enableDROFutureDatedTasks>
     <enableDROInflightRequest>true</enableDROInflightRequest>
     <enableDROTaskSource>true</enableDROTaskSource>
</DynamicFulfillmentOrchestratorSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>DynamicFulfillmentOrchestrator</members>
        <name>Settings</name>
    </types>
    <version>67.0</version>
</Package>
```

Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see Settings. For information about using the manifest file, see Deploying and Retrieving Metadata with the Zip File.

OrchestrationPlanCtxMapping

Represents the context mapping that Dynamic Revenue Orchestrator (DRO) uses to generate and orchestrate a plan for an object, such as a non-sales transaction for billing or another generic business process.

Parent Type

This type extends the Metadata metadata type and inherits its `fullName` field.

File Suffix and Directory Location

OrchestrationPlanCtxMapping components have the suffix `.orchestrationPlanCtxMapping` and are stored in the `orchestrationPlanCtxMappings` folder.

Version

OrchestrationPlanCtxMapping components are available in API version 67.0 and later.

Fields

Field Name	Description
`contextDefinition`	**Field Type** string **Description** Required. ContextDefinition that the orchestration use case is based on.
`contextItemNode`	**Field Type** string

Field Name	Description
	Description Name of the item-level node in the context definition. The item node represents the line items or child records of the root node, such as the items in an order.
`contextMapping`	**Field Type** string **Description** Required. Name of the context mapping that maps the source object fields to the nodes in the context definition.
`contextRootNode`	**Field Type** string **Description** Required. Name of the root node in the context definition. The root node represents the parent record that the orchestration plan is generated for, such as an order.
`label`	**Field Type** string **Description** Required. UI label for the orchestration plan context mapping.
`objectName`	**Field Type** string **Description** Required. API name of the object that the orchestration plan is generated for. The combination of `objectName` and `orchestrationType` must be unique.
`orchestrationType`	**Field Type** PlanUsageType (enumeration of type string) **Description** Required. Type of orchestration plan that this context mapping applies to. Valid values are: • `Billing` • `Fulfillment` • `Generic` • `IntegrationOrchestrator`

Field Name	Description
	• `InsuranceRuleAction` • `OrderFulfillment` • `StageManagement`

Declarative Metadata Sample Definition

This sample shows the definition of an OrchestrationPlanCtxMapping component for a fulfillment plan that orchestrates an order.

```
<?xml version="1.0" encoding="UTF-8"?>
<OrchestrationPlanCtxMapping xmlns="http://soap.sforce.com/2006/04/metadata">
    <label>Order Fulfillment Context Mapping</label>
    <orchestrationType>Fulfillment</orchestrationType>
    <contextDefinition>SalesTransactionContext__stdctx</contextDefinition>
    <objectName>Order</objectName>
    <contextMapping>OrderEntitiesMapping</contextMapping>
    <contextRootNode>SalesTransaction</contextRootNode>
    <contextItemNode>SalesTransactionItem</contextItemNode>
</OrchestrationPlanCtxMapping>
```

This sample `package.xml` references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>*</members>
        <name>OrchestrationPlanCtxMapping</name>
    </types>
    <version>67.0</version>
</Package>
```

Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see Deploying and Retrieving Metadata with the Zip File.

Dynamic Revenue Orchestrator Tooling API Objects

Tooling API exposes metadata used in developer tooling that you can access through REST or SOAP. Tooling API's SOQL capabilities for many metadata types allow you to retrieve smaller pieces of metadata.

CustomFulfillmentScopeCnfg
Represents a user-defined scope to define and customize scope-specific validation and orchestration for flexible fulfillment. This object is available in API version 64.0 and later.

OrchestrationPlanCtxMapping
Represents an orchestration plan context mapping entry in the org. This entry is used to connect the business data in an object to the orchestration logic within Dynamic Revenue Orchestrator (DRO) by using the orchestration type. This object is available in API version 66.0.0 and later.

SEE ALSO:
Tooling API Developer Guide: Introducing Tooling API

CustomFulfillmentScopeCnfg

Represents a user-defined scope to define and customize scope-specific validation and orchestration for flexible fulfillment. This object is available in API version 64.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported SOAP API Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Supported REST API Methods

`DELETE, GET, HEAD, PATCH, POST, Query`

Fields

Field	Details
`AssetContextTag`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Context tag that's used to derive custom scope value from assets. This field is available in API version 65.0 and later.
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Required. Name of the custom fulfillment scope.

Field	Details
DoesParticipatingAssetImpact	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. Indicates whether the technical assets related to sales transactions impact the fulfillment line item actions (`true`) or not (`false`). If set to `true`, Dynamic Revenue Orchestrator reuses the existing technical assets with the same custom value. The default value is `false`.
FallbackScope	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Scope that's used when custom scope can't be determined. Valid value is: • `LineItem` If an empty value is returned, then ID of the line item is used. The default value is `LineItem`.
IsAssetized	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the fulfillment line items grouped by the custom scope are assetized `true` or not (`false`). If set to `false`, then the scope can't be associated with assetizable products. The default value is `false`.
ItemContextTag	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Required. Context tag that's used to derive custom scope from item context nodes. The supported value is of string type only.

Field	Details
`Language`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The language of the CustomFulfillmentScopeCnfg tooling API object.
`ManageableState`	**Type** ManageableState enumerated list **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Indicates the manageable state of the specified component that is contained in a package: • `beta` • `deleted` • `deprecated` • `deprecatedEditable` • `installed` • `installedEditable` • `released` • `unmanaged`
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Label of the custom fulfillment scope.
NamespacePrefix	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values: • In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in

Field	Details
	an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. • In organizations that are not Developer Edition organizations, `NamespacePrefix` is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.

OrchestrationPlanCtxMapping

Represents an orchestration plan context mapping entry in the org. This entry is used to connect the business data in an object to the orchestration logic within Dynamic Revenue Orchestrator (DRO) by using the orchestration type. This object is available in API version 66.0.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Fields

Field	Details
`ContextDefinition`	**Type** reference **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. Name of the context definition to be used for the object.
`ContextItemNode`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Required. Name of the node that represents an item in the context definition.
`ContextMapping`	**Type** string **Properties** Create, Filter, Group, Sort, Update

Field	Details
	Description Required. Name of the context definition mapping to apply. This mapping must be related to the specified context definition.
`ContextRootNode`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Required. Name of the node that represents the root in the context definition.
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Required. The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is **Record Type Name**.
`Language`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The language of the OrchestrationPlanCtxMapping tooling API object. Valid values are:
`ManageableState`	**Type** ManageableState enumerated list **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Indicates the manageable state of the specified component that is contained in a package: • `beta` • `deleted` • `deprecated` • `deprecatedEditable`

Field	Details
	• `installed` • `installedEditable` • `released` • `unmanaged`
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Label for the orchestration plan context mapping.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values: • In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. • In organizations that are not Developer Edition organizations, `NamespacePrefix` is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.
`ObjectName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** API name of the object for orchestration.
`OrchestrationType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update

Field	Details
	Description Name of the type of the orchestration plan. Valid value is `Generic`.

Callouts in Dynamic Revenue Orchestrator

Use callout step types to make HTTP calls to an external system. Callout step types use the Data Consumption Framework and Process Type Integration for interface management and communication with external systems.

Use callout step types to implement these features.

- Endpoint configuration
- Authentication parameters
- Default sync and async implementation
- Extensions or Apex Interfaces
- Error handling and fallout management
- Request and response logging
- Timeouts

Dynamic Revenue Orchestrator supports these types of callouts.

Type	Description
Standard Fulfillment Provider	Use this callout provider to use a fixed payload structure to request an order. You can also define Omnistudio Integration Procedures for request transformation and response handling.
Apex Type Provider	Use this callout provider to implement custom integration scenarios via the `industriesintegrationfwk.ProcessIntegrationProvider` Apex interface.
External Services Defined Provider	Use this callout provider to implement custom integration scenarios via external services through the OpenAPI specification. You can also define Omnistudio Integration Procedures for request transformation and response handling. To use this callout, the Omnistudio Admin and Omnistudio Runtime permissions are required.

Callouts support these integration patterns.

Type	Description
Sync	The callout step is completed when the external system returns a response.

Type	Description
Async	The callout step is set to `In Progress` when the external system returns the acknowledgment response with 202 HTTP code. The system waits until the external system sends a callback response to complete the callout step. See Asynchronous Interaction Pattern on page 1945.

Configure Callout Settings

Before you set up a callout provider, configure the callout settings. The settings include the creation of a named credential and an external credential, the creation of an integration definition, and the configuration of a fulfillment step definition.

Standard Fulfillment Provider

The Standard Fulfillment Provider or `CalloutIntegrationProvider` is a provider for the order fulfillment usage type. A Fulfillment Designer can configure this provider.

Apex Type Provider

Implement custom integration logic via Apex by using the Apex Type Provider. This provider requires an Apex Integration Developer to implement a custom Apex adapter interface.

External Services Defined Provider

Generate interface contract and Apex types by using external services and Open API compatible schema.

Asynchronous Interaction Pattern

To specify an asynchronous request, you must add the callback URI to the integration definition for Standard Fulfillment Provider or Apex Type Provider as an optional attribute.

Input and Output Transformation Processors

Use input and output processors to process a standard fulfillment request before sending it to an external system.

SEE ALSO:

Salesforce Help: Data Consumption Framework

Configure Callout Settings

Before you set up a callout provider, configure the callout settings. The settings include the creation of a named credential and an external credential, the creation of an integration definition, and the configuration of a fulfillment step definition.

Meet these prerequisites before you configure the callout settings.

- Configure named and external credentials to define access to an external system. Specify a named credential as the callout endpoint and an external credential to configure the authentication protocol.

  See Create Named Credentials and External Credentials.

- Create integration definitions to connect Salesforce with an external system. Integration definitions use APIs to perform operations in both Salesforce and the external system. You can create Apex Defined, External Services Defined, or Standard integration definitions.

  See Create an Integration Definition.

EDITIONS

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

USER PERMISSIONS

To create authenticated callouts:

- External Credentials Principal Access Permission

- Define a fulfillment step with `Callout` as the step type. Additionally, set the integration definition name and integration user. See Callout Fulfillment Step.

Standard Fulfillment Provider

The Standard Fulfillment Provider or `CalloutIntegrationProvider` is a provider for the order fulfillment usage type. A Fulfillment Designer can configure this provider.

The Standard Fulfillment Provider includes these features.

- Predefined payload with sales transaction items and fulfillment items data, including attribute values
- Fixed integration parameters such as timeouts, credentials, encoding styles, and path. See Integration Definition for Standard Fulfillment Provider on page 1937 for details about the integration parameters.
- Modified requests and responses via Omnistudio Integration Procedures
- Asynchronous interaction pattern. See Asynchronous Interaction Pattern on page 1945.
- Request and response logging
- Error handling and retry policies. See Fallout Design and Management.
- Request transformation and response handling via integration procedures

To configure the callout settings for Standard Fulfillment Provider, see Configuration Steps.

Request Payload

This example shows a sample request payload structure with data for sales transaction items and fulfillment transaction items. This data is derived using context definition mappings that are defined through settings. See Context Definitions in Order Orchestration.

            "ParentReference": "0a4xx00000000JNAAY",
            "LineAttributeName": "FDTCharge",
            "LineAttributeKey": "0tjxx00000000eNAAQ"
          }
        ],
        "FulfillmentItemAction": "ADD",
        "FulfillmentItemProductCode": "iPhone-Tech",
        "FulfillmentOrderItemQuantity": "2.0",
        "FulfillmentItemProductName": "iPhone-Tech",
        "FulfillmentOrderId": "0a3xx00000000JNAAY",
        "FulfillmentItemTypeCode": "Product",
        "FulfillmentItemType": "Order Product",
        "FulfillmentOrderNumber": "FO-0001",
        "FulfillmentItemStartDate": "2024-10-10T00:00:00.000Z",
        "FulfillmentItemProductId": "01txx0000006igrAAA"
      }
    ]
}
```

The step source ID of the fulfillment step, which is either a related order or fulfillment item, determines the payload composition with these considerations.

- If the step source ID is an order item, then all order items of the order are included in the payload under the SalesTransactionItems node.
- If the step source ID is a fulfillment item, then all fulfillment items of the fulfillment order are included in the payload under the FulfillmentTransactionItems node.
- If a product attribute doesn't have a defined code, then the attribute is excluded from the payload.

Considerations

Keep these considerations in mind for the request payload.

- The maximum request payload size limit is 12 MB.
- The default timeout period is five seconds, and the maximum timeout period is 120 seconds.
- The encoding style for fulfillment order line items, sales transaction items, and attributes can be configured through the Integration Definition for Standard Fulfillment Provider on page 1937.

Error Handling

To verify if the callout request was successful, check the `status` value in the payload. If the status is undefined, then these HTTP codes indicate a successful response.

- `200`
- `201`
- `202`
- `203`
- `204`
- `205`
- `206`
- `302`
- `304`

If the request isn't successful, then the fulfillment step state is marked as `Fatally Failed`.

Integration Definition Configurations

You can configure these additional features for the integration definition.

- Select the **Save the request and response as attachments to the record** checkbox for the integration definition to save request and response payloads as attachments to the Integration Provider Execution record. Content publish limits apply when saving request and response payloads as attachments. Use Shield Platform Encryption for secure storage of sensitive information.
- Define Input and Output Processors for the Integration Definition for the pre-processing of the standard fulfillment request before you send the request to an external system. See Omnistudio Integration Procedures.

See Create an Integration Definition.

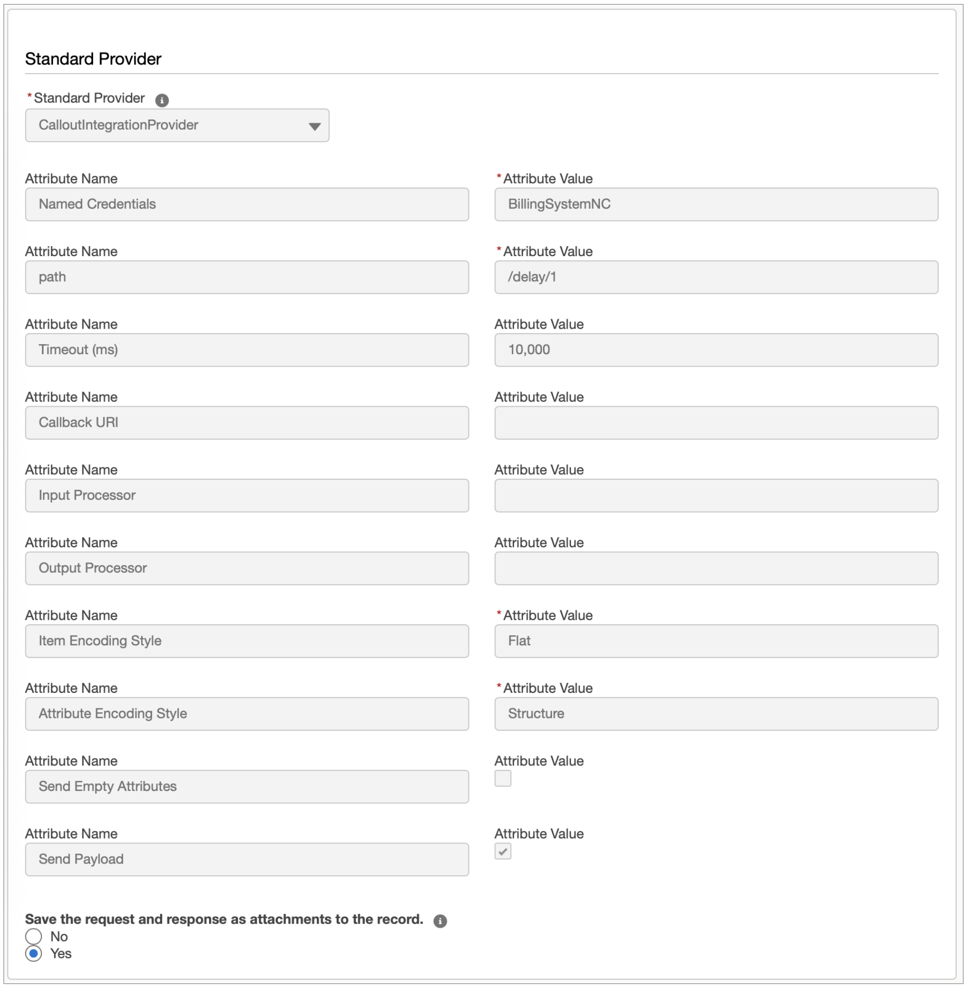
Integration Definition for Standard Fulfillment Provider

Use supported attribute values of an integration definition for a Standard Fulfillment Provider to implement features as per your requirement.

Integration Definition for Standard Fulfillment Provider

Use supported attribute values of an integration definition for a Standard Fulfillment Provider to implement features as per your requirement.

The Standard Fulfillment Provider supports these attribute values.



Attribute Name	Description
Named Credentials	API name of the associated named credentials.
Path	Additional string that's added to the URL specified in the named credential endpoint.
Timeout (ms)	Number of milliseconds to set as a timeout parameter for the HTTP connection.
Callback URI	Attribute used by a third party as the callback to process steps in case of a async callout. Additionally, this attribute also indicates these scenarios. • The configured callout is an async callout. • If callback URI is defined, then it's included as the `ResponseUri` parameter value in the default payload for Standard Fulfillment Provider. For example, a `ResponseUri` parameter value as `/services/apexrest/async/callout`.

Attribute Name	Description
	• The executor expects 202 response code from the remote destination. • The 202 response code keeps the Fulfillment Step state as Running whereas 200 response code completes it.
Input Processor	`Type_Subtype` or `Id` of OmniProcess to process the input payload.
Output Processor	`Type_Subtype` or `Id` of OmniProcess to process the output payload.
Item Encoding Style	Required. Encoding style for fulfillment transaction items and sales transaction items. Valid values are: • `Flat`—Includes a list of fulfillment transaction items and sales transaction items without any hierarchy details in the payload. • `Structure`—Includes a list of all child line items if the step's source line item has a hierarchy of line items associated with it. If item encoding style is configured as `Structure` on a fulfillment order line item or a sales transaction item, then the payload contains the details of the line item that the fulfillment order line item or sales transaction item is decomposed from. If the fulfillment order line item or sales transaction item is decomposed from the root of a bundle order line item or sales transaction item, then the payload contains the entire order line item or sales transaction item bundle structure. The default value is `Flat`.
Attribute Encoding Style	Required. Generates the payload for attributes based on the specified encoding style. Valid values are: • `Flat`—Includes specific details in key-value pair format that doesn't include granular details of attributes. • `Structure`—This payload structure includes granular details of attributes. The default value is `Structure`.
Send Empty Attributes	If this checkbox is selected, the request payload includes empty attribute values wherever applicable.
Send Payload	If this checkbox is selected, a default request payload is generated to optimize processing performance. If this checkbox isn't selected, a value for the input processor is required.

Apex Type Provider

Implement custom integration logic via Apex by using the Apex Type Provider. This provider requires an Apex Integration Developer to implement a custom Apex adapter interface.

Use a custom Apex adapter to:

- Include and use integration parameters in adapter implementations such as timeouts, credentials, and path.
- Generate and transform requests and responses via Omnistudio Integration Procedures or Extract, Transform, Load (ETL) libraries.
- Enable asynchronous interaction pattern.
- Enable request and response logging by implementing a specific Apex interface.
- Handle errors, and integrate with fallout rules.

To configure the callout settings for Apex Type Provider, see Configuration Steps.

Integration Adapter Implementation

Implement the `industriesintegrationfwk.ProcessIntegrationProvider` Apex interface. Use the `industriesintegrationfwk.ApexProviderAttr` class to define and access the attribute values in the integration provider definition.

```
global with sharing class DROSampleOrderAdapter implements
industriesintegrationfwk.ProcessIntegrationProvider {

    // Named credential attribute
    private static final String MOCK_CALLOUT_NAMED_CREDENTIAL =
'callout:DROOrderInterfaceNamedCred';
    private final static Integer TIMEOUT = 10000; // Request timeout in milliseconds, or
can be defined on Integration Definition as an Attribute

    private static final industriesintegrationfwk.ApexProviderAttr NAMED_CRED_ATTR = new
industriesintegrationfwk.ApexProviderAttr('Named Credential',
    'Named_Credential', 'DROOrderInterfaceNamedCred', true, 'String');
    private static final industriesintegrationfwk.ApexProviderAttr ENDPOINT_ATTR = new
industriesintegrationfwk.ApexProviderAttr('Endpoint URI',
    'Endpoint_URI', '/v1/orderitems/', true, 'String');

    /**
     * @param requestGuid                Request Globally Unique Identifier (GUID) provided
 by the client
     * @param inputRecordId              Input Record ID — value is taken from Fulfillment
 Step > Fulfillment Step Source > Source Line Item
     * @param payload                    Payload to be passed to the Provider Class (empty
 in DRO)
     * @param attributes                 Map of configuration attributes
     * @return IntegrationCalloutResponse Response sent to the client
    */
   global static industriesintegrationfwk.IntegrationCalloutResponse executeCallout(String
 requestGuid, String inputRecordId, String payload, Map<String, Object> attributes) {
        // create request
        String msgBody = '{\"message\":\"Hello\",'
            + '\n\"requestGuid\":\"' + requestGuid + '\",\n'
```

```
            + '\n\"inputRecordId\":\"' + inputRecordId + '\",\n'
            + '\n\"payload\":\"' + payload + '\"}'
            ;

        String endpointUri = (String) attributes.get('Endpoint_URI');

        // Make a call
        HttpResponse response = makeCallout(endpointUri, msgBody);
        // process response and pass details to the DRO Callout Step processor by using
IntegrationCalloutResponse(isSuccess, ResponseCode, ErrorMessage)

         industriesintegrationfwk.IntegrationCalloutResponse integrationCalloutResponse =
 handleResponse(response);

        return integrationCalloutResponse;
    }

    // define configurable attriobutes
    global static List<industriesintegrationfwk.ApexProviderAttr> getProviderAttributes()
 {
        List<industriesintegrationfwk.ApexProviderAttr> defaults = new
List<industriesintegrationfwk.ApexProviderAttr>();
        defaults.add(NAMED_CRED_ATTR);
        defaults.add(ENDPOINT_ATTR);
        // add any attributes such as endpoint, timeout, interface, and params
        // ...
        return defaults;
    }

    // Call Mock Service API.
    private static HttpResponse makeCallout(String endpointUri, String msgBody) {

        // Construct the request object
        String endPoint = MOCK_CALLOUT_NAMED_CREDENTIAL + endpointUri;
        HttpRequest request = new HttpRequest();
        request.setMethod('POST');
        request.setHeader('Content-Type', 'application/json');
        request.setHeader('Accept', 'application/json');
        request.setEndpoint(endPoint);
        request.setTimeout(TIMEOUT);
        request.setBody(msgBody);

        // Send request
        HttpResponse response = new Http().send(request);
        return response;
    }
}
```

Error Handling

This sample shows how to pass errors from response to orchestration via the `IntegrationResponse` interface in the Apex provider implementation. See ProcessIntegrationProvider Interface.

```
public static industriesintegrationfwk.IntegrationCalloutResponse handleResponse(HttpResponse
 response) {

        industriesintegrationfwk.IntegrationCalloutResponse integrationCalloutResponse;

        Map<String, Object> responseGroup = getResponseGroupAfterCallout(response);

        if(response.getStatusCode() == 200)
        {
            // SUCCESS
            integrationCalloutResponse = new
industriesintegrationfwk.IntegrationCalloutResponse(true);
                    integrationCalloutResponse.setResponseCode(response.getStatusCode());

              integrationCalloutResponse.setReturnValue(responseGroup);

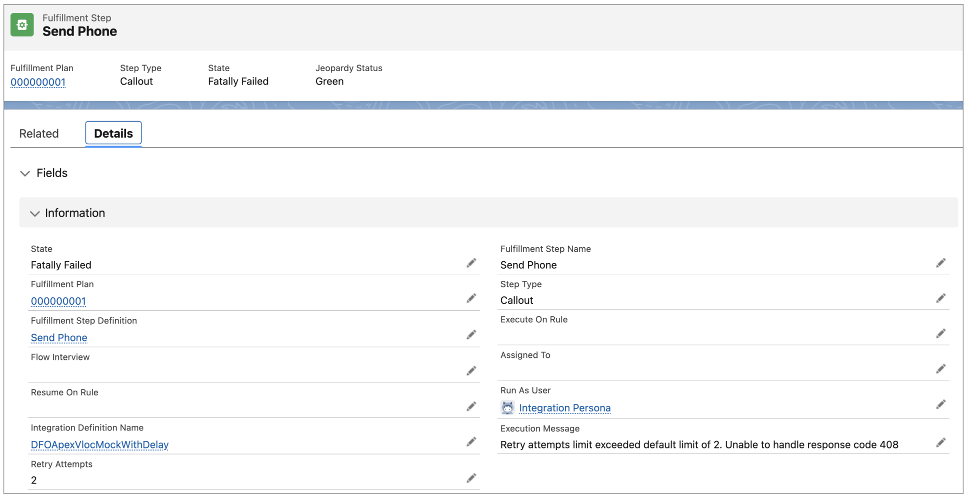
        } else {
            //FAILURE - pass error to DRO Fallout Handling to apply Retry Policies
            integrationCalloutResponse = new
industriesintegrationfwk.IntegrationCalloutResponse(false);
            integrationCalloutResponse.setResponseCode(response.getStatusCode());
            integrationCalloutResponse.setReturnValue(responseGroup);
            integrationCalloutResponse.setErrorMessage('Unable to process request.');
        }
        return integrationCalloutResponse;
        }

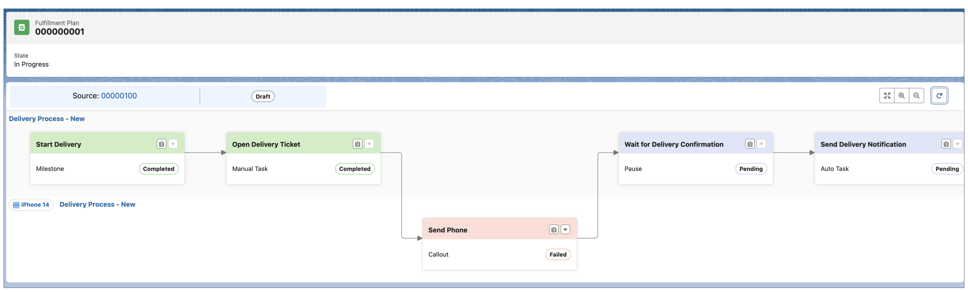
    // Process Response payLoad
   private static Map<String, Object> getResponseGroupAfterCallout(HttpResponse response)
 {
        Map<String, Object> responseGroup = new Map<String, Object>();
        if (response.getStatusCode() == 200) {
            responseGroup.put('isSuccess', true);
        } else {
            responseGroup.put('isSuccess', false);
        }
        responseGroup.put('response', getResponseMap(response.getBody()));
        return responseGroup;
    }

    // Convert response string into Map
    private static Map<String,Object> getResponseMap(String responseBody) {
        try {
            Map<String,Object> responseBodyMap = (Map<String,Object>)
JSON.deserializeUntyped(responseBody);
            return responseBodyMap;
        } catch (Exception e) {
            Map<String, Object> responseMap = new Map<String,Object>();
            responseMap.put('response', responseBody);
            return responseMap;
```

```
            }
        }
```

The fulfillment step state changes to `Fatally Failed`, and the error message is saved in the `Execution Message` field.





Apex Advanced Interface Implementation

To use advanced features such as logging, the Apex provider must implement the Apex Provider Advanced interface. You must use the HttpBaseProvider client for HTTP requests.

This example shows a sample of the `ProcessIntegrationProviderAdvanced` Apex interface implementation.

```
global with sharing class DFOApexVlocMockWithDelay
implements industriesintegrationfwk.ProcessIntegrationProviderAdvanced {
...
global static industriesintegrationfwk.IntegrationCalloutResponse executeCallout(String
requestGuid, String inputRecordId, String payload, Map<String, Object> attributes,
industriesintegrationfwk.HttpBaseProvider httpProvider) {
...
String endPoint = MOCK_CALLOUT_NAMED_CREDENTIAL + '/delay/5';
HttpRequest request = new HttpRequest();
request.setMethod('POST');
request.setHeader('Content-Type', 'application/json');
request.setHeader('Accept', 'application/json');
request.setEndpoint(endPoint);
request.setTimeout(TIMEOUT);
request.setBody(msgBody);
```

```
// Send request
//HttpResponse response = httpProvider.httpCallout(request);
HttpResponse response = new Http().send(request);
```

Integration Definition Configuration

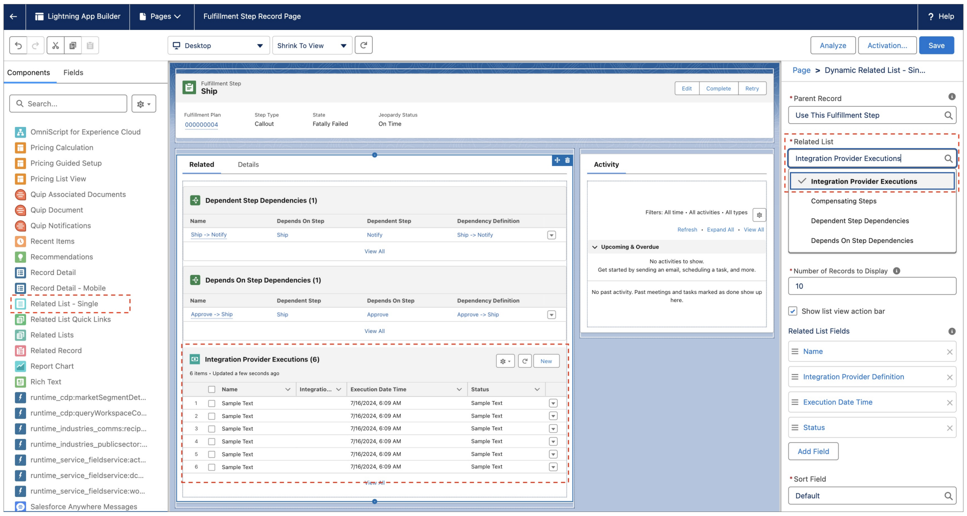
Select the **Save the request and response as attachments to the record** checkbox for the integration definition to save request and response payloads as attachments to the Integration Provider Execution record. Content publish limits apply when saving request and response payloads as attachments. Use Shield Platform Encryption for secure storage of sensitive information.

See Create an Integration Definition.

Log Records

Integration Provider execution records are created on every request and associated with the fulfillment step. The referenced object identifier is set to order item or fulfillment order line item ID. SeeIntegrationProviderExecution.

To view the Integration Provider execution records, configure the Fulfillment Step record page to include the Integration Provider Executions related list by using Lightning App Builder. See Lightning App Builder.



External Services Defined Provider

Generate interface contract and Apex types by using external services and Open API compatible schema.

To configure the callout settings for External Services Defined Provider, see Configuration Steps.

As an integration specialist user or admin user, perform these steps.

- Set up an external service and actions.
- In the external service definition, include integration parameters such as error codes, credentials, and path.

External Service

Use external services for outbound integrations from Salesforce by using low-code, process-based integrations to enhance your Apex integrations. See External Services.

Integration Definition Configurations

You can configure these additional features for the integration definition.

- Select the **Save the request and response as attachments to the record** checkbox for the integration definition to save request and response payloads as attachments to the Integration Provider Execution record. Content publish limits apply when saving request and response payloads as attachments. Use Shield Platform Encryption for secure storage of sensitive information.
- Define Input and Output Processors for the Integration Definition for the pre-processing of the standard fulfillment request before you send the request to an external system. See Omnistudio Integration Procedures.

See Create an Integration Definition.

Step Definition

Set the created integration definition on the Step Definition record with `Callout` as the step type.

Asynchronous Interaction Pattern

To specify an asynchronous request, you must add the callback URI to the integration definition for Standard Fulfillment Provider or Apex Type Provider as an optional attribute.

Standard Fulfillment Provider

- Provide the callback URI in the integration definition to accept the callback.
- Use these steps to set up the async callout.
  - Use the `ResponseUri` key to retrieve the Callback URI value from the payload.
  - Use the `StepId` key to retrieve the Fulfillment Step value from the payload. If order item ID is returned instead of Fulfillment Step ID, use `CorrelationId` key to extract the value of the step ID. For example, `callout:13Wxx0000004CAf:`.
  - Pass the StepId value to the callback URI endpoint. Return 202 response code to ensure the Fulfillment Step is in `Running` state. Otherwise, the 200 response code completes the step.

    Here's a sample payload.

    ```
    {
        "ResponseUri": "/services/apexrest/async/callout",
        "StepId": "802xx000001nb1MAAQ",
        "CorrelationId": "callout:13Wxx0000004CAf:",
        ...//Other values
    }
    ```
- Extract the step ID from the request. Find the Fulfillment Step ID in the org by using the extracted step ID and update the Fulfillment Step state to `Completed`.

Apex Type Provider

- Provide the callback URI in the integration definition to accept the callback.
- Set up the async callout by using Apex Type Provider.

- Create an Apex class that implements the `ProcessIntegrationProvider` interface.

  Here's a sample that shows the addition of a callback URI to the provider attribute for Apex Type Provider.

```
global with sharing class DFOAsyncApexSample implements
industriesintegrationfwk.ProcessIntegrationProvider {

    private static final industriesintegrationfwk.ApexProviderAttr NAMED_CRED_ATTR
  =
          new industriesintegrationfwk.ApexProviderAttr('Named Credential',
          'Named_Credential', 'DFOCalloutMockCreds', true, 'String');

    private static final industriesintegrationfwk.ApexProviderAttr CALLBACK_URL_ATTR
  =
          new industriesintegrationfwk.ApexProviderAttr('Callback URL',
          'Callback_URL', 'DFOCallbackUrl', true, 'String');

     global static List<industriesintegrationfwk.ApexProviderAttr>
getProviderAttributes() {
          List<industriesintegrationfwk.ApexProviderAttr> defaults = new
List<industriesintegrationfwk.ApexProviderAttr>();
          defaults.add(NAMED_CRED_ATTR);
          defaults.add(CALLBACK_URL_ATTR);

          return defaults;
     }
```

- Specify the Fulfillment Step ID as the value of the `requestGuid` parameter of the `executeCallout` method. You can also extract the Step ID from the `CorrelationId` key value. For example, `"callout:13Wxx0000004CAf:"`.

  Here's a sample payload that assigns the provider attribute values.

```
public interface ProcessIntegrationProvider {
    IntegrationCalloutResponse executeCallout(String requestGuid,
    String inputRecordId, String payload, Map<String, Object> attributes);

    List<ProviderAttr> getProviderAttributes();
}
```

- Set response code to 202 to indicate that the callout is asynchronously executed and in `Processing` state.

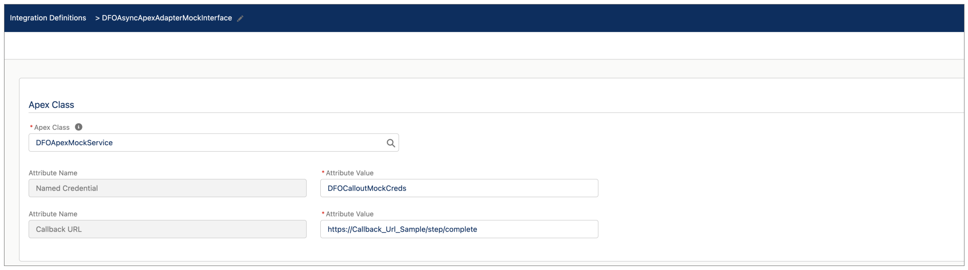
  Here's a sample payload that sets the response code.

```
global with sharing class DFOAsyncApexSample implements
industriesintegrationfwk.ProcessIntegrationProvider {
...
IntegrationCalloutResponse executeCallout(String requestGuid,
    String inputRecordId, String payload, Map<String, Object> attributes){
    // execute http request
    ...
    // set accepted if no failures
    IntegrationCalloutResponse acceptedResponse =
        new IntegrationCalloutResponse(true);
    acceptedResponse.setResponseCode(202);

    return new IntegrationCalloutResponse();
```

```
        }
}
```

- The callback URI is visible in the integration definition.



- Extract the step ID from the request. Find the Fulfillment Step ID in the org by using the extracted step ID and update the Fulfillment Step state to `Completed`.

```
FulfillmentStep step = new FulfillmentStep(id = 'stepId', State = 'Completed');
upsert step;
```

Input and Output Transformation Processors

Use input and output processors to process a standard fulfillment request before sending it to an external system.

Prerequisites

- Omnistudio license is required.
- Omnistudio Admin permission set license is assigned to Integration Configuration User (Fulfillment Designer).
- The input and output procedure attributes of an integration definition, which are available from Setup, are assigned with the Omnistudio Integration Procedure request and response. You can use `Type_Subtype` or `Id` of OmniProcess as the values for attributes.

When a callout step is executed, these steps are followed.

- The defined integration procedures are identified for request and response handling from an integration definition.
- The input processor generates the request by using `Fulfillment Step Source > SourceIdentifier` as the `InputRecordId` input parameter value. For example, the ID of an order item.
- The output processor handles the response by passing a map to the Integration Procedure service. The results from the Integration Procedure are used to identify any errors and details are passed to Dynamic Revenue Orchestrator.

Dynamic Revenue Orchestrator Platform Events

Salesforce publishes standard platform events in response to an action that occurred in the org or to report errors.

FulfillmentSourceChangeEvent

Notifies updates to the sources orchestrated by Dynamic Revenue Orchestrator like order product or fulfillment order product. This object is available in API version 66.0 and later.

SalesTrxnDecompositionEvent
Notifies when the decomposition process status changes. This object is available in API version 66.0 and later.

FulfillmentSourceChangeEvent

Notifies updates to the sources orchestrated by Dynamic Revenue Orchestrator like order product or fulfillment order product. This object is available in API version 66.0 and later.

Supported Calls

`describeSObjects()`

Supported Subscribers

Subscriber	Supported?
Apex Triggers	✓

Streaming API Subscription Channel

`/event/SalesTrxnDecompositionEvent`

Special Access Rules

This object is available in orgs with Revenue Management.

Event Delivery Allocation Enforced

Yes

Fields

Field	Details
`EventUuid`	**Type** string **Properties** Nillable

Field	Details
	Description A universally unique identifier (UUID) that identifies a platform event message.
`RecordIdentifier`	**Type** string **Properties** Create, Nillable **Description** The identifier of the source record that has been updated.
`ReplayId`	**Type** string **Properties** Nillable **Description** Represents an ID value that is populated by the system and refers to the position of the event in the event stream. Replay ID values aren't guaranteed to be contiguous for consecutive events. A subscriber can store a replay ID value and use it on resubscription to retrieve missed events that are within the retention window.

SalesTrxnDecompositionEvent

Notifies when the decomposition process status changes. This object is available in API version 66.0 and later.

Fields

Field	Details
`ErrorCode`	**Type** string **Properties** Create, Nillable **Description** The error code returned for a decomposition process failure.
`EventUuid`	**Type** string **Properties** Nillable **Description** A universally unique identifier (UUID) that identifies a platform event message.
`ReplayId`	**Type** string **Properties** Nillable **Description** Represents an ID value that is populated by the system and refers to the position of the event in the event stream. Replay ID values aren’t guaranteed to be contiguous for consecutive events. A subscriber can store a replay ID value and use it on resubscription to retrieve missed events that are within the retention window.
`SalesTransactionIdentifier`	**Type** string **Properties** Create, Nillable

Field	Details
	Description The sales transaction being decomposed.
`Status`	**Type** string **Properties** Create, Nillable **Description** The status of the decomposition process.

CHAPTER 11 Usage Management

In this chapter ...

Provide transparent, accurate, and efficient management of usage data and estimated usage amount to enhance revenue management capabilities.

EDITIONS

Available in: Lightning Experience

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Usage Management Standard Objects

The Usage Management data model provides objects and fields to set up and manage consumption of usage-based products.

ProductUsageGrant

Represents the details of a grant associated with a resource, product, or service, such as the purchased quantity, renewal and rollover policy, and validity of the grant. This object is available in API version 62.0 and later.

ProductUsageResource

Represents the mapping of a product and its usage resources. This object is available in API version 64.0 and later.

ProductUsageResourcePolicy

Represents the policies applicable to the usage resource when it's associated with a sellable product. These policies are derived from the parent usage resource and can be overridden when setting up usage modeling.This object is available in API version 65 and later.

TransactionUsageEntitlement

Represents the details of each usage entitlement that's granted with the purchased sellable product, such as quantity and date when the entitlements were granted. This object is available in API version 63.0 and later.

TransactionJournal

Represents consumption details of a usage resource that are recorded for creating usage summaries. This object is available for usage management in API version 63.0 and later.

UnitOfMeasure

Defines the units and systems of units used to account for quantities of a usage resource. This object is available for usage management in API version 62.0 and later.

UnitOfMeasureClass

Represents a standard unit of measure dimension. This object is available in API version 63.0 and later.

UsageBillingPeriodItem

Represents the calculated overages for the usage entitlement and the amount that's charged for these overages. This object is available in API version 63.0 and later.

UsageCmtAssetRelatedObj

Represents the relation between an asset for the commitment-based usage product and an asset, account, contract, or custom object. This object is available in API version 64.0 and later.

UsageCommitmentPolicy

Represents the set of rules that determines how commitments are applied to a usage resource. This object is available in API version 65 and later.

UsageEntitlementAccount

Represents the entitlement account details related to the asset that holds the wallet with the granted units. This object is available in API version 63.0 and later.

UsageEntitlementBucket

Represents a usage entitlement that's granted with the sellable product. This object is available in API version 63.0 and later.

UsageEntitlementEntry

Represents the usage entitlement details, such as the usage consumption, rollovers, and details of expired units for each tenure. This object is available in API version 63.0 and later.

UsageGrantRenewalPolicy

Represents a policy about the rollover of a usage grant. This object is available in API version 62.0 and later.

UsageGrantRolloverPolicy

Represents a policy about the rollover of a usage grant.This object is available in API version 62.0 and later.

UsageOveragePolicy

Represents the set of rules that determine the management of usage resource's units consumed beyond the granted limit. This object is available in API version 65 and later.

UsagePrdGrantBindingPolicy

Represents the association of a usage resource's grants with a sellable product. This object is available in API version 63.0 and later.

UsageRatableSummary

Represents the aggregation of the usage summaries that are used to calculate the rate at which the overages are charged. This object is available in API version 63.0 and later.

UsageRatableSumCmtAssetRt

Represents the rate that's calculated and applicable for the usage resource associated with the commitment assets related to an anchor. This object is available in API version 65.0 and later.

UsageResource

Represents an entitlement granted to a user or party by a provider, such as data storage, computing power, bandwidth, or any other product or service. Additionally, this object is used to represent resources consumed over time. This object is available in API version 62.0 and later.

UsageResourcePolicy

Represents the policies applicable to the usage resource whether it's associated with a sellable product or not. This object is available in API version 65 and later.

UsageResourceBillingPolicy

Represents information about how the usage is accumulated before rating a usage resource.This object is available in API version 62.0 and later.

UsageSummary

Represents the aggregation of the entries in the transaction journal for a usage entitlement for a specified period. This object is available in API version 63.0 and later.

SEE ALSO:

Object Reference for the Salesforce Platform: Overview of Salesforce Objects and Fields

SOAP API Developer Guide: Introduction to SOAP API

ProductUsageGrant

Represents the details of a grant associated with a resource, product, or service, such as the purchased quantity, renewal and rollover policy, and validity of the grant. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To create, update, and delete product usage grant records, you must have the Usage Management Design Time permission set license.

Fields

Field	Details
`DrawdownOrder`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The order that's used to debit entitlement consumption from the usage entitlement bucket. Valid values are: • `ExpiringFirst` • `GrantedFirst` • `GrantedLast` This field is deprecated and will be retired in a future version.
`EffectiveEndDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time until when the grant remains effective.
`EffectiveStartDate`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The date and time when the grant becomes effective.
`Label`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The identifying label for the product usage grant.

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
OverageChargeable	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies whether to charge for overages. Valid values are: • No • Yes This field is deprecated and will be retired in a future version.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the product usage grant. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
ProductOfferId	**Type** reference

Field	Details
	Properties Create, Filter, Group, Sort, Update **Description** The sellable product that grants the usage resource. This field is a relationship field. This field is deprecated and will be retired in a future version. **Relationship Name** ProductOffer **Refers To** Product2
`ProductSellingModelId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The product selling model associated with the product usage grant. This field is available in API version 65.0 and later. This field is a relationship field. **Relationship Name** ProductSellingModel **Refers To** ProductSellingModel
`ProductUsageGrantNum`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The number of each resource grant map that starts with one and is consecutive.
`ProductUsageResourceId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The product usage resource associated with the product usage grant. Available in API version 64.0 and later. This field is a relationship field. **Relationship Name** ProductUsageResource

Field	Details
	Refers To ProductUsageResource
`Quantity`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The quantity of the granted resource.
`RenewalPolicyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The grant renewal policy associated with the product usage grant. This field is a relationship field. **Relationship Name** RenewalPolicy **Refers To** UsageGrantRenewalPolicy
`RolloverPolicyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The grant rollover policy associated with the product usage grant. This field is a relationship field. **Relationship Name** RolloverPolicy **Refers To** UsageGrantRolloverPolicy
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of the product usage grant. Valid values are:

Field	Details
	• `Active` • `Draft` • `Inactive`
`Type`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of model that defines how the usage resource is consumed. Valid values are: • `Commit` • `Grant` The default value is `Grant`. Available in API version 64.0 and later.
`UnitOfMeasureClassId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The unit of measure class associated with the product usage grant. This field is a relationship field. **Relationship Name** UnitOfMeasureClass **Refers To** UnitOfMeasureClass
`UnitOfMeasureId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The unit for measure associated with the product usage grant. This value when specified, overrides the default unit of measure defined in the associated unit of measure class. This field is a relationship field. **Relationship Name** UnitOfMeasure **Refers To** UnitOfMeasure

Field	Details
`UsageDefinitionProductId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The sellable product associated with the usage resource that's used to retrieve tax policy, calculate rating during overages, and other invoicing actions. This field is a relationship field. **Relationship Name** UsageDefinitionProduct **Refers To** Product2
`UsageModelType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The ID of the unit of measure associated with the product. The type of usage model for a product or service. `Anchor` is the main subscription product or service. `Pack` is the add-on product or service that grants additional usage resources for consumption. `Commit` is the product or service with a specific committed quantity of consumption. Valid values are: • `Anchor` • `Pack` • `Token Commitment` • `Quantity Commitment` • `Monetary Commitment` This field is available in API version 65.0 and later.
`UsageResourceId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The usage resource associated with the product usage grant. This field is a relationship field. This field is deprecated and will be retired in a future version. **Relationship Name** UsageResource

Field	Details
	Refers To UsageResource
`ValidityPeriodTerm`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The period until when the resource grant is valid.
`ValidityPeriodUnit`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The length of a validity period for the resource grant, when used with the `ValidityPeriodTerm` field. Valid values are: • `Month` • `None` • `Year`

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ProductUsageGrantHistory
History is available for tracked fields of the object.

ProductUsageGrantOwnerSharingRule
Sharing rules are available for the object.

ProductUsageGrantShare
Sharing is available for the object.

ProductUsageResource

Represents the mapping of a product and its usage resources. This object is available in API version 64.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Fields

Field	Details
`EffectiveEndDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time when the relationship between the product and the usage resource stops being active, and any usage tracking or billing related to this relationship ends.
`EffectiveStartDate`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The date and time when the relationship between the product and the usage resource becomes active or effective, and any usage tracking or billing related to this relationship begins.
IsOptional	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the product usage resource is optional when the associated product is one of the commitment usage model types (`true`) or not (`false`). The default value is `false`. This field is available in API version 65.0 and later.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The timestamp for when the current user last viewed a record related to this record.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the product usage grant. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
`ProductId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The sellable product that grants the usage resource. This field is a relationship field. **Relationship Name** ProductOffer **Refers To** Product2
`ProductUsageResourceNum`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The number of each resource grant map that starts with one and is consecutive.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of the product usage resource record. Valid values are:

Field	Details
	• `Active` • `Draft` • `Inactive`
TokenResourceId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The usage resource of category `Token` that's associated with the selected usage resource. This field is available in API version 65.0 and later. This field is a relationship field. **Relationship Name** TokenResource **Refers To** UsageResource
`UsageResourceId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The usage resource associated with the product usage grant. This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ProductUsageResourceChangeEvent
Change events are available for the object.

ProductUsageResourceFeed
Feed tracking is available for the object.

ProductUsageResourceHistory
History is available for tracked fields of the object.

ProductUsageResourceOwnerSharingRule
Sharing rules are available for the object.

ProductUsageResourceShare
Sharing is available for the object.

ProductUsageResourcePolicy

Represents the policies applicable to the usage resource when it's associated with a sellable product. These policies are derived from the parent usage resource and can be overridden when setting up usage modeling.This object is available in API version 65 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date and time when the current user last viewed or modified this record, a record related to this record, or a list view.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date and time when the current user last viewed or modified this record.
`ProductSellingModelId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The product selling model associated with this policy. This field is a relationship field.

Field	Details
	Relationship Name ProductSellingModel **Refers To** ProductSellingModel
`ProductUsageResourceId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The product usage resource associated with this policy. This field is a relationship field. **Relationship Name** ProductUsageResource **Relationship Type** Master-detail **Refers To** ProductUsageResource (the master object)
`RatingFrequencyPolicyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The rating frequency policy associated with the usage resource. This field is a relationship field. **Relationship Name** RatingFrequencyPolicy **Refers To** RatingFrequencyPolicy
`UsageAggregationPolicyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage aggregation policy associated with the usage resource. This field is a relationship field. **Relationship Name** UsageAggregationPolicy

Field	Details
	Refers To UsageResourceBillingPolicy
`UsageCommitmentPolicyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage commitment policy associated with the usage resource. This field is a relationship field. **Relationship Name** UsageCommitmentPolicy **Refers To** UsageCommitmentPolicy
`UsageOveragePolicyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage overage policy associated with the usage resource. This field is a relationship field. **Relationship Name** UsageOveragePolicy **Refers To** UsageOveragePolicy

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ProductUsageResourcePolicyFeed
Feed tracking is available for the object.

ProductUsageResourcePolicyHistory
History is available for tracked fields of the object.

TransactionUsageEntitlement

Represents the details of each usage entitlement that's granted with the purchased sellable product, such as quantity and date when the entitlements were granted. This object is available in API version 63.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To create, update, and delete transaction usage entitlement records, you must have the Usage Management Run Time permission set license.

Fields

Field	Details
`AccountId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The account that's associated with the usage entitlement. This field is a relationship field. **Relationship Name** Account **Refers To** Account
`ActionType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of action that resulted in the transaction usage entitlement. Valid values are: • `Amend` • `Cancellation` • `New` • `Ramp` • `Renewal`
`AssetId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The asset associated with the sellable product. This field is a relationship field. **Relationship Name** Asset **Refers To** Asset
`ChargeForOverage`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The action to be taken when the entitlements are used beyond their grant values. Valid values are: • `No`—Don't charge for overconsumption • `Yes`—Charge for overconsumption
`DrawdownOrder`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The order that's used to debit entitlement consumption from the usage entitlement bucket. Valid values are: • `ExpiringFirst` • `GrantedFirst` • `GrantedLast`
`EffectiveEndDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time when the active transaction usage entitlement ends.
`EffectiveStartDateTime`	**Type** dateTime **Properties** Create, Filter, Sort, Update

Field	Details
	Description The date and time when the transaction usage entitlement becomes active.
`EntitlementQuantity`	**Type** double **Properties** Create, Filter, Sort, Update **Description** The entitlement quantity for the usage resource.
`EntitlementProcessingStatus`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates whether the transaction usage entitlement has been processed by entitlement service to be used in Billing. Available in API version 65.0 and later. Possible values are: • `PENDING`—Pending • `PROCESSED`—Processed The default value is `PENDING`.
`EntitlementUomClassId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The unit of measure class for the usage entitlement. This field is a relationship field. **Relationship Name** EntitlementUomClass **Refers To** UnitOfMeasureClass
`EntitlementUomId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The unit of measure to calculate the usage entitlement.

Field	Details
	This field is a relationship field. **Relationship Name** EntitlementUom **Refers To** UnitOfMeasure
ExternalOrderItem	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The custom or external order item that's associated with the entitlement.
GrantBindingTargetId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The target associated with the entitlements that are granted with the sellable product. This field is a relationship field. **Relationship Name** GrantBindingTarget **Refers To** Account, Asset, BindingObjectCustomExt, Contract
GrantType	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies the type of model that defines how the usage resource is consumed. Available in API version 65.0 and later. Possible values are: • `Commit` • `Grant` The default value is `Grant`.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The date when this record was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
Name	**Type** string **Properties** Auto number, Defaulted on create, Filter, idLookup, Sort **Description** Autogenerated identifier for the transaction usage entitlement record.
NetQuantity	**Type** double **Properties** Create, Filter, Sort, Update **Description** The total quantity that combines the amended quantity with the initial transaction quantity in the order item.
OriginalEndDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The end date of the transaction usage entitlement when the related order was assetized, amended, renewed, or canceled.
OrderItemId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The order item that's associated with the entitlement. This field is a polymorphic relationship field.

Field	Details
	Relationship Name OrderItem **Refers To** OrderItem, WorkOrderLineItem
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the transaction usage entitlement. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
PricebookEntryId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The price book entry that's associated with the sellable product. This field is a relationship field. **Relationship Name** PricebookEntry **Refers To** PricebookEntry
ProductId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The sellable product for which the entitlement is granted. This field is a relationship field. **Relationship Name** Product **Refers To** Product2

Field	Details
RatingFrequencyPolicyId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The sellable product for which the entitlement is granted. Available in API version 64.0 and later. This field is deprecated and will be retired in a future version. This field is a relationship field. **Relationship Name** RatingFrequencyPolicy **Refers To** RatingFrequencyPolicy
TokenResourceId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage resource of category Token associated with the usage resource related to the usage product added in the quote line item. Available in API version 65.0 and later. This field is a relationship field. **Relationship Name** TokenResource **Refers To** UsageResource
TransactionQuantity	**Type** double **Properties** Create, Filter, Sort, Update **Description** The transaction quantity in the order for the usage entitlement.
UsageAggregationPolicyId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The usage aggregation policy for this entitlement. This field is deprecated and will be retired in a future version. This field is a relationship field.

Field	Details
	Relationship Name UsageAggregationPolicy **Refers To** UsageResourceBillingPolicy
UsageGrantRefreshPolicyId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage grant refresh policy that's associated with the transaction usage entitlement. This field is a relationship field. **Relationship Name** UsageGrantRefreshPolicy **Refers To** UsageGrantRenewalPolicy
UsageGrantRolloverPolicyId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage grant rollover policy that's associated with the transaction usage entitlement. This field is a relationship field. **Relationship Name** UsageGrantRolloverPolicy **Refers To** UsageGrantRolloverPolicy
UsageModelType	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of usage model for a product or service. `Anchor` is the main subscription product or service. `Pack` is the add-on product or service that grants additional usage resources for consumption. `Commit` is the product or service with a specific committed quantity of consumption. Valid values are: • `Anchor` • `Monetary Commitment`

Field	Details
	• `Pack` • `Quantity Commitment` • `Token Commitment` Available in API version 64.0 and later.
`UsageResourceId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The usage resource record that's associated with the transaction usage entitlement. This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource
`ValidityPeriodTerm`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The duration for which the usage resource grant is valid, when used with the validity period units.
`ValidityPeriodUnit`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The length of a validity period for the usage resource grant, when used with the validity period term. Valid values are: • `Month` • `None` • `Year`

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

TransactionUsageEntitlementFeed
Feed tracking is available for the object.

TransactionUsageEntitlementHistory
History is available for tracked fields of the object.

TransactionUsageEntitlementOwnerSharingRule
Sharing rules are available for the object.

TransactionUsageEntitlementShare
Sharing is available for the object.

TransactionJournal

Represents consumption details of a usage resource that are recorded for creating usage summaries. This object is available for usage management in API version 63.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You must have the Usage Management Run Time permission set license.

Fields

Field	Details
`AccountId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The account associated with the consumption. This field is a relationship field. **Relationship Name** Account **Refers To** Account
`ActivityDate`	**Type** dateTime

Field	Details
	Properties Create, Filter, Sort, Update **Description** Required. The date of the transaction.
CurrencyIsoCode	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The three-letter ISO 4217 currency code of the monetary currency in which the transaction took place. Possible values are: • AED—UAE Dirham • EUR—Euro • GBP—British Pound • INR—Indian Rupee • JPY—Japanese Yen • USD—U.S. Dollar The default value is USD.
EndDate	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The end date associated with the transaction.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The most recent date on which a user referenced this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The most recent date on which a user viewed this record.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The autogenerated number of the transaction journal.
`Quantity`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The number of units consumed.
`QuantityUnitOfMeasureId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The unit of measure for the associated usage resource. This field is a relationship field. **Relationship Name** QuantityUnitOfMeasure **Refers To** UnitOfMeasure
`ReferenceRecordId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The asset associated with the transaction journal. This field is a polymorphic relationship field. **Relationship Name** ReferenceRecord **Refers To** Asset

Field	Details
StartDate	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The start date associated with the transaction.
Status	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The status of the transaction. Possible values are: • Cancelled • Error • Pending • Processed
UniqueIdentifier	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The unique identifier of the transaction journal.
UsageResourceId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage resource that's associated with the transaction journal. This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource
UsageSummaryId	**Type** reference

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The usage summary that's associated with the transaction journal. Available in API version 64.0 and later. This field is a relationship field. **Relationship Name** UsageSummary **Refers To** UsageSummary
`UsageType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of usage. Valid value is `UsageManagement`.

UnitOfMeasure

Defines the units and systems of units used to account for quantities of a usage resource. This object is available for usage management in API version 62.0 and later.

Examples of units of measure include Liter (for volume), Kilogram (for weight), and single units (such as Can, sachet, and packet).

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`ConversionFactor`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The factor or rate that's used to convert this unit of measurement to the base unit.

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Autogenerated identifier for the unit of measure record.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the unit of measure record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
Sequence	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The sequence number assigned to the unit of measure.

Field	Details
Status	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The status of the unit of measure. Valid values are: • Active • Draft • Inactive
Type	**Type** picklist **Properties** Create, Filter, Group, Sort, Update **Description** The type of the unit of measure. For example, weight, distance, period.
UnitCode	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The code for the unit of measure.
UnitOfMeasureClassId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The unit of measure class associated with the unit of measure. This field is a relationship field. **Relationship Name** UnitOfMeasureClass **Refers To** UnitOfMeasureClass

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

UnitOfMeasureChangeEvent
Change events are available for the object.

UnitOfMeasureShare
Sharing is available for the object.

UnitOfMeasureClass

Represents a standard unit of measure dimension. This object is available in API version 63.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`BaseUnitOfMeasureId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The base unit of measure that's used to calculate and display quantities. This field is a relationship field. **Relationship Name** BaseUnitOfMeasure **Refers To** UnitOfMeasure
`Code`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique user-defined string for the unit of measure class.
`DefaultUnitOfMeasureId`	**Type** reference

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The default unit of measure that's used to calculate and display quantities. This measure can be different from the base unit of measure and overridden by individual resources. This field is a relationship field. **Relationship Name** DefaultUnitOfMeasure **Refers To** UnitOfMeasure
`Description`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The description of the unit of measure class.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Autogenerated identifier for the unit of measure class record.
`Status`	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of the unit of measure class. Valid values are: • `Active` • `Draft` • `Inactive`
`Type`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of the unit of measure class. Valid values are: • `Currency` • `Token` • `Usage` The default value is `Usage`. Available in API version 64.0 and later. This is a required field.

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

UnitOfMeasureClassHistory
History is available for tracked fields of the object.

UsageBillingPeriodItem

Represents the calculated overages for the usage entitlement and the amount that's charged for these overages. This object is available in API version 63.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To create, update, and delete transaction usage entitlement records, you must have the Usage Management Run Time permission set license.

Fields

Field	Details
AccountId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The account that's associated with the billing period item. This field is a relationship field. **Relationship Name** Account **Refers To** Account
AssetId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The asset that's associated with the usage billing period item. This field is a relationship field. **Relationship Name** Asset **Refers To** Asset
EndDateTime	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The end date and time of the billing period.
ErrorCode	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The error code when the billing request fails. Valid value is: • `INTERNAL_ERROR`
`ErrorDescription`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The error description that corresponds to the error code.
`GrantBindingTargetId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The record that's associated with the usage entitlement account. This field is a relationship field. **Relationship Name** GrantBindingTarget **Refers To** Account, Asset, BindingObjectCustomExt, Contract
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.

Field	Details
OverageAmount	**Type** currency **Properties** Create, Filter, Sort, Update **Description** The amount calculated for the overage.
OverageAmountDerived	**Type** double **Properties** Filter, Nillable, Sort **Description** The numeric value specified in the `OverageAmount` field to process Data processing Engine (DPE) jobs. This field is a calculated field.
OverageQuantity	**Type** double **Properties** Create, Filter, Sort, Update **Description** The quantity of the usage entitlement that was overused for the specified billing period.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the usage billing period item. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
StartDateTime	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The start date and time of the billing period.

Field	Details
Status	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of the usage billing period item. Valid values are: • Invoiced • InvoicingFailed • LiableSummaryComplete • New • ReadyForInvoicing • Inactive—Available in API version 65.0 and later. • InProgress—Available in API version 66.0 and later.
TotalUsedQuantity	**Type** double **Properties** Create, Filter, Sort, Update **Description** The total quantity of usage entitlement that was used for the billing period. This includes granted and overused entitlements.
UoMId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The unit of measure for the overage quantity of usage entitlement. This field is a relationship field. **Relationship Name** UoM **Refers To** UnitOfMeasure
UsageBillingPeriodItemNum	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort

Field	Details
	Description Autogenerated identifier for the usage billing period item record.
UsageEntitlementAccountId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The usage entitlement account associated with the source usage entitlement bucket. This field is a relationship field. **Relationship Name** UsageEntitlementAccount **Refers To** UsageEntitlementAccount
UsageEntitlementBucketId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The usage entitlement bucket that's associated with the billing period item. This field is a relationship field. **Relationship Name** UsageEntitlementBucket **Refers To** UsageEntitlementBucket
UsageResourceId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The usage resource associated with the usage entitlement bucket. This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

UsageBillingPeriodItemFeed
Feed tracking is available for the object.

UsageBillingPeriodItemHistory
History is available for tracked fields of the object.

UsageBillingPeriodItemOwnerSharingRule
Sharing rules are available for the object.

UsageBillingPeriodItemShare
Sharing is available for the object.

UsageCmtAssetRelatedObj

Represents the relation between an asset for the commitment-based usage product and an asset, account, contract, or custom object. This object is available in API version 64.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AssetId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The asset associated with the commitment-based usage product. This field is a relationship field. **Relationship Name** Asset **Relationship Type** Master-detail **Refers To** Asset (the master object)

Field	Details
EffectiveEndDateTime	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time until when the commitment for the related asset remains effective.
EffectiveStartDateTime	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The date and time when the commitment for the related asset becomes effective.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Autogenerated identifier for the usage commitment asset related object record.
RelatedObjectId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The asset, account, or contract associated with the asset.

Field	Details
	This field is a polymorphic relationship field. **Relationship Name** RelatedObject **Refers To** Account, Asset, Contract Only Asset is supported in API version 64.0.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

UsageCmtAssetRelatedObjFeed
Feed tracking is available for the object.

UsageCmtAssetRelatedObjHistory
History is available for tracked fields of the object.

UsageCommitmentPolicy

Represents the set of rules that determines how commitments are applied to a usage resource. This object is available in API version 65 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Fields

Field	Details
`CommitmentRate`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The rate that's applicable to the usage resource's units consumed post the commitment is utilized, but the commitment period is still active. Valid values are: • `Bounded Object Rate`

Field	Details
	• `Lowest Commitment Rate` The default value is `Lowest Commitment Rate`.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date and time when the current user last viewed or modified this record, a record related to this record, or a list view.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date and time when the current user last viewed or modified this record.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the usage commitment policy.

UsageEntitlementAccount

Represents the entitlement account details related to the asset that holds the wallet with the granted units. This object is available in API version 63.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AccountId	**Type** reference

Field	Details
	Properties Create, Filter, Group, Sort, Update **Description** The account that's associated with the usage entitlement. This field is a relationship field. **Relationship Name** Account **Refers To** Account
BillDayOfMonth	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The day of the month that the bill is generated on and that ends the billing period.
BillingPeriodEndDateTime	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The date and time when the billing period of the usage entitlements ends.
BillingPeriodStartDateTime	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The date and time when the billing period of the usage entitlements starts.
BillingPeriodTerm	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The frequency at which the bill is generated.
BillingPeriodUnit	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Restricted picklist, Sort, Update **Description** The unit to measure the billing frequency. Valid value is: • MONTH
EffectiveEndDateTime	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time when the usage entitlement account ends.
EffectiveStartDateTime	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The date and time when the usage entitlement account starts.
GrantBindingTargetId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The target that's associated with the usage entitlement account. This field is a relationship field. **Relationship Name** GrantBindingTarget **Refers To** Account, Asset, BindingObjectCustomExt, Contract
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.

Field	Details
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
Name	**Type** string **Properties** Auto number, Defaulted on create, Filter, idLookup, Sort **Description** Autogenerated identifier for the usage entitlement account record.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the usage entitlement account. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
PricebookEntryId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The price book entry that's associated with the sellable product. This field is a relationship field. **Relationship Name** PricebookEntry **Refers To** PricebookEntry
ProductId	**Type** reference

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The sellable product for which the entitlements are granted. This field is a relationship field. **Relationship Name** Product **Refers To** Product2

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

UsageEntitlementAccountFeed
Feed tracking is available for the object.

UsageEntitlementAccountHistory
History is available for tracked fields of the object.

UsageEntitlementAccountOwnerSharingRule
Sharing rules are available for the object.

UsageEntitlementAccountShare
Sharing is available for the object.

UsageEntitlementBucket

Represents a usage entitlement that's granted with the sellable product. This object is available in API version 63.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`BucketBalance`	**Type** double **Properties** Create, Filter, Sort, Update

Field	Details
	Description The balance of the usage entitlement bucket after each transaction.
BucketBalanceUomId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The unit that's used to measure the usage entitlement bucket balance. This field is a relationship field. **Relationship Name** BucketBalanceUom **Refers To** UnitOfMeasure
CompletedRollovers	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The number of rollovers that were completed for the entitlements.
ConsumedEntitlement	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The entitlements that have been consumed from this bucket.
EffectiveEndDateTime	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time when the usage entitlement bucket period ends.
EffectiveStartDateTime	**Type** dateTime **Properties** Create, Filter, Sort, Update

Field	Details
	Description The date and time when the usage entitlement bucket becomes effective.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Autogenerated identifier for the usage entitlement bucket record.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the usage entitlement bucket. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
ParentId	**Type** reference **Properties** Create, Filter, Group, Sort, Update

Field	Details
	Description The parent record that's associated with the usage entitlement bucket. This field is a polymorphic relationship field. **Relationship Name** Parent **Refers To** UsageEntitlementAccount, UsageEntitlementBucket
ProvisionalBucketBalance	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The provisional entitlement balance available in the usage bucket. Available in API version 66.0 and later.
TotalAsOfBalance	**Type** double **Properties** Filter, Nillable, Sort **Description** The balance of the entitlements granted with the usage resource for a Usage entitlement account.
TotalConsumedEntitlement	**Type** double **Properties** Filter, Nillable, Sort **Description** The entitlements that have been consumed from this bucket.
TotalProvisionalBalance	**Type** double **Properties** Filter, Nillable, Sort **Description** The total provisional entitlement balance in the usage entitlement account as of the specified date. Available in API version 66.0 and later.
TransactionUsageEntitlementId	**Type** reference

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The transaction usage entitlement associated with this usage entitlement bucket. This field is a relationship field. **Relationship Name** TransactionUsageEntitlement **Refers To** TransactionUsageEntitlement
`UsageResourceId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The usage resource that's associated with the usage entitlement bucket. This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

UsageEntitlementBucketFeed
Feed tracking is available for the object.

UsageEntitlementBucketHistory
History is available for tracked fields of the object.

UsageEntitlementBucketOwnerSharingRule
Sharing rules are available for the object.

UsageEntitlementBucketShare
Sharing is available for the object.

UsageEntitlementEntry

Represents the usage entitlement details, such as the usage consumption, rollovers, and details of expired units for each tenure. This object is available in API version 63.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`ClosingBalance`	**Type** double **Properties** Create, Filter, Sort, Update **Description** The quantity of the entitlement after adjusting the transaction quantity for the current entitlement validity period.
`EffectiveEndDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time when the usage entitlement entry ends.
`EffectiveStartDateTime`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The date and time when the usage entitlement entry starts.
`EntitlementBucketId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The usage entitlement bucket that's associated with the entitlement entry. This field is a relationship field. **Relationship Name** EntitlementBucket

Field	Details
	Relationship Type Master-detail **Refers To** UsageEntitlementBucket (the master object)
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Autogenerated identifier for the usage entitlement entry record.
OpeningBalance	**Type** double **Properties** Create, Filter, Sort, Update **Description** The starting quantity of the entitlement for the current entitlement validity period.
ParentEntitlementBucketId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The parent usage entitlement bucket record that's associated with the entitlement entry. This field is a relationship field.

Field	Details
	Relationship Name ParentEntitlementBucket **Refers To** UsageEntitlementBucket
TransactionDate	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The date when the transaction usage entitlement entry was updated.
TransactionQuantity	**Type** double **Properties** Create, Filter, Sort, Update **Description** The quantity of the entitlement used during the current entitlement validity period.
TransactionReason	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The reason for the usage entitlement entry. Valid values are: • Amend • Cancel • Consumption • Original • Refresh • Renew • Rollover
TransactionType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of transaction.

Field	Details
	Valid values are: • `Credit` • `Debit` • `Expired`
`TransactionUsageEntitlementId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The transaction usage entitlement that's associated with this usage entitlement entry. This field is a relationship field. **Relationship Name** TransactionUsageEntitlement **Refers To** TransactionUsageEntitlement
`TransactionalBucketId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage entitlement bucket that's used to debit the consumption of entitlements. This field is a relationship field. **Relationship Name** TransactionalBucket **Refers To** UsageEntitlementBucket
`UomId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The unit of measure that's associated with the usage entitlement. This field is a relationship field. **Relationship Name** Uom **Refers To** UnitOfMeasure

Field	Details
UsageSummaryId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage summary that's associated with the usage entitlement. Available in API version 64.0 and later. This field is a relationship field. **Relationship Name** UsageSummary **Refers To** UsageSummary

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

UsageEntitlementEntryFeed
Feed tracking is available for the object.

UsageEntitlementEntryHistory
History is available for tracked fields of the object.

UsageGrantRenewalPolicy

Represents a policy about the rollover of a usage grant. This object is available in API version 62.0 and later.

A usage grant renewal policy is used if you want to never renew a usage grant or renew on a specific frequency.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
Code	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update

Field	Details
	Description A unique user-defined string for the usage grant renewal policy.
`IsRenewalAllowed`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the policy renewal is allowed (`true`) or not (`false`). If `true`, then the policy can be renewed. The default value is `false`.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the renewal policy record.
`RenewalFrequency`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The frequency of the policy renewals, when used with the `RenewalFrequencyUnit` field.

Field	Details
RenewalFrequencyUnit	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The renewal duration for a policy. Valid values are: • Month • Quarter • Year
Status	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of the renewal policy. Valid values are: • Active • Draft • Inactive

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

UsageGrantRenewalPolicyFeed
Feed tracking is available for the object.

UsageGrantRenewalPolicyHistory
History is available for tracked fields of the object.

UsageGrantRolloverPolicy

Represents a policy about the rollover of a usage grant.This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
Code	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** A unique user-defined string for the usage grant rollover policy.
IsRolloverAllowed	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the policy allows the rollover of the usage grant. The default value is `false`.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
MaximumRolloverCount	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The maximum number of times that the usage grant can roll over.
Name	**Type** string

Field	Details
	Properties Create, Filter, Group, idLookup, Sort, Update **Description** The name of the rollover policy record.
ShouldAllowRolloverExpiry	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the rollover for the associated usage grant is allowed to expire. The default value is `false`.
Status	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies the status of the rollover policy. Possible values are: • `Active` • `Draft` • `Inactive`

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

UsageGrantRolloverPolicyFeed
Feed tracking is available for the object.

UsageGrantRolloverPolicyHistory
History is available for tracked fields of the object.

UsageOveragePolicy

Represents the set of rules that determine the management of usage resource's units consumed beyond the granted limit. This object is available in API version 65 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date and time when the current user last viewed or modified this record, a record related to this record, or a list view.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date and time when the current user last viewed or modified this record.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the usage overage policy.
`OverageChargeable`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies whether the overconsumption beyond the granted quantity is to be charged. Valid values are: • `No` • `Yes`

UsagePrdGrantBindingPolicy

Represents the association of a usage resource's grants with a sellable product. This object is available in API version 63.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`GrantBindingTargetType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type of binding instance to which the grant is added. Valid values are: • `Custom` • `Product` • `Contract` • `Account`
`GrantBindingType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of binding that indicates where the grant is added. Valid values are: • `Self` • `Target`
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.

Field	Details
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Autogenerated identifier for the usage product grant binding policy.
Product2Id	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The sellable product associated with the usage product grant binding policy. This field is a relationship field. **Relationship Name** Product2 **Refers To** Product2

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

UsagePrdGrantBindingPolicyFeed
Feed tracking is available for the object.

UsagePrdGrantBindingPolicyHistory
History is available for tracked fields of the object.

UsageRatableSummary

Represents the aggregation of the usage summaries that are used to calculate the rate at which the overages are charged. This object is available in API version 63.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AccountId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The account that's associated with the ratable summary. This field is a relationship field. **Relationship Name** Account **Refers To** Account
`AssetId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The asset that's associated with the ratable summary. This field is a relationship field. **Relationship Name** Asset **Refers To** Asset
`EndDateTime`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The end date and time of the ratable period.
`ErrorCode`	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The code that represents the error encountered when the ratable summary is rated. Valid value is: • `INTERNAL_ERROR`
`ErrorDescription`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The error description that corresponds to the error code.
`GrantBindingTargetId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The record that's associated with the usage ratable summary. Available in API version 64.0 and later. This field is a relationship field. **Relationship Name** GrantBindingTarget **Refers To** Account, Asset, BindingObjectCustomExt, Contract
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.

Field	Details
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Autogenerated identifier for the usage ratable summary record.
`NetUnitRate`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The rate that's used to calculate the amount for each unit of usage entitlement overage.
`NetUnitRateUomId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The unit of measure for the net unit rate applied to the overage. This field is a relationship field. **Relationship Name** NetUnitRateUom **Refers To** UnitOfMeasure
`OverageQuantity`	**Type** double **Properties** Create, Filter, Sort, Update **Description** The quantity of the usage entitlements that were overused.
`OverageQuantityUomId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The unit of measure that's used for overage quantity. This field is a relationship field.

Field	Details
	Relationship Name OverageQuantityUom **Refers To** UnitOfMeasure
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the usage ratable summary. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
RatingDecisionDateTime	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The date and time when the decision about rating consumption is done.
RatingExecutionIdentifier	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the rating service execution that's used to retrieve waterfall logs.
RatingRequestId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID that invokes the rating service that's used to rate the usage ratable summary. This field is a relationship field. **Relationship Name** RatingRequest

Field	Details
	Refers To RatingRequest
`SourceUsageResourceId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage resource that's rated in tokens when usage ratable summary is created. This field is available in API version 65.0 and later. This field is a relationship field. **Relationship Name** SourceUsageResource **Refers To** UsageResource
`StartDateTime`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The start date and time of the ratable period.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of the ratable summary. Valid values are: • `New` • `RatingComplete` • `RatingFailed` • `SummaryCreated` • `Inactive`—Available in API version 65.0 and later. • `InProgress`—Available in API version 66.0 and later.
`TierQuantity`	**Type** double

Field	Details
	Properties Create, Filter, Sort, Update **Description** The quantity that impacts the net unit rate of a usage entitlement.
`TierQuantityUomId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The unit of measure for the tier quantity. This field is a relationship field. **Relationship Name** TierQuantityUom **Refers To** UnitOfMeasure
`TotalAmount`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The total amount after calculating the overage based on the net unit rate.
`UsageEntitlementAccountId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The usage entitlement account that's associated with the source of the ratable summary. This field is a relationship field. **Relationship Name** UsageEntitlementAccount **Refers To** UsageEntitlementAccount
`UsageEntitlementBucketId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update

Field	Details
	Description The usage entitlement bucket that's associated with the source of the ratable summary. This field is a relationship field. **Relationship Name** UsageEntitlementBucket **Refers To** UsageEntitlementBucket
`UsageResourceId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The usage resource associated with the usage entitlement bucket. This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

UsageRatableSummaryHistory
History is available for tracked fields of the object.

UsageRatableSummaryOwnerSharingRule
Sharing rules are available for the object.

UsageRatableSummaryShare
Sharing is available for the object.

UsageRatableSumCmtAssetRt

Represents the rate that's calculated and applicable for the usage resource associated with the commitment assets related to an anchor. This object is available in API version 65.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Fields

Field	Details
`CommitmentAssetId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The asset ID associated with the Usage Ratable Summary. This field is a relationship field. **Relationship Name** CommitmentAsset **Refers To** Asset
`ErrorCode`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies the unique code generated when an error occurs. Valid value is `INTERNAL_ERROR`.
`ErrorDescription`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Specifies the description of the error that occurred.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The date when this record was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Name of the Usage Commitment Summary record.
NetUnitRate	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The calculated per-unit rate for usage after applying commitment-specific discounts during the rating process.
UsageRatableSummaryId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The usage ratable summary associated with the usage commitment summary record. This field is a relationship field. **Relationship Name** UsageRatableSummary **Relationship Type** Master-detail **Refers To** UsageRatableSummary (the master object)

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

UsageRatableSumCmtAssetRtHistory
History is available for tracked fields of the object.

UsageResource

Represents an entitlement granted to a user or party by a provider, such as data storage, computing power, bandwidth, or any other product or service. Additionally, this object is used to represent resources consumed over time. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`Category`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The category of the usage resource that's used to organize and understand the product grant maps. Valid values are: • `Currency`—Available in API version 65.0 and later. • `Usage` • `Token`—Available in API version 64.0 and later.
`Code`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The unique user-defined string for the usage resource.
`DefaultUnitOfMeasureId`	**Type** reference

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The default unit of measure for the given resource. The default value can be overridden with an alternate default unit of measure for a given resource. This field is a relationship field. **Relationship Name** DefaultUnitOfMeasure **Refers To** UnitOfMeasure
`Description`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The description of the usage resource.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the usage resource record.
`OwnerId`	**Type** reference

Field	Details
	Properties Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the usage resource record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of the usage resource. Valid values are: • `Active` • `Draft` • `Inactive`
`TokenResourceId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage resource of Category `Token` that's used to charge this usage resource. For example, you can select a usage resource Credits (Token category) to rate the usage resource Data (Usage category). This field is available in API version 65.0 and later. **Relationship Name** TokenResource **Refers To** UsageResource
`UnitOfMeasureClassId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The unit of measure class that's used with the resource to define the units in which this resource is measured.

Field	Details
	This field is a relationship field. **Relationship Name** UnitOfMeasureClass **Refers To** UnitOfMeasureClass
`UsageDefinitionProductId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The product associated with the usage resource to retrieve tax policy, calculate rating during overages, and other invoicing actions. This field is a relationship field. **Relationship Name** UsageDefinitionProduct **Refers To** Product2
`UsageResourceBillingPolicyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage resource billing policy that defines how the usage resource can be aggregated before it's sent for rating. This field is a relationship field. This field is deprecated and will be retired in a future version. **Relationship Name** UsageResourceBillingPolicy **Refers To** UsageResourceBillingPolicy

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

UsageResourceFeed
Feed tracking is available for the object.

UsageResourceHistory
History is available for tracked fields of the object.

UsageResourceOwnerSharingRule

Sharing rules are available for the object.

UsageResourceShare

Sharing is available for the object.

UsageResourcePolicy

Represents the policies applicable to the usage resource whether it's associated with a sellable product or not. This object is available in API version 65 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Fields

Field	Details
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date and time when the current user last viewed or modified this record, a record related to this record, or a list view.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date and time when the current user last viewed or modified this record.
`RatingFrequencyPolicyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The rating frequency policy associated with the usage resource. This field is a relationship field. **Relationship Name** RatingFrequencyPolicy **Refers To** RatingFrequencyPolicy
UsageAggregationPolicyId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage aggregation policy associated with the usage resource. This field is a relationship field. **Relationship Name** UsageAggregationPolicy **Refers To** UsageResourceBillingPolicy
UsageCommitmentPolicyId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The usage commitment policy associated with the usage resource. This field is a relationship field. **Relationship Name** UsageCommitmentPolicy **Refers To** UsageCommitmentPolicy
UsageOveragePolicyId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage overage policy associated with the usage resource. This field is a relationship field.

Field	Details
	Relationship Name UsageOveragePolicy **Refers To** UsageOveragePolicy
UsageResourceId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The usage resource associated with the usage resource policy. This field is a relationship field. **Relationship Name** UsageResource **Relationship Type** Master-detail **Refers To** UsageResource (the master object)

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

UsageResourcePolicyFeed
Feed tracking is available for the object.

UsageResourcePolicyHistory
History is available for tracked fields of the object.

UsageResourceBillingPolicy

Represents information about how the usage is accumulated before rating a usage resource.This object is available in API version 62.0 and later.

A usage resource billing policy object is used to configure the properties of usage resources related to how aggregation is performed on the usage records before rating. Usage resource billing policies are defined at the usage resource level and can be reused across multiple usage resources.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
Code	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** A unique user-defined string for the usage resource billing policy.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the usage resource billing policy record.
Status	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of the policy. Valid values are: • Active • Draft • Inactive

Field	Details
UsageAccumulationMethod	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update, Defaulted On Create **Description** The method used to accumulate the usage. Valid values are: • `Peak` • `Sum`
UsageAccumulationPeriod	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The duration for which the usage is accumulated. Valid values are: • `Daily` • `Monthly`

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

UsageResourceBillingPolicyFeed
Feed tracking is available for the object.

UsageResourceBillingPolicyHistory
History is available for tracked fields of the object.

UsageSummary

Represents the aggregation of the entries in the transaction journal for a usage entitlement for a specified period. This object is available in API version 63.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AccountId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The account that's associated with the sellable product that was purchased. This field is a relationship field. **Relationship Name** Account **Refers To** Account
AssetId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The asset that's associated with the entitlement that was summarized. This field is a relationship field. **Relationship Name** Asset **Refers To** Asset
ConsumptionUnits	**Type** double **Properties** Create, Filter, Sort, Update **Description** The quantity that was used by the usage entitlement bucket.
DebitedUnits	**Type** double **Properties** Create, Filter, Sort, Update **Description** The units that are debited from the associated usage entitlement bucket.

Field	Details
EndDateTime	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The end date and time of the usage summary.
GrantBindingTargetId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The record that's associated with the usage summary. Available in API version 64.0 and later. This field is a relationship field. **Relationship Name** GrantBindingTarget **Refers To** Account, Asset, BindingObjectCustomExt, Contract
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LiableSummaryId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage billing period item that's associated with this usage summary. This field is a relationship field.

Field	Details
	Relationship Name LiableSummary **Refers To** UsageBillingPeriodItem
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Autogenerated identifier for the usage summary record.
OverageUnits	**Type** double **Properties** Create, Filter, Sort, Update **Description** The quantity that was overused by the usage entitlement bucket.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the usage summary. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
ParentUsageSummaryId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The parent usage summary that's associated with this usage summary. This field is available in API version 65.0 and later. This field is a relationship field. **Relationship Name** ParentUsageSummary

Field	Details
	Refers To UsageSummary
`RatableSummaryId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ratable summary that's associated with this usage summary. This field is a relationship field. **Relationship Name** RatableSummary **Refers To** UsageRatableSummary
`StartDateTime`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The start date and time of the usage summary.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of the usage summary. Valid values are: • `DrawdownComplete` • `LiableSummaryComplete` • `New` • `RatableSummaryComplete` • `Rated` • `UsageSummaryComplete` • `UsageSummaryInProgress` • `Inactive`—Available in API version 65.0 and later.
`UomId`	**Type** reference

Field	Details
	Properties Create, Filter, Group, Sort, Update **Description** The unit of measure for the usage resource. This value overrides the default unit of measure defined in the associated unit of measure class. This field is a relationship field. **Relationship Name** Uom **Refers To** UnitOfMeasure
`UsageEntitlementAccountId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The usage entitlement account that's associated with the usage summary. This field is a relationship field. **Relationship Name** UsageEntitlementAccount **Refers To** UsageEntitlementAccount
`UsageEntitlementBucketId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The usage entitlement bucket that's associated with the usage summary. This field is a relationship field. **Relationship Name** UsageEntitlementBucket **Refers To** UsageEntitlementBucket
`UsageResourceId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The usage resource that's associated with the source of the usage entitlement bucket.

Field	Details
	This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

UsageSummaryHistory
History is available for tracked fields of the object.

UsageSummaryOwnerSharingRule
Sharing rules are available for the object.

UsageSummaryShare
Sharing is available for the object.

Usage Management Fields on Standard Objects

Usage Management adds standard and custom fields to some standard Salesforce objects. These fields are available only in orgs where Usage Management is enabled. This object is available in API version 63.0 and later.

Usage Management Fields on Product2

Standard and custom fields extend the standard Product2 object for use in Usage Management to represent information about products.

Fields

Field	Details
`UsageModelType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type of usage model for a product or service. Valid values are:

Field	Details
	• `Anchor`—The main subscription product or service. Available in API version 62.0 and later. • `Pack`—The add-on product or service that grants additional usage resources for consumption. Available in API version 62.0 and later. • `Monetary Commitment`—An agreement by a customer to spend a minimum amount for a product or service in a defined period. Available in API version 65.0 and later. • `Quantity Commitment`—An agreement by a customer to use a minimum quantity of a product or service in a defined period. Available in API version 65.0 and later. • `Token Commitement`—An agreement by a customer to use a minimum quantity of tokens for a product or service in a defined period. Available in API version 65.0 and later.

Usage Management Standard Invocable Actions

Learn more about the standard invocable actions available with Usage Management.

Invoke Summary Creation Action

Invoke the service that creates various summaries, such as usage, ratable, and liable summaries where the usage amount is zero. The service also checks and updates the billing period of the usage entitlement account if the billing period is expired.

Process Consumption Overages Action

Process consumption overages for the usage summary records with `SummaryComplete` status. This action uses the entitlement service to process the overages.

Refresh Usage Entitlement Bucket Action

Refresh entitlements by evaluating the usage entitlement bucket records and creating a new usage entitlement entry.

Retrigger Entitlement Creation Process Action

Retrigger entitlement creation process for failed or unprocessed assets.

Salesforce Help: Usage Management

Invoke Summary Creation Action

Invoke the service that creates various summaries, such as usage, ratable, and liable summaries where the usage amount is zero. The service also checks and updates the billing period of the usage entitlement account if the billing period is expired.

This action is available in API version 63.0 and later.

Special Access Rules

The Invoke Summary Creation action is available in Enterprise, Developer, and Unlimited Editions where Usage Management is enabled. To use this action, you need the Usage Management Run Time User permission.

Supported REST HTTP Methods

URI

`/services/data/v`***`67.0`***`/actions/standard/invokeSummaryCreationService`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer` ***`token`***

Inputs

Input	Details
usageEntitlementAccountId	**Type** string **Description** Required. ID of the usage entitlement account record that's used to create summaries.

Outputs

None.

Example

POST

This example shows a sample request for the Invoke Summary Creation action.

```
{
  "inputs": [
    {
      "usageEntitlementAccountId": "3ttDU00000000iZYAQ"
    }
  ]
}
```

This example shows a sample response for the Invoke Summary Creation action.

```
{
  "actionName": "invokeSummaryCreationService",
  "errors": null,
  "isSuccess": true
}
```

Salesforce Help: Permission Set Licenses, Personas, and User Permissions for Usage Management

Process Consumption Overages Action

Process consumption overages for the usage summary records with `SummaryComplete` status. This action uses the entitlement service to process the overages.

This action is available in API version 63.0 and later.

Special Access Rules

The Process Consumption Overages action is available in Enterprise, Developer, and Unlimited Editions where Usage Management is enabled. To use this action, you need the Usage Management Run Time User permission.

Supported REST HTTP Methods

URI

`/services/data/v`***`67.0`***`/actions/standard/processConsumptionOverages`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer` ***`token`***

Inputs

Input	Details
`usageRatableSummaryId`	**Type** string **Description** Required. ID of the usage ratable summary record that contains the consumption details, and is used to calculate consumption overages and create usage entitlement entry records.

Outputs

None.

Example

POST

This example shows a sample request for the Process Consumption Overages action.

```
{
  "inputs": [
    {
      "usageRatableSummaryId": "3ttDU00000000iZYAQ"
    }
  ]
}
```

This example shows a sample response for the Process Consumption Overages action.

```
{
  "actionName": "processConsumptionOverages",
  "errors": null,
  "isSuccess": true
}
```

Salesforce Help: Permission Set Licenses, Personas, and User Permissions for Usage Management

Refresh Usage Entitlement Bucket Action

Refresh entitlements by evaluating the usage entitlement bucket records and creating a new usage entitlement entry.

This action is available in API version 63.0 and later.

Special Access Rules

The Refresh Usage Entitlement Bucket action is available in Enterprise, Developer, and Unlimited Editions where Usage Management is enabled. To use this action, you need the Usage Management Run Time User permission.

Supported REST HTTP Methods

URI

`/services/data/v`***`67.0`***`/actions/standard/refreshUsageEntitlementBucket`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer` ***`token`***

Inputs

Input	Details
transactionUsageEntitlementId	**Type** string **Description** Required. ID of the transaction usage entitlement record that's associated with the usage entitlement buckets that you need to refresh.

Outputs

None.

Example

POST

This example shows a sample request for the Refresh Usage Entitlement Bucket action.

```
{
  "inputs": [
    {
      "transactionUsageEntitlementId": "3ttDU00000000iZYAQ"
    }
  ]
}
```

This example shows a sample response for the Refresh Usage Entitlement Bucket action.

```
{
  "actionName": "refreshUsageEntitlementBucket",
  "errors": null,
  "isSuccess": true
}
```

Retrigger Entitlement Creation Process Action

Retrigger entitlement creation process for failed or unprocessed assets.

Trigger the entitlement creation process again in these scenarios.

- Process failed assets in the asset to entitlement journey.
- Assetize or create wallets for assets without corresponding records in Usage Management.

This action is available in API version 65.0 and later.

Special Access Rules

The Retrigger Entitlement Creation Process action is available in Enterprise, Developer, and Unlimited Editions where Usage Management is enabled. To use this action, you need the Usage Management Run Time User permission.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/retriggerEntlCreaProc`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearertoken`

Inputs

Input	Details
`assetId`	**Type** string **Description** Required. ID of the asset for which you want to trigger the asset to entitlement process again.

Outputs

None.

Example

POST

Here's a sample request for the Retrigger Entitlement Creation Process action.

```
{
  "inputs": [
    {
      "assetId": "02iSB000000JzZFYA0"
    }
  ]
}
```

Here's a sample response for the Retrigger Entitlement Creation Process action.

```
[
  {
    "actionName": "retriggerEntlCreaProc",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": null,
    "sortOrder": -1,
    "version": 1
  }
]
```

Usage Management Business APIs

Use the Usage Management Business APIs to get details of a usage-based product that's associated with an asset, an order item, or a quote line item.

This table lists the available Usage Management resources.

Resource	Description
`/asset-management/assets/`***`assetId`***`/usage-details` (GET)	Get details of a usage-based product associated with an asset. This covers details of grants, resources, and configured rates for the product, including negotiated rates in case of a rate override.
`/commerce/sales-orders/line-items/`***`orderItemId`***`/usage-details` (GET)	Get details of a usage-based product associated with an order item.
`/commerce/quotes/line-items/`***`quoteLineItemId`***`/usage-details` (GET)	Get details of a usage-based product associated with a quote line item.
`/revenue/usage-management/binding-objects/`***`bindingObjectId`***`/actions/usage-details` (GET)	Get details of grants, resources, rates, and any configured policies for a specified binding object.
`/revenue/usage-management/consumption/actions/trace` (POST)	Get a comprehensive breakdown of overage charges and resource drawdown, enabling you to view information that's applicable to specific invoice lines.

Resource	Description
`/revenue/usage-management/usage-products/actions/validate` (POST)	Validate cross-object relationships and business rules for usage-based products.

SEE ALSO:

Connect REST API Developer Guide: Introduction

Resources

Learn more about the available Usage Management API resources.

Asset Usage Details (GET)
Get details of a usage-based product associated with an asset. This covers details of grants, resources, and configured rates for the product, including negotiated rates in case of a rate override.

Binding Object Usage Details (GET)
Get details of grants, resources, rates, and any configured policies for a specified binding object.

Consumption Traceabilities (POST)
Get a comprehensive breakdown of overage charges and resource drawdown, enabling you to view information that's applicable to specific invoice lines.

Order Item Usage Details (GET)
Get details of a usage-based product associated with an order item.

Quote Line Item Usage Details (GET)
Get details of a usage-based product associated with a quote line item.

Usage Product Activation (POST)
Activate a usage product and its related records, such as usage resources, grants, policies, and rate card entries, in a single request.

Usage Product Validation (POST)
Validate cross-object relationships and business rules for usage-based products.

Asset Usage Details (GET)

Get details of a usage-based product associated with an asset. This covers details of grants, resources, and configured rates for the product, including negotiated rates in case of a rate override.

Here are the details that this API returns.

- Grants and resources for the product, if rates aren't configured.
- Grants, resources, and any configured rates for the product. The rates are returned by the Rate Plan (GET) API.
- Resources that include grants, if applicable, and any negotiated rates for the product in case of a rate override request.

This API doesn't return binding target rates. Use the Binding Object Usage Details API to retrieve binding target rates.

Resource

```
/asset-management/assets/assetId/usage-details
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/asset-management/assets/02iRM0000000tCdYAI/usage-details
```

Available version

63.0

HTTP methods

GET

Path parameter for GET

Parameter Name	Type	Description	Required or Optional	Available Version
`assetId`	String	ID of the asset.	Required	63.0

Query parameters for GET

Parameter Name	Type	Description	Required or Optional	Available Version
`effectiveDate`	String	Date that's used to search for the applicable rate card entries.	Required	63.0
`optionalFields`	String[]	Custom fields that you can use to query these objects. • AssetRateCardEntry • AssetRateAdjustment	Optional	63.0

Response body for GET

Usage Details

Binding Object Usage Details (GET)

Get details of grants, resources, rates, and any configured policies for a specified binding object.

Use this API to display the details for a binding object during the selling journey. Additionally, display the details after assetization on the selected binding objects.

The supported binding objects are Account, Contract, BindingObjectCustomExt, or Anchor Asset that's not bound to a target.

Resource

```
/revenue/usage-management/binding-objects/bindingObjectId/actions/usage-details
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/revenue/usage-management/binding-objects/1BRxx0000004C9EGAU/actions/usage-details?effectiveDate=2025-08-07
```

Available version

65.0

HTTP methods

GET

Path parameter for GET

Parameter Name	Type	Description	Required or Optional	Available Version
`bindingObjectId`	String	ID of the binding object.	Required	65.0

Query parameter for GET

Parameter Name	Type	Description	Required or Optional	Available Version
`effectiveDate`	String	Date filter that's used to retrieve the grants, rates, and applicable policies as of the specified date in `yyyy-MM-dd` format.	Required	65.0

Response body for GET

Binding Object Usage Detail

Consumption Traceabilities (POST)

Get a comprehensive breakdown of overage charges and resource drawdown, enabling you to view information that's applicable to specific invoice lines.

This API provides an automated, clear, and traceable breakdown of all charges with details of specific rates, tiers, and discounts.

Resource

```
/revenue/usage-management/consumption/actions/trace
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/revenue/usage-management/consumption/actions/trace
```

Available version

66.0

HTTP methods

POST

Request body for POST

JSON example

```
{
  "liableSummaryIds": [
    "1HG000000000001"
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
liableSummaryIds	String[]	List of liable summary IDs to trace the consumption.	Required	66.0

Response body for POST

Consumption Traceabilities

Order Item Usage Details (GET)

Get details of a usage-based product associated with an order item.

Here are the details that this API returns.

- Grants and resources for the product, if rates aren't configured.
- Grants, resources, and any configured rates for the product. The rates are returned by the Rate Plan (GET) API.
- Resources that include grants, if applicable, and any negotiated rates for the product in case of a rate override request.

This API doesn't return binding target rates. Use the Binding Object Usage Details API to retrieve binding target rates.

Resource

```
/commerce/sales-orders/line-items/orderItemId/usage-details
```

HTTP methods

GET

Path parameter for GET

Parameter Name	Type	Description	Required or Optional	Available Version
orderItemId	String	ID of the order item.	Required	63.0

Query parameters for GET

Parameter Name	Type	Description	Required or Optional	Available Version
`effectiveDate`	String	Date that's used to search for the applicable rate card entries.	Optional	63.0
`optionalFields`	String[]	Custom fields that you can use to query these objects. • OrderItemRateCardEntry • OrderItemRateAdjustment	Optional	63.0

Response body for GET

Usage Details

Quote Line Item Usage Details (GET)

Get details of a usage-based product associated with a quote line item.

Here are the details that this API returns.

- Grants and resources for the product, if rates aren't configured.
- Grants, resources, and any configured rates for the product. The rates are returned by the Rate Plan (GET) API.
- Resources that include grants, if applicable, and any negotiated rates for the product in case of a rate override request.

This API doesn't return binding target rates. Use the Binding Object Usage Details API to retrieve binding target rates.

HTTP methods

GET

Request parameters for GET

Parameter Name	Type	Description	Required or Optional	Available Version
`effectiveDate`	String	Date that's used to search for the applicable rate card entries.	Optional	62.0
`optionalFields`	String[]	Custom fields that you can use to query these objects. • QuoteLineRateCardEntry	Optional	62.0

Parameter Name	Type	Description	Required or Optional	Available Version
		• QuoteLineRateAdjustment		

Response body for GET

Usage Details

Usage Product Activation (POST)

Activate a usage product and its related records, such as usage resources, grants, policies, and rate card entries, in a single request.

Keep these considerations in mind when you use this API.

- In version 67.0, each request activates one product. If a request includes more than one product, the API returns the `MAX_LIMIT_EXCEEDED` error.
- Each record in the request stays in Draft status until activation runs. If any record for the product fails to activate, the API rolls back all activations for that product.
- The records activate in the order required by their dependencies, so a child record never activates before its parent.
- Each request activates a maximum of 200 records, including the product and all of its associated child records. If the request exceeds 200 records, the API returns the `MAX_LIMIT_EXCEEDED` error.

Resource

```
/revenue/usage-management/usage-products/actions/activate
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/revenue/usage-management/usage-products/actions/activate
```

Available version

67.0

HTTP methods

POST

Request body for POST

JSON example

```
{
  "shouldValidateProductSetup": false,
  "activationRequests": [
    {
      "productId": "01txx0000006i2gAAA",
      "usageResourceIds": [
        "0hUxx000000001",
        "0hUxx000000002"
      ]
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
activationRequests	Usage Activation Request Input[]	List of activation requests. Each entry identifies a product and the usage resources to activate for that product. This list accepts only one entry. If you include more, the API returns the `MAX_LIMIT_EXCEEDED` error.	Required	67.0
shouldValidateProductSetup	Boolean	Indicates whether to run product setup validation before activation (`true`) or not (`false`). The default value is `true`.	Optional	67.0

Response body for POST

Usage Product Activation

Usage Product Validation (POST)

Validate cross-object relationships and business rules for usage-based products.

This API returns validation results with errors and warnings.

Resource

```
/revenue/usage-management/usage-products/actions/validate
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/revenue/usage-management/usage-products/actions/validate
```

Available version

66.0

HTTP methods

POST

Request body for POST

JSON example

```
{
  "productIds": [
    "01txx0000006i2gAAA",
    "01txx0000006j2gAAA"
  ],
  "startDate": "2024-01-01T00:00:00Z",
  "endDate": "2024-12-31T23:59:59Z"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`productIds`	String[]	List of product IDs to be validated. The maximum limit is `10` valid product IDs.	Required	66.0
`startDate`	String	Start date of the date range in which all active records are validated.	Optional	66.0
`endDate`	String	End date of the date range in which all active records are validated.	Optional	66.0

Response body for POST

Usage Product Validation

Request Bodies

Learn more about the available request bodies of Usage Management APIs.

Consumption Traceabilities Input

Input representation of the details of the liable summary IDs that are used to trace the consumption.

Usage Activation Request Input

Input representation for a single product entry in a usage product activation request. Each entry identifies one product and the usage resources to activate for that product.

Usage Product Activation Input

Input representation of a usage product activation request.

Usage Product Validation Input

Input representation of the usage product validation request.

Consumption Traceabilities Input

Input representation of the details of the liable summary IDs that are used to trace the consumption.

JSON example

```
{
  "liableSummaryIds": [
    "1HG000000000001"
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
liableSummaryIds	String[]	List of liable summary IDs to trace the consumption.	Required	66.0

Usage Activation Request Input

Input representation for a single product entry in a usage product activation request. Each entry identifies one product and the usage resources to activate for that product.

JSON example

```
{
  "productId": "01txx0000006i2gAAA",
  "usageResourceIds": [
    "0hUxx000000001",
    "0hUxx000000002"
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
productId	String	ID of the Product2 record whose associated usage records are activated.	Required	67.0
usageResourceIds	String[]	List of usage resource IDs to activate for the given product. The activation extends to all design-time records linked to these resources, such as product usage grants, usage policies, units of measure, units of measure classes, and rate card entries. If this property is empty or omitted, all usage records associated with the given product are activated.	Optional	67.0

Usage Product Activation Input

Input representation of a usage product activation request.

JSON example

```
{
  "shouldValidateProductSetup": false,
  "activationRequests": [
    {
```

```
        "productId": "01txx0000006i2gAAA",
        "usageResourceIds": [
          "0hUxx000000001",
          "0hUxx000000002"
        ]
      }
    ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
activation Requests	Usage Activation Request Input[]	List of activation requests. Each entry identifies a product and the usage resources to activate for that product. This list accepts only one entry. If you include more, the API returns the MAX_LIMIT_EXCEEDED error.	Required	67.0
shouldValidate ProductSetup	Boolean	Indicates whether to run product setup validation before activation (true) or not (false). The default value is true.	Optional	67.0

Usage Product Validation Input

Input representation of the usage product validation request.

JSON example

```
{
  "productIds": [
    "01txx0000006i2gAAA",
    "01txx0000006j2gAAA"
  ],
  "startDate": "2024-01-01T00:00:00Z",
  "endDate": "2024-12-31T23:59:59Z"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
productIds	String[]	List of product IDs to be validated. The maximum limit is 10 valid product IDs.	Required	66.0
startDate	String	Start date of the date range in which all active records are validated.	Optional	66.0
endDate	String	End date of the date range in which all active records are validated.	Optional	66.0

Response Bodies

Learn more about the available response bodies of Usage Management APIs.

Asset Detail

Output representation of the details of a specific asset.

Billing Period

Output representation of the details of a specific billing period.

Binding Object Detail

Output representation of the list of records with the binding target details.

Binding Object Grant Detail

Output representation of the details of usage resource grants for a specified binding object.

Binding Object Rate Adjustments

Output representation of the details of binding target rate adjustments.

Binding Object Rate

Output representation of the details of Binding Object Rates object or Asset Rates object.

Binding Object Resource Grant And Policy Detail

Output representation of the details of resource grants and binding policies.

Binding Object Resource Policy Detail

Output representation of the details of a usage resource policy.

Binding Object Usage Detail

Output representation of the usage details of a binding object.

Consumption Source Detail

Output representation of the details of a specific consumption source.

Consumption Traceabilities

Output representation of the overage and resource drawdown details.

Errors

Output representation of the group of error messages with the same error code.

Error Details

Output representation of the top-level error detail when validation fails.

Error Message

Output representation of the details of records that failed with this specific error.

Error Warning Details

Output representation of the individual warning or error message with associated record details.

Consumption Traceabilities Data

Output representation of the list of asset details.

Fields Response

Output representation of the details of the optional fields on the usage-based selling-related objects.

Grant Detail

Output representation of the details of a grant from the ProductUsageGrant, LineItemUsageResourceGrant, or TransactionUsageEntitlement objects.

[Generic Error Details](#)

Output representation of the error details encountered during the API request.

[Lookup Detail](#)

Output representation of the details of a usage resource record.

[Policy Details](#)

Output representation of the details of a policy.

[Product Activation Result](#)

Output representation of the activation outcome for a single product, including any errors that occurred while activating the product or its associated usage records.

[Product Validation Result](#)

Output representation of the validation result for a specific product.

[Rate Adjustments](#)

Output representation of the details of a rate adjustment.

[Rate and Consumption Source Detail](#)

Output representation of the details of a specific rate and its consumption source.

[Rate Card Entry](#)

Output representation of the details of a rate card entry.

[Record Details](#)

Output representation of the record details including ID and name.

[Resource Detail](#)

Output representation of the details of a specific usage resource.

[Resource Policy Detail](#)

Output representation of the details of a usage resource policy.

[Usage Activation Error](#)

Output representation of a single error encountered while activating a usage product or one of its related records.

[Usage Activation Result](#)

Output representation that groups the activation outcome and the validation outcome for the product in a usage product activation request.

[Usage Details](#)

Output representation of the usage details of a quote, an order, or an asset.

[Usage Details Error Response](#)

Output representation of the details of an error related to usage details.

[Usage Product Activation](#)

Output representation of a usage product activation response.

[Usage Product Validation](#)

Output representation of all the performed validations.

[Usage Resource Grant And Policy Detail](#)

Output representation of the details of a usage resource grant and policy.

[Validation Error](#)

Output representation of the validation errors grouped by rule name.

Validation Result

Output representation of the validation results grouped by rule name.

Validation Warning

Output representation of the validation warnings grouped by rule name.

Warnings

Output representation of a group of warning messages with the same warning code.

Warning Message

Output representation of the details of records that triggered this specific warning.

Asset Detail

Output representation of the details of a specific asset.

      },
      "usageResource": {
        "id": "1BRSB0000001x4h4AA"
      }
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`bindingObjectRate`	Binding Object Rate	Details about the `Binding Object Rates` object or `Asset Rates` object.	Big, 65.0	65.0
`bindingObjectResourceGrantAndPolicyDetail`	Binding Object Resource Grant and Policy Detail	Details about the resource grants and binding policies.	Big, 65.0	65.0
`usageResource`	Lookup Detail	Details of the usage resource such as the ID of the record.	Big, 65.0	65.0

Binding Object Grant Detail

Output representation of the details of usage resource grants for a specified binding object.

JSON example

This example includes the details of usage resource grants for a specified binding object.

```
{
  "bindingObjectGrantDetail": [
    {
      "effectiveEndDate": "Sat Oct 04 23:59:59 GMT 2025",
      "effectiveStartDate": "Fri Sep 05 00:00:00 GMT 2025",
      "grantType": "Grant",
      "id": "1B0SB0000000Eiv0AE",
      "product": {
        "id": "01tSB000006XMtqYAG"
      },
      "quantity": 100,
      "record": {
        "id": "02iSB000000IoETYA0"
      },
      "unitOfMeasure": {
        "id": "0hESB0000003yfp2AA"
      },
      "usageRefreshPolicy": {
        "id": "1BYSB0000001lOH4AY",
        "negotiable": null
      },
      "usageRolloverPolicy": {
        "id": "1BVSB000000A1xJ4AS",
        "negotiable": null
      },
      "validityPeriodTerm": 1,
      "validityPeriodUnit": "Month"
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`effectiveEndDate`	String	Effective end date for the asset lifecycle.	Big, 65.0	65.0
`effectiveStartDate`	String	Effective start date for the asset lifecycle.	Big, 65.0	65.0
`grantType`	String	Type of usage resource grant.	Big, 65.0	65.0
`id`	String	ID of the `Transaction Usage Entitlement` record responsible for the grant.	Big, 65.0	65.0
`product`	Lookup Detail	Details of the product.	Big, 65.0	65.0

Property Name	Type	Description	Filter Group and Version	Available Version
`quantity`	Double	Quantity of the binding object usage resource grant.	Big, 65.0	65.0
`record`	Lookup Detail	ID of the asset.	Big, 65.0	65.0
`unitOfMeasure`	Lookup Detail	unit of measure of the usage resource.	Big, 65.0	65.0
`usageRefreshPolicy`	Policy Detail	ID of the usage grant refresh policy.	Big, 65.0	65.0
`usageRolloverPolicy`	Policy Detail	ID of the usage grant rollover policy.	Big, 65.0	65.0
`validityPeriodTerm`	Double	Validity period term of the usage resource grant.	Big, 65.0	65.0
`validityPeriodUnit`	String	Validity period unit of the usage resource grant.	Big, 65.0	65.0

Binding Object Rate Adjustments

Output representation of the details of binding target rate adjustments.

JSON example

This example includes the details of binding target rate adjustments.

```
{
  "negotiatedRateAdjustments": [
    {
      "lowerBound": 101,
      "name": null,
      "rateAdjustmentId": "1DMSB000001N3C74AK",
      "rateAdjustmentType": "Amount",
      "rateAdjustmentValue": 10,
      "tierUnitOfMeasure": "USD",
      "upperBound": null
    },
    {
      "lowerBound": 1,
      "name": null,
      "rateAdjustmentId": "1DMSB000001N3C64AK",
      "rateAdjustmentType": "Percentage",
      "rateAdjustmentValue": 30,
      "tierUnitOfMeasure": "USD",
      "upperBound": 100
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
lowerBound	Double	Minimum quantity for the adjustment to be applicable.	Small, 65.0	65.0
name	String	Name of the tier or binding object rate adjustment.	Small, 65.0	65.0
rateAdjustmentId	String	ID of the binding object rate adjustment.	Small, 65.0	65.0
rateAdjustmentType	String	Type of the binding object rate adjustment.	Small, 65.0	65.0
rateAdjustmentValue	Double	Value of the binding object rate adjustment.	Small, 65.0	65.0
tierUnitOfMeasure	String	Unit of measure that represents the tier or binding object rate adjustment.	Small, 65.0	65.0
upperBound	Double	Maximum quantity for the adjustment to be applicable.	Small, 65.0	65.0

Binding Object Rate

Output representation of the details of Binding Object Rates object or Asset Rates object.

JSON example

This example includes the details of a binding object rate.

```
{
  "bindingObjectRate": {
    "id": "1QNSB0000001JyH4AU,1QNSB0000001JyI4AU",
    "negotiatedRate": null,
    "negotiatedRateAdjustments": [
      {
        "lowerBound": 101,
        "name": null,
        "rateAdjustmentId": "1DMSB000001N3C74AK",
        "rateAdjustmentType": "Amount",
        "rateAdjustmentValue": 10,
        "tierUnitOfMeasure": "USD",
        "upperBound": null
      },
      {
        "lowerBound": 1,
        "name": null,
        "rateAdjustmentId": "1DMSB000001N3C64AK",
        "rateAdjustmentType": "Percentage",
        "rateAdjustmentValue": 30,
        "tierUnitOfMeasure": "USD",
        "upperBound": 100
      }
    ],
    "rate": 100,
    "rateCardEntryId": "1CJSB000000207R4AQ,1CJSB000000207S4AQ",
    "rateUnitOfMeasureName": "USD"
```

```
    }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`id`	String	ID of the `Binding Object Rate Card Entry` or `Asset Rate Card Entry` object.	Big, 65.0	65.0
`negotiated Rate`	Double	Negotiated rate available in the `Binding Object Rate Card Entry` or `Asset Rate Card Entry` object.	Big, 65.0	65.0
`negotiatedRate Adjustments`	Binding Object Rate Adjustments[]	List of rate adjustments available in the `Binding Object Rate Adjustment` or `Asset Rate Adjustment`.	Big, 65.0	65.0
`rate`	Double	Rate of the rate card entry associated to the `Binding Object Rate Card Entry` or `Asset Rate Card Entry` object.	Big, 65.0	65.0
`rateCard EntryId`	String	ID of the rate card entry associated to the `Binding Object Rate Card Entry` or `Asset Rate Card Entry`.	Big, 65.0	65.0
`rateUnitOf MeasureName`	String	Rate unit of measure of the rates.	Big, 65.0	65.0

Binding Object Resource Grant And Policy Detail

Output representation of the details of resource grants and binding policies.

JSON example

This example includes the details of resource grants and binding policies for a specified binding object.

```
{
  "bindingObjectResourceGrantAndPolicyDetail": {
    "bindingObjectGrantDetail": [
      {
        "effectiveEndDate": "Sat Oct 04 23:59:59 GMT 2025",
        "effectiveStartDate": "Fri Sep 05 00:00:00 GMT 2025",
        "grantType": "Grant",
        "id": "1B0SB0000000Eiv0AE",
        "product": {
          "id": "01tSB000006XMtqYAG"
        },
        "quantity": 100,
        "record": {
          "id": "02iSB000000IoETYA0"
```

```
        },
        "unitOfMeasure": {
          "id": "0hESB0000003yfp2AA"
        },
        "usageRefreshPolicy": {
          "id": "1BYSB0000001lOH4AY",
          "negotiable": null
        },
        "usageRolloverPolicy": {
          "id": "1BVSB000000A1xJ4AS",
          "negotiable": null
        },
        "validityPeriodTerm": 1,
        "validityPeriodUnit": "Month"
      }
    ],
    "bindingObjectResourcePolicyDetail": {
      "drawdownOrder": "ExpiringFirst",
      "id": "1X2SB00000002WT0AY",
      "ratingFrequencyPolicy": {
        "id": "1HJSB0000000G3B4AU",
        "negotiable": null
      },
      "usageAggregationPolicy": {
        "id": "1cfSB0000001xHPYAY",
        "negotiable": null
      },

        "id": "7UkSB00000002OP0AY",
        "negotiable": null
      }
    }
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
bindingObject GrantDetail	Binding Object Grant Detail[]	Details of the negotiated resource grants for the specified binding object.	Big, 65.0	65.0
bindingObject ResourcePolicy Detail	Binding Object Resource Policy Detail	Detail of the binding policies.	Big, 65.0	65.0

Binding Object Resource Policy Detail

Output representation of the details of a usage resource policy.

JSON example

This example includes the details of a usage resource policy.

```
{
  "bindingObjectResourcePolicyDetail": {
    "drawdownOrder": "ExpiringFirst",
    "id": "1X2SB00000002WT0AY",
    "ratingFrequencyPolicy": {
      "id": "1HJSB0000000G3B4AU",
      "negotiable": null
    },
    "usageAggregationPolicy": {
      "id": "1cfSB0000001xHPYAY",
      "negotiable": null
    },
    "usageCommitmentPolicy": {
      "id": null,
      "negotiable": null
    },
    "usageOveragePolicy": {
      "id": "7UkSB00000002OP0AY",
      "negotiable": null
    }
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
drawdownOrder	String	Specifies the order or way to process the drawdown. See Usage Management Essentials to know more about a drawdown process.	Big, 65.0	65.0
id	String	ID of the Binding Object Usage Resource Policy record.	Big, 65.0	65.0
ratingFrequencyPolicy	Policy Detail	Details of the rating frequency policy.	Big, 65.0	65.0
usageAggregationPolicy	Policy Detail	Details of the usage aggregation policy.	Big, 65.0	65.0
usageCommitmentPolicy	Policy Detail	Details of the commitment policy of the usage resource.	Big, 65.0	65.0
usageOveragePolicy	Policy Detail	Details of the overage policy of the usage resource.	Big, 65.0	65.0

Binding Object Usage Detail

Output representation of the usage details of a binding object.

JSON example

This example shows a sample successful response.

```
{
  "records": [
    {
      "bindingObjectRate": {
        "id": "1QNSB0000001JyH4AU,1QNSB0000001JyI4AU",

      }
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
errors	Usage Detail Error Response[]	List of errors encountered during the processing of the API request.	Small, 65.0	65.0
records	Binding Object Detail[]	List of records that contains the binding target details.	Small, 65.0	65.0

Consumption Source Detail

Output representation of the details of a specific consumption source.

JSON example

```
{
  "consumptionSources": [
    {
```

```
      "consumptionSourceId": "1AE000000000001",
      "consumptionUnit": 500
    },
    {
      "consumptionSourceId": "1CO000000000001",
      "consumptionUnit": 375,
      "commitRate": 1.5,
      "targetRate": 2,
      "cmtAssetRatableSummaryId": "URSCARID1"
    },
    {
      "consumptionSourceId": "1CO000000000002",
      "consumptionUnit": 125,
      "commitRate": 0.75,
      "targetRate": 1,
      "cmtAssetRatableSummaryId": "URSCARID2"
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
cmtAssetRatableSummaryId	String	ID for querying rating waterfall.	Big, 66.0	66.0
commitRate	Double	Net unit rate at which drawdown is done for commitment products.	Big, 66.0	66.0
consumptionSourceId	String	Object on which the consumption was recorded.	Big, 66.0	66.0
consumptionUnit	Double	Recorded quantity of consumption.	Big, 66.0	66.0
targetRate	Double	Input unit rate which is used for commitment products.	Big, 66.0	66.0

Consumption Traceabilities

Output representation of the overage and resource drawdown details.

JSON example

```
{
  "success": true,
  "data": {
    "assets": [
      {
        "assetId": "ASSET1",
        "usageEntitlementAccountId": "1EA000000000001",

              }
            ]
          }
        ]
      }
    ],
    "error": null
  }
}
```

zProperty Name	Type	Description	Filter Group and Version	Available Version
`data`	Consumption Traceabilities Data[]	Payload that contains the traceability details.	Big, 66.0	66.0
`error`	Generic Error Details[]	Error details if the request isn't successful.	Big, 66.0	66.0
`success`	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Big, 66.0	66.0

Errors

Output representation of the group of error messages with the same error code.

JSON example

This example shows a group of error messages with the same error code.

```
{
  "errors": [
    {
      "errorCode": "EFFECTIVITY_MISMATCH",
      "errorMessages": [
        {
          "errorMessage": "PUR and RCE effective date ranges must have overlap for proper
 rating functionality",
          "errorDetails": []
        }
      ]
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Standardized error code. For example, `EFFECTIVITY_MISMATCH`.	Big, 66.0	66.0
`errorMessages`	Error Message[]	List of error messages for records that failed with this error code.	Big, 66.0	66.0

Error Details

Output representation of the top-level error detail when validation fails.

JSON example

This example shows a sample error response.

```
{
  "errors": [
    {
```

```
      "errorCode": "VALIDATION_FAILED",
      "message": "Product validation completed with cross-entity errors",
      "products": [
        {
          "productId": "01txx0000006i2gAAA",
          "validationResult": {
            "validationErrors": [],
            "validationWarnings": []
          }
        }
      ]
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Standardized error code. For example, `VALIDATION_FAILED`.	Big, 66.0	66.0
`message`	String	Human-readable error message that describes the overall validation failure.	Big, 66.0	66.0
`products`	Product Validation Result[]	List of product validation results.	Big, 66.0	66.0

Error Message

Output representation of the details of records that failed with this specific error.

JSON example

This example shows an error message with details.

```
{
  "errorMessages": [
    {
      "errorMessage": "PUR and RCE effective date ranges must have overlap for proper
rating functionality",
      "errorDetails": [
        {
          "relatedObjectAPIName": "ProductUsageRule",
          "records": [
            {
              "id": "a0bxx0000004CqZAAU",
              "name": "PUR-001"
            }
          ]
        }
      ]
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
errorMessage	String	Human-readable error message that describes the validation failure.	Big, 66.0	66.0
errorDetails	Error Warning Details[]	Details of records that failed with this specific error.	Big, 66.0	66.0

Error Warning Details

Output representation of the individual warning or error message with associated record details.

JSON example

This example shows error details with record information.

```
{
  "errorDetails": [
    {
      "relatedObjectAPIName": "ProductUsageRule",
      "records": [
        {
          "id": "a0bxx0000004CqZAAU",
          "name": "PUR-001"
        }
      ]
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
relatedObjectAPIName	String	API name of the related object.	Big, 66.0	66.0
records	Record Details[]	Details of records that triggered the specific warning or error.	Big, 66.0	66.0

Consumption Traceabilities Data

Output representation of the list of asset details.

JSON example

```
{
  "data": {
    "assets": [
      {
        "assetId": "ASSET1",
        "usageEntitlementAccountId": "1EA000000000001",
        "grantBindingTargetId": "1GB000000000001",
        "billingPeriods": [
          {
```

```
            "startDate": "2025-01-01",
            "endDate": "2025-01-31",
            "resources": [
              {
                "liableSummaryId": "1HG000000000001",
                "usageResourceId": "1BX000000000004",
                "usageResourceName": "SF Credits",
                "usageResourceUomId": "1UM000000000001",
                "usageResourceUomUnitCode": "CREDIT",
                "resourceTotalOverageQuantity": 333.33,
                "resourceTotalOverageAmount": 333.33,
                "resourceTotalConsumption": 1500,
                "rateAndConsumptionSources": [
                  {
                    "startDate": "2025-01-01",
                    "endDate": "2025-01-31",
                    "rateUomId": "USD",
                    "ratableSummaryId": "URS3",
                    "ratingExecutionId": "1RE000000000001",
                    "overageQuantity": 333.33,
                    "overageAmount ": 333.33,

                        "consumptionUnit": 500
                      },
                      {
                        "consumptionSourceId": "1CO000000000001",
                        "consumptionUnit": 375,
                        "commitRate": 1.5,
                        "targetRate": 2,
                        "cmtAssetRatableSummaryId": "URSCARID1"
                      },
                      {
                        "consumptionSourceId": "1CO000000000002",
                        "consumptionUnit": 125,
                        "commitRate": 0.75,
                        "targetRate": 1,
                        "cmtAssetRatableSummaryId": "URSCARID2"
                      }
                    ]
                  }
                ]
              }
            ]
          }
        ]
      }
    ]
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
assets	Asset Detail[]	List of assets for the specified liable summaries.	Big, 66.0	66.0

Fields Response

Output representation of the details of the optional fields on the usage-based selling-related objects.

JSON Example

```
"fields": {
  "MyCustomDate__c": {
    "displayValue": "2024-09-24",
    "value": "2024-09-24T17:46:30.662Z"
  },
  "MyCustomNumber__c": {
    "displayValue": "20.0",
    "value": 20
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
displayValue	String	Display value of a field.	Big, 63.0	63.0
value	Object	Value of a field in its original data form.	Big, 63.0	63.0

Grant Detail

Output representation of the details of a grant from the ProductUsageGrant, LineItemUsageResourceGrant, or TransactionUsageEntitlement objects.

JSON Example

```
{
  "negotiatedGrantDetail": {
    "grantType": "Grant",
    "id": "1X6xx00000000OECAY",
    "quantity": 100,
    "usageGrantNegotiable": "Negotiable",
    "usageRefreshPolicy": {
      "displayName": null,
      "id": "1BYxx0000004C92GAE",
      "negotiable": "Non-Negotiable"
    },
    "usageRolloverPolicy": {
      "displayName": null,
      "id": "1BVxx0000004C92GAE",
      "negotiable": "Non-Negotiable"
    },
```

```
    "validityPeriodTerm": 12,
    "validityPeriodUnit": "Month"
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
grantType	String	Details about the grant type.	Big, 65.0	65.0
id	String	ID of the usage resource grant.	Big, 65.0	65.0
quantity	Double	Quantity of the negotiated usage resource grant.	Big, 65.0	65.0
usageGrantNegotiable	String	Specifies whether the grant is negotiable or not.	Big, 65.0	65.0
usageRefreshPolicy	Policy Detail	ID of the usage grant refresh policy.	Big, 65.0	65.0
usageRolloverPolicy	Policy Detail	ID of the usage grant rollover policy.	Big, 65.0	65.0
validityPeriodTerm	Double	Validity period term of the grant.	Big, 65.0	65.0
validityPeriodUnit	String	Validity period unit of the grant.	Big, 65.0	65.0

Generic Error Details

Output representation of the error details encountered during the API request.

JSON example

```
{
  "data": [],
  "error": {
    "errorCode": "INVALID_API_INPUT",
    "message": "Liable summary IDs cannot be null or empty."
  },
  "success": false
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
errorCode	String	Error code that represents the type of error.	Big, 67.0	67.0
message	String	Detailed error message that specifies the cause of failure.	Big, 67.0	67.0

Lookup Detail

Output representation of the details of a usage resource record.

JSON example

This example includes the details of a usage resource.

```
{
  "usageResource": {
    "id": "1BRxx0000004C9EGAU"
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
id	String	ID of the usage resource record.	Big, 65.0	65.0

Policy Details

Output representation of the details of a policy.

JSON example

This example includes the details for different policy types.

```
{
  "bindingObjectGrantDetail": [
    {
      "effectiveEndDate": "Sat Oct 04 23:59:59 GMT 2025",
      "effectiveStartDate": "Fri Sep 05 00:00:00 GMT 2025",
      "grantType": "Grant",
      "id": "1B0SB0000000Eiv0AE",
      "product": {
        "id": "01tSB000006XMtqYAG"
      },
      "quantity": 100,
      "record": {
        "id": "02iSB000000IoETYA0"
      },
      "unitOfMeasure": {
        "id": "0hESB0000003yfp2AA"
      },
      "usageRefreshPolicy": {
        "id": "1BYSB0000001lOH4AY",
        "negotiable": null
      },
      "usageRolloverPolicy": {
        "id": "1BVSB000000A1xJ4AS",
        "negotiable": null
      },
      "validityPeriodTerm": 1,
      "validityPeriodUnit": "Month"
    }
```

```
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`id`	String	ID of the policy.	Big, 65.0	65.0
`negotiable`	String	Indicates whether the policy is negotiable. Valid values are: • `Negotiable` • `Non-Negotiable`	Big, 65.0	65.0

Product Activation Result

Output representation of the activation outcome for a single product, including any errors that occurred while activating the product or its associated usage records.

JSON example

```
{
  "productId": "01txx0000006i2hAAA",
  "errors": [
    {
      "productUsageResourceId": "0iUxx000000009",
      "usageResourceId": "0hUxx000000003",
      "message": "Usage Resource not found for product",
      "objectApiName": "ProductUsageResource",
      "fieldName": "UsageResourceId",
      "recordId": null,
      "recordName": null
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Usage Activation Error[]	List of errors that occurred while activating the product or its associated usage records.	Big, 67.0	67.0
`productId`	String	ID of the Product2 record that this activation outcome describes.	Big, 67.0	67.0

Product Validation Result

Output representation of the validation result for a specific product.

JSON example

This example shows the product validation result.

```
{
  "products": [
    {
      "productId": "01txx0000006i2gAAA",
      "validationResult": {
        "validationErrors": [],
        "validationWarnings": []
      }
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`productId`	String	Unique product ID that's being validated.	Big, 67.0	67.0
`validationResult`	Validation Result	Validation results grouped by rule name.	Big, 67.0	67.0

Rate Adjustments

Output representation of the details of a rate adjustment.

JSON Example

```
      "rateAdjustments": [
        {
           "fields": {},
           "lowerBound": 0.0,
           "name": null,
           "negotiatedRateAdjustmentId": null,
           "rateAdjustmentId": "1ENxx0000004C9BGAU",
           "rateAdjustmentType": "Percentage",
           "rateAdjustmentValue": 10.0,
           "tierUnitOfMeasure": "USD",
           "upperBound": 50.0
        }
    ]
```

If the `negotiable` property value that’s associated with a rate card entry is blank, then the data is derived from Product Catalog Management. If it isn’t blank, then the data is derived from Rate Management.

Property Name	Type	Description	Filter Group and Version	Available Version
`fields`	Map<String, Fields Response>	List of optional fields and their values that belong to the rate adjustment object.	Big, 63.0	63.0
`lowerBound`	Double	Minimum quantity for the adjustment to be applicable.	Small, 63.0	63.0

Property Name	Type	Description	Filter Group and Version	Available Version
name	String	Name of the tier.	Small, 63.0	63.0
negotiatedRateAdjustmentId	String	ID of the negotiated rate adjustment.	Small, 63.0	63.0
rateAdjustmentId	String	ID of the rate adjustment.	Small, 63.0	63.0
rateAdjustmentType	String	Type of the rate adjustment.	Small, 63.0	63.0
rateAdjustmentValue	Double	Value of the rate adjustment.	Small, 63.0	63.0
tierUnitOfMeasure	String	Unit of measure representing the tier.	Small, 63.0	63.0
upperBound	Double	Maximum quantity for the adjustment to be applicable.	Small, 63.0	63.0

Rate and Consumption Source Detail

Output representation of the details of a specific rate and its consumption source.

JSON example

```
{
  "rateAndConsumptionSources": [
    {
      "startDate": "2025-01-01",
      "endDate": "2025-01-31",
      "rateUomId": "USD",
      "ratableSummaryId": "URS3",
      "ratingExecutionId": "1RE000000000001",
      "overageQuantity": 333.33,
      "overageAmount ": 333.33,
      "totalConsumption": 1500,
      "netUnitRate": 1,
      "consumptionSources": [
        {
          "consumptionSourceId": "1AE000000000001",
          "consumptionUnit": 500
        },
        {
          "consumptionSourceId": "1CO000000000001",
          "consumptionUnit": 375,
          "commitRate": 1.5,
          "targetRate": 2,
          "cmtAssetRatableSummaryId": "URSCARID1"
        },
        {
          "consumptionSourceId": "1CO000000000002",
```

```
            "consumptionUnit": 125,
            "commitRate": 0.75,
            "targetRate": 1,
            "cmtAssetRatableSummaryId": "URSCARID2"
          }
        ]
      }
    ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
consumptionSourceDetails	Consumption Source Detail[]	Details on the consumption source.	Big, 66.0	66.0
endDate	String	End date for the specific rate period.	Big, 66.0	66.0
netUnitRate	Double	Net unit rate.	Big, 66.0	66.0
overageAmt	Double	Amount for the overage quantity.	Big, 66.0	66.0
overageQty	Double	Quantity of consumption that was rated as overage.	Big, 66.0	66.0
ratableSummaryId	String	Unique ID for the summary used in rating.	Big, 66.0	66.0
ratableSummaryStatus	String	Status of ratable summary.	Big, 66.0	66.0
rateUomId	String	Unit of measure for the rate.	Big, 66.0	66.0
rateUomName	String	Name of the rate unit of measure	Big, 66.0	66.0
ratingExecutionId	String	Execution ID of the rating.	Big, 66.0	66.0
sourceUsageResourceId	String	ID of the source usage resource.	Big, 66.0	66.0
sourceUsageResourceName	String	Name of the source usage resource.	Big, 66.0	66.0
startDate	String	Start date for the specific rate period.	Big, 66.0	66.0
totalConsumption	Double	Total quantity consumed for this rate.	Big, 66.0	66.0

Rate Card Entry

Output representation of the details of a rate card entry.

JSON Example

```
{
  "records": [
    {
      "bindingInstanceTargetType": "Product",
      "bindingInstanceType": "Target",
      "chargeForOverages": "Yes",
      "fields": {},
      "isOptional": false,
      "name": "Paddle Board",
      "negotiable": "Negotiable,Non-Negotiable",
      "negotiatedRate": 20,
      "negotiatedRateCardEntryId": "1ELxx0000004C9JGAU,1ELxx0000004C9KGAU",
      "quantity": 15,
      "rate": 5,
      "rateAdjustments": [
        {
          "fields": {},
          "lowerBound": 0,
          "name": "Tier 1",
          "negotiatedRateAdjustmentId": "1ENxx0000004C9BGAU",
          "rateAdjustmentId": "1ENxx0000004C9BGAU",
          "rateAdjustmentType": "Percentage",
          "rateAdjustmentValue": 10,
          "tierUnitOfMeasure": "USD",
          "upperBound": 50
        }
      ],
      "rateCardEntryId": "1CJxx0000004C9IGAU,1CJxx0000004C9JGAU",
      "rateUnitOfMeasureName": "USD",
      "unitOfMeasure": "GB",
      "usageResourceGrantAndPolicyDetail": {
        "grantDetail": {
          "grantType": "Grant",
          "id": "1BXxx0000004C9lGAE",
          "quantity": 100,
          "usageGrantNegotiable": "Negotiable",
          "usageRefreshPolicy": {
            "id": "1BYxx0000004C92GAE",

```

If the `negotiable` property value is blank, then the data is derived from Product Catalog Management. If it isn't blank, then the data is derived from Rate Management.

Property Name	Type	Description	Filter Group and Version	Available Version
`binding Instance TargetType`	String	Type of the target object that's associated with this transaction.	Big, 63.0	63.0
`bindingInstance Type`	String	Type of the binding instance. Valid values are: • `Self` • `Target`	Big, 63.0	63.0
`chargeFor Overages`	String	Specifies whether overage is permitted. Valid values are: • `Yes` • `No` • `NA`	Big, 63.0	63.0
`fields`	Map<String, Fields Response>	List of optional fields and their values that's associated with the rate card entry object.	Big, 63.0	63.0
`isOptional`	Boolean	Indicates whether the product usage resource is optional when the associated product is one of the commitment usage model types (`true`) or not (`false`).	Big, 65.0	65.0
`name`	String	Name of the resource.	Big, 63.0	63.0
`negotiable`	String	Type of the base rate and the tier rate, if applicable. Valid values are: • `Negotiable` • `Non-Negotiable`	Big, 63.0	63.0
`negotiated Rate`	Double	User-overridden overage rate.	Big, 63.0	63.0
`negotiated RateCard EntryId`	String	ID of the negotiated rate card entry and the tier rate card entry, if applicable.	Big, 63.0	63.0
`quantity`	Double	Amount granted for the resource.	Big, 63.0	63.0
`rate`	Double	Base overage rate.	Big, 63.0	63.0
`rate Adjustments`	Rate Adjustments[]	List of tiers associated with the rate card entry, if applicable.	Big, 63.0	63.0

Property Name	Type	Description	Filter Group and Version	Available Version
rateCard EntryId	String	ID of the base rate card entry and the tier rate card entry, if applicable.	Big, 63.0	63.0
rateUnit OfMeasureName	String	Unit of measure for rates in the rate card entry.	Big, 64.0	64.0
unitOfMeasure	String	Unit of measure of the grant. For example, Unit.	Big, 63.0	63.0
usageResource Id	String	ID of the usage resource.	Big, 65.0	65.0
usageResource GrantAndPolicy Detail	Usage Resource Grant And Policy Detail	Details of a usage resource grant and policy.	Big, 65.0	65.0

Record Details

Output representation of the record details including ID and name.

JSON example

This example shows the record details with ID and name.

```
{
  "records": [
    {
      "id": "a0bxx0000004CqZAAU",
      "name": "PUR-001"
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
id	String	Unique identifier of the object.	Big, 66.0	66.0
name	String	Display name of the object.	Big, 66.0	66.0

Resource Detail

Output representation of the details of a specific usage resource.

JSON example

```
{
  "resources": [
    {
      "liableSummaryId": "1HG000000000001",
      "usageResourceId": "1BX000000000004",
```

```

            ]
          }
        ]
      }
    ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`liableSummaryId`	String	Unique identifier for the consumption summary.	Big, 66.0	66.0
`liableSummary Status`	String	Status of liable summary.	Big, 66.0	66.0

Property Name	Type	Description	Filter Group and Version	Available Version
rateAndConsumptionSources	Rate And Consumption Source Detail[]	Details on rates and consumption sources.	Big, 66.0	66.0
resourceTotalConsumption	Double	Total quantity of consumption for the resource.	Big, 66.0	66.0
resourceTotalOverageAmount	Double	Total amount for the overage.	Big, 66.0	66.0
resourceTotalOverageQuantity	Double	Total overage quantity.	Big, 66.0	66.0
usageResourceId	String	ID of the specific usage resource.	Big, 66.0	66.0
usageResourceName	String	Name of the usage resource.	Big, 66.0	66.0
usageResourceUomId	String	Unit of measure ID for the usage resource.	Big, 66.0	66.0
usageResourceUomUnitCode	String	Unit of measure code for the usage resource.	Big, 66.0	66.0

Resource Policy Detail

Output representation of the details of a usage resource policy.

Property Name	Type	Description	Filter Group and Version	Available Version
id	String	ID of the usage resource policy.	Big, 65.0	65.0
ratingFrequencyPolicy	Policy Detail	Details of the rating frequency policy.	Big, 65.0	65.0
usageAggregationPolicy	Policy Detail	Details of the usage aggregation policy.	Big, 65.0	65.0
usageCommitmentPolicy	Policy Detail	Details of the usage commitment policy.	Big, 65.0	65.0
usageOveragePolicy	Policy Detail	Details of the usage overage policy.	Big, 65.0	65.0

Usage Activation Error

Output representation of a single error encountered while activating a usage product or one of its related records.

JSON example

```
{
  "productUsageResourceId": "0iUxx0000000678",
  "usageResourceId": "0hUxx000000004",
  "message": "Related Unit of measure records is inactive, activate it first.",
  "objectApiName": "ProductUsageGrant",
  "fieldName": "DefaultUnitofMeasure",
  "recordId": "1BXSM000000404f4AA",
  "recordName": "PUG-000000001"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`fieldName`	String	API name of the field that caused the error.	Big, 67.0	67.0
`message`	String	Human-readable description of the error.	Big, 67.0	67.0
`objectApiName`	String	API name of the object on which the error occurred.	Big, 67.0	67.0
`productUsageResourceId`	String	ID of the ProductUsageResource record that links the product and the usage resource for which the error occurred.	Big, 67.0	67.0
`recordId`	String	ID of the record that failed activation.	Big, 67.0	67.0
`recordName`	String	Name of the record that failed activation.	Big, 67.0	67.0
`usageResourceId`	String	ID of the usage resource record from the input request for which the error occurred.	Big, 67.0	67.0

Usage Activation Result

Output representation that groups the activation outcome and the validation outcome for the product in a usage product activation request.

JSON example

```
{
  "productActivationResults": [
    {
      "productId": "01txx0000006i2hAAA",
      "errors": []
    }
  ],
  "productValidationResults": [
    {
      "productId": "01txx0000006i2gAAA",
      "validationResult": {
        "validationErrors": [],
        "validationWarnings": []
      }
    }
```

```
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`productActivationResults`	Product Activation Result[]	List of product activation results.	Big, 67.0	67.0
`productValidationResults`	Product Validation Result[]	List of product validation results.	Big, 67.0	67.0

Usage Details

Output representation of the usage details of a quote, an order, or an asset.

JSON example

This sample response shows resources that include grants, if applicable, and resources without rates when you retrieve the usage details of an order item.

```
{
  "records": [
    {
      "bindingInstanceTargetType": null,

This sample response shows values for the type and target type of a binding instance if the `BindingInstanceTargetId` value is available in the QuoteLineItem, OrderItem, and AssetStatePeriod objects. Additionally, the rate, negotiated rates, and rate card entry values show the associated details of the binding object.

```

}
```

Property Name	Type	Description	Filter Group and Version	Available Version
errors	Usage Detail Error Response[]	List of errors encountered during the processing of the API request.	Small, 63.0	63.0
records	Rate Card Entry[]	List of rate card entry records.	Small, 63.0	63.0

Usage Details Error Response

Output representation of the details of an error related to usage details.

JSON Example

```
{
   "errors": [
        {
            "referenceId": "MyOrderItem",
            "errorCode": "INVALID_API_INPUT",
            "message": "Something has failed"
```

```
        }
    ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
errorCode	String	Code associated with the error.	Small, 63.0	63.0
message	String	Message associated with the error.	Small, 63.0	63.0
referenceId	String	Unique ID that's associated with the specific error for tracking and reference purposes.	Small, 63.0	63.0

Usage Product Activation

Output representation of a usage product activation response.

JSON example

```
{
  "success": true,
  "errors": null,
  "activatedProducts": [
    "01txx0000006i2hAAB"
  ],

          "validationWarnings": []
        }
      }
    ]
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`activated Products`	String[]	ID of the product whose associated usage records were activated. The array contains at most one entry.	Big, 67.0	67.0

Property Name	Type	Description	Filter Group and Version	Available Version
activation Results	Usage Activation Result	Activation and validation outcome for the product in the request.	Big, 67.0	67.0
errors	Generic Error[]	List of top-level API errors. For example, a guardrail violation or an invalid request.	Big, 67.0	67.0
success	Boolean	Indicates whether the API request was processed (`true`) or rejected at the top level (`false`).	Big, 67.0	67.0

Usage Product Validation

Output representation of all the performed validations.

JSON example

This example shows the validation output with errors and warnings.

```
{
  "errors": [
    {
      "errorCode": "VALIDATION_FAILED",
      "message": "Product validation completed with cross-entity errors",
      "products": [
        {
          "productId": "01txx0000006i2gAAA",
          "validationResult": {
            "validationErrors": [

```

Property Name	Type	Description	Filter Group and Version	Available Version
grantDetail	Grant Detail	Details about the grants from the ProductUsageGrant object.	Big, 65.0	65.0

Property Name	Type	Description	Filter Group and Version	Available Version
negotiated GrantDetail	Grant Detail	Details about the negotiated grants from the LineItemUsageResourceGrant or TransactionUsageEntitlement object.	Big, 65.0	65.0
negotiated Resource PolicyDetail	Resource Policy Detail	Details about the policy from the LineItemUsageResourcePolicy or BindingObjectUsageResourcePolicy object.	Big, 65.0	65.0
resourcePolicy Detail	Resource Policy Detail	Details about the policy from the ProductUsageResourcePolicy object.	Big, 65.0	65.0

Validation Error

Output representation of the validation errors grouped by rule name.

JSON example

This example shows a validation error grouped by rule name.

```
{
  "validationErrors": [
    {
      "ruleName": "Usage vs Rating Effectivity",
      "errors": [
        {
          "errorCode": "EFFECTIVITY_MISMATCH",
          "errorMessages": []
        }
      ]
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
ruleName	String	Name of the validation rule. For example, `Usage vs Rating Effectivity`.	Big, 66.0	66.0
errors	Errors[]	List of error code groups for this validation.	Big, 66.0	66.0

Validation Result

Output representation of the validation results grouped by rule name.

JSON example

This example shows a validation result with errors and warnings.

```
{
  "validationResult": {
    "validationErrors": [
```

```
        {
          "ruleName": "Usage vs Rating Effectivity",
          "errors": []
        }
      ],
      "validationWarnings": [
        {
          "ruleName": "Performance Optimization",
          "warnings": []
        }
      ]
    }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
validationErrors	Validation Error[]	List of validation errors grouped by rule name.	Big, 66.0	66.0
validationWarnings	Validation Warning[]	List of validation warnings grouped by rule name.	Big, 66.0	66.0

Validation Warning

Output representation of the validation warnings grouped by rule name.

JSON example

This example shows a validation warning grouped by rule name.

```
{
  "validationWarnings": [
    {
      "ruleName": "Performance Optimization",
      "warnings": [
        {
          "warningCode": "PERFORMANCE_SUBOPTIMAL",
          "warningMessages": []
        }
      ]
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
ruleName	String	Name of the validation rule. For example, Performance Optimization.	Big, 66.0	66.0
warnings	Warnings[]	List of warning code groups for this validation.	Big, 66.0	66.0

Warnings

Output representation of a group of warning messages with the same warning code.

JSON example

This example shows a group of warning messages with the same warning code.

```
{
  "warnings": [
    {
      "warningCode": "PERFORMANCE_SUBOPTIMAL",
      "warningMessages": [
        {
          "warningMessage": "PUR and RCE date ranges could be optimized for better
performance",
          "warningDetails": []
        }
      ]
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
warningCode	String	Standardized warning code. For example, PERFORMANCE_SUBOPTIMAL.	Big, 66.0	66.0
warningMessages	Warning Message[]	List of warning messages for records that triggered with this warning.	Big, 66.0	66.0

Warning Message

Output representation of the details of records that triggered this specific warning.

JSON example

This example shows a warning message with details.

```
{
  "warningMessages": [
    {
      "warningMessage": "PUR and RCE date ranges could be optimized for better
performance",
      "warningDetails": [
        {
          "relatedObjectAPIName": "ProductUsageRule",
          "records": [
            {
              "id": "a0bxx0000004CqZAAU",
              "name": "PUR-001"
            }
          ]
        }
      ]
```

```
        }
    ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`warningMessage`	String	Human-readable warning message that describes the validation concern.	Big, 66.0	66.0
`warningDetails`	Error Warning Details[]	Details of records that triggered this specific warning.	Big, 66.0	66.0

Usage Management Metadata API Types

Metadata API enables you to access some types and feature settings that you can customize in the user interface.

Flow for Usage Management
Represents the metadata associated with a flow. With Flow, you can create an application that navigates users through a series of screens to query and update records in the database. You can also execute logic and provide branching capability based on user input to build dynamic applications.

IndustriesUsageSettings
Represents the settings for Usage Management.

SEE ALSO:

Metadata API Developer Guide: Understanding Metadata API

Flow for Usage Management

Represents the metadata associated with a flow. With Flow, you can create an application that navigates users through a series of screens to query and update records in the database. You can also execute logic and provide branching capability based on user input to build dynamic applications.

FlowActionCall

Usage Management exposes additional actionType values for the FlowActionCall Metadata type.

Field Name	Field Type	Description
`actionType`	InvocableActionType (enumeration of type string)	Required. The action type. Additional valid values only for Usage Management include: • `invokeSummaryCreationService`—Invoke the service that creates various summaries, such as usage, ratable, and liable summaries where the usage amount is zero. The service also checks

Field Name	Field Type	Description
		and updates the billing period of the usage entitlement account if the billing period is expired. • `processConsumptionOverages`—Process consumption overages for the usage summary records with `SummaryComplete` status. This action uses the entitlement service to process the overages. • `refreshUsageEntitlementBucket`—Refresh entitlements by evaluating the usage entitlement bucket records and creating a new usage entitlement entry. • `retriggerEntlCreaProc`—Retrigger entitlement creation process for failed or unprocessed assets.

IndustriesUsageSettings

Represents the settings for Usage Management.

Parent Type and Manifest Access

This type extends the Metadata metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See Settings for more details.

File Suffix and Directory Location

`IndustriesUsageSettings` values are stored in the `IndustriesUsage.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there is only one settings file for each settings component.

Version

IndustriesUsageSettings components are available in API version 63.0 and later.

Fields

Field Name	Description
`enableUsage`	**Field Type** boolean **Description** Indicates whether to create and access Usage Management objects to manage product usage and determine rates based on usage (`true`) or not (`false`). The default value is `false`.

Declarative Metadata Sample Definition

The following is an example of an IndustriesUsageSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<IndustriesUsageSettings xmlns="http://soap.sforce.com/2006/04/metadata">
    <enableUsage>true</enableUsage>
</IndustriesUsageSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>IndustriesUsage</members>
        <name>Settings</name>
    </types>
    <version>[ftest]</version>
</Package>
```

Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see Settings. For information about using the manifest file, see Deploying and Retrieving Metadata with the Zip File.

CHAPTER 12 Billing

In this chapter ...

Automate processes related to billing, credit application, and invoice generation. Generate billing schedules by using context service, and create invoices from a billing schedule.

EDITIONS

Available in: Lightning Experience

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Billing Standard Objects

The Billing data model provides objects and fields to manage billing and tax configurations, credit memos, and invoices, and accounting periods for legal entities.

AccountingPeriod

Represents information about a time period for which businesses prepare reports and analyze performance. Each billing transaction is associated with an accounting period. This object is available in API version 62.0 and later.

BillingArrangement

Represents the arrangement for invoicing a transaction's billing amount to one or more accounts. The arrangement specifies whether the total amount must be invoiced to the owning account or a different billing account, or whether the invoices must be split among multiple billing accounts. This object is available in API version 66.0 and later.

BillingArrangementLine

Represents the billing account, billing profile, and the percentage of billing amount to be invoiced. Each billing arrangement line results in a separate invoice addressed to the selected billing account. This object is available in API version 66.0 and later.

BillingBatchScheduler

Represents a scheduled processing job that triggers recurring invoice batch runs. This object is available in API version 62.0 and later.

BillingBatchFilterCriteria

Represents the filter that all eligible billing schedules must satisfy in order to be picked up by an invoice run. This object is available in API version 62.0 and later.

BillingMilestonePlan

Represents a structured approach to invoicing where invoices are scheduled based on predefined milestones. This object is available in API version 63.0 and later.

BillingMilestonePlanItem

Represents a specific billing milestone within the billing milestone plan that's used to manage and track billing based on the completion of certain deliverables or stages. This object is available in API version 63.0 and later.

BillingPeriodItem

Represents a payment period for an invoice. The billing period item is used to pass billing information to an invoice line. This object is available in API version 62.0 and later.

BillingPolicy

Represents information about a set of billing treatments that define the rules to invoice a customer for an order item. This object is available in API version 62.0 and later.

BillingSchedule

Represents information about the order item that's used in the invoicing process. This object is available in API version 62.0 and later.

BillingScheduleGroup

Represents a consolidated view of all the billing schedules related to the order items generated from one asset, including new orders and amendment orders. This object is available in API version 62.0 and later.

BillingTreatment

Represents information about the billing of an order item. This object is available in API version 62.0 and later.

BillingTreatmentItem

Represents information about allocation of the total amount of an order item to billing schedules throughout the order item's lifecycle. This object is available in API version 62.0 and later.

BsgRelationship

Represents a relationship between billing schedule groups to support bundles where one parent billing schedule group has multiple child billing schedule groups. This object is available in API version 62.0 and later.

CaseServiceProcessExtension

Represents additional information for a case record based on the type of service process for which the case was raised. This object is available in API version 67.0 and later.

CreditMemo

Represents a document that's used to reduce the amount that a buyer owes a seller under the terms of an earlier invoice. This object is available in API version 62.0 and later.

CreditMemoAddressGroup

Represents the storage of the buyer's address information, which is used to determine the tax credit amount for a buyer when a credit memo is issued. This object is available in API version 62.0 and later.

CreditMemoInvApplication

Represents information about the application of a credit memo to an invoice. This object is available in API version 62.0 and later.

CreditMemoLine

Represents the product, service, adjustment, or tax line items included in a credit memo. This object is available in API version 62.0 and later.

CreditMemoLineInvoiceLine

Represents a junction between a credit memo line and an invoice line. This object is available in API version 62.0 and later.

CreditMemoLineTax

Represents tax information of a credit memo line of type `Tax`. This object is available in API version 62.0 and later.

DebitMemo

Represents the document used to charge an additional amount to a buyer by a seller. An invoice is generated for the debit memo in the next invoice run. This object is available in API version 65.0 and later.

DebitMemoAddress

Represents the buyer's address information, which is used to determine the tax amount for a buyer when a debit memo is issued. This object is available in API version 65.0 and later.

DebitMemoLine

Represents the additional charge amount that the buyer must pay for the product, service, or debit memo line tax that's related to the debit memo. This object is available in API version 65.0 and later.

DebitMemoLineTax

Represents the tax information for a debit memo line. This object is available in API version 66.0 and later.

GeneralLedgerAccount

Represents information about the accounting codes, types, and names that are used to store and organize financial transactions. This object is available in API version 63.0 and later.

GeneralLedgerAcctAsgntRule

Represents information about the rule based on which general ledger accounts are assigned to transaction journals that are created for billing transactions. This object is available in API version 63.0 and later.

GeneralLdgrAcctPrdSummary

Represents a junction between a general ledger account and a legal entity accounting period. Stores information about the total credit amount, total debit amount, opening balance, and closing balance of a general ledger account for a specific legal entity accounting period. This object is available in API version 65.0 and later.

GeneralLedgerJrnlEntryRule

Represents information about the transaction journal entry rule, based on which transaction journals are created for the selected credit and debit general ledger accounts, transaction amount field, and percentage. This object is available in API version 65.0 and later.

InvBatchDraftToPostedRun

Represents information about the batch job that posts all invoices with the status as `Draft` that are generated by the invoice batch run associated with the billing schedule. This object is available in API version 62.0 and later.

Invoice

Represents information about a financial document describing the total amount a buyer must pay for provided products or services. This object is available in API version 62.0 and later.

InvoiceAddressGroup

Represents the storage of the buyer's address information. This object is available in API version 62.0 and later.

InvoiceBatchRun

Represents a batch processing job in Billing. During an invoice batch run, all billing schedules that meet the specified criteria are processed, resulting in the generation of invoices. This object is available in API version 62.0 and later.

InvoiceBatchRunCriteria

Represents a batch processing job and its required criteria in Billing. During an invoice batch run, all billing schedules that meet the specified criteria are processed, resulting in the generation of invoices. This object is available in API version 62.0 and later.

InvoiceBatchRunRecovery

Represents information about the recovery procedure of an invoice batch run. This object is available in API version 62.0 and later.

InvoiceDocument

Represents the PDF document generated for an invoice. This object is available in API version 63.0 and later.

InvoiceLine

Represents the amount that a buyer must pay for a product, service, or fee. Invoice lines are created based on the amount of an order line. This object is available in API version 62.0 and later.

InvoiceLineRelationship

Represents a relationship between invoice line items to support bundles where one parent invoice line has multiple child invoice lines. This object is available in API version 62.0 and later.

InvoiceLineTax

Represents tax information of an invoice line of type `Tax`. This object is available in API version 62.0 and later.

LegalEntity

Represents the way an organization is structured. An organization can be a single legal entity or it can comprise more than one legal entity. This object is available in API version 62.0 and later.

LegalEntyAccountingPeriod

Represents a junction between a legal entity and an accounting period. This object is available in API version 62.0 and later.

PaymentBatchRun

Represents a batch processing job that processes payments in Billing. During a payment batch run, all the payment schedules that meet the specified criteria are processed and the corresponding Payment records are created. These payments are then applied to invoices or invoice lines. This object is available in API version 64.0 and later.

PaymentLineInvoiceLine

Represents information about a payment line that's applied to or unapplied from an invoice line. This object is available in API version 64.0 and later.

PaymentRetryRule

Represents the specific payment retry rule for a failed payment schedule item. Each rule defines actionable parameters such as the maximum number of retries for the failed records and time intervals between subsequent retry attempts. This object is available in API version 66.0 and later.

PaymentRetryRuleSet

Represents the payment retry rule definition that defines how failed payments are retried based on the error codes across various retry categories. This object is available in API version 66.0 and later.

PaymentSchedule

Represents information about a set of payments that a customer wants to collect at different times for a certain record. A schedule contains one or more payment schedule items, where each item represents one payment to be processed. Each of a schedule's items can have different payment configuration fields, such as payment methods, payment dates, and payment accounts. When a payment scheduler launches a payment run, the run evaluates active payment schedule items, and picks them up for payment processing if they match the scheduler's payment criteria. This object is available in API version 64.0 and later.

PaymentSchedulePolicy

Represents information about the configuration for the payment schedule. This object is available in API version 64.0 and later.

PaymentScheduleTreatment

Represents information about the processing of payment schedules including the payment method and the payment amount for the payment schedule. This object is available in API version 64.0 and later.

PaymentScheduleTreatmentDtl

Represents information about the processing of payment schedules after the corresponding invoices are posted. This object is available in API version 64.0 and later.

PymtSchdDistributionMethod

Represents information about the partial payments that the total payment is divided into. This object is available in API version 64.0 and later.

PaymentScheduleItem

Represents information about a payment to be processed. Each schedule item can have different payment configuration fields, such as payment methods, payment dates, and payment accounts. When a payment scheduler launches a payment run, the run evaluates active payment schedule items, and picks them up for payment processing if they match the scheduler's payment criteria. This object is available in API version 64.0 and later.

PaymentTerm

Represents an agreement between a buyer and a seller about when payment is due for an invoice. This object is available in API version 62.0 and later.

PaymentTermItem

Represents configuration of a payment term. This object is available in API version 62.0 and later.

RevenueTransactionErrorLog

Represents the details of errors that occurred during the processing of a request. The error record persists until a new error with the same category, primary record, and, if necessary, related record occurs. This object is available in API version 62.0 and later.

SeqPolicySelectionCondition

Represents the condition used to determine which sequence policy is applied to a record. This object is available in API version 65.0 and later.

SequenceGapReconciliation

Represents a missing sequence value identified during reconciliation, which can be used later to ensure there are no gaps in the sequence policy numbers. This object is available in API version 65.0 and later.

SequencePolicy

Represents the configuration of rules and parameters for generating unique, sequential numbers for records. Stores settings such as numbering patterns, prefixes, suffixes, sequence start numbers, increment values, and filter criteria to ensure accurate and compliant numbering. This object is available in API version 65.0 and later.

TaxEngine

Represents information about an instance of a tax engine provider as well as the merchant credentials for that specific instance. This object is available in API version 62.0 and later.

TaxEngineInteractionLog

Represents a record of a communication with an external tax engine following a tax calculation request. This object is available in API version 62.0 and later.

TaxEngineProvider

Represents general information about a service that manages a tax engine. Tax engine providers have a one-to-many relationship with tax engines, where the tax engine record represents a specific configuration of a tax engine that can be assigned to multiple order items. This object is available in API version 62.0 and later.

TaxPolicy

Represents information about a group of tax treatments, where each treatment represents parameters to determine how a particular product is taxed for a transaction line item. Tax policies are related to products, which pass the policy on to the resulting order items and in turn the billing schedules. This object is available in API version 62.0 and later.

TaxTreatment

Represents information about tax calculation by external engines. Each product requires a tax policy to determine whether to apply tax. Each tax policy requires at least one tax treatment. The tax treatments determine how taxable products are taxed. This object is available in API version 62.0 and later.

Tax Treatment Item

Represents tax code information that's used to calculate tax for a product by a specific tax engine. This object is available in API version 66.0 and later.

SOAP API Developer Guide: Introduction to SOAP API

AccountingPeriod

Represents information about a time period for which businesses prepare reports and analyze performance. Each billing transaction is associated with an accounting period. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Accounts Receivables Admin permission set to access this object.

Fields

Field	Details
EndDate	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** Required. The end date of an accounting period.
FinancialYear	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Required. The financial year in which an accounting period falls.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed an accounting period indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed an accounting period. If this value is null, it’s possible that the user only accessed the accounting period or a related list view (LastReferencedDate), but not viewed the accounting period itself.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The auto-generated name of an accounting period. The name is a combination of the accounting period's start date, start month, end date, and end month.

Field	Details
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. The user who owns an Accounting Period record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
StartDate	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** Required. The start date of an accounting period.
Status	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The status of an accounting period. Valid values are: • Closed • Open
TotalAssetsAmount	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The sum of all the assets from legal entity accounting periods associated with the accounting period. This field is available in API version 65.0 and later.
TotalEquitiesAmount	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update

Field	Details
	Description The sum of all the equities from legal entity accounting periods associated with the accounting period. This field is available in API version 65.0 and later.
`TotalExpensesAmount`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The sum of all the expenses from legal entity accounting periods associated with the accounting period. This field is available in API version 65.0 and later.
`TotalLiabilitiesAmount`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The sum of all the liabilities from legal entity accounting periods associated with the accounting period. This field is available in API version 65.0 and later.
`TotalRevenueAmount`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The sum of all the revenue from legal entity accounting periods associated with the accounting period. This field is available in API version 65.0 and later.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AccountingPeriodShare **on page 2877**
Sharing is available for the object.

AccountingPeriodFeed **on page 2866**
Feed tracking is available for the object.

AccountingPeriodHistory **on page 2873**
History is available for tracked fields of the object.

BillingArrangement

Represents the arrangement for invoicing a transaction's billing amount to one or more accounts. The arrangement specifies whether the total amount must be invoiced to the owning account or a different billing account, or whether the invoices must be split among multiple billing accounts. This object is available in API version 66.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Fields

Field	Details
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the billing arrangement record was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the billing arrangement record was last viewed.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. A user-defined name for the billing arrangement.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the billing arrangement record. This field is a polymorphic relationship field.

Field	Details
	Relationship Name Owner **Refers To** Group, User
RemainderBillingPercentage	**Type** double **Properties** Filter, Sort **Description** Required. The percentage of the billing amount that isn’t assigned to any of the billing accounts.
ShouldBillRemainderToAccount	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether to bill the remainder billing percentage to the owning account (`true`) or not (`false`).
Status	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. Specifies the status of the billing arrangement. Valid values are: • `Active` • `Draft` • `Inactive`
VersionNumber	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** A numerical value indicating the current version of the billing arrangement record. The version number increases when new billing arrangement line records are added or existing billing arrangement line records are updated.

BillingArrangementLine

Represents the billing account, billing profile, and the percentage of billing amount to be invoiced. Each billing arrangement line results in a separate invoice addressed to the selected billing account. This object is available in API version 66.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AccountId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Required. The ID of the account that's related to the billing arrangement line. This field is a relationship field. **Relationship Name** Account **Refers To** Account
`BillingAccountId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Required. The ID of the billing account record that's related to the billing arrangement line. This field is a relationship field. **Relationship Name** BillingAccount **Refers To** BillingAccount
`BillingArrangementId`	**Type** reference

Field	Details
	Properties Create, Filter, Group, Sort **Description** Required. The ID of the billing arrangement record that's related to the billing arrangement line. This field is a relationship field. **Relationship Name** BillingArrangement **Relationship Type** Master-detail **Refers To** BillingArrangement (the master object)
`BillingArrangementLineName`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort
`BillingPercentage`	**Type** double **Properties** Create, Defaulted on create, Filter, Sort, Update **Description** Required. The percentage of the billing amount to be assigned to the billing account of the billing arrangement line.
`ShouldBillRemainder`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the remainder percentage must be billed to the billing account of the billing arrangement line (`true`) or not (`false`). The default value is `false`.
`VersionNumber`	**Type** int **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description A numerical value indicating the current version of the billing arrangement record. The version number increases when new billing arrangement line records are added or existing billing arrangement line records are updated.

BillingBatchScheduler

Represents a scheduled processing job that triggers recurring invoice batch runs. This object is available in API version 62.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
`BillingSchedulerName`	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** Required. The name of the scheduler.
`Comments`	**Type** textarea **Properties** Filter, Nillable, Sort **Description** Additional details about the billing batch scheduler.
`CronExpression`	**Type** string **Properties** Filter, Group, Sort **Description** Required. This field determines how often the scheduler recurs.

Field	Details
EndDate	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date when the scheduler stops triggering batch processing jobs.
FrequencyCadence	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. The frequency of the scheduler triggering the invoice batch run. Valid values are: • `Daily`— The scheduled job recurs every day. • `Monthly`— The scheduled job recurs every month. • `Once`— The scheduled job occurs one time and doesn't recur. • `Weekly`— The scheduled job recurs every week.
FrequencyOptions	**Type** textarea **Properties** Nillable **Description** This field is a derived field that stores the scheduler configuration.
JobType	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. The type of batch processing job that the scheduler triggers. Valid value is `Invoice` for which the scheduler starts a batch invoice run.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a billing batch scheduler record indirectly, for example, through a list view or related record.

Field	Details
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a billing batch scheduler record. If this value is null, it's possible that the user only accessed the billing batch scheduler record or a related list view (`LastReferencedDate`), but not viewed the billing batch scheduler record itself.
NextRunTime	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and timestamp of the next scheduled batch invoice run in the user's time zone.
OwnerId	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the user who created the scheduler. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
RecurringSubType	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The frequency at which the batch processing job recurs when the `FrequencyCadence` field value is set to `Monthly`. Valid values are: • `Every`— The processing job recurs at every instance of the frequency of the value. For example, if the `RecurringSubType` field value is `Every` and the `FrequencyCadence` field value is `Weekly`, then the batch processing job recurs every week.

Field	Details
	• `SpecificDate`— The scheduler triggers the batch processing job on the selected date. For example, if the selected date is 5, and the `FrequencyCadence` field value is `Monthly`, then the job recurs on the fifth day of each month.
`RecurringType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The frequency at which the batch processing job is repeated when the `FrequencyCadence` field value is set to `Weekly`. Valid value is `Every`.
`RecursOn`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The interval at which the scheduler triggers a batch processing job. If the `FrequencyCadence` field value is `Monthly`, you must select either the specific date or the interval when the schedule triggers the job. Valid values are: • `First` • `Fourth` • `Last` • `Second` • `Third` **Example:** To configure the scheduler to trigger the job on the first Monday of the month, set the following fields: • `FrequencyCadence=Monthly` • `RecursOn=First` • `RecursOnDay= Monday`
`RecursOnDate`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The date on which the scheduler triggers a batch processing job.

Field	Details
	Example: To configure the scheduler to trigger the job on the fifth day of the month, set the following fields: • `FrequencyCadence=Monthly` • `RecursOnDate=` 5 **Example:** To configure the scheduler to trigger the job on the second to last day of the month, set the following fields: • `FrequencyCadence=Monthly` • `RecursOnDate=SecondToLast` If you select `Last`, `SecondToLast`, or `ThirdToLast`, the date of the batch processing job varies depending on the number of days in the month. For example, consider `SecondToLast` is selected. If the month has 30 days, such as June, then the batch processing job occurs on the 28th day. If the month has 31 days, such as July, then the batch processing job occurs on the 29th day.
`RecursOnDay`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The day on which the scheduler triggers a batch processing job. If the `FrequencyCadence` field value is set to `Weekly`, then you must select the day when the scheduler runs. The scheduler recurs every week on the selected day; for example, weekly on Monday. Valid values are: • `Sunday` • `Monday` • `Tuesday` • `Wednesday` • `Thursday` • `Friday` • `Saturday`
`RunCriteriaId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the filter criteria that's defined for the invoice batch run or the payment batch run. This field is a polymorphic relationship field.

Field	Details
	Relationship Name RunCriteria **Refers To** InvoiceBatchRunCriteria
`ShouldExcludeWkendAndHldy`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Required. Indicates whether weekends and holidays are excluded from the billing schedule (`true`) or not (`false`). The default value is `false`.
`ShouldStartRunImmediately`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Required. Indicates whether the invoice scheduler must start the run immediately (`true`) or not (`false`). The default value is `false`. Available in API version 63.0 and later.
`StartDate`	**Type** date **Properties** Filter, Group, Sort **Description** Required. The date when the scheduler triggers its first batch processing job.
`StartTime`	**Type** time **Properties** Filter, Sort **Description** Required. The time when the scheduler triggers the batch processing job.
`Status`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort

Field	Details
	Description Required. The status of the scheduler. Only active schedulers can trigger batch processing jobs. Valid values are: • `Active` • `Canceled` • `Draft` • `Inactive`
`TimeZone`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The time zone is either the value selected when the run was configured, or it's the user's time zone. The time zone is shown in Greenwich Mean Time (GMT).

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

BillingBatchSchedulerShare on page 2877
Sharing is available for the object.

BillingBatchFilterCriteria

Represents the filter that all eligible billing schedules must satisfy in order to be picked up by an invoice run. This object is available in API version 62.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
`BatchCriteriaId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the batch criteria record. This field is a polymorphic relationship field. **Relationship Name** BatchCriteria **Refers To** InvoiceBatchRunCriteria
`BillingBatchFilterCriteriaNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The auto-generated reference number for the billing batch filter criteria.
`ColumnEnum`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. The column or field to which the filter criteria are applied.
`CriteriaFieldType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The data type of the custom or standard criteria field. Valid values are: • `CustomBoolean` • `CustomCurrency` • `CustomDate` • `CustomLookup` • `CustomNumber`

Field	Details
	• `CustomPercent` • `CustomText` Available in API version 63.0 and later.
`CriteriaSequence`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The order in which the filter criteria are applied on the billing batch.
`CustomCriteriaFieldName`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The API name of the custom field on the object specified in the `ObjectName` field. The filter criteria is applied on the custom field. This object is available in API version 65.0 and later.
`InvoiceRunMatchingValue`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** A value to match during an invoice run. This field is useful for filtering the invoices based on specific criteria during the billing process.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The timestamp when the current user last viewed this record or list view. If this value is null, and `LastReferenceDate` is not null, the user accessed this record or list view indirectly.
`ObjectName`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. The object on which the filter criteria are applied. Valid values are: • `AccountBillingAccount` — Available in API version 63.0 and later. • `BillingAccount` — Available in API version 63.0 and later. • `BillingSchedule` • `BillingScheduleGroup` • `CreditMemo` — Available in API version 63.0 and later. • `CreditMemoInvApplication` — Available in API version 63.0 and later. • `CreditMemoLine` — Available in API version 63.0 and later. • `CreditMemoLineInvoiceLine` — Available in API version 63.0 and later. • `CreditMemoLineTax` — Available in API version 63.0 and later. • `DebitMemoLine` — Available in API version 65.0 and later. • `Invoice` — Available in API version 63.0 and later. • `InvoiceLine` — Available in API version 63.0 and later. • `InvoiceLineTax` — Available in API version 63.0 and later. • `Payment` — Available in API version 64.0 and later. • `PaymentGateway` — Available in API version 64.0 and later. • `PaymentLineInvoice` — Available in API version 64.0 and later. • `PaymentLineInvoiceLine` — Available in API version 64.0 and later. • `PaymentSchedule` — Available in API version 64.0 and later. • `PaymentScheduleItem` — Available in API version 64.0 and later. • `Refund` — Available in API version 64.0 and later. • `RefundLinePayment` — Available in API version 64.0 and later.
`Operation`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort

Field	Details
	Description Required. The type of comparison or logical operation to be performed on the specified column or field. Valid values are: • `Contains` — Available in API version 63.0 and later. • `Equals` • `GreaterThan` — Available in API version 63.0 and later. • `GreaterThanOrEqualTo` — Available in API version 63.0 and later. • `InList` • `LessThan` — Available in API version 63.0 and later. • `LessThanOrEqualTo` • `NotEquals` — Available in API version 63.0 and later. • `OfType` • `StartsWith` — Available in API version 63.0 and later.
`OwnerId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the user who created the billing batch filter criteria. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
`PaymentRunMatchingValue`	**Type** picklist **Properties** Filter, Group, Nillable, Sort **Description** A value to match during a payment run. This field is useful for filtering the payments based on specific criteria during the billing process. This field is visible but isn't used in API version 62.0.
`StandardCriteriaField`	**Type** string **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The name of the standard field for the object specified in the `ObjectName` field. The filter criteria is applied on the standard field. Available in API version 63.0 and later.
`Value`	**Type** string **Properties** Filter, Group, Sort **Description** Required. The value to be used in the filter criteria.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

BillingBatchFilterCriteriaHistory on page 2873
History is available for tracked fields of the object.

BillingMilestonePlan

Represents a structured approach to invoicing where invoices are scheduled based on predefined milestones. This object is available in API version 63.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

You need Revenue Cloud Billing license and the Billing Admin permission set to access this object.

Fields

Field	Details
`BillingTreatmentId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. The billing treatment associated with the billing milestone plan.

Field	Details
	This field is a relationship field. **Relationship Name** BillingTreatment **Refers To** BillingTreatment
Description	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Additional details about the billing milestone plan.
ExternalReference	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The external reference item that links a billing milestone plan item to the original transaction item. Available in API version 65.0 and later.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a billing milestone plan record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a billing milestone plan record. If this value is null, it's possible that the user only accessed the billing milestone plan record or a related list view (LastReferencedDate), but not viewed the billing milestone plan record itself.
Name	**Type** string

Field	Details
	Properties Create, Filter, Group, idLookup, Sort, Update **Description** Required. The name of the billing milestone plan.
ReferenceItemAmount	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The total reference item amount to be billed.
ReferenceItemId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the reference item that links a billing milestone plan item to the original order item. This field is a polymorphic relationship field. **Relationship Name** ReferenceItem **Refers To** BillingSchedule, OrderItem
Status	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The status of the billing milestone plan. Valid values are: • Active • Cancelled • Completely Billed • Draft

BillingMilestonePlanItem

Represents a specific billing milestone within the billing milestone plan that's used to manage and track billing based on the completion of certain deliverables or stages. This object is available in API version 63.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

You need Revenue Cloud Billing license and the Billing Admin permission set to access this object.

Fields

Field	Details
`BillingMilestonePlanId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The billing milestone plan associated with the billing milestone plan item. This field is a relationship field. **Relationship Name** BillingMilestonePlan **Relationship Type** Master-detail **Refers To** BillingMilestonePlan (the master object)
`BillingScheduleGroupId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The billing schedule group that's related to the billing milestone plan item. Available in API version 64.0 and later. This field is a relationship field. **Relationship Name** BillingScheduleGroup **Refers To** BillingScheduleGroup

Field	Details
CommencementDate	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The action that triggers the start of the billing milestone plan for a date-based milestone. Valid value is: • OrderProductActivation
CommencementDateOffset	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The offset applied to the commencement date to determine the milestone achievement date for a date-based milestone.
CommencementDateOffsetUnit	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The unit of time for the commencement date offset. Valid values are: • Days • Months • Years
Description	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Additional details about the billing milestone plan item.
FlatAmount	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update

Field	Details
	Description The amount in terms of units of currency, such as $10 or $21.52, to invoice from the order item. Used only when `Type` field has a value of `FlatAmount`.
`IsMilestoneAccomplished`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. Indicates whether the billing treatment is for milestone billing (`true`) or not (`false`).
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a billing milestone plan item record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a billing milestone plan item record. If this value is null, it's possible that the user only accessed the billing milestone plan item record or a related list view (`LastReferencedDate`), but not viewed the billing milestone plan item record itself.
`MilestoneAccomplishmentDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date the milestone is achieved for date-based milestones. For event-based milestones, this field indicates the date when the milestone is manually marked as completed.
`MilestoneAmount`	**Type** currency **Properties** Filter, Nillable, Sort

Field	Details
	Description The amount that's billed when the milestone is reached or completed.
MilestoneType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The milestone type for the billing treatment item. Valid values are: • Date • Event
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The name of the billing milestone plan item.
Percentage	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The percentage,such as 10% or 12.5%, to invoice from the order item. Used only when Type field has a value of Percentage.
ServicePeriodEnd	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The end date of the service associated with the milestone. Valid value is: • Order Product End Date
ServicePeriodStart	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

Field	Details
	Description The start date of the service associated with the milestone. Valid value is: • `Order Product Start Date`
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of the billing milestone plan item. Valid values are: • `Cancelled` • `Draft` • `Error` • `Invoiced` • `Ready for Invoicing` • `Waiting for Milestone Accomplishment`
`Type`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. Specifies whether billing schedules created from this billing treatment item are based on a flat amount or a percentage of the order item's total amount. Valid values are: • `FlatAmount` • `Percentage` • `Remainder`

BillingPeriodItem

Represents a payment period for an invoice. The billing period item is used to pass billing information to an invoice line. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
`Amount`	**Type** currency **Properties** Filter, Sort **Description** Required. The price for the billing period item. This field is used to calculate the invoice line's amount.
`BillingPeriodEndDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The end date of a billing period that's used to calculate the invoice line's end date.
`BillingPeriodItemNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. An auto-generated number identifying the billing period item.
`BillingPeriodStartDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The start date of a billing period item that's used to calculate the invoice line's start date.
`BillingScheduleGroupId`	**Type** reference

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The ID of the parent billing schedule group record that's related to the billing period item. Available in API version 64.0 and later. This field is a relationship field. **Relationship Name** BillingScheduleGroup **Refers To** BillingScheduleGroup
`BillingScheduleId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the parent billing schedule record of the billing period item. This field is a relationship field. **Relationship Name** BillingSchedule **Relationship Type** Master-detail **Refers To** BillingSchedule (the master object)
`InvoiceBatchRunId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the parent invoice batch run record of the billing period item. This field is a relationship field. **Relationship Name** InvoiceBatchRun **Refers To** InvoiceBatchRun
`InvoiceId`	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The ID of the parent Invoice record of the Invoice Line record that's generated from the billing period item. This field is a relationship field. **Relationship Name** Invoice **Refers To** Invoice
`InvoiceLineId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the Invoice Line record that's generated from the billing period item. This field is populated only when a billing period item is generated by an invoice batch run. Otherwise, this field is empty. This field is a relationship field. **Relationship Name** InvoiceLine **Refers To** InvoiceLine
`InvoiceStatus`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. The status of the invoice that contains the invoice line created from the billing period item. Valid values are: • `Canceled`— The invoice for this billing period item was canceled. • `Draft`— The invoice has been created but hasn't been posted. • `DraftInProgress`— The invoice hasn't been created yet. When the invoice is created, the `InvoiceStatus` field value is changed to `Draft`. If the invoice generation process fails, the `InvoiceStatus` field value shows `DraftInProgress`. • `Error`— The invoice for this billing period item was generated in error. • `Pending`— The invoice for this billing period item is being generated. • `Posted`— An invoice line based on this billing period has been created and added successfully to the invoice.

Field	Details
	• `PostingInProgress`— An invoice line based on this billing period has been created and is in the process of being added to the invoice. • `Voided`— An invoice line based on this billing period was voided. • `VoidInProgress`— An invoice line based on this billing period is in the process of being voided.
`OverageQuantity`	**Type** double **Properties** Filter, Nillable, Sort **Description** The quantity of the usage overage that has exceeded the initial grant. This field is available in API version 63.0 and later with Revenue Cloud Billing license.
`RelatedMilestonePlanItemId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The billing milestone plan item that creates the billing period item. This field is available in API version 63.0 and later with Revenue Cloud Billing license. This field is a relationship field. **Relationship Name** RelatedMilestonePlanItem **Refers To** BillingMilestonePlanItem
`RelatedUsageBillPeriodItemId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The method for retrieving billing information for usage-based products. This field is available in API version 63.0 and later with Revenue Cloud Billing license. This field is a relationship field. **Relationship Name** RelatedUsageBillPeriodItem **Refers To** UsageBillingPeriodItem
`Status`	**Type** picklist

Field	Details
	Properties Filter, Group, Restricted picklist, Sort **Description** Required. The status of the billing period item. Draft billing period items aren't evaluated for invoice line creation. Valid values are: • `Canceled` • `Draft` • `Reviewed`
`TotalUsedQuantity`	**Type** double **Properties** Filter, Nillable, Sort **Description** The total quantity of the usage resource consumed during the billing period. This includes granted entitlements, excess consumption, or consumption below the granted entitlements. This field is available in API version 63.0 and later with Revenue Cloud Billing license.
`UnitOfMeasureId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The units used to measure the overage. For example, bytes or minutes. Available in API version 63.0 and later. This field is a relationship field. **Relationship Name** UnitOfMeasure **Refers To** UnitOfMeasure

BillingPolicy

Represents information about a set of billing treatments that define the rules to invoice a customer for an order item. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
`BillingTreatmentSelection`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. Defines how billing treatments are assigned to order items and assets that are related to the billing policy. Valid values are: • `Default` • `LegalEntity` • `Manual`
`DefaultBillingTreatmentId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** When `BillingTreatmentSelection` has a value of `Default`, the selected billing treatment is used for all the order items and assets that are related to the billing policy. This field is a relationship field. **Relationship Name** DefaultBillingTreatment **Refers To** BillingTreatment
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Additional details about the billing policy.
`LastReferencedDate`	**Type** dateTime

Field	Details
	Properties Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a billing policy indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a billing policy. If this value is null, it's possible that the user only accessed the billing policy or a related list view (`LastReferencedDate`), but not viewed the accounting period itself.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The name of the billing policy.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The status of the billing policy. Valid values are: • `Active` • `Draft` • `Inactive`

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

BillingPolicyHistory on page 2873

History is available for tracked fields of the object.

BillingSchedule

Represents information about the order item that's used in the invoicing process. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
`BillDayOfMonth`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The day of the month on which a recurring billing process is scheduled to occur.
`BilledAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total amount (excluding tax) that has been invoiced from the billing schedule. This field is a calculated field.
`BillingAccountId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the account that's related to the billing schedule. This field is a relationship field. **Relationship Name** BillingAccount

Field	Details
	Refers To Account
BillingMethod	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of billing used for the source item. Valid values are: • Evergreen • OrderAmount • Usage—Available in API version 63.0 and later with Revenue Cloud Billing license.
BillingMilestonePlanId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The billing milestone plan associated with the billing schedule. This field is available in API version 63.0 and later with Revenue Cloud Billing license. This field is a relationship field. **Relationship Name** BillingMilestonePlan **Refers To** BillingMilestonePlan
BillingPeriodAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The amount to be invoiced each billing period. For example, if the billing period is monthly, this field shows the monthly amount that appears on the invoice line.
BillingScheduleEndDate	**Type** date **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The last date that the billing schedule is available for invoicing. This value is inherited from the `EndDate` field on the order item.
`BillingScheduleGroupId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The billing schedule group that contains the billing schedule. Billing schedules are grouped when they have the same source order item. The source order item is the original order item that a customer bought. Afterwards, if the customer amends, cancels, or renews the order item, a new billing schedule is created with the `BillingScheduleGroupId` for the original order item. This field is a relationship field. **Relationship Name** BillingScheduleGroup **Relationship Type** Master-detail **Refers To** BillingScheduleGroup (the master object)
`BillingScheduleNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The auto-generated reference number for the billing schedule.
`BillingScheduleStartDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date when the billing schedule is available for invoicing. This value is inherited from the `ServiceDate` field on the order item.
`BillingTerm`	**Type** int **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The duration for which the customer is invoiced.
BillingTermUnit	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. The unit of measurement of the billing term. Valid values are: • BillingMilestonePlan—Available in API version 63.0 and later with Revenue Cloud Billing license. • Day • Month • OneTime • Quarter • Semi-Annual • Year
BillingTreatmentId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the billing treatment record associated with the billing schedule. Available in API version 67.0 and later. This field is a relationship field. **Relationship Name** BillingTreatment **Refers To** BillingTreatment
BillingTreatmentItemId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The billing treatment item that's used to configure invoiceable amounts on the billing schedule. This field is a relationship field.

Field	Details
	Relationship Name BillingTreatmentItem **Refers To** BillingTreatmentItem
BillingType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The timing of invoicing for a product or service relative to its delivery to the customer. Valid values are: • Advance— Invoices a product or service before its delivery. • Arrears — Invoices a product or service after its delivery.
CancellationDate	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date from when the user can no longer access the service. For example, if a service ends on August 31, the cancellation date is September 1 because that's the date from when the user can no longer use the service. Billing schedules past their cancellation date aren't invoiced.
Category	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. The category of the billing schedule. Valid values are: • Amendment— A billing schedule for an order that was amended. Available in API version 67.0 and later. • AmendQuantity— A billing schedule for an order that changes the quantity. • Cancellation — A billing schedule for an order that was canceled. • Original — A billing schedule for the initial order. • Renewal — A billing schedule for an order that was renewed.
CustomInvoiceGroupKey	**Type** string

Field	Details
	Properties Filter, Group, Restricted picklist, Sort **Description** The group identifier for which an invoice must be generated when the invoice group type is `Custom`. This field is available in API version 63.0 and later with Revenue Cloud Billing license.
`InvBatchDraftToPostedRunId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The batch job that posts all invoices with a status as `Draft` that are generated by the invoice batch run associated with the billing schedule. This field is a relationship field. **Relationship Name** InvBatchDraftToPostedRun **Refers To** InvBatchDraftToPostedRun
`InvoiceBatchRunId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The invoice batch run that evaluated the billing schedule and its billing period items to generate an invoice. This field is a relationship field. **Relationship Name** InvoiceBatchRun **Refers To** InvoiceBatchRun
`InvoiceGroupType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies whether to generate an invoice for a billing schedule, a custom group, or the default group of account, bill-to-contact, payment term, currency, and tax engine. Valid values are:

Field	Details
	• `Billing Schedule` • `Custom` • `Default` This field is available in API version 63.0 and later with Revenue Cloud Billing license.
`InvoiceRunMatchingValue`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The batch value used by the invoice run that evaluated the billing schedule. During an invoice run, billing schedules with the same batch value, including null, are grouped to the same invoice run.
`LineAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The amount associated with a specific line item in the billing schedule. Available in API version 63.0 and later.
`NetUnitPrice`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The net unit price of the order item for which the billing schedule was created. Available in API version 64.0 and later.
`NextBillingDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date that the next billing period starts for the invoice. This date is used to calculate which invoice lines are included on an invoice. When an invoice scheduler or API evaluates an order for invoicing, billing schedules with a next billing date on or before the invoice's target date are included in the invoice.
`NextChargeFromDate`	**Type** date

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The date that the billing schedule is invoiced in the upcoming billing period. For example, if you invoiced a customer for a billing period of 01/01/24 through 01/31/24, the billing schedule's `NextChargeFromDate` is 02/01/22.
`OriginalBillingScheduleId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** If the billing schedule is an amended or canceled billing schedule, then this field shows the original billing schedule. Otherwise, this field is null. This field is a relationship field. **Relationship Name** OriginalBillingSchedule **Refers To** BillingSchedule
`PendingAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The amount from the current billing term that hasn't been billed yet. For example, the unbilled amount for a month, quarter, or year, depending on this billing schedule's billing term.
PricingTermUnit	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. The unit of time for which the pricing of the product applies. Valid values are: • `Months` • `Quarterly` • `Semi-Annual` • `Annual` Available in API version 66.0 and later.

Field	Details
ProcessingOrder	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Specifies the order in which billing transactions are applied. Available in API version 67.0 and later. This field is an autogenerated field.
Quantity	**Type** double **Properties** Filter, Nillable, Sort **Description** The quantity of the order item that created the billing schedule.
Reference	**Type** reference **Properties** Filter, Group, idLookup, Sort **Description** The ID of the parent record of the reference item for which the billing schedule is created. Available in API version 61.0 and later.
ReferenceEntityId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The parent order of the order item that created the billing schedule. This field is a polymorphic relationship field. **Relationship Name** ReferenceEntity **Refers To** Order
ReferenceEntityItemId	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The order item or asset that created the billing schedule. This field is a polymorphic relationship field. **Relationship Name** ReferenceEntityItem **Refers To** OrderItem, OrderItemAdjustmentLineItem
`ReferenceItem`	**Type** reference **Properties** Filter, Group, idLookup, Sort **Description** The ID of the transaction line item record for which the billing schedule is created. Available in API version 61.0 and later.
SubCategory	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The subcategory of the billing schedule. Available in API version 67.0 and later. Valid values are: • `AsIsRenewal` • `BillingFrequencyAmendment` • `ChangeEndDate` • `DeltaPriceAmend` • `PriceAmend` • `QuantityAmendment` • `SimplifiedCancel` • `SimplifiedRenewal`
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The status of the order item that the billing schedule represents. Valid values are:

Field	Details
	• `WaitingForMilestoneEventAccomplishment`—Available in API version 63.0 and later with Revenue Cloud Billing license. • `CompletelyBilled` • `Error` • `Processing` • `ReadyForInvoicing`
`TaxTreatmentId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the treatment that's used to calculate tax for the billing schedule. This value is defined based on the order item's tax policy. This field is a relationship field. **Relationship Name** TaxTreatment **Refers To** TaxTreatment
`TotalAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total amount of the order item represented by the billing schedule.
`Type`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The type of the billing schedule. Valid values are: • `LineItemAdjustedCharge` • `LineItemAdjustment` • `LineItemCharge`
`UnitOfMeasureId`	**Type** reference

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The ID of the unit of measure for the billing schedule. Available in API version 63.0 and later. This field is a relationship field. **Relationship Name** UnitOfMeasure **Refers To** UnitOfMeasure
`UnitPrice`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The price for an individual unit of the billing schedule's parent order item, including charges, adjustments, and discounts. This value is inherited from the order item's `UnitPrice` field.
`UsageResourceId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The usage resource associated with the billing schedule. This field is available in API version 63.0 and later with Revenue Cloud Billing license. This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource

BillingScheduleGroup

Represents a consolidated view of all the billing schedules related to the order items generated from one asset, including new orders and amendment orders. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
`AnchorProdtBillingSchdGrpId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The billing schedule group for the anchor product in a usage-based product. The anchor product contains the grants for the usage-based product. This field is available in API version 63.0 and later with Revenue Cloud Billing license. This field is a relationship field. **Relationship Name** AnchorProdtBillingSchdGrp **Refers To** BillingScheduleGroup
`BillDayOfMonth`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The day of the month on which a recurring billing process is scheduled to occur.
`BillToContactId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the contact related to the billing schedule group. This field can't be modified when related billing schedules are in processing. This field is a relationship field. **Relationship Name** BillToContact

Field	Details
	Refers To Contact
BillingAccountId	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the account that's related to the billing schedule group. This field is a relationship field. **Relationship Name** BillingAccount **Refers To** Account
BillingAddress	**Type** address **Properties** Filter, Nillable **Description** The compound form of the billing address. Read only. See Address Compound Fields for details on compound address fields.
BillingArrangementId	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the billing arrangement that's related to the billing schedule group. Available in API version 66.0 and later. This field is a relationship field. **Relationship Name** BillingArrangement **Refers To** BillingArrangement
BillingMethod	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort

Field	Details
	Description Required. The type of billing used for the source item. Valid values are: • `Evergreen` • `OrderAmount` • `Usage`
`BillingResumptionDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date when billing for the asset related to the billing schedule group is resumed. Available in API version 63.0 and later.
`BillingScheduleGroupNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The auto-generated reference number for the billing schedule group.
`BillingStartMonth`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** This is a read-only field used with annual billing. The field shows the numbers from 1 through 12, which indicate the month when billing begins for an annual subscription. For example, if billing starts in January, the value is 1; if billing starts in June, the value is 6.
`BillingSuspensionDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date when billing for the asset related to the billing schedule group is suspended. Available in API version 63.0 and later.
`BillingTerm`	**Type** int

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** This field is used with `BillingTermUnit`field to define a billing cycle. For example, bill every 20 days or every two months. In this example, the `BillingTerm` field value is 20 and the `BillingTermUnit` field value is `Day`.
`BillingTermUnit`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. The unit of measurement of the billing term. Valid values are: • `BillingMilestonePlan`—Available in API version 63.0 and later with Revenue Cloud Billing license. • `Day` • `Month` • `OneTime` • `Quarter` • `Semi-Annual` • `Year`
`BillingTreatmentId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The billing treatment item that's used to configure invoiceable amounts on the billing schedule group. This field is a relationship field. **Relationship Name** BillingTreatment **Refers To** BillingTreatment
`BillingType`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort

Field	Details
	Description Required. The timing of invoicing for a product or service relative to its delivery to the customer. Valid values are: • `Advance`— Invoices a product or service before its delivery. • `Arrears`— Invoices a product or service after its delivery.
`BindingInstanceId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The asset or custom object record associated with the billing schedule group. This field is available in API version 63.0 and later with Revenue Cloud Billing license. This field is a polymorphic relationship field. **Relationship Name** BindingInstance **Refers To** Asset
`CancellationDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date from when the user can no longer access the service. For example, if a service ends on August 31, the cancellation date is September 1 because that’s the date from when the user can no longer use the service. Billing schedules past their cancellation date aren't invoiced.
`Controller`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. During the invoicing process, this field determines which date is used when the billing schedule group and billing schedule have a related field with conflicting values. For example, when Controller has a value of `BillingScheduleGroup`, if the billing schedule's billing day of month is 5 while the billing schedule group's billing day of month is 10, the invoice is sent on the 10th day of the month. Valid values are:

Field	Details
	• `BillingScheduleGroup` • `None`
`EffectiveNextBillingDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The earliest `NextBillingDate` from all billing schedules in the billing schedule group. This field is a reference field that isn't used for any features or calculations. This field is a calculated field.
`EndDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The end date of the billing schedule group.
`ExternalBindingInstance`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The custom target associated with the entitlements that are granted with the sellable product. This field is available in API version 63.0 and later with Revenue Cloud Billing license.
`ExternalRefRecordIdentifier`	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The identifier of the external record for which the billing schedule group was created. Available in API version 64.0 and later.
`LegalEntityId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the legal entity that's related to the billing schedule group. This field is a relationship field.

Field	Details
	Relationship Name LegalEntity **Refers To** LegalEntity
NextBillingDateOverride	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The next billing date for all the billing schedules related to the billing schedule group. If specified, this date overrides the next billing dates of the billing schedules. Available in API version 63.0 and later.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. The ID of the user who created the billing schedule group. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
PaymentTermId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the payment term used in this billing schedule group. This field can’t be modified when related billing schedules are in processing. This field is a relationship field. **Relationship Name** PaymentTerm **Refers To** PaymentTerm
PeriodBoundary	**Type** picklist

Field	Details
	Properties Filter, Group, Nillable, Restricted picklist, Sort **Description** This field is inherited from the order item's parent quote line item or sales transaction item. The period boundary determines the start and end date of the billing periods. Valid values are: • `AlignToCalendar` • `Anniversary` • `DayOfPeriod` • `LastDayOfPeriod`
`Product2Id`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The product that was charged or ordered to create the billing schedule group. This field is a relationship field. **Relationship Name** Product2 **Refers To** Product2
`ProductName`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The name of the product for the order item that's represented by each billing schedule in the billing schedule group.
`ProrationPolicyId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the proration policy that applies to this billing schedule group. The proration policy defines how time periods are calculated for orders. For example, whether partial periods are allowed. This field is inherited from the shared proration policy for each billing schedule in the billing schedule group. This field is a relationship field.

Field	Details
	Relationship Name ProrationPolicy **Refers To** ProrationPolicy
ReferenceEntityId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The asset used to create the billing schedules in the billing schedule group. This field is a relationship field. **Relationship Name** ReferenceEntity **Refers To** Asset
ReferenceRecordId	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the Salesforce record for which the billing schedule group was created. Available in API version 64.0 and later. This field is a polymorphic relationship field. **Relationship Name** BillingScheduleGroups
SavedPaymentMethodId	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the SavedPaymentMethod record that's used to collect payment for the billing schedule group. Available in API version 64.0 and later. This field is a relationship field. **Relationship Name** BillingScheduleGroups **Refers To** SavedPaymentMethod

Field	Details
ShipFromAddress	**Type** address **Properties** Filter, Nillable **Description** The address from which the product in the billing schedule group is shipped. Available in API version 64.0 and later.
ShippingAddress	**Type** address **Properties** Filter, Nillable **Description** The compound form of the shipping address. See Address Compound Fields for details on compound address fields. This field is a read-only field.
StartDate	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The earliest start date from all billing schedules in the billing schedule group.
TaxTreatmentId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the tax treatment record that's used to calculate tax for the billing schedule group. This value is defined based on the order item's tax policy. This field is a relationship field. **Relationship Name** TaxTreatment **Refers To** TaxTreatment
TotalBilledAmount	**Type** currency **Properties** Filter, Nillable, Sort

Field	Details
	Description The amount that has been invoiced for the billing schedules within the billing schedule group. This field is a calculated field.
`TotalPendingAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The amount that hasn't yet been invoiced for the billing schedules within the billing schedule group. This field is a calculated field.
UsageType	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The usage type for the billing schedule group. Valid values are: • `Revenue Cloud` • `Commerce Cloud` • `Insurance Cloud` Available in API version 66.0 and later.

BillingTreatment

Represents information about the billing of an order item. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
BillingPolicyId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The billing policy that's related to the billing treatment. This field is a relationship field. **Relationship Name** BillingPolicy **Refers To** BillingPolicy
CanChangeBillingFrequency	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the billing frequency can be changed for the billing treatment (`true`) or not (`false`). The default value is `false`.
Description	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Additional details about the billing treatment.
ExcludeFromBilling	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. Specifies whether any order items assigned to the treatment are excluded from billing. Valid values are: • `No` • `Yes`

Field	Details
IsMilestoneBilling	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. Indicates whether the billing treatment is for milestone billing (`true`) or not (`false`). The default value is `false`. This field is available in API version 63.0 and later with Revenue Cloud Billing license.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a billing treatment indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a billing treatment. If this value is null, it’s possible that the user only accessed the billing treatment or a related list view (`LastReferencedDate`), but not viewed the billing treatment itself.
LegalEntityId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity that's used to assign the treatment to order items when the parent billing policy's `BillingTreatmentSelection` field value is `LegalEntity`. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity
Name	**Type** string

Field	Details
	Properties Create, Filter, Group, idLookup, Sort, Update **Description** Required. The name of the billing treatment.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The status of the billing treatment. Valid values are: • `Active` • `Draft` • `Inactive` Draft or inactive billing treatments can't be assigned to order items.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

BillingTreatmentHistory on page 2873
History is available for tracked fields of the object.

BillingTreatmentItem

Represents information about allocation of the total amount of an order item to billing schedules throughout the order item's lifecycle. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
`BillingTreatmentId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. The parent billing treatment for the billing treatment item. This field is a relationship field. **Relationship Name** BillingTreatment **Relationship Type** Master-detail **Refers To** BillingTreatment (the master object)
`BillingType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The timing of invoicing for a product or service relative to its delivery to the customer. Advance billing invoices a product or service before its delivery, whereas arrears billing invoices it after delivery. The billing system assesses the billing type to determine the next billing date for an order product. Valid values are: • `Advance`—If the order item is billed in advance, the order's billing day of month is evaluated to choose the nearest date on or before the order product's start date. For example, if a monthly order product's start date is January 1, and the order's billing day of month is 15, the next billing date is December 15. • `Arrears`—If the order item is billed in arrears, the order's billing day of month is evaluated to choose the nearest date after the order product's start date. For example, if a monthly order product's start date is January 1, and the order's billing day of month is 15, the order product's next billing date is January 15. • `None`
`Controller`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. During the invoicing process, this field determines which value is used when the billing schedule group and billing schedule have a shared field with different values. For

Field	Details
	example, when Controller has a value of `BillingScheduleGroup`, if the billing schedule's billing day of month is 5 while the billing schedule group's billing day of month is 10, the value of 10 is used. Valid values are: • `BillingScheduleGroup` • `None`
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Additional details about the billing treatment item.
`FlatAmount`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The amount in terms of units of currency (such as $10 or $21.52) to invoice from the order item. Used only when Type has a value of `FlatAmount`.
`Handling0Amount`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. Specifies how invoices are generated for billing period items that have an amount of $0. Valid values are: • `CreateInvoice` • `None`
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a billing treatment item indirectly, for example, through a list view or related record.

Field	Details
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a billing treatment item. If this value is null, it's possible that the user only accessed the billing treatment item or a related list view (`LastReferencedDate`), but not viewed the billing treatment item itself.
MilestoneStartDate	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The occurrence whose date is used to calculate the milestone accomplishment date for the associated billing milestone plan item based on the provided offset details. Valid value is: • `OrderProductActivation` This field is available in API version 63.0 and later with Revenue Cloud Billing license.
MilestoneStartDateOffset	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The calculated value that determines the time difference from the start of a milestone. This value is calculated from the milestone start date record. This field is available in API version 63.0 and later with Revenue Cloud Billing license.
MilestoneStartDateOffsetUnit	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The unit type to use with the milestone start date offset, which defines the milestone date. Valid values are: • `Days` • `Months` • `Years` This field is available in API version 63.0 and later with Revenue Cloud Billing license.

Field	Details
MilestoneType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The milestone type for the billing treatment item. Valid values are: • Date • Event This field is available in API version 63.0 and later with Revenue Cloud Billing license.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The name of the billing treatment item.
Percentage	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The percentage (such as 10% or 12.5%) to invoice from the order item. Used only when Type field has a value of Percentage.
ProcessingOrder	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** Required. The order in which billing schedules are created based on each billing treatment item. Lower numbers are evaluated first. For example, if your billing treatment has a billing treatment item that invoices at 25 percentage and a ProcessingOrder of 1, and another item that invoices at 75 percentage and a ProcessingOrder of 2, your first billing schedule will be for 25% of the order item's total amount, and your second billing schedule will be for 75% of the order item's total amount.
Sequencing	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The number used to start invoice numbers on invoices generated from this billing treatment item. Valid values are: • `Manual` • `None`
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The status of the billing treatment item. Valid values are: • `Active` • `Draft`– Draft billing treatment items aren't evaluated for creating billing schedules.
`Type`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. Specifies whether billing schedules created from this billing treatment item are based on a flat amount or a percentage of the order item's total amount. Valid values are: • `FlatAmount` • `Percentage` • `Remainder`

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

BillingTreatmentItemHistory on page 2873
History is available for tracked fields of the object.

BsgRelationship

Represents a relationship between billing schedule groups to support bundles where one parent billing schedule group has multiple child billing schedule groups. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
`AssociatedBsgId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the related billing schedule group. In a bundle relationship, this billing schedule group is the child. This field is a relationship field. **Relationship Name** AssociatedBsg **Refers To** BillingScheduleGroup
`AssociatedBsgPricing`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. This field describes how the related billing schedule group is priced relative to the primary billing schedule group. Valid values are: • `IncludedInBundlePrice` • `NotIncludedInBundlePrice`
`AssociatedBsgRole`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort

Field	Details
	Description Required. This field describes the role of the related billing schedule group in the relationship. Valid values are: • `AddOnComponent` • `BundleComponent` • `ClassificationComponent` • `SetComponent`
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a billing schedule group record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a billing schedule group relationship record. If this value is null, it's possible that the user only accessed the billing schedule group relationship record or a related list view (`LastReferencedDate`), but not viewed the billing schedule group relationship record itself.
`MainBsgId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the primary billing schedule group. In a bundle relationship, this billing schedule group is the parent. This field is a relationship field. **Relationship Name** MainBsg **Relationship Type** Master-detail **Refers To** BillingScheduleGroup (the master object)

Field	Details
MainBsgRole	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. This field describes the role of the primary billing schedule group in the relationship. Valid values are: • AddOn • Bundle • Set
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The auto-generated reference number for the billing schedule relationship.
ProductRelationshipTypeId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the relationship type between the main and associated billing schedule group. This field is a relationship field. **Relationship Name** ProductRelationshipType **Refers To** ProductRelationshipType

CaseServiceProcessExtension

Represents additional information for a case record based on the type of service process for which the case was raised. This object is available in API version 67.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Billing Admin, Billing Operations User, or Billing Customer Service User permission set to access this object.

Fields

Field	Details
`CaseId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The case record related to the invoice. **Relationship Name** Case **Relationship Type** Master-detail **Refers To** Case
`CaseServiceProcessExtensionNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The autogenerated number of the case.
`CustomServiceProcess`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies the name of the service process when the type of service process is `Custom`.
`IntakeMethod`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort, Update

Field	Details
	Description Specifies whether the case was raised internally within the org or by using the self-service Billing portal. Valid values are: • `Internal` • `External`
`ReferenceRecordId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The record ID associated with the case record such as an invoice record. This field is a polymorphic relationship field. **Relationship Name** CaseServiceProcessExtensionsByReference
`ServiceProcess`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies the type of service process that created the case. Valid values are: • `Extend Invoice Due Date` • `Invoice Charge Correction` • `Suspend Billing` • `Update Bill-To Contact` • `Other Billing Inquiries` • `Custom`
`ReferenceRecordId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The record ID associated with the case record such as an invoice record. This field is a polymorphic relationship field. **Relationship Name** CaseServiceProcessExtensionsByReference

Field	Details
`UsageType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies the name of the cloud or function that uses the CaseServiceProcessExtension object. Valid value is `Billing`.

Usage

This section covers a sample Apex class to support backward compatibility for cases created before the availability of the `CaseServiceProcessExtension` object. The class finds billing cases that don't yet have extension records, maps service process values from service catalog extended attributes for supported templates. This class also populates required extension fields such as service process, reference record ID, usage type, and intake method. For other billing queries where template entries aren't available in extended attributes, the class optionally accepts product IDs to identify and process those cases. The implementation runs as batch Apex for large data volumes and reports processing results in logs.

This example shows a sample Apex class. You can modify this class as per your requirements.

```
/**
 * Batchable Apex class to backfill CaseServiceProcessExtension records
 * for billing cases that were created in API version 66.0 and earlier.
 *
 * Identifies billing cases with no CaseServiceProcessExtension and populates the extension
 record.
 *
 * Additionally, accepts a set of Product IDs to identify billing cases and populates the
 extension record
 * for other billing inquiries.
 *
 * Usage:
 *   Set<Id> productIds = new Set<Id>{'01tXX0000000001', '01tXX0000000002'};
 *   Database.executeBatch(new BillingCaseServiceProcessExtensionBatch(productIds), 200);

 *
 */

CreditMemo

Represents a document that's used to reduce the amount that a buyer owes a seller under the terms of an earlier invoice. This object is available in API version 62.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`

Special Access Rules

You need the Credit Memo Operations User permission set to access this object.

Fields

Field	Details
`Balance`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The amount of the credit memo that's available for allocation.
`BillToContactId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** This field is inherited from the account's `Bill to Account` field. This field is a relationship field. **Relationship Name** BillToContact **Refers To** Contact
`BillingAccountId`	**Type** reference **Properties** Filter, Group, Sort, Update **Description** Required. The ID of the customer account associated with this credit memo. This field is a relationship field. **Relationship Name** BillingAccount **Refers To** Account
`Category`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies whether the credit memo is created due to writing off an invoice, converting negative invoice lines, or referencing an existing record. Valid values are:

Field	Details
	• `InvoiceWriteOff` • `Referenced` • `Standalone` This field is available in API version 64.0 and later.
`CorpCrcyCnvTotAmtWithTax`	**Type** double **Properties** Filter, Nillable, Sort **Description** The sum of the total amount with tax on the credit memo in corporate currency. Available in API version 63.0 and later.
`CorporateCurrencyCvsnDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date on which the credit memo amounts are converted to the corporate currency. Available in API version 63.0 and later.
`CorporateCurrencyCvsnRate`	**Type** double **Properties** Filter, Nillable, Sort **Description** The exchange rate that's used to convert credit memo amounts to the corporate currency. Available in API version 63.0 and later.
`CorporateCurrencyIsoCode`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The currency ISO code of the corporate currency. Available in API version 63.0 and later.
`CreationMode`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies whether the credit memo originated in Salesforce or an external system.

Field	Details
	Valid values are: • `External` • `Salesforce`
`CreditDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date when the credit memo was posted.
`CreditMemoNumber`	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The number of the credit memo.
`Description`	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** Additional details about the credit memo.
`DocumentNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The auto-generated reference number for the credit memo.
`EffectiveDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The effective date of the credit memo. If this field is empty, the credit date is used. For reporting purposes only; this field drives no other logic.
`ExternalReference`	**Type** string

Field	Details
	Properties Filter, Group, Nillable, Sort, Update **Description** An external system's ID for the credit memo.
ExternalReferenceDataSource	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The name of the external system that also contains the credit memo.
FuncCrcyCnvTotAmtWithTax	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The total amount with tax value in functional currency. Available in API version 66.0 and later.
FunctionalCurrencyCvsnDate	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The date on which the total amount with tax value is converted into functional currency. Available in API version 66.0 and later.
FunctionalCurrencyCvsnRate	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The exchange rate that's used to convert the total amount with tax value into functional currency. Available in API version 66.0 and later.
FunctionalCurrencyIsoCode	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The ISO code of the functional currency. Available in API version 66.0 and later.

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a credit memo record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a credit memo record. If this value is null, it's possible that the user only accessed the credit memo record or a related list view (LastReferencedDate), but not viewed the credit memo record itself.
LegalEntityAccountingPeriodId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity accounting period record that's related to the credit memo. This field is available in API version 65.0 and later. This field is a relationship field. **Relationship Name** LegalEntityAccountingPeriod **Refers To** LegalEntyAccountingPeriod
LegalEntityId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity record that's related to the credit memo. This field is available in API version 65.0 and later. This field is a relationship field. **Relationship Name** LegalEntity

Field	Details
	Refers To LegalEntity
`NetCreditsApplied`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total difference between the credit applied to and credit unapplied from the invoice. This field is a calculated field.
`OwnerId`	**Type** reference **Properties** Filter, Group, Sort, Update **Description** Required. The ID of the user who owns a credit memo record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
`ReasonCode`	**Type** picklist **Properties** Filter, Group, Nillable, Sort **Description** The reason code for the credit memo's category. For example, BD can be the reason code when the credit memo's category is `InvoiceWriteOff` and the reason for the invoice write-off is bad debt. This field is available in API version 64.0 and later.
`ReferenceEntityId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the record that this credit memo was generated from. For example, the order, order summary, or invoice. This field is a polymorphic relationship field.

Field	Details
	Relationship Name ReferenceEntity **Refers To** Invoice, Order
SettlementLevel	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies whether the credit memo amount was applied to an invoice or an invoice line.
SourceAction	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies which Salesforce API created the credit memo. Valid values are: • Invoice • NegativeInvoiceLineConversion • Standalone • VoidPostedInvoice • WriteOffPostedInvoice—Available in API version 64.0 and later.
Status	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort, Update **Description** Required. The status of the credit memo. Valid values are: • Canceled • Draft • Error • Pending • Posted • Void In Progress—Available in API version 64.0 and later. • Voided

Field	Details
TotalAdjustmentAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the `TotalAmount` field values for the credit memo’s adjustment lines. This field is a calculated field.
TotalAdjustmentAmountWithTax	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the credit memo’s adjustment line amounts, including tax. Available in API versions 62.0 and 63.0.
TotalAdjustmentTaxAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the credit memo’s adjustment line tax. Adjustment line balances are excluded. Available in API versions 62.0 and 63.0.
TotalAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the credit memo’s `TotalLineAmount` and `TotalAdjustmentAmount` field values. This field is a calculated field.
TotalAmountWithTax	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total credit memo amount, with tax included. This field is a calculated field.

Field	Details
`TotalChargeAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the `TotalAmount` field values for the credit memo’s charge lines. This field is a calculated field.
`TotalChargeAmountWithTax`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the credit memo’s charge line amounts, including tax. Available in API versions 62.0 and 63.0.
`TotalChargeTaxAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the credit memo’s charge tax amount. Available in API versions 62.0 and 63.0.
`TotalTaxAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the `TotalAmount` field values for the credit memo’s tax lines. This field is a calculated field.
`TotalTaxesCapturedAtHeader`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The total tax calculated at the transaction header level. Available in API version 66.0 and later.

CreditMemoAddressGroup

Represents the storage of the buyer's address information, which is used to determine the tax credit amount for a buyer when a credit memo is issued. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`

Special Access Rules

You need the Credit Memo Operations User permission set to access this object.

Fields

Field	Details
`Address`	**Type** address **Properties** Filter, Nillable **Description** The buyer's address.
`CreditMemoAddressGroupNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The auto-generated reference number for the credit memo address group.
`CreditMemoId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the credit memo associated with the address group. This field is a relationship field. **Relationship Name** CreditMemo

Field	Details
	Relationship Type Master-detail **Refers To** CreditMemo (the master object)
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a credit memo address group record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a credit memo address group record. If this value is null, it's possible that the user only accessed the credit memo address group record or a related list view (`LastReferencedDate`), but not viewed the credit memo address group record itself.

CreditMemoInvApplication

Represents information about the application of a credit memo to an invoice. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`

Special Access Rules

You need the Credit Memo Operations User permission set to access this object.

Fields

Field	Details
`Amount`	**Type** currency **Properties** Filter, Sort **Description** Required. The amount of the credit memo that was applied to or unapplied from the invoice.
`AppliedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when the credit memo was applied. If the credit memo invoice application's type is `Unapplied`, this value is inherited from the `Applied` date of the credit memo referenced in the `AssociatedLineId` field.
`AssociatedLineId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the original credit memo invoice application for a credit memo invoice application that represents an unapplied credit memo. This field is a relationship field. **Relationship Name** AssociatedLine **Refers To** CreditMemoInvApplication
`CreditMemoBalance`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The balance of a credit memo after it's applied or unapplied. This field is a snapshot of the credit memo's balance after the action. This field isn't updated after further changes to the credit memo balance.
`CreditMemoId`	**Type** reference

Field	Details
	Properties Filter, Group, Sort **Description** Required. The credit memo that was applied or unapplied. This field is a relationship field. **Relationship Name** CreditMemo **Refers To** CreditMemo
`CreditMemoInvoiceNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. An auto-generated number identifying the credit memo invoice application.
`Date`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when the credit memo amount was applied to the invoice.
`Description`	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** Additional details about the credit memo applied to an invoice.
`EffectiveDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The effective date of the application or unapplication of credit. You can provide this value when applying or unapplying the credit memo. This field is optional and provided only for reporting purposes. It doesn't affect the credit memo invoice application's other fields.

Field	Details
HasBeenUnapplied	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies whether this credit memo application has been unapplied from the target invoice. Valid values are: • NA • No • Yes
ImpactAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The net adjustment to the invoice's balance after a credit memo is applied or unapplied. If a credit memo was applied, this value is the negative version of the credit memo invoice application's Amount field. If a credit memo was unapplied, this value is the positive version of the credit memo invoice application's Amount field. This field is a calculated field.
InvoiceBalance	**Type** currency **Properties** Filter, Nillable, Sort **Description** The balance of the credit memo after a credit memo is applied or unapplied. This field is a snapshot of the credit memo's balance after the action. This field isn't updated after further changes to the credit memo balance.
InvoiceId	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The invoice to which the credit memo is applied. This field is a relationship field. **Relationship Name** Invoice

Field	Details
	Relationship Type Master-detail **Refers To** Invoice (the master object)
LegalEntityAccountingPeriodId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity accounting period record that's related to the credit memo invoice application. This field is available in API version 67.0 and later. This field is a relationship field. **Relationship Name** LegalEntityAccountingPeriod **Refers To** LegalEntyAccountingPeriod
LegalEntityId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity record that's related to the credit memo invoice application. This field is available in API version 67.0 and later. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity
Type	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. Specifies whether the credit memo line application was generated because of an apply action (application) or an unapply action (unapplication). Valid values are: • Applied • Unapplied

Field	Details
`UnappliedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this application was unapplied from the target invoice.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

CreditMemoInvApplicationFeed on page 2866
Feed tracking is available for the object.

CreditMemoInvApplicationHistory on page 2873
History is available for tracked fields of the object.

CreditMemoLine

Represents the product, service, adjustment, or tax line items included in a credit memo. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`

Special Access Rules

You need the Credit Memo Operations User permission set to access this object.

Fields

Field	Details
`AdjustmentAmount`	**Type** currency **Properties** Filter, Nillable, Sort, Update **Description** The amount of this credit memo line item if its type is Adjustment.

Field	Details
AdjustmentAmountWithTax	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the adjustment amount and the adjustment tax amount. Available in API versions 62.0 and 63.0.
AdjustmentTaxAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The amount of the tax related to the adjustment amount. Available in API versions 62.0 and 63.0.
Balance	**Type** currency **Properties** Filter, Nillable, Sort **Description** The amount of the credit memo line available for allocation.
BillingAddressId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the billing address related to this credit memo line. This field is a relationship field. **Relationship Name** BillingAddress **Refers To** CreditMemoAddressGroup
ChargeAmount	**Type** currency **Properties** Filter, Nillable, Sort, Update **Description** The amount of this credit memo line item if its type is Charge.

Field	Details
ChargeAmountWithTax	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the charge amount and the charge tax amount. Available in API versions 62.0 and 63.0.
ChargeTaxAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The amount of the tax related to the charge amount. Available in API versions 62.0 and 63.0.
CorpCurrencyCnvChargeAmt	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The amount of the credit memo line item if its type is `Charge` in corporate currency. Available in API version 63.0 and later.
CorpCurrencyCnvTotalTaxAmt	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The sum of the total amount with the tax on the credit memo line in corporate currency. Available in API version 63.0 and later.
CorporateCurrencyCvsnDate	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The date on which the credit memo line amounts are converted to the corporate currency. Available in API version 63.0 and later.
CorporateCurrencyCvsnRate	**Type** double

Field	Details
	Properties Filter, Nillable, Sort, Update **Description** The exchange rate that's used to convert the credit memo line amounts to the corporate currency. Available in API version 63.0 and later.
CorporateCurrencyIsoCode	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The currency ISO code of the corporate currency. Available in API version 63.0 and later.
CreditMemoId	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the parent credit memo. This field is a relationship field. **Relationship Name** CreditMemo **Relationship Type** Master-detail **Refers To** CreditMemo (the master object)
Description	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** Additional details about the credit memo line.
EndDate	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The description of the credit memo line.

Field	Details
FuncCrcyCnvTotalTaxAmount	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The total tax amount value in functional currency. Available in API version 66.0 and later.
FuncCurrencyCnvChargeAmt	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The charge amount value in functional currency. Available in API version 66.0 and later.
FunctionalCurrencyCvsnDate	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The date on which the credit memo line amounts are converted into functional currency. Available in API version 66.0 and later.
FunctionalCurrencyCvsnRate	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The exchange rate that's used to convert credit memo line amounts into functional currency. Available in API version 66.0 and later.
FunctionalCurrencyIsoCode	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The ISO code of the functional currency. Available in API version 66.0 and later.
LegalEntityAccountingPeriodId	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update

Field	Details
	Description The ID of the legal entity accounting period record of the credit memo line. This field is a relationship field. **Relationship Name** LegalEntityAccountingPeriod **Refers To** LegalEntyAccountingPeriod
LegalEntityId	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the legal entity record related to the credit memo line. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity
LineAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The amount of the credit memo line. This field is a calculated field.
Name	**Type** string **Properties** Filter, Group, idLookup, Sort, Update **Description** Required. The name of the credit memo line.
NetCreditsApplied	**Type** currency **Properties** Filter, Nillable, Sort

Field	Details
	Description The total amount applied to invoice lines from the credit memo. This amount is calculated by subtracting the total unapplied credit amount from the total applied credit amount. This field is a calculated field.
`Product2Id`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the product or service being credited in the credit memo line. This field is a relationship field. **Relationship Name** Product2 **Refers To** Product2
`ReferenceEntityItemId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The order product or invoice line corresponding to this credit memo line. This field is a polymorphic relationship field. **Relationship Name** ReferenceEntityItem **Refers To** InvoiceLine, OrderItem
`ReferenceEntityItemType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type of transaction that generated the credit memo line. Valid values are: • `Delivery Charge` • `Fee` • `Order Product`

Field	Details
ReferenceEntityItemTypeCode	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type of object that generated the credit memo line. Valid values are: • `Charge` • `Product`
ShipFromAddressId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The address from which the product in the credit memo line is shipped. Available in API version 64.0 and later. This field is a relationship field. **Relationship Name** ShipFromAddress **Refers To** CreditMemoAddressGroup
ShippingAddressId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the shipping address. This field is a relationship field. **Relationship Name** ShippingAddress **Refers To** CreditMemoAddressGroup
StartDate	**Type** date **Properties** Filter, Group, Nillable, Sort, Update

Field	Details
	Description The first date of the billing for the service for credit memo lines generated from a time-based service.
`Status`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The status of the credit memo line. This field is inherited from the credit memo.
`TaxAmount`	**Type** currency **Properties** Filter, Nillable, Sort, Update **Description** The total tax amount for the credit memo.
`TaxTreatmentId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the tax treatment record for the credit memo line. This field is a relationship field. **Relationship Name** TaxTreatment **Refers To** TaxTreatment

CreditMemoLineInvoiceLine

Represents a junction between a credit memo line and an invoice line. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Special Access Rules

You need the Credit Memo Operations User permission set to access this object.

Fields

Field	Details
Amount	**Type** currency **Properties** Filter, Sort **Description** Required. The amount that's been applied to or unapplied from the invoice line.
AppliedDateTime	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time when the credit memo line was applied to the invoice line.
CreditMemoLineBalance	**Type** currency **Properties** Filter, Nillable, Sort **Description** The balance of the credit memo line after it's applied to or unapplied from the invoice line.
CreditMemoLineId	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the credit memo line record that's applied to or unapplied from the invoice line. This field is a relationship field. **Relationship Name** CreditMemoLine **Refers To** CreditMemoLine
CreditMemoLineInvoiceLineNumber	**Type** string

Field	Details
	Properties Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. An auto-generated number identifying the credit memo line invoice line.
`Description`	**Type** textarea **Properties** Filter, Group, Nillable, Sort, Update **Description** Additional details about the credit memo line invoice line.
`EffectiveDateTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time when the credit memo line's application to or unapplication from the invoice line becomes effective.
`ImpactAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The credit memo line invoice line’s financial impact against the customer’s accounts receivable. If the credit memo line invoice line's type is `Applied`, the impact amount is the negative equivalent of the credit memo line invoice line's amount. Otherwise, the impact amount is equal to the credit memo line invoice line's amount. This field is a calculated field.
`InvoiceLineBalance`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The balance of the invoice line after the credit memo line was applied or unapplied.
`InvoiceLineId`	**Type** reference **Properties** Filter, Group, Sort

Field	Details
	Description Required. The ID of the invoice line record to which the credit memo line has been applied or unapplied. This field is a relationship field. **Relationship Name** InvoiceLine **Relationship Type** Master-detail **Refers To** InvoiceLine (the master object)
`LegalEntityAccountingPeriodId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the legal entity accounting period record related to the credit memo line invoice line. This field is a relationship field. **Relationship Name** LegalEntityAccountingPeriod **Refers To** LegalEntyAccountingPeriod
`LegalEntityId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the legal entity record related to the credit memo line invoice line. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity
`RelatedCrMemoLineInvcLineId`	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The ID of the related credit memo line invoice line record of the type `Applied` when the credit memo line invoice line's type is `Unapplied`. This field is a relationship field. **Relationship Name** RelatedCrMemoLineInvcLine **Refers To** CreditMemoLineInvoiceLine
`Type`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. Specifies whether the credit memo line has been applied to or unapplied from the invoice line. Valid values are: • `Applied` • `Unapplied`
`UnappliedDateTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time when the credit memo line was unapplied from the invoice line.
`UnappliedStatus`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. Specifies whether the credit memo line has been unapplied from the invoice line. Valid values are: • `NA` • `No` • `Yes`

CreditMemoLineTax

Represents tax information of a credit memo line of type `Tax`. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`

Special Access Rules

You need the Tax Admin permission set to access this object.

Fields

Field	Details
`BillingAddressId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The billing address of the parent credit memo line. This field is a relationship field. **Relationship Name** BillingAddress **Refers To** CreditMemoAddressGroup
`CalculationStatus`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** The status of the tax calculation. Valid values are: • `Complete` • `Error` • `None` The default value is `None`.

Field	Details
CorpCrcyCnvTaxAmount	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The total tax amount of the credit memo line tax in corporate currency. Available in API version 63.0 and later.
CorporateCurrencyCvsnDate	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The date on which the credit memo line tax amounts are converted to the corporate currency. Available in API version 63.0 and later.
CorporateCurrencyCvsnRate	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The exchange rate that's used to convert the credit memo line tax amounts to the corporate currency. Available in API version 63.0 and later.
CorporateCurrencyIsoCode	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The currency ISO code of the corporate currency. Available in API version 63.0 and later.
CreditMemoLineId	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the parent charge or adjustment credit memo line record that a credit memo line tax is related to. This field is a relationship field. **Relationship Name** CreditMemoLine

Field	Details
	Relationship Type Master-detail **Refers To** CreditMemoLine (the master object)
`CreditMemoLineTaxNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. An auto-generated number identifying a credit memo line tax.
`Description`	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** Additional details about the credit memo line tax.
`EndDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The end date of a credit memo line tax.
`FuncCrcyCnvTaxAmount`	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The tax amount value in functional currency. Available in API version 66.0 and later.
`FunctionalCurrencyCvsnDate`	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The date on which the tax amount value is converted into functional currency. Available in API version 66.0 and later.

Field	Details
FunctionalCurrencyCvsnRate	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The exchange rate that's used to convert the tax amount value into functional currency. Available in API version 66.0 and later.
FunctionalCurrencyIsoCode	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The ISO code of the functional currency. Available in API version 66.0 and later.
LegalEntityAccountingPeriodId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the legal entity accounting period record that's related to a credit memo line tax. This field is a relationship field. **Relationship Name** LegalEntityAccountingPeriod **Refers To** LegalEntyAccountingPeriod
LegalEntityId	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the legal entity record that's related to a credit memo line tax. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity
Product2Id	**Type** reference

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The product or service being credited in the parent credit memo line. Available in API version 62.0 only. This field is a relationship field. **Relationship Name** Product2 **Refers To** Product2
`ReferenceEntityItemId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The invoice line tax corresponding to a credit memo line tax. This field is a relationship field. **Relationship Name** ReferenceEntityItem **Refers To** InvoiceLineTax
`ShipFromAddressId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ship from address specified in the parent credit memo line. Available in API version 64.0 and later. This field is a relationship field. **Relationship Name** ShipFromAddress **Refers To** CreditMemoAddressGroup
`ShippingAddressId`	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The shipping address of the parent credit memo line. This field is a relationship field. **Relationship Name** ShippingAddress **Refers To** CreditMemoAddressGroup
`StartDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The start date of a credit memo line tax.
`TaxAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total amount of a credit memo line tax.
`TaxCode`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The code that's used to calculate the tax rate for the parent credit memo line.
`TaxDocumentNumber`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The document number that's used to calculate the tax rate for the parent credit memo line.
`TaxEffectiveDate`	**Type** date **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The date used to calculate the tax amount.
TaxName	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The user-defined name for a credit memo line tax.
TaxRate	**Type** percent **Properties** Filter, Nillable, Sort **Description** The percentage that's used to calculate tax.
TaxTransactionNumber	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The number of the transaction in the external tax engine that calculated tax for the parent credit memo line.
TaxTreatmentId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the tax treatment record that's related to a credit memo line tax. This field is a relationship field. **Relationship Name** TaxTreatment **Refers To** TaxTreatment

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

CreditMemoLineTaxFeed on page 2866
Feed tracking is available for the object.

CreditMemoLineTaxHistory on page 2873
History is available for tracked fields of the object.

DebitMemo

Represents the document used to charge an additional amount to a buyer by a seller. An invoice is generated for the debit memo in the next invoice run. This object is available in API version 65.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

You need Revenue Cloud Billing license and one of these permission sets to access this object.

- Billing Admin permission set
- Billing Operations User permission set
- Payments Admin permission set
- Payments Operation User permission set
- Credit Memo Operations User permission set

Fields

Field	Details
`AccountId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The account that's related to the debit memo record. This field is a relationship field. **Relationship Name** Account **Refers To** Account
`CorpCrcyCnvTotChargeAmt`	**Type** double **Properties** Filter, Nillable, Sort, Update

Field	Details
	Description The total charge amount of the debit memo in corporate currency.
CorporateCurrencyCvsnDate	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The exchange date that's used to convert the debit memo amounts into corporate currency.
CorporateCurrencyCvsnRate	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The exchange rate that's used to convert the debit memo amounts into corporate currency.
CorporateCurrencyIsoCode	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The currency ISO code of the corporate currency.
Description	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The description of the debit memo.
DocumentNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** An autogenerated number assigned to the debit memo record.
FuncCrcyCnvTotChargeAmt	**Type** double **Properties** Filter, Nillable, Sort, Update

Field	Details
	Description The total charge amount value in functional currency. Available in API version 66.0 and later.
`FunctionalCurrencyCvsnDate`	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The exchange date that's used to convert the total charge amount value into functional currency. Available in API version 66.0 and later.
`FunctionalCurrencyCvsnRate`	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The exchange rate that's used to convert the total charge amount value into functional currency. Available in API version 66.0 and later.
`FunctionalCurrencyIsoCode`	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The ISO code of the functional currency. Available in API version 66.0 and later.
`InvoiceGenerationStatus`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of invoice generation for the debit memo. Valid values are: • `Draft Invoice Generated` • `None` • `Posted Invoice Generated` • `Processing` • `Ready for Invoice Generation` • `Not Applicable`—Available in API version 66.0 and later.

Field	Details
`InvoiceMatchingRefKeyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates the product or Asset ID. This key, combined with the account, currency, and legal entity, is used to find a matching invoice. The invoice lines converted from debit memo lines are then added to this matched invoice. This field is a polymorphic relationship field. **Relationship Name** InvoiceMatchingRefKey **Refers To** Asset, Product2
`InvoiceMatchingRefName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates the product's name. This text, combined with the account, currency, and legal entity, is used to find a matching invoice. The invoice lines converted from debit memo lines are then added to this matched invoice.
`IsManuallyProcessed`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the debit memo lines of the debit memo are converted to invoice lines manually (`true`) or not (`false`). The default value is `false`.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a debit memo address group record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime

Field	Details
	Properties Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a debit memo address record. If this value is null, it's possible that the user only accessed the debit memo address record or a related list view (`LastReferencedDate`), but not viewed the debit memo address record itself.
`LegalEntityId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity record that's related to the debit memo. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity
`NextBillingDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date indicates when the next billing period begins for the debit memo. This date is used to determine when invoices are created for the debit memos. When the invoice scheduler or API evaluates debit memos to generate invoices, those with a next billing date on or before the user-specified target date are included in the invoice batch run.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of this object. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User

Field	Details
PostedDate	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date when the debit memo is posted.
ReasonCode	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Specifies a dynamic picklist of reasons for generating debit memos.
ReferenceRecord	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The record ID associated with the debit memo record. The record ID is a credit memo record. Available in API version 66.0 and later. This field is a polymorphic relationship field. **Relationship Name** InvoiceMatchingRefKey **Refers To** Credit Memo
Status	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of the debit memo. Valid values are: • Canceled • Draft • Posted • Void • Pending—Available in API version 66.0 and later. • Error—Available in API version 66.0 and later.

Field	Details
TotalAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the debit memo's TotalLineAmount and TotalAdjustmentAmount field values. Available in API version 66.0 and later. This field is a calculated field.
TotalChargeAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the charge amount field values of the debit memo lines. This field is a calculated field.
TotalTaxAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the TotalAmount field values for the debit memo's tax lines. Available in API version 66.0 and later. This field is a calculated field.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

DebitMemoFeed on page 2866
Feed tracking is available for the object.

DebitMemoHistory on page 2873
History is available for tracked fields of the object.

DebitMemoOwnerSharingRule on page 2875
Sharing rules are available for the object.

DebitMemoShare on page 2877
Sharing is available for the object.

DebitMemoAddress

Represents the buyer's address information, which is used to determine the tax amount for a buyer when a debit memo is issued. This object is available in API version 65.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need Revenue Cloud Billing license and one of these permission sets to access this object.

- Billing Admin permission set
- Billing Operations User permission set
- Payments Admin permission set
- Payments Operation User permission set
- Credit Memo Operations User permission set

Fields

Field	Details
`Address`	**Type** address **Properties** Filter **Description** The billing or shipping address of the debit memo.
`DebitMemoAddressNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The auto-generated reference number for the debit memo address.
`DebitMemoId`	**Type** reference **Properties** Create, Filter, Group, Sort

Field	Details
	Description The ID of the debit memo associated with the address. This field is a relationship field. **Relationship Name** DebitMemo **Relationship Type** Master-detail **Refers To** DebitMemo (the master object)
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a debit memo address record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a debit memo address record. If this value is null, it's possible that the user only accessed the debit memo address record or a related list view (`LastReferencedDate`), but not viewed the debit memo address record itself.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

DebitMemoAddressHistory on page 2873
History is available for tracked fields of the object.

DebitMemoLine

Represents the additional charge amount that the buyer must pay for the product, service, or debit memo line tax that's related to the debit memo. This object is available in API version 65.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

You need Revenue Cloud Billing license and one of these permission sets to access this object.

- Billing Admin permission set
- Billing Operations User permission set
- Payments Admin permission set
- Payments Operation User permission set
- Credit Memo Operations User permission set

Fields

Field	Details
`BillingAddressId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The billing address record that's related to the debit memo line. This field is a relationship field. **Relationship Name** BillingAddress **Refers To** DebitMemoAddress
`ChargeAmount`	**Type** currency **Properties** Create, Filter, Sort, Update **Description** The amount of the debit memo line item.
`CorpCurrencyCnvChargeAmt`	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The charge amount of the debit memo line in corporate currency.

Field	Details
CorporateCurrencyCvsnDate	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The date on which the debit memo line amounts are converted into corporate currency.
CorporateCurrencyCvsnRate	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The exchange rate that's used to convert debit memo line amounts into corporate currency.
CorporateCurrencyIsoCode	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The currency ISO code of the corporate currency.
DebitMemoId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The parent debit memo record that's related to the debit memo line record. This field is a relationship field. **Relationship Name** DebitMemo **Relationship Type** Master-detail **Refers To** DebitMemo (the master object)
Description	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The description of the debit memo line.

Field	Details
EndDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The end date of the debit memo line that determines which billing cycle it must be associated with.
FuncCrcyCnvTotalTaxAmt	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The total tax amount value in functional currency. Available in API version 66.0 and later.
FuncCrcyCnvChargeAmount	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The charge amount value in functional currency. Available in API version 66.0 and later.
FunctionalCurrencyCvsnDate	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The date on which the debit memo line amounts is converted into functional currency. Available in API version 66.0 and later.
FunctionalCurrencyCvsnRate	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The exchange rate that's used to convert the debit memo line amounts into functional currency. Available in API version 66.0 and later.
FunctionalCurrencyIsoCode	**Type** string **Properties** Filter, Group, Nillable, Sort, Update

Field	Details
	Description The ISO code of the functional currency. Available in API version 66.0 and later.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a debit memo address record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a debit memo address record. If this value is null, it's possible that the user only accessed the debit memo address record or a related list view (LastReferencedDate), but not viewed the debit memo address record itself.
LegalEntityAccountingPeriodId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity accounting period record that's related to the debit memo line. This field is a relationship field. **Relationship Name** LegalEntityAccountingPeriod **Refers To** LegalEntyAccountingPeriod
LegalEntityId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity record that's related to the debit memo line. This field is a relationship field. **Relationship Name** LegalEntity

Field	Details
	Refers To LegalEntity
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** An auto-generated name assigned to the debit memo line.
`Product2Id`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the product or service being debited in the debit memo line. This field is a relationship field. **Relationship Name** Product2 **Refers To** Product2
`ReferenceRecordId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The record ID associated with the debit memo line record. The record ID is an asset, invoice line, contract, or refund record. This field is a polymorphic relationship field. **Relationship Name** ReferenceRecord **Refers To** Asset, Contract, InvoiceLine, Refund, Credit Memo Line
`ShippingAddressId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The shipping address record that’s related to the debit memo line.

Field	Details
	This field is a relationship field. **Relationship Name** ShippingAddress **Refers To** DebitMemoAddress
`StartDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The start date of the debit memo line that determines which billing cycle it must be associated with.
`TaxTreatmentId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the tax treatment record that's related to the debit memo line. This field is a relationship field. **Relationship Name** TaxTreatment **Refers To** TaxTreatment

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

DebitMemoLineFeed on page 2866
Feed tracking is available for the object.

DebitMemoLineHistory on page 2873
History is available for tracked fields of the object.

DebitMemoLineTax

Represents the tax information for a debit memo line. This object is available in API version 66.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`

Special Access Rules

You need Revenue Cloud Billing license and the Tax Admin permission set to access this object.

Fields

Field	Details
`BillingAddressId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The billing address specified in the parent debit memo line. This field is a relationship field. **Relationship Name** BillingAddress **Refers To** DebitMemoAddress
`CurrencyIsoCode`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Required. The currency ISO code of the corporate currency.
`DebitMemoLineId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The parent debit memo line that the debit memo tax line is related to. This field is a relationship field. **Relationship Name** DebitMemoLine **Relationship Type** Master-detail **Refers To** DebitMemoLine (the master object)

Field	Details
DebitMemoLineTaxNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. An auto-generated number that identifies a debit memo line tax.
Description	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The description of the debit memo line tax.
EndDate	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The end date of the debit memo line tax that determines which billing cycle it's associated with.
JurisdictionTaxCode	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The code of the jurisdiction that's used to calculate the tax rate for the parent debit memo line.
JurisdictionTaxName	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The user-defined name for the debit memo line tax.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The timestamp when the current user last accessed a debit memo line tax record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a debit memo line tax record. If this value is null, it's possible that the user only accessed the debit memo line tax record or a related list view (`LastReferencedDate`), but not viewed the debit memo line tax record itself.
`LegalEntityAccountingPeriodId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The legal entity accounting period record associated with the debit memo line. This field is a relationship field. **Relationship Name** LegalEntityAccountingPeriod **Refers To** LegalEntyAccountingPeriod
`LegalEntityId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The legal entity record associated with the debit memo line. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity
`ShipFromAddressId`	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The shipping address specified in the parent debit memo line. This field is a relationship field. **Relationship Name** ShipFromAddress **Refers To** DebitMemoAddress
StartDate	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The start date of the debit memo line tax that determines which billing cycle it's associated with.
TaxAmount	**Type** currency **Properties** Filter, Sort **Description** Required. The total amount of the debit memo line tax.
TaxRate	**Type** percent **Properties** Filter, Nillable, Sort **Description** The percentage that's used to calculate tax amount based on the charge amount.
TaxTransactionNumber	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The transaction number in the external tax engine that calculated the tax for the parent debit memo line.

GeneralLedgerAccount

Represents information about the accounting codes, types, and names that are used to store and organize financial transactions. This object is available in API version 63.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need Revenue Cloud Billing license and the Accounts Receivables Admin permission set to access this object.

Fields

Field	Details
`AccountingCode`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The code that's used to organize information about the general ledger account.
`AccountingName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The user-specified name for the general ledger account.
`AccountingType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The accounting type for the general ledger account.
`Description`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Additional details about the general ledger account.

Field	Details
FinancialStatement	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The financial statement that's created by using the information from the general ledger account.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, and `LastReferenceDate` is not null, the user accessed this record or list view indirectly.
LegalEntityId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity that's related to the general ledger account. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity
Name	**Type** string **Properties** Filter, Group, idLookup, Sort

Field	Details
	Description An auto-generated name identifying the general ledger account, which is a combination of the accounting code and the account name.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of this object or ID of the creator of this object. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
`Type`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies the accounting type for the general ledger account. This field is available in API version 65.0 and later. Valid values are: • `Asset` • `Liability` • `Equity` • `Revenue` • `Expense` • `Others`

GeneralLedgerAcctAsgntRule

Represents information about the rule based on which general ledger accounts are assigned to transaction journals that are created for billing transactions. This object is available in API version 63.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need Revenue Cloud Billing license and the Accounts Receivables Admin permission set to access this object.

Fields

Field	Details
CreditGeneralLedgerAccountId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The general ledger account for a credit transaction that's related to the general ledger account assignment rule. This field is a relationship field. **Relationship Name** CreditGeneralLedgerAccount **Refers To** GeneralLedgerAccount
CurrencyIsoCode	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The currency code of the general ledger account assignment rule for Salesforce orgs with multicurrency enabled. Valid values are: • AUD—Australian Dollar • EUR—Euro • SGD—Singapore Dollar • USD—U.S. Dollar The default value is USD.
DebitGeneralLedgerAccountId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The general ledger account for a debit transaction that's related to the general ledger account assignment rule. This field is a relationship field.

Field	Details
	Relationship Name DebitGeneralLedgerAccount **Refers To** GeneralLedgerAccount
FilterCriteria	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The filter criteria for the general ledger account assignment rule. Valid values are: • All • Any • Custom
FilterLogic	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The filter logic for the general ledger account assignment rule when the filter criteria is Custom. Transaction journals are created for the transactions of the selected type that meet the defined filter logic.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, and LastReferenceDate is not null, the user accessed this record or list view indirectly.

Field	Details
LegalEntityId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity that's related to the general ledger account assignment rule. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** A user-defined name for the general ledger account assignment rule.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the general ledger account assignment rule record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
Priority	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The priority of the general ledger account assignment rule when there are multiple general ledger account assignment rules defined for a transaction type.
Status	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of the general ledger account assignment rule. Valid values are: • `Active` • `Inactive`
`TransactionAmountField`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The amount field on the transaction type that's used to record the credit or debit amount in the transaction journals that are generated for that specific transaction type. This field is available in API version 64.0 and later.
`TransactionType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The transaction type that's related to the general ledger account assignment rule. Valid values are: • `CreditMemo` • `CreditMemoInvApplication` • `CreditMemoLine` • `CreditMemoLineInvoiceLine` • `CreditMemoLineTax` • `DebitMemoLine`—Available in API version 65.0 and later. • `Invoice` • `InvoiceLine` • `InvoiceLineTax` • `Payment`—Available in API version 64.0 and later. • `PaymentLineInvoice`—Available in API version 64.0 and later. • `PaymentLineInvoiceLine`—Available in API version 64.0 and later. • `Refund`—Available in API version 64.0 and later. • `RefundLinePayment`—Available in API version 64.0 and later.

GeneralLdgrAcctPrdSummary

Represents a junction between a general ledger account and a legal entity accounting period. Stores information about the total credit amount, total debit amount, opening balance, and closing balance of a general ledger account for a specific legal entity accounting period. This object is available in API version 65.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need Revenue Cloud Billing license and the Accounts Receivables Admin permission set to access this object.

Fields

Field	Details
`ClosingBalanceAmount`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The closing balance amount for a general ledger accounting period summary is calculated based on the general ledger account's type. For asset and expense type general ledger accounts, it's the opening balance amount plus total debit amount minus total credit amount. For liability, equity, and revenue type general ledger accounts, it's the opening balance amount plus total credit amount minus total debit amount.
`GeneralLedgerAccountId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The general ledger account that's related to the general ledger accounting period summary. This field is a relationship field. **Relationship Name** GeneralLedgerAccount **Relationship Type** Master-detail **Refers To** GeneralLedgerAccount (the master object)

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed general ledger accounting period summary record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed general ledger accounting period summary record or list view. If this value is null, and `LastReferenceDate` is not null, the user accessed this record or list view indirectly.
LegalEntityAccountingPeriodId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The legal entity accounting period that's related to the general ledger account. This field is a relationship field. **Relationship Name** LegalEntityAccountingPeriod **Refers To** LegalEntyAccountingPeriod
OpeningBalanceAmount	**Type** currency **Properties** Create, Filter, Sort, Update **Description** The opening balance is the same as the closing balance of the previous general ledger account period summary.
TotalCreditAmount	**Type** currency **Properties** Create, Filter, Sort, Update

Field	Details
	Description The sum of the credit fields from all transaction journals of the general ledger account for a specific legal entity accounting period.
`TotalDebitAmount`	**Type** currency **Properties** Create, Filter, Sort, Update **Description** The sum of the debit fields from all transaction journals of the general ledger account for a specific legal entity accounting period.

GeneralLedgerJrnlEntryRule

Represents information about the transaction journal entry rule, based on which transaction journals are created for the selected credit and debit general ledger accounts, transaction amount field, and percentage. This object is available in API version 65.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need Revenue Cloud Billing license and the Accounts Receivables Admin permission set to access this object.

Fields

Field	Details
`CreditGeneralLedgerAccountId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The general ledger account for a credit transaction. This field is a relationship field. **Relationship Name** CreditGeneralLedgerAccount

Field	Details
	Refers To GeneralLedgerAccount
DebitGeneralLedgerAccountId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The general ledger account for a debit transaction. This field is a relationship field. **Relationship Name** DebitGeneralLedgerAccount **Refers To** GeneralLedgerAccount
GeneralLedgerAcctAsgntRuleId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The general ledger account assignment rule that's related to the general ledger journal entry rule. This field is a relationship field. **Relationship Name** GeneralLedgerAcctAsgntRule **Relationship Type** Master-detail **Refers To** GeneralLedgerAcctAsgntRule (the master object)
Percentage	**Type** percent **Properties** Create, Filter, Sort, Update **Description** The percentage of the amount field value that's used to record the credit or debit amount in the transaction journals generated for the general ledger journal entry rule.
TransactionAmountField	**Type** string

Field	Details
	Properties Create, Filter, Group, Sort, Update **Description** The amount field on the transaction type that's used to record the credit or debit amount in the transaction journals generated for that specific transaction type.

InvBatchDraftToPostedRun

Represents information about the batch job that posts all invoices with the status as `Draft` that are generated by the invoice batch run associated with the billing schedule. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Special Access Rules

You need the Billing Operations User permission set to access this object.

Fields

Field	Details
`BatchJobId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The batch management job that's used to track the progress of the invoice batch run. This field is available in API version 67.0 and later. This field is a relationship field. **Relationship Name** BatchJob **Refers To** BatchJob
`Comments`	**Type** textarea

Field	Details
	Properties Filter, Nillable, Sort, Update **Description** Additional notes or comments for the invoice batch draft to posted run record.
CompletionDateTime	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The completion date and time of this invoice batch draft to posted run process.
CreditApplicationStatus	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The status of a credit application to the invoices that are posted by the invoice batch draft to posted run process. Valid values are: • Completed • Failed • NotApplicable
InvBatchDraftToPostedRunNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The auto-generated number of the invoice batch draft to posted run record.
InvoiceBatchRunId	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the invoice batch run record associated with the invoice batch draft to posted run record. This field is a relationship field. **Relationship Name** InvoiceBatchRun

Field	Details
	Relationship Type Master-detail **Refers To** InvoiceBatchRun (the master object)
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed an invoice batch draft to posted run record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed an invoice batch draft to posted run record. If this value is null, it's possible that the user only accessed the invoice batch draft to posted run record or a related list view (`LastReferencedDate`), but not viewed the invoice batch draft to posted run record itself.
`StartDateTime`	**Type** dateTime **Properties** Filter, Sort **Description** Required. The start date and time of the invoice batch draft to posted run process.
`Status`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Required. The status of the invoice batch draft to posted run record. Valid values are: • `Completed` • `CompletedWithErrors` • `Failed` • `Started`

Field	Details
	The default value is `Started`.
`TotalDraftInvoicesSelected`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of invoices that are selected to be processed by the invoice batch draft to posted run process.
`TotalInvoiceAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total amount of all the invoices posted by the invoice batch draft to posted run process.
`TotalInvoicesFailed`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of invoices that the invoice batch draft to posted run process failed to post.
`TotalPostedInvoices`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of invoices posted by the invoice batch draft to posted run process.

Invoice

Represents information about a financial document describing the total amount a buyer must pay for provided products or services. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Special Access Rules

You need the Billing Operations User permission set to access this object.

Fields

Field	Details
`Balance`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The outstanding balance of an invoice. The balance is equal to the invoice's total amount with tax, excluding payments and adjustments.
`BalanceValue`	**Type** double **Properties** Filter, Nillable, Sort **Description** The balance value is derived from an existing balance field in an invoice. Available in API version 65.0 and later. This field is a calculated field.
`BillToContactId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The bill to contact ID of the account that's related to an invoice. This field is a relationship field. **Relationship Name** BillToContact **Refers To** Contact
`BillingAccountId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Required. The ID of the customer account related to an invoice.

Field	Details
	This field is a relationship field. **Relationship Name** BillingAccount **Refers To** Account
`BillingArrangementId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the billing arrangement record used to generate the invoice. Available in API version 66.0 and later. This field is a relationship field. **Relationship Name** BilllingArrangement **Refers To** BilllingArrangement
`BillingAccountId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The billing account for which the invoice is generated. Available in API version 66.0 and later. This field is a relationship field. **Relationship Name** BillingAccount **Refers To** BillingAccount
`BillingArrangementVerNumber`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The version number of the billing arrangement record that's used to generate the invoice. Available in API version 66.0 and later. This field is an autogenerated field.

Field	Details
CorrelationIdentifier	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** A unique identifier that’s used to associate and track invoices that are generated based on the same billing arrangement. Available in API version 66.0 and later. This field is an autogenerated field.
CorpCrcyCnvTotAmtWithTax	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The sum of the total amount with tax on the related invoice lines in corporate currency. Available in API version 63.0 and later.
CorporateCurrencyCvsnDate	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The date on which the invoice’s total amount with tax was converted to the corporate currency. Available in API version 63.0 and later.
CorporateCurrencyCvsnRate	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The exchange rate that's used to convert invoice’s total amount with tax to the corporate currency. Available in API version 63.0 and later.
CorporateCurrencyIsoCode	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The currency ISO code of the corporate currency. Available in API version 63.0 and later.
DaysInvoiceOpen	**Type** int

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The number of days from the day an invoice was created to the day it was paid. This field is a calculated field.
DaysInvoiceOverdue	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of days since the date when the payment for an invoice was due. This field is a calculated field.
Description	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Additional details about the invoice.
DocumentNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. An auto-generated number identifying an invoice.
DueDate	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** Required. The date by when the customer must pay an invoice.
FullSettlementDate	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date when the customer has paid an invoice in full.

Field	Details
`FuncCrcyCnvTotAmtWithTax`	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The functional currency converted to total amount with tax based on the dated exchange rate. Available in API version 66.0 and later.
`FunctionalCurrencyCvsnDate`	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The date at which the exchange rate is used for functional currency conversions. Available in API version 66.0 and later.
`FunctionalCurrencyCvsnRate`	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The exchange rate that's used for functional currency conversions. Available in API version 66.0 and later.
`FunctionalCurrencyIsoCode`	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The ISO code of the functional currency. Available in API version 66.0 and later.
`InvBatchDraftToPostedRunId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the invoice batch to posted run record that generated a posted invoice from a draft invoice. This field is a relationship field. **Relationship Name** InvBatchDraftToPostedRun

Field	Details
	Refers To InvBatchDraftToPostedRun
`InvoiceBatchRunId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the invoice batch run record that generated an invoice. This field is a relationship field. **Relationship Name** InvoiceBatchRun **Refers To** InvoiceBatchRun
`InvoiceDate`	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** Required. The date when an invoice was posted. The payment term's net is added to this date to calculate the invoice's due date. For example, an invoice with an invoice date of 04/01 and the related payment term's period as 30 days has a due date of 05/01.
`InvoiceLockedDateTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time at which an invoice is locked.
`InvoiceNumber`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Required. The user-specified reference number for the invoice.
`IsBillingScheduleGroupSkipped`	**Type** boolean

Field	Details
	Properties Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the invoice is generated from a billing transaction directly and if the billing schedule group wasn't created for the transaction (`true`), or if the invoice is generated from the billing schedule group that was created for the transaction (`false`). The default value is `false`. Available in API version 63.0 and later.
`IsInvoiceLocked`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort, Update **Description** Required. Indicates whether an invoice is locked for editing or not (`true`) or not (`false`). The default value is `false`.
`LastEmailDispatchStatus`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Indicates the dispatch status of the last email that was sent for the invoice. Available in API version 65.0 and later. Valid values are: • `Failed` • `Sent With Invoice Document` • `Sent Without Invoice Document`
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed an invoice record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The timestamp when the current user last viewed an invoice record. If this value is null, it's possible that the user only accessed the invoice record or a related list view (`LastReferencedDate`), but not viewed the invoice record itself.
`LegalEntityAccountingPeriodId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The legal entity accounting period record that's related to the invoice. Available in API version 65.0 and later. This field is a relationship field. **Relationship Name** LegalEntityAccountingPeriod **Refers To** LegalEntyAccountingPeriod
`LegalEntityId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The legal entity used in this invoice. Available in API version 65.0 and later. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity
`NetCreditsApplied`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The net credits applied to an invoice. This amount is calculated by subtracting the sum of all the unapplied lines from the sum of all the applied lines. This field is a calculated field.
`NetPaymentsApplied`	**Type** currency

Field	Details
	Properties Filter, Nillable, Sort **Description** The net payments applied to an invoice. This field is visible from API version 62.0 but can only be used from API version 64.0 and later with the Revenue Cloud Billing license. This field is a calculated field.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. The ID of the user who owns an Invoice record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
`PaymentExclusionReason`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The reason for skipping the creation of payment schedules and payment schedule items for the invoice. Available in API version 64.0 and later with the Revenue Cloud Billing license.
PaymentScheduleId	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the payment schedule record that's related to the invoice. Available in API version 67.0 and later. This field is a relationship field. **Relationship Name** PaymentSchedule **Refers To** PaymentSchedule

Field	Details
PaymentTermId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The payment term used for an invoice. This field is a relationship field. **Relationship Name** PaymentTerm **Refers To** PaymentTerm
PostedDate	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date when an invoice was posted.
ReferenceEntityId	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the Debit Memo, Credit Memo, or Order record that created an invoice. This field is a polymorphic relationship field. **Relationship Name** ReferenceEntity **Refers To** DebitMemo, CreditMemo, Order
SavedPaymentMethodId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the Saved Payment Method record that's used for the invoice. Available in API version 64.0 and later with the Revenue Cloud Billing license. This field is a relationship field. **Relationship Name** SavedPaymentMethod

Field	Details
	Refers To SavedPaymentMethod
`SequencePolicyId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The sequence policy associated with the invoice. Available in API version 65.0 and later. This field is a relationship field. **Relationship Name** SequencePolicy **Refers To** SequencePolicy
`SettlementLevel`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The level at which the credit was applied. Valid values are: • `Invoice` • `InvoiceLine`
`SettlementStatus`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The status of an invoice's payment. Valid values are: • `Not Applicable` • `Not Settled` • `Partially Settled` • `Settled`
`ShouldExcludePayment`	**Type** boolean

Field	Details
	Properties Defaulted on create, Filter, Group, Sort **Description** Indicates whether to skip creating payment schedules and payment schedule items for the invoice (`true`). Available in API version 64.0 and later with the Revenue Cloud Billing license. The default value is `false`.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The status of an invoice. Valid values are: • `Canceled`— Indicates that the invoice was generated and later canceled. • `Draft`— Indicates that the invoice is a draft. • `Draft In Progress`— Indicates that the draft invoice is in progress. • `Error`— Indicates that an error occurred when processing the invoice. • `Pending`— Indicates that the invoice is being processed. • `Posted`— Indicates that the invoice has been generated and sent to the customer. • `Posting In Progress`—Indicates that the invoice posting is in progress. • `Void In Progress`—Indicates that the invoice is pending a status change. • `Voided`—The invoice's status after the API successfully voids the invoice.
`TotalAdjustmentAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the invoice's adjustment line amounts. This field is a calculated field.
`TotalAdjustmentAmountWithTax`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the invoice's adjustment line amounts, including tax.

Field	Details
TotalAdjustmentTaxAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total amount of tax applied to the invoice line’s adjustment lines.
TotalAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the total amount on the invoice’s lines. This field is a calculated field.
TotalAmountWithTax	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the total amount with tax on the invoice’s lines. This field is a calculated field.
TotalChargeAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the amount fields on the invoice’s charge-type invoice lines. This field is a calculated field.
TotalChargeAmountWithTax	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the amount fields on the invoice’s charge-type invoice lines, including tax.
TotalChargeTaxAmount	**Type** currency

Field	Details
	Properties Filter, Nillable, Sort **Description** The total amount of tax applied to the invoice's charge lines.
`TotalConvertedNegAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of all negative invoice lines that were converted to a credit memo. For example, if one negative invoice line was for -$10 and one was for -$15, the total amount that's converted to a credit memo is -$25. This field is a calculated field.
`TotalTaxAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the tax amount on the invoice lines. This field is a calculated field.
TotalTaxesCapturedAtHeader	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total tax amount for the invoice, captured at the header level by the tax engine. Available in API version 66.0 and later.
`UniqueIdentifier`	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** The unique identifier of an externally ingested invoice that's used to ensure that duplicate invoices aren't inserted. Available in API version 63.0 and later.
`WriteOffStatus`	**Type** picklist

Field	Details
	Properties Filter, Group, Nillable, Restricted picklist, Sort **Description** The status of the invoice write-off request. This field is unique within your organization. Valid values are: • `Completed` • `Failed` • `InProgress` Available in API version 64.0 and later. This field is available in API version 64.0 and later with the Revenue Cloud Billing license.
`WriteOffTotalChargeAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total charge amount of the invoice that's written off. This field is unique within your organization. This field is available in API version 64.0 and later with the Revenue Cloud Billing license.
`WriteOffTotalTaxAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total tax amount of the invoice that's written off. This field is unique within your organization. This field is available in API version 64.0 and later with the Revenue Cloud Billing license.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

InvoiceFeed on page 2866
Feed tracking is available for the object.

InvoiceHistory on page 2873
History is available for tracked fields of the object.

InvoiceShare on page 2877
Sharing is available for the object.

InvoiceAddressGroup

Represents the storage of the buyer's address information. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`

Special Access Rules

You need the Billing Operations User permission set to access this object.

Fields

Field	Details
`Address`	**Type** address **Properties** Filter, Nillable **Description** The buyer's address. See Compound Field Considerations and Limitations for details on geolocation compound fields.
`InvoiceAddressGroupNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The auto-generated reference number for the invoice address group.
`InvoiceId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the invoice associated with the address group. This field is a relationship field. **Relationship Name** Invoice

Field	Details
	Relationship Type Master-detail **Refers To** Invoice (the master object)

InvoiceBatchRun

Represents a batch processing job in Billing. During an invoice batch run, all billing schedules that meet the specified criteria are processed, resulting in the generation of invoices. This object is available in API version 62.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
`BatchJobId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The batch management job that's used to track the progress of the invoice batch run. This field is available in API version 67.0 and later. This field is a relationship field. **Relationship Name** BatchJob **Refers To** BatchJob
`BillingBatchSchedulerId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the related billing batch scheduler.

Field	Details
	This field is a relationship field. **Relationship Name** BillingBatchScheduler **Refers To** BillingBatchScheduler
`Comments`	**Type** textarea **Properties** Filter, Nillable, Sort, Update **Description** Additional notes or comments for the invoice batch run.
`CompletionTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the invoice batch run finished processing.
`CreditApplicationStatus`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The status of applying credit memos or credit memo lines to invoices or invoice lines during invoices batch runs. Valid values are: • `Completed` • `Failed` • `NotApplicable`
`DocGenCompletionTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The completion time of generating invoice documents by the invoice batch run. This field is available in API version 63.0 and later with Revenue Cloud Billing license.

Field	Details
DocGenStartTime	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The start time of generating invoice documents by the invoice batch run. This field is available in API version 63.0 and later with Revenue Cloud Billing license.
DocGenStatus	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** The status of the invoice documents generated by the invoice batch run. Valid values are: • `Canceled` • `Completed` • `Failed` • `In Progress` • `Not Started` • `Paused` The default value is `Not Started`. This field is available in API version 63.0 and later with Revenue Cloud Billing license.
InvoiceBatchRunNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The auto-generated reference number for the invoice batch run.
InvoiceDocsGenFailed	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of invoice documents that the invoice batch run failed to generate. This field is available in API version 63.0 and later with Revenue Cloud Billing license.

Field	Details
InvoiceDocsGenerated	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of invoice documents that the invoice batch run generated. This field is available in API version 63.0 and later with Revenue Cloud Billing license.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed an invoice batch run record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed an invoice batch run record. If this value is null, it's possible that the user only accessed the invoice batch run record or a related list view (LastReferencedDate), but not viewed the invoice batch run record itself.
OwnerId	**Type** reference **Properties** Filter, Group, Sort, Update **Description** Required. The ID of the user who created the related billing batch scheduler. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
RecoveryStatus	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort

Field	Details
	Description The status of the invoice batch run recovery process. Valid values are: • `CompletelyRecovered`—All billing schedules included in the recovery run were reset to `Ready for Invoicing`. These billing schedules are included in the next scheduled invoice batch run. • `PartiallyRecovered`—Some, but not all, billing schedules that were part of the recovery run were reset to `Ready for Invoicing`. The billing schedules that were recovered are included in the next scheduled invoice batch run. The billing schedules that weren't successfully recovered must be manually reset to `Ready for Invoicing` so they can be processed. • `RecoveryFailed`—The recovery job was unsuccessful. • `RecoveryStarted`—The recovery job is in progress.
`StartTime`	**Type** dateTime **Properties** Filter, Sort **Description** Required. The timestamp when the invoice batch run started processing.
`Status`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Required. The status of the invoice batch run. Valid values are: • `Canceled` • `Completed` • `Failed` • `Started` • `Stopped` The default value is `Started`.
`StatusSubtype`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort

Field	Details
	Description The status subtype of the invoice batch run. The subtype corresponds to the status of the invoice batch run. Valid values are: • `Billing Schedules Filtering Started`—The data processing engine (DPE) selection service has started. The selection service includes the Billing Schedule records that meet the conditions defined when scheduling the invoice run. • `Billing Schedules Filtering In Progress`—The invoice run is identifying the billing schedules to include for invoice generation. • `Billing Schedules Filtering Completed`—The invoice run has identified the billing schedules to include for invoice generation. • `Invoice Generation Started`—The invoice generation service has started. • `Invoice Generation In Progress`—The invoice run is generating invoices for the identified billing schedules. • `Invoice Generation Completed`—The invoice run has finished generating invoices for the identified billing schedules. • `Invoice Tax Calculation In Progress`—The tax calculation step has started. • `Billing Schedule and Billing Schedule Group Updates In Progress`—The post processing step has started. • `Invoice Generation Summarization In Progress`—The invoice generation summarization step has started. • `Completed`—The invoice batch run has completed successfully. • `Failed`—The invoice batch run was unsuccessful. Available in API version 63.0 and later.
TotBillSchdUpdtDurDrftToPost	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total duration taken to update the billing schedule from `Draft` to `Posted` status during an invoice batch run.
TotalBillSchedRecovered	**Type** int **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The number of billing schedules that were a part of the recovery run that were reset to `Ready for Invoicing`. These billing schedules are included in the next scheduled invoice batch run.
`TotalBillSchedUnrecovered`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of billing schedules that were a part of the recovery run that weren't reset to `Ready for Invoicing`. These billing schedules that weren't successfully recovered must be manually reset to `Ready for Invoicing` so they can be processed.
`TotalBillingSchedulesFailed`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of billing schedules that weren't successfully processed. When a billing schedule isn't successfully processed, then the system doesn't generate an invoice for it. For details about errors, check the Revenue Transaction Error Log.
`TotalBsSuccessfullyProcessed`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of billing schedules for which the system was able to generate and process invoices.
`TotalDraftInvoiceAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total amount of all invoices in the `Draft` status.
`TotalDraftInvoices`	**Type** int **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The total number of invoices in the `Draft` status.
`TotalFilteredBillingSchedules`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of billing schedules that met the invoice run scheduler's matching criteria. The matching criteria specify which billing schedules are included in the invoice batch run. The field label is **Total Matching Billing Schedules**.
`TotalInvSuccessfullyProcessed`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of invoices that were successfully processed.
`TotalInvoicedAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total amount of income including taxes that's represented by the successfully processed invoices.
`TotalInvoicesCanceled`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of invoices that weren't processed. To find out what went wrong, check the Revenue Transaction Error Log. Then fix the errors and run the invoice batch run recovery process.
`TotalInvoicesFailed`	**Type** int **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The total number of invoices that weren't processed successfully. To find out what went wrong, check the Revenue Transaction Error Log. Then fix the errors and run the invoice batch run recovery process.
`TotalInvoicesGenerated`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of invoices that were generated from the billing schedules processed by the invoice batch run.
`TotalPostedInvoices`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of invoices in `Posted` status that were generated from the billing schedules.

InvoiceBatchRunCriteria

Represents a batch processing job and its required criteria in Billing. During an invoice batch run, all billing schedules that meet the specified criteria are processed, resulting in the generation of invoices. This object is available in API version 62.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
`Comments`	**Type** textarea **Properties** Filter, Nillable, Sort

Field	Details
	Description Additional notes or comments for the invoice batch run criteria.
`CriteriaExpression`	**Type** textarea **Properties** Filter, Nillable, Sort **Description** The formula that specifies criteria for filtering the billing schedules. For example, you can filter billing schedules by the currency code.
`CriteriaMatchType`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Required. The type of matching criteria required for the batch. Valid value is `MatchAll`. The default value is `MatchAll`.
`ExpectedInvoiceStatus`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of invoice a batch run generates. Valid values are: • `Draft` • `Posted`
`InvoiceBatchRunCriteriaNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The auto-generated reference number for the invoice batch run criteria.
`InvoiceDate`	**Type** date **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The date displayed on the invoice. This date is also used for tax calculations.
`InvoiceDateOffset`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The offset that's applied to the target date to calculate the invoice date.
`IsInvoiceDateFromRunDate`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Required. Indicates whether the invoice date is derived from the run date (`true`) or not (`false`). The default value is `false`. Available in API version 63.0 and later.
`OwnerId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the user who created the invoice batch run criteria. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
`TargetDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The target date for the invoice run. Billing schedules having the next billing date before this date are picked up for invoicing.
`TargetDateOffset`	**Type** int

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The offset that's applied to the next run date to calculate the target date.

InvoiceBatchRunRecovery

Represents information about the recovery procedure of an invoice batch run. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
`BatchJobId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The batch management job that's used to track the progress of the invoice batch run. This field is available in API version 67.0 and later. This field is a relationship field. **Relationship Name** BatchJob **Refers To** BatchJob
`Comments`	**Type** textarea **Properties** Filter, Nillable, Sort, Update

Field	Details
	Description Additional notes or comments for the invoice batch run recovery.
CompletionTime	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the invoice batch run recovery finished processing.
InvoiceBatchRunId	**Type** reference **Properties** Filter, Group, Sort **Description** Required. A unique identifier of the invoice batch run that's related to this recovery run. This field is a relationship field. **Relationship Name** InvoiceBatchRun **Relationship Type** Master-detail **Refers To** InvoiceBatchRun (the master object)
InvoiceBatchRunRecoveryNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. A unique identifier of the recovery process for the invoice batch run.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed an invoice batch run recovery record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime

Field	Details
	Properties Filter, Nillable, Sort **Description** The timestamp when the current user last viewed an invoice batch run recovery record. If this value is null, it's possible that the user only accessed the invoice batch run recovery record or a related list view (`LastReferencedDate`), but not viewed the invoice batch run recovery record itself.
`StartTime`	**Type** dateTime **Properties** Filter, Sort **Description** Required. The timestamp when the invoice batch run recovery started processing.
`Status`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Required. The final state of the recovery process for the invoice batch runs. Valid values are: • `Completed` • `CompletedWithErrors` • `Failed` • `Started` The default value is `Started`.

InvoiceDocument

Represents the PDF document generated for an invoice. This object is available in API version 63.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`

Special Access Rules

You need Revenue Cloud Billing license, and the Billing Admin permission set or the Billing Operations User permission set to access this object.

Fields

Field	Details
ContentDocumentId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the generated PDF document. This field is a relationship field. **Relationship Name** ContentDocument **Refers To** ContentDocument
DateGenerated	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date on which the PDF is generated.
DocumentGenerationProcessId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the document generation process that contains the information used to create the PDF invoice. This field is a relationship field. **Relationship Name** DocumentGenerationProcess **Refers To** DocumentGenerationProcess
DocumentNumber	**Type** string

Field	Details
	Properties Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. A unique number assigned to the PDF invoice document.
`ErrorMessage`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Any errors that occur during PDF generation.
`InvoiceId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the Invoice to which the Invoice Doc is attached. This field is a relationship field. **Relationship Name** Invoice **Relationship Type** Master-detail **Refers To** Invoice (the master object)
`Status`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The status of the PDF generation process. Valid values are: • `Blocked` • `Cancelled` • `Failure` • `Pending` • `Success`

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

InvoiceDocumentFeed on page 2866
Feed tracking is available for the object.

InvoiceDocumentHistory on page 2873
History is available for tracked fields of the object.

InvoiceLine

Represents the amount that a buyer must pay for a product, service, or fee. Invoice lines are created based on the amount of an order line. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
AdjustmentAmount	**Type** currency **Properties** Filter, Nillable, Sort, Update **Description** The sum of adjustments made to the invoice line.
AdjustmentAmountWithTax	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of adjustment amounts, including associated taxes related to the invoice line.
AdjustmentTaxAmount	**Type** currency

Field	Details
	Properties Filter, Nillable, Sort **Description** The sum of tax adjustments to the invoice line.
`Balance`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The outstanding balance for an invoice line. This amount is equal to the invoice’s total amount with tax after deducting the payments made.
`BillingAddressId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** This field is related to an `InvoiceAddressGroup` field containing the billing address for the invoice line. For example, one `InvoiceAddressGroup` field is related to the invoiceLine's `BillingAddressID` field, and another `InvoiceAddressGroup` field is related to the invoiceLine's `ShippingAddressId` field. This field is a relationship field. **Relationship Name** BillingAddress **Refers To** InvoiceAddressGroup
`BillingScheduleGroupId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the billing schedule group for the invoice line. This field is a relationship field. **Relationship Name** BillingScheduleGroup **Refers To** BillingScheduleGroup

Field	Details
BillingScheduleId	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the billing schedule for the invoice line. Edit access is enabled for this field. You must not modify this field when the invoice line is related to a posted invoice. This field is a relationship field. **Relationship Name** BillingSchedule **Refers To** BillingSchedule
ChargeAmount	**Type** currency **Properties** Filter, Nillable, Sort, Update **Description** The sum of charges made to the invoice line.
ChargeAmountWithTax	**Type** currency **Properties** Filter, Nillable, Sort **Description** The amount on a charge invoice line, including tax.
ChargeConvertedNegAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The amount on a charge invoice line that's converted to credit.
ChargeTaxAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The tax to be applied on a charge invoice line.

Field	Details
ConvertedNegAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The amount from an invoice line that’s converted to credit.
CorpCurrencyCnvChargeAmt	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The sum of charges made to the invoice line in corporate currency. Available in API version 63.0 and later.
CorpCurrencyCnvTotalTaxAmt	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The total tax amount of the invoice line in corporate currency. Available in API version 63.0 and later.
CorporateCurrencyCvsnDate	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The date on which the invoice line amounts are converted to corporate currency. Available in API version 63.0 and later.
CorporateCurrencyCvsnRate	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The exchange rate that's used to convert the invoice line amounts to corporate currency. Available in API version 63.0 and later.
CorporateCurrencyIsoCode	**Type** string

Field	Details
	Properties Filter, Group, Nillable, Sort, Update **Description** The currency ISO code of the corporate currency. Available in API version 63.0 and later.
`Description`	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The description of the invoice line.
`FuncCrcyCnvTotalTaxAmt`	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The total tax amount value in functional currency. Available in API version 66.0 and later.
`FuncCurrencyCnvChargeAmt`	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The charge amount value in functional currency. Available in API version 66.0 and later.
`FunctionalCurrencyCvsnDate`	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The date on which the invoice line amount values are converted into functional currency. Available in API version 66.0 and later.
`FunctionalCurrencyCvsnRate`	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The exchange rate that's used to convert the invoice line amount values into functional currency. Available in API version 66.0 and later.

Field	Details
FunctionalCurrencyIsoCode	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The ISO code of the functional currency. Available in API version 66.0 and later.
GroupReferenceEntityItemId	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the record that the invoice line corresponds to. This field is a polymorphic relationship field. **Relationship Name** GroupReferenceEntityItem **Refers To** DebitMemoLine, OrderItem, OrderItemAdjustmentLineItem, OrderItemDetail, QuoteLineDetail, QuoteLineItem
HasMultipleItems	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Required. Indicates whether this field merges items from the same billing period (`true`) or not (`false`). The default value is `false`.
InvoiceId	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the invoice record that contains this invoice line. This field is a relationship field. **Relationship Name** Invoice **Relationship Type** Master-detail

Field	Details
	Refers To Invoice (the master object)
InvoiceLineEndDate	**Type** date **Properties** Filter, Group, Sort, Update **Description** Required. The end date of the billing for the service for invoice lines made from a time-based service.
InvoiceLineStartDate	**Type** date **Properties** Filter, Group, Sort, Update **Description** Required. The first date of the billing for the service for invoice lines made from a time-based service.
InvoiceStatus	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The status of the invoice line. This field is inherited from the invoice's status.
IsUsageBasedInvoiceLine	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Required. Indicates whether the product is usage-based (`true`) or not (`false`). The default value is `false`. This field is available in API version 63.0 and later with Revenue Cloud Billing license.
LegalEntityAccountingPeriodId	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the legal entity accounting period record used in this invoice line.

Field	Details
	This field is a relationship field. **Relationship Name** LegalEntityAccountingPeriod **Refers To** LegalEntyAccountingPeriod
`LegalEntityId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the legal entity record used in this invoice line. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity
`LineAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The amount of the invoice line. This field is a calculated field.
`Name`	**Type** string **Properties** Filter, Group, idLookup, Sort, Update **Description** Required. The name of the invoice line.
`NetCreditsApplied`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total credit memo line amount applied to the invoice line. This amount is calculated by subtracting the unapplied credit memo line amount from the applied credit memo line amount.

Field	Details
	This field is a calculated field.
NetPaymentsApplied	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total payment amount that's applied to the invoice line after unapplication of payments. This amount is calculated by subtracting the unapplied payment line invoice line amount from the applied payment line invoice line amount. Available in API version 61.0 and later. This field is a calculated field.
OverageUnitOfMeasure	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The unit that's used to measure the overage. For example, byte or minute. This field is available in API version 63.0 and later with Revenue Cloud Billing license.
ParentInvoiceLineId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the parent invoice line record. This field is a relationship field. **Relationship Name** ParentInvoiceLine **Refers To** InvoiceLine
Product2Id	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the product that was charged or ordered to create the invoice line. This field is a relationship field. **Relationship Name** Product2

Field	Details
	Refers To Product2
Quantity	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The number of units of the order product that created the invoice line.
ReferenceEntityItemId	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The order item or adjustment item that created the invoice line. This field is a polymorphic relationship field. **Relationship Name** ReferenceEntityItem **Refers To** OrderItem, OrderItemAdjustmentLineItem
ReferenceEntityItemType	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type of transaction that created the invoice line. Valid values are: • Delivery Charge • Fee • Order Product
ReferenceEntityItemTypeCode	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type of object that created the invoice line. Valid values are:

Field	Details
	• `Charge` • `Product`
`ShipFromAddressId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The shipping origin of the invoiced product. Available in API version 64.0 and later. This field is a relationship field. **Relationship Name** ShipFromAddress **Refers To** InvoiceAddressGroup
`ShippingAddressId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the shipping address record associated with the invoice line. This field is a relationship field. **Relationship Name** ShippingAddress **Refers To** InvoiceAddressGroup
`TaxAmount`	**Type** currency **Properties** Filter, Nillable, Sort, Update **Description** The total tax for the invoice line.
`TaxProcessingStatus`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The status of the tax processing of the invoice line. Valid values are:

Field	Details
	• `Estimated` • `Pending` • `Posted`
`TaxTreatmentId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The tax treatment used on this invoice line. This field is a relationship field. **Relationship Name** TaxTreatment **Refers To** TaxTreatment
`Type`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The type of the invoice line. Valid values are: • `Adjustment` • `Charge` • `Tax`
`UnitOfMeasureId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The unit of measure of the product associated with the invoice line. Available in API version 63.0 and later. This field is a relationship field. **Relationship Name** UnitOfMeasure **Refers To** UnitOfMeasure

Field	Details
UnitPrice	**Type** currency **Properties** Filter, Nillable, Sort, Update **Description** The price for one unit of the item on the invoice line.
UsageOverageQuantity	**Type** double **Properties** Filter, Nillable, Sort **Description** The quantity of the usage overage that’s being invoiced. This field is available in API version 63.0 and later with Revenue Cloud Billing license.
UsageProductBillSchdGrpId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the usage-based product billing schedule group associated with the invoice line. This field is available in API version 63.0 and later with Revenue Cloud Billing license. This field is a relationship field. **Relationship Name** UsageProductBillSchdGrp **Refers To** BillingScheduleGroup
UsageProductId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the usage-based product that was charged or ordered to create the invoice line. This field is available in API version 63.0 and later with Revenue Cloud Billing license. This field is a relationship field. **Relationship Name** UsageProduct **Refers To** Product2

InvoiceLineRelationship

Represents a relationship between invoice line items to support bundles where one parent invoice line has multiple child invoice lines. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
`AssociatedInvoiceLineId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the related invoice line record. In a bundle relationship, this invoice line is the child. This field is a relationship field. **Relationship Name** AssociatedInvoiceLine **Refers To** InvoiceLine
`AssociatedInvoiceLinePricing`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. This field describes how the related invoice line is priced relative to the primary invoice line. Valid values are: • `IncludedInBundlePrice` • `NotIncludedInBundlePrice`

Field	Details
AssociatedInvoiceLineRole	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. This field describes the role of the related invoice line in the relationship. The value is derived from the AssociatedProductRoleCat field of the ProductRelationshipType object. Valid values are: • AddOnComponent • BundleComponent • ClassificationComponent • SetComponent
InvoiceId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the related invoice record. This field is a relationship field. **Relationship Name** Invoice **Refers To** Invoice
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed an invoice line relationship record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed an invoice line relationship record. If this value is null, it's possible that the user only accessed the invoice line relationship record or

Field	Details
	a related list view (`LastReferencedDate`), but not viewed the invoice line relationship record itself.
`MainInvoiceLineId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the primary invoice line record. In a bundle relationship, this invoice line is the parent. This field is a relationship field. **Relationship Name** MainInvoiceLine **Relationship Type** Master-detail **Refers To** InvoiceLine (the master object)
`MainInvoiceLineRole`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. This field describes the role of the primary invoice line in the relationship. The value is derived from the `MainProductRoleCat` field of the ProductRelationshipType object. Valid values are: • `AddOn` • `Bundle` • `Set`
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. An auto-generated number identifying the invoice line relationship.
`ProductRelationshipTypeId`	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The ID of the product relationship type record between the main and associated invoice lines. This field is a relationship field. **Relationship Name** ProductRelationshipType **Refers To** ProductRelationshipType

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

InvoiceLineRelationshipFeed **on page 2866**
Feed tracking is available for the object.

InvoiceLineRelationshipHistory **on page 2873**
History is available for tracked fields of the object.

InvoiceLineTax

Represents tax information of an invoice line of type `Tax`. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`

Special Access Rules

You need the Tax Admin permission set to access this object.

Fields

Field	Details
`BillingAddressId`	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update

Field	Details
	Description The billing address of the parent invoice line. Edit access is enabled for this field. You must not modify this field when the invoice line is related to a posted invoice. This field is a relationship field. **Relationship Name** BillingAddress **Refers To** InvoiceAddressGroup
`ConvertedNegAmount`	**Type** currency **Properties** Filter, Nillable, Sort, Update **Description** The amount from the parent invoice line that's converted to credit. Edit access is enabled for this field. You must not modify this field when the invoice line is related to a posted invoice.
`CorpCrcyCnvTaxAmount`	**Type** double **Properties** Filter, Group, Nillable, Sort **Description** The total tax amount of the invoice line tax in corporate currency. Available in API version 63.0 and later.
`CorporateCurrencyCvsnDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date on which the invoice line tax amounts are converted to the corporate currency. Available in API version 63.0 and later.
`CorporateCurrencyCvsnRate`	**Type** double **Properties** Filter, Nillable, Sort **Description** The exchange rate that's used to convert the invoice line tax amounts to the corporate currency. Available in API version 63.0 and later.

Field	Details
CorporateCurrencyIsoCode	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The currency ISO code of the corporate currency. Available in API version 63.0 and later.
Description	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** Additional details about the invoice line tax.
EndDate	**Type** date **Properties** Filter, Group, Sort, Update **Description** Required. The end date of an invoice line tax.
FuncCrcyCnvTaxAmount	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The tax amount value in functional currency. Available in API version 66.0 and later.
FunctionalCurrencyCvsnDate	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The date on which the tax amount value is converted into functional currency. Available in API version 66.0 and later.
FunctionalCurrencyCvsnRate	**Type** double **Properties** Filter, Nillable, Sort, Update

Field	Details
	Description The exchange rate that's used to convert the tax amount value into functional currency. Available in API version 66.0 and later.
FunctionalCurrencyIsoCode	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The ISO code of the functional currency. Available in API version 66.0 and later.
InvoiceLineId	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the parent charge or adjustment invoice line record that an invoice line tax is related to. This field is a relationship field. **Relationship Name** InvoiceLine **Relationship Type** Master-detail **Refers To** InvoiceLine (the master object)
InvoiceLineTaxNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. An auto-generated number identifying an invoice line tax.
LegalEntityAccountingPeriodId	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the legal entity accounting period record that's related to an invoice line tax. This field is a relationship field.

Field	Details
	Relationship Name LegalEntityAccountingPeriod **Refers To** LegalEntyAccountingPeriod
LegalEntityId	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the legal entity that's related to an invoice line tax. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity
Product2Id	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The product that was charged or ordered to create the parent invoice line. Available in API version 62.0 only. This field is a relationship field. **Relationship Name** Product2 **Refers To** Product2
Quantity	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The number of units of the order product that created the parent invoice line. Available in API version 62.0 only.
ShipFromAddressId	**Type** reference

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The ship from address specified in the parent invoice line. Edit access is enabled for this field. You must not modify this field when the invoice line is related to a posted invoice. Available in API version 64.0 and later. This field is a relationship field. **Relationship Name** ShipFromAddress **Refers To** InvoiceAddressGroup
ShippingAddressId	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the shipping address record of the parent invoice line. Edit access is enabled for this field. You must not modify this field when the invoice line is related to a posted invoice. This field is a relationship field. **Relationship Name** ShippingAddress **Refers To** InvoiceAddressGroup
StartDate	**Type** date **Properties** Filter, Group, Sort, Update **Description** Required. The start date of an invoice line tax.
TaxAmount	**Type** currency **Properties** Filter, Nillable, Sort, Update **Description** The total amount of an invoice line tax. Edit access is enabled for this field. You must not modify this field when the invoice line is related to a posted invoice. Available in API version 65.0 and later.

Field	Details
TaxCode	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The code that's used to calculate the tax rate for the parent invoice line. Edit access is enabled for this field. You must not modify this field when the invoice line is related to a posted invoice.
TaxDocumentNumber	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The number of the latest record in the external tax engine in which the parent invoice line is included. Edit access is enabled for this field. You must not modify this field when the invoice line is related to a posted invoice.
TaxEffectiveDate	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The date used to calculate the tax amount. Edit access is enabled for this field. You must not modify this field when the invoice line is related to a posted invoice.
TaxExemptAmount	**Type** currency **Properties** Filter, Nillable, Sort, Update **Description** The amount that's exempted from tax. Edit access is enabled for this field. You must not modify this field when the invoice line is related to a posted invoice.
TaxName	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The user-defined name for an invoice line tax. Edit access is enabled for this field. You must not modify this field when the invoice line is related to a posted invoice.

Field	Details
TaxProcessingStatus	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The processing status of the invoice line tax. Valid values are: • Estimated • Pending • Posted
TaxRate	**Type** percent **Properties** Filter, Nillable, Sort, Update **Description** The percentage of the order product price that's used to calculate tax. Edit access is enabled for this field. You must not modify this field when the invoice line is related to a posted invoice.
TaxTransactionNumber	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The number of the transaction in the external tax engine that calculated tax for the parent invoice line.
TaxTreatmentId	**Type** reference **Properties** Filter, Group, Nillable, Sort, Update **Description** The ID of the tax treatment record that's related to an invoice line tax. Edit access is enabled for this field. You must not modify this field when the invoice line is related to a posted invoice. This field is a relationship field. **Relationship Name** TaxTreatment **Refers To** TaxTreatment

Field	Details
UnitPrice	**Type** currency **Properties** Filter, Nillable, Sort, Update **Description** The price per unit of the order product that's related to an invoice line tax. Available in API version 62.0 only.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

InvoiceLineTaxFeed on page 2866
Feed tracking is available for the object.

InvoiceLineTaxHistory on page 2873
History is available for tracked fields of the object.

LegalEntity

Represents the way an organization is structured. An organization can be a single legal entity or it can comprise more than one legal entity. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Accounts Receivables Admin permission set to access this object.

Fields

Field	Details
CompanyName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The name of the company that this legal entity represents.

Field	Details
Description	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Additional details about the legal entity.
EmailTemplateId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A template that's used to send emails for the legal entity. This field is available in API version 65.0 and later. This field is a relationship field. **Relationship Name** EmailTemplate **Refers To** EmailTemplate
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a legal entity indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a legal entity. If this value is null, it’s possible that the user only accessed the legal entity or a related list view (`LastReferencedDate`), but not viewed the legal entity itself.
LegalEntityAddress	**Type** address **Properties** Filter, Nillable

Field	Details
	Description The address of the company that this legal entity represents. See Address Compound Fields for details on compound address fields.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The name of the legal entity.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. The ID of the record owner. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
`ShouldAttachInvoiceDocToEmail`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether to attach the invoice PDF document to the email that's sent for the legal entity (`true`) or not (`false`). This field is available in API version 65.0 and later. The default value is `false`.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The status of the legal entity. Valid values are: • `Active` • `Inactive`

LegalEntyAccountingPeriod

Represents a junction between a legal entity and an accounting period. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Accounts Receivables Admin permission set to access this object.

Fields

Field	Details
`AccountingPeriodId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the accounting period record that's related to a legal entity accounting period. This field is a relationship field. **Relationship Name** AccountingPeriod **Refers To** AccountingPeriod
`ClosureStage`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies the closure stage of the legal entity accounting period. This field is available in API version 65.0 and later. Valid values are: • `CloseLegalEntityAccountingPeriod` • `Completed` • `Open` • `CreateGeneralLedgerAccountingPeriodSummaries` • `CreateUnrealizedGainOrLossTransactionJournals`

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a legal entity accounting period record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a legal entity accounting period record. If this value is null, it’s possible that the user only accessed the legal entity accounting period record or a related list view (`LastReferencedDate`), but not viewed the legal entity accounting period record itself.
LegalEntityId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Required. The ID of the legal entity record that's related to a legal entity accounting period. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity
Name	**Type** string **Properties** Filter, Group, idLookup, Sort **Description** Required. The auto-generated name of a legal entity accounting period. The name is a combination of the names of the legal entity and the accounting period.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description Required. The ID of the user who owns a legal entity accounting period record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
Status	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** Required. The status of a legal entity accounting period record. Valid values are: • Closed • Error • Open • PendingClosure • PendingReopen • Reopened
TotalAssetsAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total assets for a legal entity accounting period is a roll up summary of the closing balances of the general ledger accounting period summary records that are related to an asset type general ledger account. This field is available in API version 65.0 and later.
TotalEquitiesAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total equities for a legal entity accounting period is a roll up summary of the closing balances of the general ledger accounting period summary records that are related to an equity type general ledger account. This field is available in API version 65.0 and later.

Field	Details
`TotalExpensesAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total expenses for a legal entity accounting period is a roll up summary of the closing balances of the general ledger accounting period summary records that are related to an expense type general ledger account. This field is available in API version 65.0 and later.
`TotalLiabilitiesAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total liabilities for a legal entity accounting period is a roll up summary of the closing balances of the general ledger accounting period summary records that are related to a liability type general ledger account. This field is available in API version 65.0 and later.
`TotalRevenueAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total revenue for a legal entity accounting period is a roll up summary of the closing balances of the general ledger accounting period summary records that are related to a revenue type general ledger account. This field is available in API version 65.0 and later.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

LegalEntyAccountingPeriodShare on page 2877
Sharing is available for the object.

PaymentBatchRun

Represents a batch processing job that processes payments in Billing. During a payment batch run, all the payment schedules that meet the specified criteria are processed and the corresponding Payment records are created. These payments are then applied to invoices or invoice lines. This object is available in API version 64.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Special Access Rules

You need the Revenue Cloud Billing license, and the Payment Admin permission set or the Payment Operations User permission set to access this object.

Fields

Field	Details
`BillingBatchSchedulerId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Required. The ID of the billing batch scheduler that's used to schedule the payment batch run. This field is a relationship field. **Relationship Name** BillingBatchScheduler **Refers To** BillingBatchScheduler
`Comments`	**Type** textarea **Properties** Filter, Nillable, Sort, Update **Description** Additional details about the payment batch run.
`CompletionTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time when the payment batch run completed processing payments.
`IsPaymentRetry`	**Type** boolean **Properties** Filter, Nillable, Sort **Description** Indicates whether the payment batch run is for retrying a failed payment (`true`) or not (`false`). The default value is `false`. Available in API version 66.0 and later.

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, and `LastReferenceDate` is not null, the user accessed this record or list view indirectly.
OwnerId	**Type** reference **Properties** Filter, Group, Sort, Update **Description** Required. The ID of the owner of the Payment Batch Run record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
PaymentBatchRunNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The auto-generated reference number for the payment batch run.
StartTime	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time when the payment batch run started processing payments.

Field	Details
Status	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Required. The status of the payment batch run. Valid values are: • `Completed` • `Failed` • `New` • `Started` • `Stopped` The default value is `New`.
TotalFailedScheduleItems	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of payment schedules that weren't processed by the payment batch run. When a payment schedule isn't processed, the system doesn't generate a Payment record for it. For details about errors, check the Revenue Transaction Error Log records for the payment batch run.
TotalFilteredScheduleItems	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of payment schedule items that meet the payment run scheduler's matching criteria. The matching criteria identifies the payment schedule items that are included for processing by the payment batch run.
TotalProcessedScheduleItems	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of payment schedule items that were processed by the payment batch run.

Field	Details
TotalScheduleItemsApplied	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of payment schedule items that were processed and had corresponding payments also applied to invoices or invoice lines.
TotalScheduleItemsApplyFailed	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The total number of payment schedule items that were processed but had corresponding payments that weren't applied to invoices or invoice lines.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

PaymentBatchRunShare on page 2877
Sharing is available for the object.

PaymentLineInvoiceLine

Represents information about a payment line that's applied to or unapplied from an invoice line. This object is available in API version 64.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

You need the Revenue Cloud Billing license, and the Payment Admin permission set or the Payment Operations User permission set to access this object.

Fields

Field	Details
AccountId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The account of the customer who made a payment that's related to the payment line invoice line. This field is a relationship field. **Relationship Name** Account **Refers To** Account
Amount	**Type** currency **Properties** Create, Filter, Sort **Description** Required. The amount that's been applied or unapplied by a payment line.
AppliedDateTime	**Type** dateTime **Properties** Create, Filter, Nillable, Sort **Description** The date and time when a payment line was applied to an invoice line.
AppliedImpactAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** If the payment line invoice line's `Type` value is `Applied`, the applied impact amount is the same as the `ImpactAmount` value. The applied impact amount is 0 when the `Type` value is `Unapplied`. This field is a calculated field.
Description	**Type** textarea

Field	Details
	Properties Create, Filter, Nillable, Sort, Update **Description** Additional details about the payment line invoice line.
`EffectiveDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort **Description** The date and time when a payment line's application to or unapplication from an invoice line becomes effective.
`ImpactAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** If the payment line invoice line's `Type` value is `Applied`, the impact amount is the negative equivalent of the payment line invoice line's `Amount` value. Otherwise, it's equal to the payment line invoice line's `Amount` value. This field is a calculated field.
`InvoiceLineBalance`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The balance of the invoice line after a payment line was applied to it or unapplied from it.
`InvoiceLineId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. The invoice line to which a payment line has been applied or unapplied. This field is a relationship field. **Relationship Name** InvoiceLine **Relationship Type** Master-detail

Field	Details
	Refers To InvoiceLine (the master object)
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, and `LastReferenceDate` is not null, the user accessed this record or list view indirectly.
`LegalEntityAccountingPeriodId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity accounting period related to the payment line invoice line. This field is a relationship field. **Relationship Name** LegalEntityAccountingPeriod **Refers To** LegalEntyAccountingPeriod
`LegalEntityId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity related to the payment line invoice line. This field is a relationship field. **Relationship Name** LegalEntity

Field	Details
	Refers To LegalEntity
PaymentBalance	**Type** currency **Properties** Filter, Nillable, Sort **Description** The balance of the Payment record after it was applied to or unapplied from an invoice line.
PaymentId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. The parent Payment record that's related to the payment line invoice line. This field is a relationship field. **Relationship Name** Payment **Refers To** Payment
PaymentLineInvoiceLineNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. An auto-generated number identifying the payment line invoice line.
RelatedPaymentLineInvcLineId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The related payment line invoice line with the `Type` value as `Applied` when the payment line invoice line's `Type` value is `Unapplied`. This field is a relationship field. **Relationship Name** RelatedPaymentLineInvcLine **Refers To** PaymentLineInvoiceLine

Field	Details
Type	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** Required. Specifies whether a payment line has been applied to or unapplied from an invoice line. Valid values are: • Applied • Unapplied
UnappliedDateTime	**Type** dateTime **Properties** Create, Filter, Nillable, Sort **Description** The date and time when a payment line was unapplied from an invoice line.
UnappliedStatus	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** Required. Specifies whether a payment line has been unapplied from an invoice line. Valid values are: • NA—Not Applicable • No • Yes

PaymentRetryRule

Represents the specific payment retry rule for a failed payment schedule item. Each rule defines actionable parameters such as the maximum number of retries for the failed records and time intervals between subsequent retry attempts. This object is available in API version 66.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`Description`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The description of the business details for the payment retry rule.
`IntervalUnit`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The unit of time after which a payment batch run must retry the failed payments. Valid values are: • `Days` • `Hours` • `Minutes`
`IntervalValue`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The single or comma-separated numeric values, after which the payment batch run must retry the failed payments.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed the payment retry rule record.
`LastViewedDate`	**Type** dateTime

Field	Details
	Properties Filter, Nillable, Sort **Description** The timestamp when the current user last viewed the payment retry rule record.
`MaximumRetryCount`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The maximum number of retries on the failed payment records.
`PaymentGatewayErrorCategory`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The category of payment gateway errors for which the payment retry rule must be applied. Valid values are: • `CardLimit`—Card Limit Decline • `GatewayConnection`—Gateway Connection Error • `PaymentInformation`—Invalid Payment Details • `PaymentProcessing`—Payment Processing Error • `Security`—Security Failure • `Unknown`—Unknown Error • `ValidationFailure`—Internal Validation Error
`PaymentGatewayErrorCode`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The raw error code of the payment gateway response.
`PaymentGatewayId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The unique identifier of the payment gateway for which the payment retry rule must be applied.

Field	Details
	This field is a relationship field. **Relationship Name** PaymentGateway **Refers To** PaymentGateway
`PaymentRetryRuleSetId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The payment retry rule set of the payment retry rule. This field is a relationship field. **Relationship Name** PaymentRetryRuleSet **Relationship Type** Master-detail **Refers To** PaymentRetryRuleSet (the master object)
`RetryIntervalType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies whether the payment retry rule must be applied to the failed payment records at fixed or staggered intervals of time. Valid values are: • `Fixed` • `Staggered`

PaymentRetryRuleSet

Represents the payment retry rule definition that defines how failed payments are retried based on the error codes across various retry categories. This object is available in API version 66.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
CanUseAltrnPaymentMethod	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether an alternate payment method can be used on the last retry of the failed payment schedule item (`true`) or not (`false`). When set to `true`, the mostly recently added payment method is used to retry payments on the failed payment schedule items. The default value is `false`.
DefaultIntervalUnit	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The unit of time after which a payment batch run must retry the failed payments. The related payment retry rules inherit this value by default. Valid values are: • `Days` • `Hours` • `Minutes`
DefaultIntervalValue	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The single or comma-separated numeric values, after which the payment batch run must retry the failed payments. The related payment retry rules inherit this value by default.
DefaultMaximumRetryCount	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The maximum number of retries on the failed payment records. The related payment retry rules inherit this value by default.

Field	Details
DefaultRetryIntervalType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies whether the payment retry rule set must be applied to the failed payment records at fixed or staggered intervals of time. The related payment retry rules inherit this value by default. Valid values are: • `Fixed` • `Staggered`
Description	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The description of the business details for the payment retry rule set.
IsDefaultRuleSet	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the payment retry rule must be set as default for the org (`true`) or not (`false`). The default value is `false`.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed the payment retry rule set record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed the payment retry rule set record.

Field	Details
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The user-specified name for the payment retry rule set.
Status	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies the status of the payment retry rule set. Valid values are: • `Active` • `Draft`

PaymentSchedule

Represents information about a set of payments that a customer wants to collect at different times for a certain record. A schedule contains one or more payment schedule items, where each item represents one payment to be processed. Each of a schedule's items can have different payment configuration fields, such as payment methods, payment dates, and payment accounts. When a payment scheduler launches a payment run, the run evaluates active payment schedule items, and picks them up for payment processing if they match the scheduler's payment criteria. This object is available in API version 64.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Revenue Cloud Billing license, and the Payment Admin permission set or the Payment Operations User permission set to access this object.

Fields

Field	Details
AvailableRequestedAmount	**Type** currency

Field	Details
	Properties Filter, Nillable, Sort **Description** The payment schedule's remaining amount available for the creation of payment schedule items. This value is calculated by deducting the `TotalLineRequestedAmount` value from the `TotalRequestedAmount` value. This field is a calculated field.
`CollectionPlanItemId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The collection plan item for the payment schedule that's related to an invoice. This field is a relationship field. **Relationship Name** CollectionPlanItem **Refers To** CollectionPlanItem
`Comments`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Additional details about the payment schedule.
`DefaultPaymentAccountId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** When a payment run creates payments from a payment schedule item, it sets the payment's account to the item's `PaymentAccountId` value. When the payment schedule item is created, the item's `PaymentAccountId` inherits the schedule's `DefaultPaymentAccountId`. However, you can override the `PaymentAccountId` with a different account as needed. If you do, future payments made from the item use the new account. This field is a relationship field. **Relationship Name** DefaultPaymentAccount

Field	Details
	Refers To Account
DefaultPaymentMethodId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** When a payment run creates payments from a payment schedule item, it sets the payment's payment method to the item's `PaymentMethodId`. When the payment schedule item is created, the item's `PaymentMethodId` inherits the schedule's `DefaultPaymentMethodId`. However, you can override the `PaymentMethodId` with a different method as needed. If you do, future payments made from the item will use the new method. This field is a polymorphic relationship field. **Relationship Name** DefaultPaymentMethod **Refers To** CardPaymentMethod, SavedPaymentMethod
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, and `LastReferenceDate` is not null, the user accessed this record or list view indirectly.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. The ID of the owner of the Payment Schedule record.

Field	Details
	This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
PaymentScheduleNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The auto-generated reference number for the payment schedule.
PaymentSource	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description**
ReferenceEntityId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The object record that receives payments as a result of the related payment schedule items that are processed. This field is a polymorphic relationship field. **Relationship Name** ReferenceEntity **Refers To** CollectionPlan, Contract, Invoice, Order, Quote
RemainingAmountToBeProcessed	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total pending amount of payment schedule items that haven't yet been processed for payment. This value is calculated by deducting the `TotalProcessedAmount` value from the `TotalLineRequestedAmount` value. This field is a calculated field.

Field	Details
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The status of the payment schedule. Valid values are: • `Canceled`—Payment runs can't evaluate payment schedules or use them to create payments. • `Completed`–All of the payment schedule's payment schedule items have been processed for payments. • `Draft`—The payment schedule can be edited and configured. Payment runs don't evaluate draft payment schedules. • `Open`—The payment schedule is available for payment run evaluation.
`TotalAppliedAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The amount of all the related payment schedule items that have been applied to payments. This field is a calculated field.
`TotalCanceledAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of all `RequestedAmount` values of all the related payment schedule items with a status of `Canceled`. This field is a calculated field.
`TotalPaymentScheduleItemAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total amount allocated from the payment schedule to its payment schedule items. This value is calculated by deducting the sum of each payment schedule item's `CanceledAmount` from the sum of each payment schedule item's `RequestedAmount`.

Field	Details
	This field is a calculated field.
TotalPaymentsReceived	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of all the total payment received for all the related payment schedule items. This field is a calculated field.
TotalProcessedAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of `ProcessedAmount` values of all the related payment schedule items with a status of `Processed`. This field is a calculated field.
TotalRequestedAmount	**Type** currency **Properties** Create, Filter, Sort, Update **Description** Required. The total amount available for a payment schedule to distribute to its payment schedule items. The sum of payment schedule items can't be greater than the `TotalLineRequestedAmount` value of the parent payment schedule.
UsageType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The feature using the payment schedule. Valid value is: • `CollectionPlan`

PaymentSchedulePolicy

Represents information about the configuration for the payment schedule. This object is available in API version 64.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Revenue Cloud Billing license, and the Payment Admin permission set or the Payment Operations User permission set to access this object.

Fields

Field	Details
`DefaultTreatmentId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The default payment schedule treatment. This field is a relationship field. **Relationship Name** DefaultTreatment **Refers To** PaymentScheduleTreatment
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** The user-entered description for the payment schedule policy.
`IsOrgDefault`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** If the payment schedule policy is the default policy for the org, this value is set to `true`. If not, this value is set to `false`. An org can have only one default payment policy. The default value is `false`.
`LastReferencedDate`	**Type** dateTime

Field	Details
	Properties Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, and LastReferenceDate is not null, the user accessed this record or list view indirectly.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The user-entered name of the payment schedule policy.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. The ID of the owner of the PaymentSchedulePolicy record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
Status	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of the payment schedule policy. Valid values are: • Active

Field	Details
	• `Canceled` • `Draft` • `Inactive`
`TreatmentSelection`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies the payment schedule treatment. Valid value is: • `Default`—Uses the payment schedule treatment indicated by the `DefaultTreatmentId` field.

PaymentScheduleTreatment

Represents information about the processing of payment schedules including the payment method and the payment amount for the payment schedule. This object is available in API version 64.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Revenue Cloud Billing license, and the Payment Admin permission set or the Payment Operations User permission set to access this object.

Fields

Field	Details
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** The user-entered description of the payment schedule treatment.
`DueDateWindow`	**Type** int

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The number that indicates the due date window of the payment schedule treatment. Available in API version 67.0 and later. This field is a calculated field.
`GroupingSource`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies how the payment schedule treatments are grouped, such as by an invoice or account. Available in API version 67.0 and later. Valid values are: • `Invoice` • `Account`
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, and `LastReferenceDate` is not null, the user accessed this record or list view indirectly.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The user-entered name of the payment schedule treatment.

Field	Details
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. The ID of the owner of the PaymentScheduleTreatment record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
PaymentSchedulePolicyId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the related payment schedule policy. This field is a relationship field. **Relationship Name** PaymentSchedulePolicy **Refers To** PaymentSchedulePolicy
Status	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The status of the payment schedule treatment. Valid values are: • Active • Canceled • Draft • Inactive
TriggerSource	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update

Field	Details
	Description Required. The action that caused the payment schedule treatment to be created. Valid value is: • `InvoicePosted`

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

PaymentScheduleTreatmentShare on page 2877
Sharing is available for the object.

PaymentScheduleTreatmentDtl

Represents information about the processing of payment schedules after the corresponding invoices are posted. This object is available in API version 64.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Revenue Cloud Billing license, and the Payment Admin permission set or the Payment Operations User permission set to access this object.

Fields

Field	Details
`DateOffset`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** Required. The date offset is subtracted from the `ProcessingDateReference` value to determine the processing date. It must be a number equal to or less than 0. For example, if the invoice due date is 10/17/2025 and the date offset is -7, the payment schedule item is processed by jobs that run on or before 10/10/2025.

Field	Details
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** The user-entered description for the payment schedule treatment detail.
`InstallmentPaymentType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. Indicates how the payment amount is divided into multiple payments. Valid value is: • `Percentage`
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, and `LastReferenceDate` is not null, the user accessed this record or list view indirectly.
`PaymentMethodSelectionType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. Indicates how the payment method is specified. Valid values are: • `Manual`—The user enters the payment method.

Field	Details
	• `MostRecentAutopay`—The payment method is the most recently used automatic payment method. • `DefaultSavedPaymentMethod`—The default payment method used for processing payments. Available in API version 65.0 and later.
`PaymentRunMatchingValue`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The value for the condition specified for the payment run criteria. When a payment batch run starts, all the payment schedule items that meet the specified criteria are processed.
`PaymentScheduleTreatmentDetailNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The system-generated unique identifier for the payment schedule treatment detail.
`PaymentScheduleTreatmentId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. The ID of the related payment schedule treatment. This field is a relationship field. **Relationship Name** PaymentScheduleTreatment **Relationship Type** Master-detail **Refers To** PaymentScheduleTreatment (the master object)
`Percentage`	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The percentage of the source amount that's used to create the payment schedule.

Field	Details
ProcessingDateReference	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The source of the reference date. Valid value is: • InvoiceDueDate
PymtSchdDistributionMethodId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Required. The distribution method that contains the information on how to create the payment schedule items. This field is a relationship field. **Relationship Name** PymtSchdDistributionMethod **Refers To** PymtSchdDistributionMethod

PymtSchdDistributionMethod

Represents information about the partial payments that the total payment is divided into. This object is available in API version 64.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Revenue Cloud Billing license, and the Payment Admin permission set or the Payment Operations User permission set to access this object.

Fields

Field	Details
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** The user-entered details of the payment schedule distribution method.
`DistributionCount`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** Required. The number of payment schedule items for the payment schedule. The payment schedule items are used to distribute the payment schedule's total payment into partial payments.
`DistributionMethodType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The time interval of the payment distribution method. Valid value is: • `FullDistribution`—The full amount on the payment schedule is distributed to a single payment schedule item.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The timestamp when the current user last viewed this record or list view. If this value is null, and `LastReferenceDate` is not null, the user accessed this record or list view indirectly.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The user-entered name for the payment schedule distribution method.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. The ID of the owner of the PaymentScheduleDistributionMethod record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

PymtSchdDistributionMethodOwnerSharingRule on page 2873
Sharing rules are available for the object.

PymtSchdDistributionMethodShare
Sharing is available for the object.

PaymentScheduleItem

Represents information about a payment to be processed. Each schedule item can have different payment configuration fields, such as payment methods, payment dates, and payment accounts. When a payment scheduler launches a payment run, the run evaluates active payment schedule items, and picks them up for payment processing if they match the scheduler's payment criteria. This object is available in API version 64.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Revenue Cloud Billing license, and the Payment Admin permission set or the Payment Operations User permission set to access this object.

Fields

Field	Details
AppliedAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The amount of a credit memo or payment that's applied to the parent reference entity and is excluded for payment collection.
Comments	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Additional details about the payment schedule item.
LastPaymentGatewayLogId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The most recent payment gateway log created after a payment gateway request is sent to process a payment based on the payment schedule item. This field is a relationship field. **Relationship Name** LastPaymentGatewayLog **Refers To** PaymentGatewayLog
LastReferencedDate	**Type** dateTime

Field	Details
	Properties Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, and `LastReferenceDate` is not null, the user accessed this record or list view indirectly.
`NextPaymentRetryTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort **Description** The slated time of the next payment retry for the payment schedule item. Available in API version 66.0 and later.
`NextPaymentRetryTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort **Description** The slated time of the next payment retry for the payment schedule item. Available in API version 66.0 and later.
`PaymentAccountId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The account assigned to payments made from the payment schedule item. When a payment schedule item is created, its `PaymentAccountId` inherits the payment schedule's `DefaultPaymentAccountId`. However, you can provide a new `PaymentAccountId` at any time. If you change the `PaymentAccountId`, only payments made after the change use the new account. This field is a relationship field.

Field	Details
	Relationship Name PaymentAccount **Refers To** Account
PaymentBatchRunId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The payment batch run that evaluated the payment schedule item for payment processing. This field is a relationship field. **Relationship Name** PaymentBatchRun **Refers To** PaymentBatchRun
PaymentGatewayErrorCategory	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The category of payment gateway errors for the payment schedule item. Valid values are: • CardLimit—Card Limit Decline • GatewayConnection—Gateway Connection Error • PaymentInformation—Invalid Payment Details • PaymentProcessing—Payment Processing Error • Security—Security Failure • Unknown—Unknown Error • ValidationFailure—Internal Validation Error Available in API version 66.0 and later.
PaymentGatewayErrorCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort **Description** The raw error code from the payment gateway for the payment schedule item. Available in API version 66.0 and later.

Field	Details
PaymentGatewayRespStatus	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The status of the payment gateway response when the payment schedule item is processed. Valid values are: • Decline • Indeterminate • PermanentFail • RequiresReview • Success • SystemError • ValidationError See SalesforceResultCode Enum for more information about the values.
PaymentId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The payment that a payment run created for the payment schedule item after picking up the parent payment schedule. This field is unique within your organization. This field is a relationship field. **Relationship Name** Payment **Refers To** Payment
PaymentMethodId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The payment method assigned to payments created from the payment schedule item. When a payment schedule item is created, its `PaymentMethodId` inherits the payment schedule's `DefaultPaymentMethodId`. However, you can provide a new `PaymentMethodId` at any time. If you change the `PaymentMethodId`, only payments made after the change use the new account. This field is a polymorphic relationship field.

Field	Details
	Relationship Name PaymentMethod **Refers To** CardPaymentMethod, SavedPaymentMethod
`PaymentProcessingMessage`	**Type** string **Properties** Filter, Nillable, Sort **Description** Information about whether the payment creation process has completed.
`PaymentRetryCount`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort **Description** The number of payment retries that were attempted on the payment schedule item. Available in API version 66.0 and later.
`PaymentRunMatchingValue`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The value used to match a payment schedule item to a payment run based on the payment run's matching criteria.
`PaymentScheduleId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. The parent payment schedule for the payment schedule item. This field is a relationship field. **Relationship Name** PaymentSchedule **Relationship Type** Master-detail **Refers To** PaymentSchedule (the master object)

Field	Details
PaymentScheduleItemNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The auto-generated reference number for the payment schedule item.
PaymentSource	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The process that created a payment based on the payment schedule item. Valid values are: • External Payment • Payment Run
PaymentsReceived	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The amount that's been received for the payment created for the payment schedule item.
ProcessedAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The amount of the payment schedule item that has been processed for payment and converted to a payment record.
RequestedAmount	**Type** currency **Properties** Create, Filter, Sort, Update **Description** Required. The initial amount of the payment schedule item upon creation.
Status	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The status of the payment schedule item. Valid values are: • `Applied`—The payment schedule item has been successfully applied. • `Apply Failed`—The payment run encountered an error when attempting to process the payment schedule item for payment. For more information, review the payment run's revenue transaction error log. • `Canceled`—The payment schedule item can't be picked up by payment runs for processing. When a user or process changes the item's status to `Canceled`, the item's `CanceledAmount` becomes `RequestedAmount – ProcessedAmount`. • `Draft`—Payment schedule items are created with this status. • `Failed`—The payment run has failed to process the payment schedule item for payment. • `Processed`—The payment run has processed the payment schedule item for payment. • `Processing`–The payment run is processing the payment schedule item for payment. • `Ready for Processing`—The payment schedule item is ready to be processed by a payment run.
`TargetPaymentProcessingDate`	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** Required. The date when the payment run makes a payment request to the payment gateway for the payment schedule item.
`UsageType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The feature using the payment schedule item. Valid value is: • `CollectionPlan`

PaymentTerm

Represents an agreement between a buyer and a seller about when payment is due for an invoice. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
`Description`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Additional details about the payment term.
`IsDefault`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. Indicates whether the payment term is the default term for your Salesforce org (`true`) or not (`false`). The default value is `false`.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime

Field	Details
	Properties Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, and `LastReferenceDate` field is not null, the user accessed this record or list view indirectly.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The name of the payment term. This name appears on the invoice.
`Status`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. Specifies whether the payment term is available for use on invoices. Possible values are: • `Active` • `Draft` • `Inactive` The default value is `Draft`.

PaymentTermItem

Represents configuration of a payment term. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
Description	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Additional details about the payment term item.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, and `LastReferenceDate` field is not null, the user accessed this record or list view indirectly.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The autogenerated name of the payment term item.
PaymentTermId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. The ID of the parent payment term record. This field is a relationship field. **Relationship Name** PaymentTerm

Field	Details
	Relationship Type Master-detail **Refers To** PaymentTerm (the master object)
`PaymentTimeframe`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The period by when the payment is expected. Valid value is: • `Standard`— The payment must be made by the date specified in the payment term. If payment isn't received by the due date, the payment becomes overdue.
`Period`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The number of units in the payment period. Used with the `PeriodUnit` field. For example, to define a payment term of Net 30, enter 30 as the value of the `Period` field and select `Days` as the value of the `PeriodUnit` field.
`PeriodUnit`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The unit of time for the payment period. For example, to define a payment term of Net 30, enter 30 as the value of the `Period` field and select `Days` as the value of the `PeriodUnit` field. The valid value is: • `Days`
`Type`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. Specifies how the payment term and invoice due date are derived.

Field	Details
	Valid values are: • `EOM-Plus-X`—Calculates the invoice due date by adding the `Period` field value to the last day of the month in which the invoice is posted. Available in API version 63.0 and later. • `Period-Based`—Calculates the invoice due date by adding the `Period` field value to the invoice date.

RevenueTransactionErrorLog

Represents the details of errors that occurred during the processing of a request. The error record persists until a new error with the same category, primary record, and, if necessary, related record occurs. This object is available in API version 62.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

You need the Billing Operations User permission set to access this object.

Fields

Field	Details
`AsyncOperationTrackerId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the async operation tracker record created by the request. Async operation tracker records contain information about the status of the asynchronous process initiated by the request. This field is a relationship field. **Relationship Name** AsyncOperationTracker **Refers To** AsyncOperationTracker
`BillingScheduleGroupId`	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The ID of the group related to the billing schedule with errors. This field is available in API version 64.0 and later. This field is a relationship field. **Relationship Name** BillingScheduleGroup **Refers To** BillingScheduleGroup
`Category`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies the context of the source of error. Valid values are: • `ApplyAPI` • AutomatedNegativeInvoiceLineConversion • AutomaticRefunds • `ConvertNegativeInvoiceLineToCredit`—Available in API version 56.0 and later. • `Core Invoice Generation Failure` • `CreditInvoiceAPI` • `CreditMemoRecoveryApi`—Available in API version 66.0 and later. • `CreditTaxIntegrationAPI` • `BulkCurrencyConversion`—Available in API version 66.0 and later. • `InitiateAmendment`—Available in API version 56.0 and later. • `InitiateCancel` • `InitiateRenewal` • `InsufficientAccess`—Insufficient Access to start invoice run. • `InvoiceBatchRun` • `InvoiceBatchRunDebitConversion`—Available in API version 66.0 and later. • `InvoiceBatchRunInvoiceGeneration` • `InvoiceBatchRunPostProcessor` • `InvoiceBatchRunPreProcessor` • `InvoiceBatchRunRecovery` • `InvoiceBatchRunSelectionStep` • `InvoiceBatchRunSplitInvoiceGeneration`—Available in API version 66.0 and later.

Field	Details
	• `InvoiceBatchRunSummarizer` • `InvoiceBatchRunTaxProcessor` • `MaterialLineGeneration`—Available in API version 58.0 and later. • `Invalid Tax API Input` • `Invalid Tax Integration Input` • `LoadSalesRecipientData`—Available in API version 66.0 and later. • `OrderTaxCalculationFailure`—Available in API version 61.0 and later. • `OrderToAsset` • `OrderItemToAsset`—Available in API version 59.0 and later. • `OrderToBillingSchedule` • `PaymentSale` • `PaymentScheduleGeneration`—Available in API version 56.0 and later. • `ProcessAutoQuote`—Available in API version 66.0 and later. • `PstBaseStepFailure`—Available in API version 66.0 and later. • `QuotePriceCalculationFailure`—Available in API version 61.0 and later. • `QuoteTaxCalculationFailure`—Available in API version 61.0 and later. • `QuoteToOrder`—Available in API version 56.0 and later. • `Post Tax API Failure` • `Post-Credit Tax Failure` • `Pre-Credit Tax Failure` • `SetupEnergyAgreement`—Available in API version 66.0 and later. • `StandaloneCreditAPI` • `StatementOfAccountGeneration`—Available in API version 66.0 and later. • `Tax API Failure` • `TransactionToContract`—Available in API version 59.0 and later. • `Unknown Failure`—Available in API version 56.0 and later. • `VoidCreditMemo`—Available in API version 66.0 and later. • `VoidPostedInvoiceAPI`
`ConfiguratorErrorMessage`	**Type** textarea **Properties** Nillable **Description** The text of the error message. This field is available in API version 66.0 and later.
`ErrorCode`	**Type** string

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The error code shown during the request processing, such as INVALID_INPUT.
`ErrorLogNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. An auto-generated unique ID that identifies the error.
`ErrorMessage`	**Type** textarea **Properties** Create **Description** This field contains information about the error and how to resolve it.
`OwnerId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the user who made the request that resulted in the creation of the error log. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
`PrimaryRecord2Id`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the record that's associated with this error. For example, if the error occurred while creating an invoice line from an order line, the primary2 ID is the ID of the order line. This field is available in API version 66.0 and later. This field is a polymorphic relationship field.

Field	Details
	Relationship Name PrimaryRecord2 **Refers To** Account, CreditMemoInvApplication, CreditMemoLine, CreditMemoLineInvoiceLine, CreditMemoLineTax, DebitMemo, DebitMemoLine, InvoiceLine, InvoiceLineTax, LegalEntyAccountingPeriod, Order, PaymentLineInvoice, PaymentLineInvoiceLine, RefundLinePayment
PrimaryRecordId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the record that's associated with this error. For example, if the error occurred while creating an invoice from an order, the primary ID is the ID of the order. This field is a polymorphic relationship field. **Relationship Name** PrimaryRecord **Refers To** Asset, AsyncOperationTracker, BillingBatchScheduler, BillingSchedule, CreditMemo, InvBatchDraftToPostedRun, Invoice, InvoiceBatchRun, InvoiceBatchRunRecovery, Order, OrderItem, RevenueAsyncOperation, RuleLibraryVersion
PrimaryTextRecord	**Type** string **Properties** Create, Filter, Group, Nillable, Sort **Description** The identifier of the primary record associated with the error log. For example, if the error occurred while creating an invoice from an order, the primary text Record ID is the ID of the order. There are two other fields in the same entity, PrimaryRecord and PrimaryRecord2, that are polymorphic fields, so they're limited to storing IDs from objects in their respective domains. Use this text field for all objects. This field is available in API version 63.0 and later.
RelatedRecord2Id	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description Optional. The ID of a record that can provide additional context about the error. For example, if `PrimaryRecord2Id` is the ID of an order, this field could be the ID of an invoice line. This field is available in API version 66.0 and later. This field is a polymorphic relationship field. **Relationship Name** RelatedRecord2 **Refers To** CreditMemoLine, CreditMemoLineInvoiceLine, CreditMemoLineTax, DebitMemo, GeneralLedgerAccount, GeneralLedgerAcctAsgntRule, InvoiceLine, InvoiceLineTax, Payment, PaymentLineInvoice, PaymentLineInvoiceLine, Refund, RefundLinePayment
`RelatedRecordId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of a record that can provide additional context about the error. For example, if `PrimaryRecordId` is the ID of an order, this field could be the ID of an order item. This field is a polymorphic relationship field. **Relationship Name** RelatedRecord **Refers To** Asset, BillingBatchScheduler, BillingSchedule, BillingScheduleGroup, CreditMemo, CreditMemoLine, InvBatchDraftToPostedRun, Invoice, InvoiceBatchRun, InvoiceLine, OrderItem
`Request`	**Type** textarea **Properties** Nillable **Description** Optional. A field providing additional information linking the error with the request. This field is available in API version 66.0 and later.
`RequestIdentifier`	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** A unique ID returned by the request. Use this ID to identify the revenue transaction error log records for a specific request.

Field	Details
`RevenueAsyncOperationId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the revenue async operation record created by the request. Revenue async operation records contain information about the status of the asynchronous process initiated by the request. This field is available in API version 57.0 and later. This field is a relationship field. **Relationship Name** RevenueAsyncOperation **Relationship Type** Lookup **Refers To** RevenueAsyncOperation
`Severity`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** The severity type for the error message. This field is available in API version 66.0 and later. Valid values are: • `Error` • `Warning`

SeqPolicySelectionCondition

Represents the condition used to determine which sequence policy is applied to a record. This object is available in API version 65.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
ConditionNumber	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** Required. A unique number that's assigned to a condition in a sequence policy.
FilterField	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Required. The field used in the filter condition.
FilterFieldType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The data type of the filter field. Valid values are: • Boolean • Currency • Date • DateTime • MultiPicklist • Number • Percent • Picklist • Reference • Text
FilterValue	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Required. The value in the filter condition.

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a sequence policy selection condition record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a sequence policy selection condition record. If this value is null, it's possible that the user only accessed the sequence policy selection condition record or a related list view (LastReferencedDate), but not viewed the sequence policy selection condition record itself.
Operator	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The relational operator used to compare the filter field with the filter value. Valid values are: • Equals • Not Equals
SequencePolicyId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. The parent sequence policy associated with the sequence policy selection condition. Deleting a sequencing policy automatically removes all its associated criteria. This field is a relationship field. **Relationship Name** SequencePolicy **Relationship Type** Master-detail

Field	Details
	Refers To SequencePolicy (the master object)
SequencePolicySelectionConditionName	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The name of the sequence policy selection condition.

Usage

You can create, update, or delete sequence policy selection condition records by using sObject API from API version 67.0 and later.

Create a sequence policy selection condition record by making a POST request to this resource.

```
https://yourInstance.salesforce.com/services/data/v67.0/sobjects/SeqPolicySelectionCondition
```

This example shows a sample request.

```
{
  "SequencePolicyId": "1VdSG00000001fF0AQ",
  "FilterField": "Status",
  "FilterValue": "Draft",
  "Operator": "Equals",
  "ConditionNumber": 1
}
{
  "SequencePolicyId": "1VdSG00000001fF0AQ",
  "FilterField": "Description",
  "FilterValue": "Testing",
  "Operator": "Equals",
  "ConditionNumber": 2
}
```

Update a sequence policy selection condition record record by making a PATCH request to this resource.

```
https://yourInstance.salesforce.com/services/data/v67.0/sobjects/SeqPolicySelectionCondition/id
```

This example shows a sample request.

```
{
 "FilterValue": "654"
}
```

Delete a sequence policy selection condition record by making a DELETE request to this resource.

```
https://yourInstance.salesforce.com/services/data/v67.0/sobjects/SeqPolicySelectionCondition/id
```

SequenceGapReconciliation

Represents a missing sequence value identified during reconciliation, which can be used later to ensure there are no gaps in the sequence policy numbers. This object is available in API version 65.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed sequence gap reconciliation record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a sequence gap reconciliation record. If this value is null, it’s possible that the user only accessed the sequence gap reconciliation record or a related list view (`LastReferencedDate`), but not viewed the sequence gap reconciliation record itself.
`OwnerId`	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The ID of the user who owns a sequence gap reconciliation record. This field is a polymorphic relationship field. **Relationship Name** Owner

Field	Details
	Refers To Group, User
SequenceGapReconciliationNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The reconciled sequence pattern value.
SequencePolicyId	**Type** reference **Properties** Filter, Group, Sort **Description** Required. The parent sequence policy associated with the gap reconciliation. Deleting a sequencing policy automatically removes all its associated criteria. This field is a relationship field. **Relationship Name** SequencePolicy **Refers To** SequencePolicy
SequenceValue	**Type** long **Properties** Filter, Group, Sort **Description** Required. The number that was missed during sequence policy generation.
Status	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The current status of the missed number. Valid values are: • `Assigned` • `Blocked` • `Unassigned` • `Under Review`

SequencePolicy

Represents the configuration of rules and parameters for generating unique, sequential numbers for records. Stores settings such as numbering patterns, prefixes, suffixes, sequence start numbers, increment values, and filter criteria to ensure accurate and compliant numbering. This object is available in API version 65.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Billing Admin permission set to access this object.

Fields

Field	Details
`DateStampFormat`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Required. The format of the stamp date that's appended to the sequence number. Valid values are: • `MM-YYYY`—Month Year (MM-YYYY) • `MM-dd-yyyy`—Month Day Year (MM-DD-YYYY) • `None` • `YYYY`—Year (YYYY) • `YYYY-YY`—Org Fiscal Year (YYYY–YY)
`Description`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Additional details about the sequencing policy.
`EffectiveFromDateTime`	**Type** dateTime **Properties** Create, Filter, Sort, Update

Field	Details
	Description Required. The date and time when the policy becomes effective.
`ExpirationDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time when the policy expires.
`IncrementByNumber`	**Type** long **Properties** Filter, Group, Sort **Description** Required. The sequence number increment value.
`IsActive`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. Indicates whether the policy is active (`true`) or not (`false`). The default value is `false`.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a sequence policy record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a sequence policy record. If this value is null, it's possible that the user only accessed the sequence policy record or a related list view (`LastReferencedDate`), but not viewed the sequence policy record itself.

Field	Details
MaximumSequenceNumber	**Type** long **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The maximum number the sequence number can reach. The maximum width is determined by the maximum sequence number value.
MinimumSequenceNumberWidth	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The minimum number of digits a sequence number must have. For example, if the minimum width is set to 3, sequence numbers appear as 001, 002, and so on. If the maximum sequence number is 99999, the width would be 5 digits.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The name of the sequence policy.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. The ID of the user who owns a sequence policy record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
Prefix	**Type** string **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description A string added to the start of the sequence number.
SelectionLogic	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The logic that determines the records to which the sequence policy applies.
SequenceMode	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. Specifies how sequence numbers are generated. Valid values are: • Basic—Gaps are allowed, such as when a record is canceled or rolled back. • Gapless—Numbers follow one after another with no gaps.
SequencePattern	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Required. The structure of a sequence.
SequenceStartNumber	**Type** long **Properties** Create, Filter, Group, Sort, Update **Description** Required. The starting sequence number.
Suffix	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** A string added to the end of the sequence number.

Field	Details
`TargetObject`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Required. The object to which the policy is applied.
`TimeZone`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The time zone applicable to the date and time related fields of the policy. When not specified, it takes the user's time zone by default. The time zone is shown in Greenwich Mean Time (GMT).

Usage

You can create, update, or delete sequence policy records by using sObject API from API version 67.0 and later.

Create a sequence policy record by making a POST request to this resource.

```
https://yourInstance.salesforce.com/services/data/v67.0/sobjects/SequencePolicy
```

This example shows a sample request.

```
{
  "Name": "Invoice Sequence Policy Testing",
  "Description": "Sequence policy for invoice numbering",
  "TargetObject": "Invoice",
  "SequenceMode": "Gapless",
  "SequencePattern": "IN-{Date}-{SequenceValue}",
  "DateStampFormat": "MM-dd-yyyy",
  "TimeZone": "America/Los_Angeles",
  "IsActive": false,
  "SequenceStartNumber": 1,
  "IncrementByNumber": 1,
  "MaximumSequenceNumber": 99999,
  "MinimumSequenceNumberWidth": 4,
  "EffectiveFromDateTime": "2026-03-01T00:00:00.000Z",
  "ExpirationDateTime": "2027-03-01T00:00:00.000Z"
}
```

Update a sequence policy record by making a PATCH request to this resource.

```
https://yourInstance.salesforce.com/services/data/v67.0/sobjects/SequencePolicy/id
```

This example shows a sample request.

```
{
  "Description": "Sequence policy for invoice numbering testing",
  "IsActive": true,
  "MaximumSequenceNumber": 88888
}
{
  "SelectionLogic": "1 AND 2"
}
```

Delete a sequence policy record by making a DELETE request to this resource.

```
https://yourInstance.salesforce.com/services/data/v67.0/sobjects/SequencePolicy/id
```

TaxEngine

Represents information about an instance of a tax engine provider as well as the merchant credentials for that specific instance. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Tax Admin permission set to access this object.

Fields

Field	Details
Description	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** The description of an instance of the tax engine provider and merchant credential.
ExternalReference	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update **Description** Information about the external platform used for the tax engine.

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a tax engine record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a tax engine record. If this value is null, it's possible that the user only accessed the tax engine record or a related list view (LastReferencedDate), but not viewed the tax engine record itself.
MerchantCredentialId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Required. The merchant credential setup object in Salesforce. The Tax Calculation API sends the merchant credential's information to the external tax engine that's used for tax calculation. This field is a relationship field. **Relationship Name** MerchantCredential **Refers To** NamedCredential
SellerCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Required. The seller code of the transaction for which the tax engine integration log was captured.
ShouldCaptureTaxesAtHeader	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description Required. Indicates whether taxes are captured at the header level (`true`) or not (`false`). The default value is `false`. Available in API version 66.0 and later.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The status of the tax engine record. Valid values are: • `Active` • `Inactive`
`TaxEngineAddress`	**Type** address **Properties** Filter **Description** Required. The compound form of the tax engine address. See Address Compound Fields for details on compound address fields. This field is a read-only field.
`TaxEngineName`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The name of the tax engine record.
`TaxEngineProviderId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Required. The tax engine provider that's related to the tax engine record. This field is a relationship field. **Relationship Name** TaxEngineProvider

Field	Details
	Refers To TaxEngineProvider
TaxPrvdAccountIdentifier	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The unique identifier of the external tax provider's account. Available in API version 63.0 and later.
Type	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type of the tax engine that's used to calculate tax. Valid values are: • CommerceTaxExtension • RevenueCloudTaxExtension • StandardTaxEngine • RevenueStandardTaxEngine—Available in API version 66.0 and later. • StripeNative Available in API versions 63.0 and later.

TaxEngineInteractionLog

Represents a record of a communication with an external tax engine following a tax calculation request. This object is available in API version 62.0 and later.

Supported Calls

delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), undelete()

Special Access Rules

You need the Tax Admin permission set to access this object.

Fields

Field	Details
Description	**Type** textarea **Properties** Filter, Nillable, Sort **Description** Additional details about the tax engine interaction log.
DocumentCode	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Document code of the transaction for which the tax engine integration log was captured.
EffectiveDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date that the tax engine request takes effect. This date is available for reference and bookkeeping only and doesn't have any impact on tax calculation.
InteractionHttpStatusCode	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The HHTP result code of the external callout made to a third-party tax engine provider. Refer to your third-party tax engine provider's documentation for details about the specific codes returned.
InteractionType	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Indicates the type of request made to the tax engine. Valid value is: • `CalculateTax`

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a tax engine interaction log record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a tax engine interaction log record. If this value is null, it's possible that the user only accessed the tax engine interaction log record or a related list view (`LastReferencedDate`), but not viewed the tax engine interaction log record itself.
ReferenceEntity	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The record on which tax was calculated.
RequestBody	**Type** base64 **Properties** Nillable **Description** The content of the tax calculation API request.
RequestContentType	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of data passed in the request. For example, `application/html` or `text/csv`.
RequestLength	**Type** int

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The character length of text within the request body.
`RequestName`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The name of the request.
`RequestTaxTransactionType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of tax transaction request sent to the tax engine provider. Available in API version 65.0 and later. Valid values are: • `Credit` • `Debit` • `VoidOrCredit` • `VoidOrDebit`
`ResponseContentType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The method used to deliver the tax calculation API response, such as `application/html` or `text/vnd.salesforce.quip-template`.
`ResponseLength`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The character length of text within the response body.

Field	Details
ResponseName	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The name of the response from the tax engine.
ResponseTaxTransactionType	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of tax transaction response received from the tax engine provider. Available in API version 65.0 and later. Valid values are: • Credit • Debit • Void
ResultCode	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The code describing the result of the request. Valid values are: • AdapterException • ReferenceDocumentCodeMissing • Success • TaxEngineError • ValidationError
TaxEngineId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the tax engine used in the tax calculation process. This field is a relationship field.

Field	Details
	Relationship Name TaxEngine **Refers To** TaxEngine
`TaxEngineInteractionLogNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** A system-generated number for a log entry.

TaxEngineProvider

Represents general information about a service that manages a tax engine. Tax engine providers have a one-to-many relationship with tax engines, where the tax engine record represents a specific configuration of a tax engine that can be assigned to multiple order items. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

You need the Tax Admin permission set to access this object.

Fields

Field	Details
`ApexAdapterId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the Apex adapter used by the tax provider. This field is unique within your organization. This field is a relationship field. **Relationship Name** ApexAdapter **Refers To** ApexClass

Field	Details
CustomMetadataTypeApiName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The API name of the custom metadata type that defines field mappings for tax callout requests and responses. The custom metadata type name is referenced by the tax engine provider to identify the metadata configuration to use. Available in API version 65.0 and later.
Description	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Additional details about the tax engine provider.
DeveloperName	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Required. The API name for the tax engine provider record.
Language	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The language used by the tax engine provider. Values appear based on their language codes in Salesforce, such as `da` for Danish or `th` for Thai.
MasterLabel	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The label used for the tax engine's API in Salesforce.
NamespacePrefix	**Type** string **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The Apex namespace prefix of the API used for the tax engine.

TaxPolicy

Represents information about a group of tax treatments, where each treatment represents parameters to determine how a particular product is taxed for a transaction line item. Tax policies are related to products, which pass the policy on to the resulting order items and in turn the billing schedules. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Tax Admin permission set to access this object.

Fields

Field	Details
`DefaultTaxTreatmentId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the default tax treatment record. When you order a product, the order product, and in turn the billing schedule receives this tax treatment. This field is a relationship field. **Relationship Name** DefaultTaxTreatment **Refers To** TaxTreatment
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Additional details about the tax policy.

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed an invoice batch draft to posted run record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a tax policy record. If this value is null, it's possible that the user only accessed the tax policy record or a related list view (LastReferencedDate), but not viewed the tax policy record itself.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The name of the tax policy.
Status	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The status of the tax policy. To calculate tax for order products, products must have an active tax policy. Tax policies are created with a Draft status before being assigned to a product or order product. After activating a tax policy, you can't edit certain policy fields. Valid values are: • Active • Draft • Inactive
TreatmentSelection	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update

Field	Details
	Description Required. Specifies the selection of tax treatments to billing schedules that are related to the tax policy. Valid values are: • Default —Billing schedules receive the tax treatment defined in the tax policy's `DefaultTreatmentId` field. • `LegalEntity`—Billing schedules receive the tax treatment based on matching legal entities between itself and the tax treatment. • `Manual`—Billing schedules don't receive tax treatments based on the tax policy. You must specify the treatment.

TaxTreatment

Represents information about tax calculation by external engines. Each product requires a tax policy to determine whether to apply tax. Each tax policy requires at least one tax treatment. The tax treatments determine how taxable products are taxed. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Tax Admin permission set to access this object.

Fields

Field	Details
`Description`	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Additional details about the tax treatment.
`IsTaxable`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description Required. Indicates whether to calculate tax for the order items covered by the tax treatment (`true`) or not (`false`). When this value is `true`, the CalculateTax API is called for the order item during the order item's creation. The default value is `false`.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a tax treatment record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a tax treatment record. If this value is null, it's possible that the user only accessed the tax treatment record or a related list view (`LastReferencedDate`), but not viewed the tax treatment record itself.
`LegalEntityId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the legal entity record that's related to the tax treatment. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The name of the tax treatment.

Field	Details
`ProductCode`	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update **Description** The code of the product that the tax treatment applies to.
`ProductId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the product that the tax treatment applies to. This field is a relationship field. **Relationship Name** Product **Refers To** Product2
`ShouldUseTaxTreatmentItems`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. Indicates whether the tax codes and product codes of the related tax treatment items must be used when requesting tax calculations (`true`) or not (`false`). The default value is `false`. The tax code and product code of the tax treatment are ignored by default. Available in API version 66.0 and later.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The status of the tax treatment record. Valid values are: • `Active` • `Draft` • `Inactive`

Field	Details
`TaxCode`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The reference code that's used when an external tax engine calculates tax.
`TaxEngineId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the tax engine record that's related to the tax treatment. When tax is calculated for an order item, the tax engine that's related to order item's tax treatment is used. If the tax treatment's `IsTaxable` field value is `True`, the treatment requires a tax engine. This field is a relationship field. **Relationship Name** TaxEngine **Refers To** TaxEngine
`TaxPolicyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the tax treatment's parent tax policy. This field is a relationship field. **Relationship Name** TaxPolicy **Refers To** TaxPolicy

Tax Treatment Item

Represents tax code information that's used to calculate tax for a product by a specific tax engine. This object is available in API version 66.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Billing Admin permission set or Tax Admin permission set to access this object.

Fields

Field	Details
`Description`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Additional details about the tax treatment item.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a tax treatment item record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a tax treatment item record. If this value is null, it's possible that the user only accessed the tax treatment item record or a related list view (`LastReferencedDate`), but not viewed the tax treatment item record itself.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The name of the tax treatment item.

Field	Details
ProductCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The code of the product that the tax treatment item applies to.
ProductId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Required. The ID of the product that the tax treatment item applies to. This field is a relationship field. **Relationship Name** Product **Refers To** Product2
TaxCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The reference code that's used when an external tax engine calculates tax.
TaxTreatmentId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. The parent tax treatment associated with the tax treatment item record. This field is a relationship field. **Relationship Name** TaxTreatment **Relationship Type** Master-detail **Refers To** TaxTreatment (the master object)

Billing Fields on Standard Objects

Billing adds standard fields to some standard Salesforce objects of other features to represent information specific to Billing. These fields are available only in orgs where Billing is enabled.

Billing Fields on AccountBillingAccount

Standard fields extend the AccountBillingAccount object for use in Billing to represent information about default billing accounts. This object is available in API version 63.0 and later.

Billing Fields on BillingAccount

Standard fields extend the BillingAccount object for use in Billing to represent information about the billing suspension date and the billing resumption date. This object is available in API version 63.0 and later.

Billing Fields on CollectionPlan

Standard fields extend the CollectionPlan object for use in Billing to represent information about the total invoice balance. This object is available in API version 64.0 and later.

Billing Fields on CollectionPlanItem

Standard fields extend the CollectionPlanItem object for use in Billing to represent information about the invoice balance. This object is available in API version 64.0 and later.

Billing Fields on ExpressionSet

Standard fields extend the ExpressionSet object for use in Billing. These fields represent information about an expression set that performs a series of calculations by using lookups and user-defined variables and constants to calculate taxes. This object is available in API version 66.0 and later.

Billing Fields on Dispute

Represents the details of a billing dispute that involves one invoice and one or more disputed invoice lines. The details include the disputed amount, the approved amount, and the dispute type, subtype and status. This object is available in API version 66.0 and later.

Billing Fields on DisputeItem

Represents a specific invoice line or charge that's being disputed. The details include the total transaction amount, transaction date, disputed amount, reason, and status of the dispute. This object is available in API version 66.0 and later.

Billing Fields on Payment

Standard fields extend the Payment object for use in Billing to represent information about corporate currency, transaction amounts in corporate currency, and accounting periods for legal entities. This object is available in API version 64.0 and later.

Billing Fields on PaymentLineInvoice

Standard fields extend the PaymentLineInvoice object for use in Billing to represent information about legal entities and legal entity accounting periods. This object is available in API version 64.0 and later.

Billing Fields on Refund

Standard fields extend the Refund object for use in Billing to represent information about corporate currency, transaction amounts in corporate currency, and accounting periods for legal entities. This object is available in API version 64.0 and later.

Billing Fields on RefundLinePayment

Standard fields extend the Refund Line Payment object for use in Billing to represent information about accounting periods for legal entities. This object is available in API version 64.0 and later.

Billing Fields on TaxRate

Standard fields extend the TaxRate object for use in Billing. These fields represent information about the tax rate for a transaction that's determined by the applicable tax code and country. This object is available in API version 66.0 and later.

[Billing Fields on TransactionJournal]
Standard fields extend the TransactionJournal object for use in Billing to represent information about the general ledger accounts for billing transactions. This object is available in API version 63.0 and later.

Billing Fields on AccountBillingAccount

Standard fields extend the AccountBillingAccount object for use in Billing to represent information about default billing accounts. This object is available in API version 63.0 and later.

Supported Calls

`describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search()`

Special Access Rules

You need the Billing Admin permission set, Billing Operations User permission set, or Billing Customer Service User permission set access to this object.

Fields

Field	Details
`IsDefaultBillingAccount`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the account is the default billing account (`true`) or not (`false`). The default value is `false`.

SEE ALSO:

Energy and Utilities Cloud Developer Guide: AccountBillingAccount

Billing Fields on BillingAccount

Standard fields extend the BillingAccount object for use in Billing to represent information about the billing suspension date and the billing resumption date. This object is available in API version 63.0 and later.

Supported Calls

`describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search()`

Special Access Rules

You need the Billing Admin permission set, Billing Operations User permission set, or Billing Customer Service User permission set access to this object.

Fields

Field	Details
AccountID	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Specifies the account that's related to the billing account. Available in API version 65.0 and later. This field is a relationship field. **Relationship Name** Account **Refers To** Account
AddTaxIdentificationDetails	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The additional tax identification details, such as a Peppol ID. Available in API version 66.0 and later.
BillDayOfMonth	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A number from 1 to 31 that indicates the billing date. Available in API version 64.0 and later.
BillToContactId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The contact associated with the billing account. Available in API version 64.0 and later. This field is a relationship field.

Field	Details
	Relationship Name BillToContact **Refers To** Contact
BillingResumptionDate	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date when billing for the account is resumed.
BillingSuspensionDate	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The date when billing for the account is suspended.
DeliveryTerms	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The standard code in internal trades used to define shipping responsibilities. Valid values are: • CFR • CIF • CIO • CPT • CUS • DAF • DAP • DDP • DDU • DEQ • DES • DPU • EXW • FAS

Field	Details
	• FCA • FOB • SUP The default value is USD. Available in API version 66.0 and later.
DoesSkipAutomaticPayments	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether to skip the automatic creation of payment schedules and payment schedule items for posted invoices related to billing accounts (true) or not (false). This boolean value is considered when the automatic creation of payment schedules and payment schedule items is turned on. Available in API version 65.0 and later.
EmailTemplateId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The template used for sending billing account emails. Available in API version 65.0 and later. This field is a relationship field. **Relationship Name** EmailTemplate **Refers To** Email template
InvoiceDocumentTemplateId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The document template that's used to generate PDF documents for the invoices that are related to the billing account. Available in API version 66.0 and later. This field is a relationship field. **Relationship Name** InvoiceDocumentTemplate **Refers To** DocumentTemplate

Field	Details
`IsDefaultBillingProfile`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the billing account is the default billing profile (`true`) or not (`false`). Available in API version 65.0 and later.
`PaymentTermId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The payment term associated with the billing account. Available in API version 64.0 and later. This field is a relationship field. **Relationship Name** PaymentTerm **Refers To** PaymentTerm
`SavedPaymentMethodId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The saved payment method that's used to collect payments for the default billing profile of an account when the automatic creation of payment schedules and payment schedule items is turned on. Available in API version 65.0 and later. This field is a relationship field. **Relationship Name** SavedPaymentMethod **Refers To** SavedPaymentMethod
`ShippingAddress`	**Type** address **Properties** Filter, Nillable **Description** The shipping address of the billing account. Available in API version 64.0 and later.

Field	Details
ShouldAttachInvoiceDocToEmail	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether to attach the invoice PDF document to the email that's sent to the billing account. Available in API version 65.0 and later. The default value is false.
TaxExemptionExpirationDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date until which the tax exemption is valid. Available in API version 66.0 and later.
TaxExemptionNumber	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** A unique identifier used to indicate that a transaction is tax exempt. Available in API version 66.0 and later.
TaxExemptionStatus	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The status of the tax exemption with values defined by the user. Available in API version 66.0 and later.
TaxIdentificationNumber	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The tax identification number such as a VAT ID. Available in API version 66.0 and later.

Billing Fields on CollectionPlan

Standard fields extend the CollectionPlan object for use in Billing to represent information about the total invoice balance. This object is available in API version 64.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Revenue Cloud Billing license, and the Billing Collections and Recovery Specialist permission set to access this object.

Fields

Field	Details
`TotalInvoiceBalance`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of all invoice balances for collection plan items associated with the collection plan.
OverdueRiskIndicator	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Indicates the overdue risk level for the collection plan. Available in API version 67.0 and later. Valid values are: • `Low` • `Medium` • `High`

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

CollectionPlanChangeEvent on page 2864
Change events are available for the object.

CollectionPlanFeed on page 2866
Feed tracking is available for the object.

CollectionPlanHistory on page 2873
History is available for tracked fields of the object.

CollectionPlanShare on page 2877
Sharing is available for the object.

Billing Fields on CollectionPlanItem

Standard fields extend the CollectionPlanItem object for use in Billing to represent information about the invoice balance. This object is available in API version 64.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Revenue Cloud Billing license, and the Billing Collections and Recovery Specialist permission set to access this object.

Fields

Field	Details
`InvoiceBalance`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The balance amount of the invoice associated with the collection plan item.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

CollectionPlanItemChangeEvent on page 2864
Change events are available for the object.

CollectionPlanItemFeed on page 2866
Feed tracking is available for the object.

CollectionPlanItemHistory on page 2873
History is available for tracked fields of the object

Industries Common Resources Developer Guide: CollectionPlanItem

Billing Fields on ExpressionSet

Standard fields extend the ExpressionSet object for use in Billing. These fields represent information about an expression set that performs a series of calculations by using lookups and user-defined variables and constants to calculate taxes. This object is available in API version 66.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`UsageType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. The Revenue Standard Tax Calculation value that's using the expression set to calculate taxes.

Billing Fields on Dispute

Represents the details of a billing dispute that involves one invoice and one or more disputed invoice lines. The details include the disputed amount, the approved amount, and the dispute type, subtype and status. This object is available in API version 66.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Revenue Cloud Billing license, and the Billing Operations User or the Billing Customer Service User permission set to access this object.

Fields

Field	Details
InvoiceId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The invoice ID associated with the dispute. This field is a relationship field. **Relationship Name** Invoice **Refers To** Invoice
RevisedDueDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The revised due date for the invoice.
BillingSuspensionDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when billing for the account is suspended.
BillingResumptionDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when billing for the account is resumed.
RevisedBillToContact	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The revised billing contact for the invoice.

Field	Details
	This field is a relationship field. **Relationship Name** Contact **Refers To** Contact
`ResolutionAction`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The action taken to resolve the dispute. Valid values are: • `Resolve with No Action` • `Issue Credit Memo`
`ResolutionActionStatus`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The status of the resolution action. Valid values are: • `In Progress` • `Closed` • `Error`
`MaySetContactAsDefault`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the revised billing contact is set as default for future invoices (`true`) or not (`false`). The default value is `false`.
`UsageType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

Field	Details
	Description Specifies the name of the cloud or function that uses the Dispute object. Valid value is `Billing`.

SEE ALSO:

Financial Services Cloud Developer Guide: Dispute

Billing Fields on DisputeItem

Represents a specific invoice line or charge that's being disputed. The details include the total transaction amount, transaction date, disputed amount, reason, and status of the dispute. This object is available in API version 66.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Revenue Cloud Billing license, and the Billing Operations User or the Billing Customer Service User permission set to access this object.

Fields

Field	Details
`ApprovedAmount`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The amount that's approved to be credited to the customer.
`InvoiceLineId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The invoice line ID associated with the dispute. This field is a relationship field.

Field	Details
	Relationship Name Invoice Line **Refers To** Invoice Line

SEE ALSO:

Financial Services Cloud Developer Guide: DisputeItem

Billing Fields on Payment

Standard fields extend the Payment object for use in Billing to represent information about corporate currency, transaction amounts in corporate currency, and accounting periods for legal entities. This object is available in API version 64.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Revenue Cloud Billing license, and the Payment Admin permission set or the Payment Operations User permission set to access this object.

Fields

Field	Details
`CorporateCurrencyCnvAmount`	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The payment amount in corporate currency.
`CorporateCurrencyCvsnDate`	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The date on which the payment amount is converted into corporate currency.

Field	Details
CorporateCurrencyCvsnRate	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The exchange rate that's used to convert the payment amount into corporate currency.
CorporateCurrencyIsoCode	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The currency ISO code of the corporate currency.
FunctionalCurrencyCnvAmount	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The amount value in functional currency. Available in API version 66.0 and later.
FunctionalCurrencyCvsnDate	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The date on which the amount value is converted into functional currency. Available in API version 66.0 and later.
FunctionalCurrencyCvsnRate	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The exchange rate that's used to convert the amount value into functional currency. Available in API version 66.0 and later.
FunctionalCurrencyIsoCode	**Type** string **Properties** Filter, Group, Nillable, Sort, Update

Field	Details
	Description The ISO code of the functional currency. Available in API version 66.0 and later.
`LegalEntityAccountingPeriodId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity accounting period related to the payment. This field is a relationship field. **Relationship Name** LegalEntityAccountingPeriod **Refers To** LegalEntityAccountingPeriod
`LegalEntityId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity related to the payment. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

PaymentFeed on page 2866
Feed tracking is available for the object.

Billing Fields on PaymentLineInvoice

Standard fields extend the PaymentLineInvoice object for use in Billing to represent information about legal entities and legal entity accounting periods. This object is available in API version 64.0 and later.

Supported Calls

`create()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

You need the Revenue Cloud Billing license, and the Payment Admin permission set or the Payment Operations User permission set to access this object.

Fields

Field	Details
`LegalEntityAccountingPeriodId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity accounting period related to the payment line invoice. This field is a relationship field. **Relationship Name** LegalEntityAccountingPeriod **Refers To** LegalEntyAccountingPeriod
`LegalEntityId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity related to the payment line invoice. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity

SEE ALSO:

Object Reference for the Salesforce Platform: PaymentLineInvoice

Billing Fields on Refund

Standard fields extend the Refund object for use in Billing to represent information about corporate currency, transaction amounts in corporate currency, and accounting periods for legal entities. This object is available in API version 64.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Revenue Cloud Billing license, and the Payment Admin permission set or the Payment Operations User permission set to access this object.

Fields

Field	Details
`CorporateCurrencyCnvAmount`	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The refund amount in corporate currency.
`CorporateCurrencyCvsnDate`	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The date on which the refund amount is converted into corporate currency.
`CorporateCurrencyCvsnRate`	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The exchange rate that's used to convert the refund amount into corporate currency.
`CorporateCurrencyIsoCode`	**Type** string **Properties** Filter, Group, Nillable, Sort, Update

Field	Details
	Description The currency ISO code of the corporate currency.
FunctionalCurrencyCnvAmount	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The amount value in functional currency. Available in API version 66.0 and later.
FunctionalCurrencyCvsnDate	**Type** date **Properties** Filter, Group, Nillable, Sort, Update **Description** The date on which the amount value is converted into functional currency. Available in API version 66.0 and later.
FunctionalCurrencyCvsnRate	**Type** double **Properties** Filter, Nillable, Sort, Update **Description** The exchange rate that's used to convert the amount value into functional currency. Available in API version 66.0 and later.
FunctionalCurrencyIsoCode	**Type** string **Properties** Filter, Group, Nillable, Sort, Update **Description** The ISO code of the functional currency. Available in API version 66.0 and later.
LegalEntityAccountingPeriodId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity accounting period related to the refund. This field is a relationship field.

Field	Details
	Relationship Name LegalEntityAccountingPeriod **Refers To** LegalEntityAccountingPeriod
`LegalEntityId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity related to the refund. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity

SEE ALSO:

Object Reference for the Salesforce Platform: Refund

Billing Fields on RefundLinePayment

Standard fields extend the Refund Line Payment object for use in Billing to represent information about accounting periods for legal entities. This object is available in API version 64.0 and later.

Special Access Rules

You need the Revenue Cloud Billing license, and the Payment Admin permission set or the Payment Operations User permission set to access this object.

Fields

Field	Details
`LegalEntityAccountingPeriodId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity accounting period related to the refund. This field is a relationship field.

Field	Details
	Relationship Name LegalEntityAccountingPeriod **Refers To** LegalEntityAccountingPeriod
`LegalEntityId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity related to the refund. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity

Billing Fields on TaxRate

Standard fields extend the TaxRate object for use in Billing. These fields represent information about the tax rate for a transaction that's determined by the applicable tax code and country. This object is available in API version 66.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Billing Admin permission set or Tax Admin permission set access to this object.

Fields

Field	Details
`ApplicationBasis`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies whether the tax rate is applied on the net or gross amount.

Field	Details
	Valid values are: • `Gross` • `Net` The default value is `Gross`.
`City`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The city to which the tax rate applies.
`Country`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The country name that's derived from the `GeoCountry` field value. This field is a calculated field.
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The currency ISO code that's applicable to the tax rate.
`EndDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date until when the tax rate is valid.
`FlatTaxAmount`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The flat tax amount that's applied to the transaction.

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed a tax rate record indirectly, for example, through a list view or related record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed a tax rate record. If this value is null, it’s possible that the user only accessed the debit memo line tax record or a related list view (LastReferencedDate), but not viewed the debit memo line tax record itself.
LegalEntityId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The legal entity to which the tax rate applies. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The name of the invoice line.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description Required. The ID of the user who owns a TaxRate record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
ProductCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The code of the product for which the tax rate applies.
RateUsageType	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies whether the tax rate is created for Commerce or Revenue Cloud. Valid values are: • Commerce • RevCloud The default value is Commerce.
StartDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date from when the tax rate is valid.
State	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The state name that’s derived from the GeoState field value. This field is a calculated field.

Field	Details
ZipCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The postal or ZIP code to which the tax rate applies.

Billing Fields on TransactionJournal

Standard fields extend the TransactionJournal object for use in Billing to represent information about the general ledger accounts for billing transactions. This object is available in API version 63.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

You need the Revenue Cloud Billing license and the Accounts Receivables Admin permission set to access this object.

Fields

Field	Details
ActivityDate	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The date and time when a billing transaction record is posted or processed.
Credit	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The transaction record amount when a credit general ledger account is specified.
CreditGeneralLedgerAccountId	**Type** reference

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the general ledger account for a debit transaction that's related to the transaction journal. This field is a relationship field. **Relationship Name** CreditGeneralLedgerAccount **Refers To** GeneralLedgerAccount
`Debit`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The transaction record amount when a debit general ledger account is specified.
`DebitGeneralLedgerAccountId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the General Ledger (GL) Treatment based on which transaction journals must be generated for the billing transaction. This field is a relationship field. **Relationship Name** DebitGeneralLedgerAccount **Refers To** GeneralLedgerAccount
`ForeignExchangeGainOrLossType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies the type of foreign exchange gain or loss for the transaction journal. This field is available in API version 65.0 and later. Valid values are: • `Realized` • `Unrealized`

Field	Details
	• `UnrealizedReversal`
`GeneralLedgerAcctAsgntRuleId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The general ledger account assignment rule used to assign general ledger accounts to transaction journals that's created for billing transactions. This field is a relationship field. **Relationship Name** GeneralLedgerAcctAsgntRule **Refers To** GeneralLedgerAcctAsgntRule
`GenlLdgrJournalEntryRuleId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The general ledger journal entry rule used to assign general ledger accounts to transaction journals created for billing transactions. This field is available in API version 65.0 and later. This field is a relationship field. **Relationship Name** GenlLdgrJournalEntryRule **Refers To** GeneralLedgerJrnlEntryRule
`LegalEntityId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The legal entity that's related to the transaction journal. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity

Field	Details
ReferenceTransactionRecordId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The transaction record for which the transaction journal is created. This field is a polymorphic relationship field. **Relationship Name** ReferenceTransactionRecord **Refers To** CreditMemo, CreditMemoInvApplication, CreditMemoLine, CreditMemoLineInvoiceLine, CreditMemoLineTax, Invoice, InvoiceLine, InvoiceLineTax, Payment, PaymentLineInvoice, PaymentLineInvoiceLine, Refund
TransactionType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The transaction type that's related to the transaction journal. Valid values are: • CreditMemo • CreditMemoInvApplication • CreditMemoLine • CreditMemoLineTax • CreditMemoLineInvoiceLine • DebitMemoLine—Available in API version 65.0 and later. • Invoice • InvoiceLine • InvoiceLineTax • Payment—Available in API version 64.0 and later. • PaymentLineInvoice—Available in API version 64.0 and later. • PaymentLineInvoiceLine—Available in API version 64.0 and later. • Refund—Available in API version 64.0 and later. • RefundLine—Available in API version 64.0 and later.
UniqueIdentifier	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description An auto-generated identifier for the transaction journal when the usage type is Billing. The identifier is a combination of the reference transaction record ID, the general ledger account assignment rule ID, and other internal-only fields.
`UsageType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of usage. Valid value is: • `Billing`

Salesforce Payments Objects in Billing

Billing provides access to some standard Salesforce Payments objects that you can use to authorize payments, connect to an external payment gateway, group all the payment transactions that are processed for a particular transaction, and store payment methods. You can access these objects with the Revenue Cloud Billing license.

For more information about these Salesforce Payments objects, refer to these resources.

- PaymentAuthAdjustment
- PaymentAuthorization
- PaymentGateway
- PaymentGatewayLog
- PaymentGatewayProvider
- PaymentGroup
- PaymentMethod

Billing Platform Events

Salesforce publishes standard platform events in response to an action that occurred in the org or to report errors. For example, the InvoiceProcessedEvent platform event sends notification to the customer when the billing invoice activity is complete. You can subscribe to a standard platform event by using the subscription mechanism that the event supports.

[BillingScheduleCreatedEvent]
Notifies subscribers when the `/commerce/invoicing/billing-schedules/actions/create` request is complete. This object is available in API version 63.0 and later.

[CreditInvoiceProcessedEvent]
Represents the notification to the customers after the process initiated by the `/commerce/invoicing/invoices/{invoiceId}/actions/credit` request is complete. This object is available in API version 62.0 and later.

[CreditMemoProcessedEvent]
Represents the notification to the customers after the process initiated by the `/commerce/invoicing/credit-memos` request is complete. This object is available in API version 62.0 and later.

[InvoiceProcessedEvent]
Represents the notification to the customers after the process started by the `/commerce/billing/invoices` request is complete. The process groups billing schedules by grouping keys and creates one invoice per grouping key. The `InvoiceProcessedEvent` platform event is a top-level object that contains a list of `InvoiceProcessedDetailEvents` platform events, where each detail event represents an attempt to create one invoice. This object is available in API version 62.0 and later.

[NegInvcLineProcessedEvent]
Represents the notification to the customers when a negative invoice line is converted to a credit memo This object is available in API version 62.0 and later.

[SequenceAssignedEvent]
Represents the notification to customers about the assignment of a sequence to a target record. This process is initiated by the `/sequences/actions/assign` request. This object is available in API version 65.0 and later.

[VoidInvoiceProcessedEvent]
Represents the notification to the customers after the process started by the `/commerce/invoicing/invoices/{invoiceId}/actions/void` request is complete. The request attempts to void an invoice by crediting an invoice and changing its status to `Voided`, which prevents further changes. This object is available in API version 62.0 and later.

BillingScheduleCreatedEvent

Notifies subscribers when the `/commerce/invoicing/billing-schedules/actions/create` request is complete. This object is available in API version 63.0 and later.

Fields

Field	Details
`BillingScheduleCreatedEventDetail`	**Type** BillSchdCreatedEventDetail on page 2434 **Properties** Nillable **Description** One `BillingScheduleCreatedEventDetail` entry is created for each order item in the `BillingScheduleCreatedEvent` request. One `BillSchdCreatedEventDetail` entry is created for each error that occurred.
`CorrelationIdentifier`	**Type** string **Properties** Nillable **Description** Reserved for future use.
`EventUuid`	**Type** string **Properties** Nillable **Description** A universally unique identifier (UUID) that identifies a platform event message.

Field	Details
`ReplayId`	**Type** string **Properties** Nillable **Description** Represents an ID value that is populated by the system and refers to the position of the event in the event stream. Replay ID values aren’t guaranteed to be contiguous for consecutive events. A subscriber can store a replay ID value and use it on resubscription to retrieve missed events that are within the retention window.
`RequestIdentifier`	**Type** string **Properties** Nillable **Description** ID returned in the `CreateBillingScheduleFromOrderItem` response. Use this ID to identify the `BillingScheduleCreatedEvent` for a specific request.

BillSchdCreatedEventDetail
Contains details about each order item in the `/commerce/invoicing/billing-schedules/actions/create` request and any errors that occurred while processing the request. This object is included in an `BillingScheduleCreatedEvent` message. You can't subscribe to the `BillSchdCreatedEventDetail` platform event directly. This object is available in API version 63.0 and later.

BillSchdCreatedEventDetail

Contains details about each order item in the `/commerce/invoicing/billing-schedules/actions/create` request and any errors that occurred while processing the request. This object is included in an `BillingScheduleCreatedEvent` message. You can't subscribe to the `BillSchdCreatedEventDetail` platform event directly. This object is available in API version 63.0 and later.

Supported Calls

`describeSObjects()`

Special Access Rules

This object is available when Billing is enabled in your org.

Fields

Field	Details
`BillingScheduleId`	**Type** reference **Properties** Nillable **Description** If the request was successful, this field contains the ID of the billing schedule for the order item. This field is a relationship field. **Relationship Name** BillingSchedule **Refers To** BillingSchedule
`ErrorCode`	**Type** string **Properties** Nillable **Description** If the request wasn't successful, this field contains the error code.
`ErrorMessage`	**Type** string **Properties** Nillable **Description** If the request wasn't successful, this field contains the error message.
`EventUuid`	**Type** string **Properties** Nillable **Description** A universally unique identifier (UUID) that identifies a platform event message.
`IsSuccess`	**Type** boolean **Properties** Defaulted on create

Field	Details
	Description Indicates whether the request to create a billing schedule for the order item is successful (`true`) or not (`false`). The default value is `false`.
`OrderItemId`	**Type** reference **Properties** **Description** The ID of the order item used in the `/actions/standardCreateBillingScheduleFromOrderItem` REST request. This field is a relationship field. **Relationship Name** OrderItem **Refers To** OrderItem

CreditInvoiceProcessedEvent

Represents the notification to the customers after the process initiated by the `/commerce/invoicing/invoices/{invoiceId}/actions/credit` request is complete. This object is available in API version 62.0 and later.

Fields

Field	Details
CorrelationIdentifier	**Type** string **Properties** Nillable **Description** Reserved for future use.
CrMemoProcessErrDtlEvents	**Type** CrMemoProcessErrDtlEvent[] **Properties** Nillable **Description** A compilation of error messages and error codes for a failed request. See the `ErrorDetails` field for error messages and error codes.
CreditMemoId	**Type** reference **Properties** Nillable **Description** The credit memo created as the result of a successful request. This field is a relationship field. **Relationship Name** CreditMemo **Refers To** CreditMemo
ErrorDetails	**Type** string **Properties** Nillable

Field	Details
	Description If the request fails, this field shows error messages, error codes, and the ID of the record on which the errors occurred.
`EventUuid`	**Type** string **Properties** Nillable **Description** A universally unique identifier (UUID) that identifies a platform event message.
`InvoiceId`	**Type** reference **Properties** Nillable **Description** The invoice credited as the result of a successful request. This field is a relationship field. **Relationship Name** Invoice **Refers To** Invoice
`IsSuccess`	**Type** boolean **Properties** Defaulted on create **Description** Required. Indicates whether the request was successful (`true`) or not (`false`). The default value is `false`.
`ReplayId`	**Type** string **Properties** Nillable **Description** An ID value that's populated by the system and refers to the position of the event in the event stream. Replay ID values aren't guaranteed to be contiguous for consecutive events. A subscriber can store a replay ID value and use it on resubscription to retrieve missed events that are within the retention window.

Field	Details
RequestIdentifier	**Type** string **Properties** Nillable **Description** The unique ID returned in the response. Use this ID to identify the event for a specific request.

[CrMemoProcessErrDtlEvent](#)

Represents the information about errors that occurred while creating or applying a credit memo as part of a request. This object is included in a `CreditInvoiceProcessedEvent`, `CreditMemoProcessedEvent`, `NegInvcLineProcessedEvent`, or `VoidInvoiceProcessedEvent` platform event message. You can't subscribe to `CrMemoProcessErrDtlEvent` platform event directly. This object is available in API version 62.0 and later.

CrMemoProcessErrDtlEvent

Represents the information about errors that occurred while creating or applying a credit memo as part of a request. This object is included in a `CreditInvoiceProcessedEvent`, `CreditMemoProcessedEvent`, `NegInvcLineProcessedEvent`, or `VoidInvoiceProcessedEvent` platform event message. You can't subscribe to `CrMemoProcessErrDtlEvent` platform event directly. This object is available in API version 62.0 and later.

`RequestIdentifier`	**Type** string **Properties** Nillable **Description** The unique ID returned in the response. Use this ID to identify the event for a specific request.

InvoiceProcessedEvent

Represents the notification to the customers after the process started by the `/commerce/billing/invoices` request is complete. The process groups billing schedules by grouping keys and creates one invoice per grouping key. The `InvoiceProcessedEvent` platform event is a top-level object that contains a list of `InvoiceProcessedDetailEvents` platform events, where each detail event represents an attempt to create one invoice. This object is available in API version 62.0 and later.

Field	Details
EventUuid	**Type** string **Properties** Nillable **Description** A universally unique identifier (UUID) that identifies a platform event message.
InvoiceErrorDetailEvent	**Type** InvoiceErrorDetailEvent[] **Properties** Nillable **Description** Information about errors that occurred during processing.
InvoiceProcessedDetailEvents	**Type** InvoiceProcessedDetailEvent[] **Properties** Nillable **Description** A list of `InvoiceProcessedDetailEvent` records. Each record contains information about an attempt to create an invoice from one or more billing schedules that share a grouping key.
IsSuccess	**Type** boolean **Properties** Defaulted on create **Description** Required. Indicates whether the Create Order from Invoice action was successful (`true`) or not (`false`). The default value is `false`.
ReplayId	**Type** string **Properties** Nillable **Description** An identification (ID) value that's populated by the system and refers to the position of the event in the event stream. Replay ID values aren't guaranteed to be contiguous for consecutive events. A user can store a replay ID value and use it on resubscription to retrieve missed events that are within the retention window.

Field	Details
`RequestIdentifier`	**Type** string **Properties** Nillable **Description** A unique ID returned in the `/commerce/billing/invoices` response. Use this ID to identify the event for a specific request.

InvoiceErrorDetailEvent

Represents information about the errors that occurred during the processing of a `/commerce/billing/invoices` request. This object is included in an `InvoiceProcessedEvent` platform event message. You can't subscribe to `InvoiceProcessedEvent` platform event directly. This object is available in API version 62.0 and later.

InvoiceProcessedDetailEvent

Represents the notification to customers regarding the results of an attempt to create an invoice from billing schedules as part of `/commerce/billing/invoices` request. The `InvoiceProcessedDetailEvent` platform event contains the results of an attempt to create an invoice from one or more billing schedules that share a grouping key. Each `InvoiceProcessedDetailEvent`platform event for an action is grouped within the parent `InvoiceProcessedDetailEvent` platform event. This object is available in API version 62.0 and later.

InvoiceErrorDetailEvent

Represents information about the errors that occurred during the processing of a `/commerce/billing/invoices` request. This object is included in an `InvoiceProcessedEvent` platform event message. You can't subscribe to `InvoiceProcessedEvent` platform event directly. This object is available in API version 62.0 and later.

Fields

Field	Details
`CorrelationIdentifier`	**Type** string **Properties** Nillable **Description** Reserved for future use.
`CrMemoProcessErrDtlEvents`	**Type** CrMemoProcessErrDtlEvent **Properties** Nillable **Description** A compilation of error messages and error codes for a failed request. See the `ErrorDetails` field for error messages and error codes.
`CreditMemoId`	**Type** reference **Properties** Nillable **Description** The ID of the credit memo created as a result of the successful conversion of a negative invoice line. This field is a relationship field.

Field	Details
	Relationship Name CreditMemo **Refers To** CreditMemo
`ErrorDetails`	**Type** string **Properties** Nillable **Description** If the request fails, this field shows error messages, error codes, and the ID of the record on which the errors occurred.
`EventUuid`	**Type** string **Properties** Nillable **Description** A universally unique identifier (UUID) that identifies a platform event message.
`InvoiceId`	**Type** reference **Properties** Nillable **Description** The ID of the invoice that this event is in reference to. This field is a relationship field. **Relationship Name** Invoice **Refers To** Invoice
`IsAutomatedNegativeInvoiceLineConversion`	**Type** boolean **Properties** Defaulted on create **Description** Indicates whether this event is generated either by an automated process to convert negative invoice lines to credit memos (`true`) or by a manual process (`false`). The default value is `false`.

Field	Details
IsSuccess	**Type** boolean **Properties** Defaulted on create **Description** Required. Indicates whether the negative invoice lines were converted successfully to credit memos (`true`) or not (`false`). The default value is `false`.
ReplayId	**Type** string **Properties** Nillable **Description** Represents an ID value that's populated by the system and refers to the position of the event in the event stream. Replay ID values aren't guaranteed to be contiguous for consecutive events. A subscriber can store a replay ID value and use it on resubscription to retrieve missed events that are within the retention window.
RequestIdentifier	**Type** string **Properties** Nillable **Description** The unique identifier of the request. This field is always empty.

SequenceAssignedEvent

Represents the notification to customers about the assignment of a sequence to a target record. This process is initiated by the `/sequences/actions/assign` request. This object is available in API version 65.0 and later.

Fields

Field	Details
`EventUuid`	**Type** string **Properties** Nillable **Description** A universally unique identifier (UUID) that identifies a platform event message.
`ReplayId`	**Type** string **Properties** Nillable **Description** Represents an ID value that's populated by the system and refers to the position of the event in the event stream. Replay ID values aren't guaranteed to be contiguous for consecutive events. A subscriber can store a replay ID value and use it on resubscription to retrieve missed events that are within the retention window.
`SequenceAssignmentDateTime`	**Type** dateTime **Properties** Nillable

Field	Details
	Description The date and time when the sequence pattern value was assigned to the target record.
`SequencePatternValue`	**Type** string **Properties** Nillable **Description** The complete sequence value that's assigned to the target record.
`SequencePolicyIdentifier`	**Type** string **Properties** Nillable **Description** The ID of the sequence policy that's related to the event.
`SequenceValue`	**Type** string **Properties** Nillable **Description** The sequence value that's assigned to the target record.
`TargetObjectName`	**Type** string **Properties** Nillable **Description** The name of the object to which the sequence policy is applicable.
`TargetRecordIdentifier`	**Type** string **Properties** Nillable **Description** The ID of the target record to which the sequence policy is applied.

VoidInvoiceProcessedEvent

Represents the notification to the customers after the process started by the `/commerce/invoicing/invoices/{invoiceId}/actions/void` request is complete. The request attempts to void an invoice by crediting an invoice and changing its status to `Voided`, which prevents further changes. This object is available in API version 62.0 and later.

A subscriber can store a replay ID value and use it on resubscription to retrieve missed events that are within the retention window.
`RequestIdentifier`	**Type** string **Properties** Nillable **Description** The unique ID returned in the `/commerce/billing/invoices/{invoiceId}/actions/void` response. Use this ID to identify the event for a specific request.

Billing Standard Invocable Actions

Use standard invocable actions to automate processes such as credit application, billing schedules creation, and invoice management.

Commerce Payments Invocable Actions

This table provides a list of the invocable actions of Commerce Payments, which can be used for Billing.

Resource	Description
/services/data/v**67.0**/actions/standard/applyPayment (POST)	Apply a payment record to an invoice header by creating a PaymentLineInvoice record with Applied type.
/services/data/v**67.0**/actions/standard/paymentSale (POST)	Capture a payment without any prior authorization, and create a payment record.

Billing provides these invocable actions.

Apply Credit Action
Apply a credit memo or credit memo line to an invoice or invoice line, respectively.

Apply Payments and Credits by Rules Action
Apply payments and credits to posted invoices by adhering to the specified rules.

Automate Refund Action
Initiate refund orchestration for a credit memo generated from a subscription cancellation or negative amendment.

Create Billing Schedules From Billing Transaction Action
Create one or more billing schedules for a specified billing transaction ID.

Create Standalone Billing Schedules Action
Creates billing schedules for internal or external transaction records by calling the Create Standalone Billing Schedules API.

Extend Invoice Due Date Action
Update the due date on an invoice to accommodate payment extensions or resolve billing disputes.

Generate Account Statement
Generates a comprehensive account statement for a specified account with transaction history and balance information.

Generate Invoice Documents Action
Asynchronously generate PDF documents for the invoices associated with an invoice batch run record that are in the `Draft` or `Posted` status.

Issue Credit Memo Action
Issue credit memos for disputed invoices to resolve billing disputes.

Post Draft Credit Memo Action
Post a draft credit memo to a credit memo record for review and approval.

Post Draft Invoice Action
Update the status of an invoice from `Draft` to `Posted` for a credit memo application.

Post Draft Invoice Batch Run Action
Update the status of a batch of invoices from `Draft` to `Posted` for a credit memo application.

Recover Billing Schedules Action
Recover one or more billing schedules in the `Error` or `Processing` status.

Send Dunning Email Action

Run an orchestration that sends dunning process emails for collection plans to recover overdue revenue and notify customers about amounts still due.

Suspend Billing Action

Suspend or resume the billing of an account to handle billing disputes.

Update Bill To Contact Action

Update the Bill to Contact detail on an invoice to ensure accurate billing communication and routing.

Unapply Credit Action

Unapply a credit memo or credit memo line from an invoice or invoice line, respectively.

Unapply Payment Action

Unapplies a payment that's already been applied to an invoice or invoice line by crediting the amount back to the payment and the invoice or invoice line.

Void Posted Credit Memo Action

Invoke the Void Posted Credit Memo API by providing a credit memo ID.

Write Off Invoices Action

Write off partially paid or unpaid invoices to manage pending debts and to maintain accurate financial records. This action calls the Posted Invoice List Write-Off (POST) API.

SEE ALSO:

Actions Developer Guide: Overview

REST API Developer Guide: Invocable Actions Standard

Apply Credit Action

Apply a credit memo or credit memo line to an invoice or invoice line, respectively.

This action credits the amount of the credit memo or credit memo line to the corresponding invoice or invoice line, reducing both their balances.

This action is available in API version 62.0 and later.

Special Access Rules

The Apply Credit action is available in Enterprise, Developer, and Unlimited Editions where Billing is enabled. To use this action, you need the Credit Memo Operations User permission set.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/applyCredit`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer token`

Inputs

Input	Details
`appliedCreditAmount`	**Type** double **Description** Required. Credit amount applied to an invoice or invoice line.
`creditSourceRecordId`	**Type** string **Description** Required. ID of the credit memo or credit memo line that's applied to an invoice or invoice line.
`creditTargetRecordId`	**Type** string **Description** Required. ID of the invoice or invoice line record that the credit is applied to.
`description`	**Type** string **Description** Additional details about the credit memo or credit memo line to be applied to an invoice or invoice line.
`effectiveDate`	**Type** string **Description** Date to use for applying the credit memo to an invoice or invoice line.

Outputs

Output	Details
`recordId`	**Type** string **Description** ID of the credit memo invoice application or credit memo line invoice line record of type `Applied` that the action created.

Example

POST

This example shows a sample request for the Apply Credit action.

```
{
  "inputs": [
    {
      "appliedCreditAmount": 20,
      "creditTargetRecordId": "3ttDU00000000iZYAQ",
      "creditSourceRecordId": "50gDU000000007NYAQ",
      "description": "Applied credit memo to an invoice",
      "effectiveDate": "2024-08-27"
    }
  ]
}
```

This example shows a sample response for the Apply Credit action.

```
{
  "actionName": "applyCredit",
  "errors": null,
  "invocationId": null,
  "isSuccess": true,
  "outputValues": {
    "recordId": "4sFDU00000000652AA"
  },
  "sortOrder": -1,
  "version": 1
}
```

Apply Payments and Credits by Rules Action

Apply payments and credits to posted invoices by adhering to the specified rules.

This action uses predefined logic to allocate payments and credits, reducing any manual intervention and errors.

This action is available in API version 66.0 and later.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/applyPaymentsAndCreditsByRules`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer token`

Inputs

Input	Details
`accountId`	**Type** reference **Description** Required. The ID of the account to perform the settlement of payments and credits against invoices in adherence with the applied rules.
`targetDate`	**Type** date **Description** Optional. The date used to select invoices and invoice lines with a posted date equal to or later than the target date to apply payments and credits.

Outputs

Output	Details
`rulesApplicationResponse`	**Type** Apex-defined **Description** The Apex RulesApplicationResponse record that contains the results of rules application including the list of applied rules, application details, and any errors.

Example

POST

Here's a sample request for the Apply Payments and Credits by Rules action.

```
{
  "inputs": [
    {
      "accountId": "001AAC0001NmajhYBB",
      "targetDate": "2025-08-27"
    }
  ]
}
```

Here's a sample success response for the Apply Payments and Credits by Rules action.

```
[
  {
    "actionName": "applyPaymentsAndCreditsByRules",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": {
      "rulesApplicationResponse": {
        "rulesApplicationSummary": {
          "totalPaymentApplications": 1,
          "totalCreditMemoApplications": 1,
          "fetchedPaymentsCount": 1,
          "fetchedCreditMemosCount": 1,
          "areAllInvoicesConsidered": true
        },
        "isSuccess": true,
        "errors": null,
        "appliedRules": [
          "Match Balance",

        ]
      }
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Here's a sample error response for the Apply Payments and Credits by Rules action.

```
[
  {
    "actionName": "applyPaymentsAndCreditsByRules",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": {
```

```
      "rulesApplicationResponse": {
        "rulesApplicationSummary": null,
        "isSuccess": false,
        "errors": [
          {
            "message": "We couldn't find eligible invoices to apply rules-based credits
 and payments. ",
            "errorCode": null
          }
        ],
        "appliedRules": null
      }
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Automate Refund Action

Initiate refund orchestration for a credit memo generated from a subscription cancellation or negative amendment.

When you cancel a subscription or make a change that lowers the price (a negative amendment), a credit memo is generated. A credit memo is a record that represents the amount to be returned. Use this action to process the refund for that credit memo.

During an invoice batch run, Revenue Cloud Billing uses these two org preferences to run the refund orchestration.

- Conversion of negative invoice lines to credit memo and credit memo lines—When turned on, this org preference creates a credit memo from the negative invoice lines of a cancellation or a negative amendment, and then emits a credit memo event.
- Issue refunds and settle balances — Listens to the credit memo event and starts the refund orchestration for the converted credit memo.

Turn off these org preferences to call this action directly and choose which credit memo receives a refund.

In both modes, the orchestration runs these steps in order.

- Remove payments from the original invoice. Partial removal isn't supported, so each selected payment is removed in full. For example, if an invoice has two payments P1 ($20) and P2 ($15) and the refund amount is $30, the orchestration removes both P1 and P2 in full for a total of $35.
- Apply back any extra amount to the invoice. In the example above, $35 was removed but only $30 is needed for the refund. The orchestration applies the extra $5 from P2 back to the original invoice.
- Apply the credit memo to the original invoice to record the credit.
- Send a refund request to the payment gateway. The payment gateway is the service that processes the customer's payment method. For example, a credit card processor. In the example above, the orchestration sends two separate refund requests, one for P1 ($20) and one for P2 ($10, the portion not applied back).
- Record each refund against its original payment.

The orchestration selects the fewest payments to unapply so that the total unapplied amount is at least equal to the refund amount.

This action is available in API version 67.0 and later.

For more information about automated refunds in Subscription Management, see Automate a refund (Subscription Management reference).

Special Access Rules

The Automate Refund action is available in Enterprise, Unlimited, and Developer Editions of Revenue Cloud.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/automateRefund`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearertoken`

Inputs

Input	Details
`creditMemoId`	**Type** ID **Description** Required. ID of the credit memo to generate a refund.
`invoiceId`	**Type** ID **Description** ID of the invoice that the credit memo converts from. This ID matches the value in the Reference Entity field of the credit memo object. When you omit this input, the action reads the invoice ID from the Reference Entity field. When you provide this input, the value must match the Reference Entity field. If the values don’t match, the action returns a validation error..

Outputs

Output	Details
`statusUrl`	**Type** string **Description** URL to poll for the `RefundAsyncOperation` status. Use this URL to access the tracking record for the credit memo and check the current orchestration run status.

Example

POST

This sample request is for the Automate Refund action.

```
{
  "inputs": [
    {
      "creditMemoId": "3ttxx0000000001AAA",
      "invoiceId": "3ttxx0000000002BBB"
    }
  ]
}
```

This sample response shows a successful invocation with a status URL.

```
[
  {
    "actionName": "automateRefund",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": {
      "statusUrl": "/services/data/v67.0/async-operations/00Dxx0000000000EAA/status"
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

This sample shows an error response for an invalid credit memo ID.

```
[
  {
    "actionName": "automateRefund",
    "errors": [
      {
        "statusCode": "INVALID_INPUT",
        "message": "The value \"INVALID\" for the creditMemoId parameter is invalid.",
        "fields": []
      }
    ],
    "invocationId": null,
    "isSuccess": false,
    "outcome": null,
    "outputValues": null,
    "sortOrder": -1,
    "version": 1
  }
]
```

Create Billing Schedules From Billing Transaction Action

Create one or more billing schedules for a specified billing transaction ID.

This action calls the Create Billing Schedules for Orders (POST) API to retrieve the billing transaction items associated with the billing transaction ID. The API generates the corresponding billing schedules for each of the billing transaction items for operations such as transaction modifications, renewals, cancellations, and new sales.

This action is available in API version 62.0 and later.

Special Access Rules

The Create Billing Schedules From Billing Transaction action is available in Enterprise, Unlimited, and Developer Editions where Billing is enabled. To use this action, you need the Create Billing Schedules From Billing Transactions API permission set.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/createBillingSchedulesFromBillingTransaction`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer token`

Inputs

Input	Details
`billingTransactionId`	**Type** string **Description** Required. ID of the billing transaction record to create one or more billing schedules for.

Outputs

Output	Details
`requestId`	**Type** string **Description** Universally Unique Identifier (UUID) that's used to track the status of the asynchronous action.
`statusUrl`	**Type** string

Output	Details
	Description URL that's used to check the status of the API request.

Example

POST

This example shows a sample request for the Create Billing Schedules From Billing Transaction action.

```
{
  "inputs": [
    {
      "billingTransactionId": "801xx000003JztvAAC"
    }
  ]
}
```

This example shows a sample response for the Create Billing Schedules From Billing Transaction action.

```
{
  "actionName": "createBillingSchedulesFromBillingTransaction",
  "errors": null,
  "isSuccess": true,
  "outputValues": {
    "requestId": "4sFDU00000000652AA",
   "statusUrl": "/services/data/v62.0/sobjects/AsyncOperationTracker/16Pxx0000004NhAEAU"

  },
  "sortOrder": -1,
  "version": 1
}
```

Revenue Cloud Developer Guide: Context-Aware Billing Schedule API

Create Standalone Billing Schedules Action

Creates billing schedules for internal or external transaction records by calling the Create Standalone Billing Schedules API.

This action is available in API version 64.0 and later.

See Create Standalone Billing Schedules (POST) API to know more about the mandatory and optional tags, sample transaction details, and sample payloads for various types of transactions.

Special Access Rules

This action is available in Enterprise, Unlimited, and Developer Editions with the Revenue Cloud Billing license. To use this action, you need the Billing Operations permission set.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/createBillingSchedulesFromTrxn`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer token`

Inputs

Input	Details
`contextDefinitionName`	**Type** string **Description** Required. Name of the context definition that contains the mappings for the transaction record and billing schedules.
`readContextMappingName`	**Type** string **Description** Required. Name of the context mapping with the mapping for the transaction.
`saveContextMappingName`	**Type** string **Description** Required. Name of the context mapping with the mapping for the billing schedule and billing schedule group. The save context mapping is used to save the billing schedule.
`transactionDetails`	**Type** string **Description** Required. A JSON string containing the ID of the transaction record that the billing schedule is created for and other additional transaction details.

Outputs

Output	Details
`requestId`	**Type** string **Description** Unique request identifier that you can use to poll the asynchronous request.
`statusUrl`	**Type** string **Description** Status URL that’s used to track the operation.

Example

POST

Here's a sample request for the Create Billing Schedules From Transaction action.

```
{
  "inputs": [
    {
      "transactionDetails":
[illegible]

      "contextDefinitionName": "StandaloneBillingContext__stdctx",
      "readContextMappingName": "TransactionMapping",
      "saveContextMappingName": "BSGEntitiesMapping"
    }
  ]
}
```

Here's a sample response for the Create Billing Schedules From Transaction action.

```
{
  "actionName": "createBillingSchedulesFromTrxn",
  "errors": null,
  "isSuccess": true,
  "outputValues": {
    "requestId": "16PZ6000000CnKRMA0",
   "statusUrl": "/services/data/v64.0/sobjects/AsyncOperationTracker/16PZ6000000CnKRMA0"

  },
  "sortOrder": -1,
  "version": 1
}
```

Extend Invoice Due Date Action

Update the due date on an invoice to accommodate payment extensions or resolve billing disputes.

Specify the invoice ID and the revised due date to adjust the payment timeline. Use this action to extend or change the due date on an invoice.

This action is available in API version 66.0 and later.

Special Access Rules

The Extend Invoice Due Date Action is available in Enterprise, Developer, and Unlimited Editions where Dispute Management is enabled in Billing.

Supported REST HTTP Methods

URI

`/services/data/v`***`67.0`***`/actions/standard/blngSvcExtendInvoiceDueDate`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer`***`token`***

Inputs

Input	Details
`invoiceId`	**Type** string **Description** ID of the invoice whose due date must be revised.
`revisedDueDateTime`	**Type** date **Description** Date and time that's to be updated as the new due date on the invoice.

Outputs

Output	Details
`additionalInformation`	**Type** string

Output	Details
	Description Any additional information to be included in the response.
`isSuccess`	**Type** boolean **Description** Indicates whether the due date is updated on the invoice record (`true`) or not (`false`).

Example

POST

This sample request is for the Extend Invoice Due Date action.

```
{
  "inputs": [
    {
      "invoiceID": "801xx000003GYexAAG",
      "revisedDueDate": "2025-03-31"
    }
  ]
}
```

This sample response is for the Extend Invoice Due Date action.

```
[
  {
    "actionName": "blngSvcExtendInvoiceDueDate",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": {
      "isSuccess": true,
      "additionalInformation": "{\"status\":\"Due date updated successfully\"}"
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Generate Account Statement

Generates a comprehensive account statement for a specified account with transaction history and balance information.

An account statement includes these details.

- Transaction History—List of all financial transactions, such as invoices, credit memos, debit memos, payments, and refunds, within a specified date range.
- Open Balances—Non-zero balances for invoices and other transactions.

- Account Summary—Aggregated totals including beginning balance, total charges, total payments, and ending balance.
- Multi-currency Support—Transactions across multiple currencies.

This action is available in API version 66.0 and later.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/generateAccountStatement`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer token`

Inputs

Input	Details
`accountId`	**Type** string **Description** Required. ID of the account for which to generate the statement of account.
`associatedAccountIds`	**Type** string **Description** List of associated account IDs from hierarchy to include in the statement. You can specify a maximum of 50 accounts.
`correlationId`	**Type** string **Description** Correlation ID that tracks messages related to the request. These messages are logged in Splunk by the different services involved in the request. If this ID isn't specified, a random Universally Unique Identifier (UUID) is created.
`customFields`	**Type** string **Description** JSON string specifying custom fields to include in the statement. As a best practice, we recommend that you limit the number of custom fields up to 30 fields. Valid objects to specify the associated fields are:

Input	Details
	• `Invoice` • `CreditMemo` • `Payment` • `DebitMemo` • `Refund` • `Account` Here's the expected format. `{"Invoice": ["field1", "field2"], "Account": {"base": ["field1"], "associated": ["field2"]}}` Available in API version 67.0 and later.
`documentTemplateId`	**Type** string **Description** Document template ID to use for PDF generation. If you don't specify a value, the default account statement template is used.
`shouldShowOpenBalancesOnly`	**Type** boolean **Description** Indicates whether to show only accounts with non-zero balances (`true`) or complete transaction history within date range (`false`).
`sortBy`	**Type** string **Description** Required. Criteria for sorting transactions. The default and valid value is `Date`.
`sortingOrder`	**Type** string **Description** Sort order for transactions. Valid values are: • `Ascending` • `Descending` The default value is `Desc`.

Input	Details
`startDate`	**Type** date **Description** Required. The date from when the transaction history is to be considered in YYYY MM DD format. This parameter value is required when the `shouldShowOpenBalancesOnly` parameter value is `false`. The date must be within the last 90 days and can't be in the future.
`transactionTypes`	**Type** string **Description** List of transaction types to include in the statement. If you don't specify a value or if it's empty, all transaction types are included. Valid values are: • `All` • `Invoice` • `CreditMemo` • `Payment` • `DebitMemo` • `Refund`

Outputs

Output	Details
`accountId`	**Type** string **Description** ID of the account for which to generate the account statement.
`requestIdentifier`	**Type** string **Description** Unique request identifier for tracking the async operation.
`statusUrl`	**Type** string **Description** URL that tracks the status of the request and retrieves the generated document.

Output	Details
templateId	**Type** string **Description** Document template ID that's used for PDF generation.

Example

POST

This example shows a sample request for the Generate Account Statement action.

```
{
  "inputs": [
    {
      "accountId": "001000000000001AAA",
      "shouldShowOpenBalancesOnly": false,
      "startDate": "2025-01-01",
      "transactionTypes": [
        "All"
      ],
      "sortBy": "Date",
      "sortingOrder": "Descending",
      "associatedAccountIds": [
        "001000000000002AAA",
        "001000000000003AAA"
      ],
      "documentTemplateId": "a0T000000000001AAA",
      "customFields": "{\"Invoice\": [\"TotalAmountWithTax\"], \"Account\": {\"base\":
 [\"Phone\", \"Fax\"], \"associated\": [\"Website\"]}}}"
    }
  ]
}
```

This example shows a sample response for the Generate Account Statement action.

```
{
  "accountId": "001AAC0001O5W9pYBF",
  "errors": [],
  "requestIdentifier": "3267407f-0c96-4b8a-a8e0-bb7a71c91a2f",
  "statusUrl": "16PAAC000008AIM",
  "success": true,
  "templateId": "2dtAAC000002oiIYBQ"
}
```

Generate Invoice Documents Action

Asynchronously generate PDF documents for the invoices associated with an invoice batch run record that are in the `Draft` or `Posted` status.

This action uses the ID of the invoice batch run record to find the draft or posted invoices from the batch and to generate the PDF documents for its invoices that are in the `Draft` or `Posted` status. This action creates a DocGenerationBatchProcess record that contains the Document Generation Process and Invoice Document records for each of the invoices. This action is available in API version 63.0 and later with Revenue Cloud Billing.

Special Access Rules

The Generate Invoice Documents action is available in Enterprise, Unlimited, and Developer Editions where Revenue Cloud Billing is enabled. The org must have Billing Docgen enabled and an active Invoice Document Template to generate PDF documents. To use this action, you need either the Billing Operations User or the Billing Admin permission set, along with the Docgen Designer and Docgen Designer Standard User permission sets.

Supported REST HTTP Methods

URI

`/services/data/v`***`67.0`***`/actions/standard/generateInvoiceDocuments`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer` ***`token`***

Inputs

Input	Details
`invoiceBatchRunId`	**Type** string **Description** Required. ID of the invoice batch run record that created the draft or posted invoices.

Outputs

Output	Details
`requestId`	**Type** string **Description** An alphanumeric string to track the status of the document generation request.
`requestStatus`	**Type** boolean

Output	Details
	Description Indicates whether the operation is successful (`true`) or not (`false`).

Example

POST

This example shows a sample request for the Generate Invoice Documents action.

```
{
  "inputs": [
    {
      "invoiceBatchRunId": "5IRSG000001Az014AC"
    }
  ]
}
```

This example shows a sample response for the Generate Invoice Documents action.

```
{
  "actionName": "generateInvoiceDocuments",
  "errors": null,
  "isSuccess": true,
  "outputValues": {
    "requestId": "4sFDU00000000652AA",
    "requestStatus": true
  }
}
```

Issue Credit Memo Action

Issue credit memos for disputed invoices to resolve billing disputes.

Specify the credit request list to automate the creation of credit memos during the dispute resolution process. The credit request list includes the invoice ID, the total credit amount, an optional description, and a detailed list of specific invoice lines with their corresponding credit amounts.

This action is available in API version 66.0 and later.

Special Access Rules

The Issue Credit Memo Action is available in Enterprise, Developer, and Unlimited Editions where Dispute Management is enabled in Billing.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/blngDsptIssueCreditMemo`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer`***`token`***

Inputs

Input	Details
`creditRequestList`	**Type** Apex-defined **Description** List of Apex-defined creditRequestInputRepresentations objects that contains the invoice ID, credit amount, description, and a list of creditLineRequestInputRepresentations objects. The creditLineRequestInputRepresentations objects include the invoice line ID, credit line amount, and a description. See CreditLineRequestInputRepresentations Apex class.

Outputs

Output	Details
`creditResponse`	**Type** Apex-defined **Description** An Apex-defined creditResponseOutputRepresentations object that contains the status and any additional information. See CreditResponseOutputRepresentations Apex class.

Example

POST

This sample request is for the Issue Credit Memo action.

```
{
  "inputs": [
    {
      "creditRequestList": [
        {
          "invoiceId": "801xx000003GYexAAG",
          "creditAmount": 100,
          "description": "Credit for disputed charges",
          "creditLineRequestInputRepresentations": [
```

```
              {
                "invoiceLineId": "801xx000003GYeyAAG",
                "creditLineAmount": 50,
                "description": "Line-level credit"
              }
            ]
          }
        ]
      }
    ]
}
```

This sample response is for the Issue Credit Memo action.

```
[
  {
    "actionName": "blngDsptIssueCreditMemo",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": {
      "creditResponse": {
        "success": true,
        "message": "Credit memo issued successfully"
      }
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Post Draft Credit Memo Action

Post a draft credit memo to a credit memo record for review and approval.

This action is available in API version 65.0 and later.

Supported REST HTTP Methods

URI

`/services/data/v`***`67.0`***`/actions/standard/postDraftCreditMemo`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer`***`token`***

Inputs

Input	Details
`correlationId`	**Type** string **Description** Splunk correlation ID to use to track messages that are related to the request and logged in Splunk by the different services involved in the request. If not specified, the service creates a random Universally Unique Identifier (UUID).
`creditMemoId`	**Type** string **Description** Required. ID of the credit memo record in `Draft` status to be posted.

Outputs

Output	Details
`requestIdentifier`	**Type** string **Description** The UUID that's used to track the status of the asynchronous action.
`statusUrl`	**Type** string **Description** The URL to use to check the status of the request.

Example

POST

This example shows a sample request that contains the ID of the credit memo to be posted.

```
{
  "inputs": [
    {
      "creditMemoId": "50gDU00000001MdYAI"
    }
  ]
}
```

This example shows a sample successful response.

```
[
  {
    "actionName": "postDraftCreditMemo",
    "errors": [],
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": {
      "statusUrl":
"/services/data/v67.0/sobjects/AsyncOperationTracker/16PDU000000A4nw2AC",
      "requestIdentifier": "d3a9d9ce-2a83-4a08-bcf3-df0348a0008c"
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Post Draft Invoice Action

Update the status of an invoice from `Draft` to `Posted` for a credit memo application.

This action uses the ID of the draft invoice and triggers an asynchronous process to post the invoice. This action is available in API version 62.0 and later.

Special Access Rules

The Post Draft Invoice action is available in Enterprise, Unlimited, and Developer Editions where Billing is enabled. To use this action, you need the Billing Operations User permission set.

Supported REST HTTP Methods

URI
`/services/data/v67.0/actions/standard/postDraftInvoice`

Formats
JSON, XML

HTTP Methods
POST

Authentication
`Authorization: Bearer token`

Inputs

Input	Details
correlationId	**Type** string

Input	Details
	Description Splunk correlation ID to track the messages that are related to the request and are logged in Splunk by the different services involved in the request. If the ID isn't specified, the service creates a random Universally Unique Identifier (UUID).
`invoiceId`	**Type** string **Description** Required. ID of the `Draft` invoice to be posted.

Outputs

Output	Details
`requestIdentifier`	**Type** string **Description** UUID that's used to track the status of the asynchronous action.
`statusUrl`	**Type** string **Description** URL that's used to check the status of the API request.

Example

POST

This example shows a sample request for the Post Draft Invoice action.

```
{
  "inputs": [
    {
      "invoiceId": "3ttDU00000000iZYAQ"
    }
  ]
}
```

This example shows a sample response for the Post Draft Invoice action.

```
{
  "actionName": "postDraftInvoice",
  "errors": null,
```

```
  "isSuccess": true,
  "outputValues": {
    "requestIdentifier": "4sFDU00000000652AA",
   "statusUrl": "/services/data/v62.0/sobjects/AsyncOperationTracker/16Pxx0000004NhAEAU"

  }
}
```

Post Draft Invoice Batch Run Action

Update the status of a batch of invoices from `Draft` to `Posted` for a credit memo application.

This action uses the ID of the invoice batch run record to find draft invoices from the batch and to post the draft invoices to an invoice record. This action is available in API version 62.0 and later.

Special Access Rules

The Post Draft Invoice Batch Run action is available in Enterprise, Unlimited, and Developer Editions where Billing is enabled. To use this action, you need the Billing Operations User permission set.

Supported REST HTTP Methods

URI

`/services/data/v`***`67.0`***`/actions/standard/postDraftInvoiceBatchRun`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer` ***`token`***

Inputs

Input	Details
`invoiceBatchRunId`	**Type** string **Description** Required. ID of the invoice batch run record that created the draft invoices.

Outputs

Output	Details
`invBatchDraftToPostedRunId`	**Type** string **Description** ID of the record that's created to track the batch process of posting draft invoices. These draft invoices are associated with the parent invoice batch run record.

Example

POST

This example shows a sample request for the Post Draft Invoice Batch Run action.

```
{
  "inputs": [
    {
      "invoiceBatchRunId": "5IRSG000001Az014AC"
    }
  ]
}
```

This example shows a sample response for the Post Draft Invoice Batch Run action.

```
{
  "actionName": "postDraftInvoiceBatchRun",
  "errors": null,
  "isSuccess": true,
  "outputValues": {
    "invBatchDraftToPostedRunId": "4sFDU00000000652AA"
  }
}
```

Recover Billing Schedules Action

Recover one or more billing schedules in the `Error` or `Processing` status.

This action uses the ID of the billing schedule record in the `Error` or `Processing` status to retrieve the latest generated invoice. This action also retrieves any other billing schedules in the `Error` or `Processing` status associated with that invoice.

This action is available in API version 62.0 and later.

Special Access Rules

The Recover Billing Schedules action is available in Enterprise, Unlimited, and Developer Editions where Billing is enabled. To use this action, you need the Manage Errors Using Invoice Error Recovery API permission set.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/recoverBillingSchedules`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer token`

Inputs

Input	Details
`billingScheduleId`	**Type** string **Description** Required. ID of the billing schedule record in the `Error` or `Processing` status.

Outputs

Output	Details
`successBillingScheduleIds`	**Type** string **Description** Comma-separated list of IDs associated with the parent billing schedule record in the `Error` or `Processing` status.

Example

POST

This example shows a sample request for the Recover Billing Schedules action.

```
{
  "inputs": [
    {
      "billingScheduleId": "801xx000003JztvAAC"
    }
  ]
}
```

This example shows a sample response for the Recover Billing Schedules action.

```
{
  "actionName": "recoverBillingSchedules",
  "errors": null,
  "isSuccess": true,
  "outputValues": {
    "successBillingScheduleIds": ["4sFDU00000000652AA", 16Pxx0000004NhAEAU]
  },
  "sortOrder": -1,
  "version": 1
}
```

Send Dunning Email Action

Run an orchestration that sends dunning process emails for collection plans to recover overdue revenue and notify customers about amounts still due.

Specify the collection plan for the dunning emails. Optionally, specify the email template by name or by ID. The action triggers an orchestration that sends dunning process emails for a collection plan based on your configured timeline.

This action is available in API version 67.0 and later.

Special Access Rules

The Send Dunning Email action is available in Enterprise, Unlimited, and Developer Editions of Revenue Cloud.

Supported REST HTTP Methods

URI

/services/data/v***67.0***/actions/standard/blngSendDunningEmail

Formats

JSON, XML

HTTP Methods

POST

Authentication

Authorization: Bearer***token***

Inputs

Input	Details
collectionPlanId	**Type** string **Description** Required. ID of the collection plan record for dunning emails.

Input	Details
emailTemplateNameOrId	**Type** string **Description** Email template name or ID to use for the reminder email. If not specified, the default email template is used.

Outputs

Output	Details
isDunningEmailSent	**Type** boolean **Description** Indicates whether the dunning email related to the collection plan was sent (`true`) or not (`false`).
additionalInformation	**Type** string **Description** Additional information to be passed on with the response.

Example

POST

This sample request is for the Send Dunning Email action.

```
{
  "inputs": [
    {
      "collectionPlanId": "0PLxxxxxxxxxxxxxx",
      "emailTemplateNameOrId": "Dunning_Reminder_Template"
    }
  ]
}
```

This sample response is for the Send Dunning Email action.

```
[
  {
    "actionName": "blngSendDunningEmail",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
```

```
    "outputValues": {
      "isDunningEmailSent": true,
      "additionalInformation": null
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Suspend Billing Action

Suspend or resume the billing of an account to handle billing disputes.

Specify the account ID and a date when billing must be suspended. Optionally, specify the date when billing must be resumed. The action suspends billing for the account from the suspension date and, if provided, resumes billing on the resumption date.

This action is available in API version 66.0 and later.

Special Access Rules

The Suspend Billing Action is available in Enterprise, Developer, and Unlimited Editions where Dispute Management is enabled in Billing.

Supported REST HTTP Methods

URI

`/services/data/v`***`67.0`***`/actions/standard/blngSvcSuspendBilling`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer`***`token`***

Inputs

Input	Details
`accountId`	**Type** string **Description** ID of the account for which billing must be suspended.
`resumptionDate`	**Type** date **Description** Date when the billing must be resumed.

Input	Details
suspensionDate	**Type** date **Description** Date when the billing must be suspended.

Outputs

Output	Details
additionalInformation	**Type** string **Description** Any additional information to be included in the response.
isSuccess	**Type** boolean **Description** Indicates whether the billing related to the specified account was suspended (`true`) or not (`false`). The default value is `false`.

Example

POST

This sample request is for the Suspend Billing action.

```
{
  "inputs": [
    {
      "accountId": "001xx000003GYexAAG",
      "suspensionDate": "2025-03-01",
      "resumptionDate": "2025-03-15"
    }
  ]
}
```

This sample response is for the Suspend Billing action.

```
[
  {
    "actionName": "blngSvcSuspendBilling",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
```

```
    "outputValues": {
      "isSuccess": true,
      "additionalInformation": "{\"status\":\"Billing suspended successfully\"}"
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Update Bill To Contact Action

Update the Bill to Contact detail on an invoice to ensure accurate billing communication and routing.

Specify the invoice ID and the new Bill to Contact detail. Optionally, indicate whether the new contact must be set as the default for future invoices. Use this action to change the contact to be billed on an invoice, for example, when handling a billing dispute.

This action is available in API version 66.0 and later.

Special Access Rules

The Update Bill To Contact Action is available in Enterprise, Developer, and Unlimited Editions where Dispute Management is enabled in Billing.

Supported REST HTTP Methods

URI

`/services/data/v`***`67.0`***`/actions/standard/blngSvcUpdateBillToContact`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer`***`token`***

Inputs

Input	Details
`invoiceId`	**Type** string **Description** ID of the invoice whose Bill to Contact detail must be updated.
`newBillToContactId`	**Type** string **Description** ID of the Bill to Contact record to be updated on the invoice.

Input	Details
`setAsDefault`	**Type** boolean **Description** Indicates whether the new Bill to Contact detail must be set as default for future invoices (`true`) or not (`false`). The default value is `false`.

Outputs

Output	Details
`additionalInformation`	**Type** string **Description** Any additional information to be included in the response.
`isSuccess`	**Type** boolean **Description** Indicates whether the Bill to Contact detail is updated on the invoice record (`true`) or not (`false`).

Example

POST

This sample request is for the Update Bill To Contact action.

```
{
  "inputs": [
    {
      "invoiceID": "3ttxx0000000001AAA",
      "newBillToContactid": "003xx000004XYZPAA4",
      "setAsDefault": true
    }
  ]
}
```

This sample response is for the Update Bill To Contact action.

```
[
  {
    "actionName": "blngSvcUpdateBillToContact",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
```

```
    "outcome": null,
    "outputValues": {
      "isSuccess": true,
      "additionalInformation": "{\"status\":\"Success\",\"notes\":\"Default billing
contact updated.\"}"
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Unapply Credit Action

Unapply a credit memo or credit memo line from an invoice or invoice line, respectively.

This action unapplies the credit from an invoice or invoice line. This process involves crediting the applied amount of the credit memo invoice application or credit memo line invoice line record to the related credit memo or credit memo line and invoice or invoice line.

This action is available in API version 62.0 and later.

Special Access Rules

The Apply Credit action is available in Enterprise, Developer, and Unlimited Editions where Billing is enabled. To use this action, you need the Credit Memo Operations User permission set.

Supported REST HTTP Methods

URI
`/services/data/v`***`67.0`***`/actions/standard/unapplyCredit`

Formats
JSON, XML

HTTP Methods
POST

Authentication
`Authorization: Bearer` ***`token`***

Inputs

Input	Details
`effectiveDate`	**Type** string **Description** Date when the credit is unapplied from an invoice or invoice line.
`description`	**Type** string

Input	Details
	Description Additional details about the credit memo invoice application or credit memo line invoice line record of type `Applied` that's processed.
`recordId`	**Type** string **Description** Required. ID of the credit memo invoice application or credit memo line invoice line record of type `Applied` that's processed to unapply the credit.

Outputs

Output	Details
`recordId`	**Type** string **Description** ID of the credit memo invoice application or credit memo line invoice line record of type `Unapplied` that the action created.

Example

POST

This example shows a sample request for the Unapply Credit action.

```
{
  "inputs": [
    {
      "recordId": "4sFDU000000005g2AA",
      "description": "Unapplied credit memo from an invoice",
      "effectiveDate": "2024-08-27"
    }
  ]
}
```

This example shows a sample response for the Unapply Credit action.

```
  {
    "actionName": "unapplyCredit",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outputValues": {
```

```
      "recordId": "4sFDU00000000602AA"
    },
    "sortOrder": -1,
    "version": 1
  }
```

Unapply Payment Action

Unapplies a payment that's already been applied to an invoice or invoice line by crediting the amount back to the payment and the invoice or invoice line.

If the **Apply Payments to Invoices** setting is enabled, payments can be applied to invoices, which creates the PaymentLineInvoice records of type `Applied`. If the **Apply Payments to Invoices feature** setting is disabled, payments can be applied to invoice lines, which creates the PaymentLineInvoiceLine records of type `Applied`.

When payments are unapplied, the PaymentLineInvoice or PaymentLineInvoiceLine records of type `Applied` has the associated PaymentLineInvoice or PaymentLineInvoiceLine records of type `Unapplied`.

This action is available in API version 64.0 and later.

Special Access Rules

This action is available in Enterprise, Unlimited, and Developer Editions where Billing is enabled. To use this action, you need the Payment Ops permission set.

Supported REST HTTP Methods

URI

`/services/data/v`***`67.0`***`/actions/standard/unapplyPayment`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer`***`token`***

Inputs

Input	Details
`description`	**Type** string **Description** Additional details about the payment line invoice or payment line invoice line that's processed to unapply the payment.

Input	Details
`effectiveDateTime`	**Type** datetime **Description** Date and time to use for unapplying the payment from an invoice or invoice line.
`recordId`	**Type** id **Description** Required ID of the payment line invoice or payment line invoice line record of type `Applied` that's processed to unapply the payment.

Outputs

Output	Details
`recordId`	**Type** id **Description** ID of the payment line invoice or payment line invoice line record of type `Unapplied` that the action created.
`unappliedDateTime`	**Type** datetime **Description** Date and time when the payment was unapplied.

Example

POST

This sample request is for the Unapply Payment action.

```
{
  "inputs": [
    {
      "description": "Unapply payment",
      "effectiveDateTime": "2024-08-11T07:53:15.000Z",
      "recordId": "1PLR000000000dDOAQ"
    }
  ]
}
```

This sample response is for the Unapply Payment action.

```
{
  "actionName": "unapplyPayment",
  "errors": null,
  "isSuccess": true,
  "outputValues": {
    "recordId": "1PLR000000000dDOAQ",
    "unappliedDateTime": "2024-08-11T08:09:01.000Z"
  },
  "sortOrder": -1,
  "version": 1
}
```

Void Posted Credit Memo Action

Invoke the Void Posted Credit Memo API by providing a credit memo ID.

This action is available in API version 66.0 and later.

Supported REST HTTP Methods

URI
`/services/data/v67.0/actions/standard/voidPostedCreditMemo`

Formats
JSON, XML

HTTP Methods
POST

Authentication
`Authorization: Bearertoken`

Inputs

Input	Details
`creditMemoId`	**Type** string **Description** Required. ID of the credit memo record in posted status to be voided.

Outputs

Output	Details
`debitMemoId`	**Type** string

Output	Details
	Description ID of the created debit memo record.
`statusUrl`	**Type** string **Description** URL to use to check the status of the request.

Example

POST

Here's a sample request for the Void Posted Credit Memo action.

```
{
  "inputs": [
    {
      "creditMemoId": "50gSG0000001y5NYAQ"
    }
  ]
}
```

Here's a sample response for the Void Posted Credit Memo action.

```
[
  {
    "actionName": "voidPostedCreditMemo",
    "errors": [],
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": {
      "debitMemoId": "4DmSG000001YcIP0A0",
      "statusUrl":
"/services/data/v67.0/sobjects/AsyncOperationTracker/16PSG000001qlyL2AQ"
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Write Off Invoices Action

Write off partially paid or unpaid invoices to manage pending debts and to maintain accurate financial records. This action calls the Posted Invoice List Write-Off (POST) API.

This action is available in API version 64.0 and later.

Special Access Rules

The Write Off Invoices action is available in Enterprise, Developer, and Unlimited Editions where Billing is enabled. To use this action, you need the Billing Operations User and Credit Memo Operations User permission sets.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/writeOffInvoices`

Formats

JSON, XML

HTTP Methods

GET

Authentication

`Authorization: Bearertoken`

Notes

You can also call the associated Connect REST API endpoint or InvoiceWriteOff Apex methods. See Posted Invoice List Write-Off (POST) API or InvoiceWriteOff Namespace.

Inputs

Input	Details
`writeOffInvoiceInputList`	**Type** Apex-defined **Description** Required. A collection of Apex input records that contain details about the invoices to be written off. See InvoiceWriteOff Namespace for the list of input parameters.

Outputs

Output	Details
`writeOffInvoiceResponseList`	**Type** Apex-defined **Description** A collection of Apex output records that contain details about the invoices that were written off. See InvoiceWriteOff Namespace for the list of output parameters.

Example

GET

This sample request is for the Write Off Invoices action.

```
{
  "inputs": [
    {
      "apexClass": "InvoiceWriteOff__WriteOffInvoiceInputList",
      "bytelength": 0,
      "configuration": false,
      "defaultValue": null,
     "description": "A collection of Apex WriteOffInvoiceInputList records that contain
 details about the invoices to be written-off.",
      "label": "WriteOffInvoiceInputList",
      "maxOccurs": 1,
      "name": "writeOffInvoiceInputList",
      "picklistValues": null,
      "placeholderText": null,
      "required": true,
      "sObjectType": null,
      "setupReferenceType": null,
      "toolingType": null,
      "type": null
    }
  ]
}
```

This sample response is for the Write Off Invoices action.

```
{
  "outputs": [
    {
      "additionalAttributes": null,
      "apexClass": "InvoiceWriteOff__WriteOffInvoiceResponseList",
     "description": "A collection Apex WriteOffInvoiceResponseList records that contain
 details about the invoices that were written off.",
      "label": "WriteOffInvoiceResponseList",
      "maxOccurs": 1,
      "name": "writeOffInvoiceResponseList",
      "picklistValues": null,
      "sobjectType": null,
      "type": null
    }
  ]
}
```

Billing Business APIs

Use the Billing Business APIs to manage credit application and to handle billing scenarios.

These sections list the available resources.

Credits

Resource	Description
/commerce/invoicing/credit-memos/**creditMemoId**/actions/apply (POST)	Adjust or correct already issued invoices by applying an existing credit memo to an invoice.
/commerce/invoicing/credit-memo-inv-applications/**creditMemoInvApplicationId**/actions/unapply (POST)	Unapply a credit memo from an invoice and return the invoice and the credit memo to their pre-application states.
/commerce/invoicing/credit-memo-lines/**creditMemoLineId**/actions/apply (POST)	Adjust or correct already issued invoices by applying an existing credit memo line to an invoice line.
/commerce/invoicing/credit-memo-line-invoice-line/**creditMemoLineInvoiceLineId**/actions/unapply (POST)	Unapply a credit memo line from an invoice line and return the invoice line and the credit memo line to their pre-application states.
/commerce/invoicing/credit-memos/actions/generate (POST)	Create a credit memo without applying it to an invoice. You can credit the invoice at a later date.
/commerce/invoicing/invoices/**invoiceId**/actions/void (POST)	Void a posted invoice to rebill the customer, if necessary.
/commerce/invoicing/invoices/**invoiceId**/actions/convert-to-credit on page 2559 (POST)	Convert a list of invoice lines with a negative amount into a posted credit memo. This conversion is applicable for a single invoice at a time.
/commerce/invoicing/invoices/**invoiceId**/actions/credit on page 2530 (POST)	Create a credit memo and apply it to an invoice. The credit memo can fully or partially credit the invoice.
/commerce/invoicing/credit/collection/actions/post on page 2563 (POST)	Post a draft credit memo to a credit memo record for review and approval.
/commerce/billing/credit-memos/**creditMemoId**/actions/void on page 2583 (POST)	Void a credit memo in posted state.

Billing Schedules

Resource	Description
/commerce/invoicing/billing-schedules/actions/create (POST)	Generate billing schedules for orders by using context service.
/commerce/invoicing/standalone/billing-schedules/actions/create (POST)	Generate billing schedules from any internal or external transaction by using context service.
/commerce/invoicing/billing-schedules/collection/actions/recover (POST)	Recover the latest generated invoice associated with the billing schedules in the `Error` or `Processing` status.
/commerce/invoicing/actions/suspend-billing (POST)	Suspend billing for billing schedule groups or an account for a predefined period.
/commerce/invoicing/actions/resume-billing (POST)	Resume billing for billing schedule groups or an account that's currently on hold.

Invoices

Resource	Description
/commerce/invoicing/invoices/collection/actions/post (POST)	Update the status of the invoice from Draft to Posted.
/commerce/invoicing/invoice-batch-runs/***invoiceBatchRunId***/actions/draft-to-posted (POST)	Update a batch of invoices from `Draft` to `Posted` status for a credit memo application.
/commerce/invoicing/invoices/collection/actions/preview (POST)	Generate preview invoices, which includes the estimated tax amounts, for a billing transaction for the next two billing periods.
/commerce/invoicing/invoices/collection/actions/ingest (POST)	Ingest or generate an invoice from an internal or external billing transaction data.
/commerce/billing/invoices/invoice-batch-docgen/***invoiceBatchRunId***/actions/***actionName*** (POST)	Asynchronously generate PDF documents for the invoices that are in the `Draft` or `Posted` status and are associated with an invoice batch run record.

Resource	Description
/commerce/billing/invoices/invoice-batch-docgen/***invoiceBatchRunId***/actions/***actionName*** (POST)	Asynchronously regenerate PDF documents for the invoices that are in the `Draft` or `Posted` status and failed in an earlier invoice batch run.
`/commerce/invoicing/invoices/actions/write-off` (POST)	Create credit memos with the total charge amount on the invoice as the write-off amount and close the invoice.
`/commerce/invoicing/invoice-batch-runs/actions/send-email` (POST)	Send emails for the posted invoices of a specified invoice batch run ID.
`/commerce/invoicing/invoices/collection/actions/generate` (POST)	Create an invoice for an account, order, or a list of billing schedules.
`/revenue/billing/transactions/actions/apply` (POST)	Apply payments and credits to an account's invoices based on specified rules defined on the Billing Settings page.
`/revenue/billing/document/actions/generate` (POST)	Generate an invoice document for a record, and update any junction object record.

Invoice Scheduler

Resource	Description
`/commerce/invoicing/invoice-schedulers` (POST)	Create or update an invoice scheduler to automatically generate invoices. Use the criteria and filters of the invoice scheduler to set up the invoice run schedules based on your requirements.
/commerce/invoicing/invoice-batch-runs/***invoiceBatchRunId***/actions/recover (POST)	Recover records associated with a failed invoice run. Recovery is required only when billing schedules remain in the `Processing`, `Void In Progress`, or `Error` status.

Invoice Sequencing

Resource	Description
/connect/sequences/policy (POST)	Create a sequence policy to configure a unique, sequential number for posted invoices or credit memos.
/connect/sequences/policy/***sequencePolicyId*** (PATCH)	Update the settings of a sequence policy that defines how unique, sequential numbers are generated by using specific patterns, values, and filters.
/connect/sequences/actions/assign (POST)	Assign sequence pattern values to objects based on the configured sequence policy.
/connect/sequences/gap-reconciliation (POST)	Restore a missing sequence value identified by using this API in gapless-enabled sequences. This sequence value can be used later in the subsequent sequence policy numbering, ensuring there are no gaps.

Account Statement

Resource	Description
/revenue/billing/accounts/***accountId***/statement (POST)	Generate comprehensive account statement with transaction history and balance information.

Payments

Resource	Description
/commerce/billing/payments/***paymentId***/actions/apply (POST)	Allocate the balance of a payment to reduce the balance of an invoice. The response includes an ID of the payment line invoice or payment line invoice line that represents the

Resource	Description
	payment balance allocated against the invoice.
/commerce/billing/payments/***paymentId***/paymentlines/***paymentLineId***/actions/unapply (POST)	Revert the application of a payment line from an invoice, and return the payment and invoices to their preapplication state. Use this API to correct an input during the payment application process.
/commerce/billing/refunds/***refundId***/actions/apply (POST)	Make a refund transaction against a payment.

Tax Calculation

Resource	Description
/commerce/taxes/actions/calculate (POST)	Calculate tax for a transaction.
/commerce/invoicing/invoices/collection/actions/calculate-estimated-tax (POST)	Calculate estimated tax for invoices with invoice lines that have the `TaxProcessingStatus` as either `Pending` or `Estimated`.

Salesforce Commerce Payments API

Resource	Description
/commerce/payments/payment-methods (POST)	Tokenize a payment method.
/commerce/payments/sales (POST)	Make a payment sale.
/commerce/payments/payments/***paymentId***/refunds (POST)	Create a refund for a payment.
/commerce/payments/authorizations (POST)	Authorize a payment.
/commerce/payments/authorizations/***authorizationId***/reversals (POST)	Reverse an authorized payment.
/commerce/payments/authorizations/***authorizationId***/captures (POST)	Capture an authorized payment.

Connect REST API Developer Guide: Introduction

Billing Business API Limits

Learn about the default limits on the usage of the Billing business APIs.

Refer to these default API limits and applicable recommendations to scale beyond these default limits.

Limit	Value	Scale Recommendations
The number of billing schedules that can be processed by the Create Invoices By Using Billing Schedules API.	200	Use Invoice Scheduler to scale up to 2000 invoice lines. See Invoice Scheduler or Batch Invoice Scheduler (POST) API.
The number of invoice lines that can be generated by the Create Invoices By Using Billing Schedules API.	200	Use Invoice Scheduler to scale up to 2000 invoice lines. See Invoice Scheduler or Batch Invoice Scheduler (POST) API.
The number of billing schedules that can be processed by the Recover Billing Schedule List API.	200	Use this API to follow the default API limits.
The number of invoices that can be processed by the Apply Credit Memos API.	300	Use this API recursively to apply left-over credits after 300 invoice lines.
The number of invoice lines that can be processed by the Apply Credit Memo Lines API.	300	Use this API iteratively for every 300 invoice lines to support more than 300 invoice lines.
The number of invoices that can be processed by the Create and Apply Credit Memos API.	300	Use this API to follow the default API limits. The limits include the count for both charge and tax lines.
The number of credit memo lines of type Charge that can be created by the Create a Standalone Credit Memo API.	300	Use this API to follow the default API limits. The limits include the count for both charge and tax lines.

EDITIONS

Available in: Lightning Experience

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Limit	Value	Scale Recommendations
The number of invoice lines that can be processed by the Convert Negative Invoice Lines to Credits API, which excludes the number of associated invoice line taxes.	300	Use this API to follow the default API limits. The limits include the count for invoice charge lines only.
The number of billing transaction items that can be processed by the Create Billing Schedules for Orders API.	1000	This API supports creation of 1000 order lines as billing schedules.
The number of reference IDs that can be processed by the Suspend Billing API and the Resume Billing API.	200	Use this API to follow the default API limits.
The number of invoice lines that's supported by the Invoice Draft to Posted Status API.	200	Use this API to follow the default API limits.
The number of records that can be processed by the Invoice Ingestion API.	500	Use this API to follow the default API limits. The limits include the count for all invoices, invoice lines, taxes, and address group records.
The number of invoice lines or billing schedules that can be processed by the Invoice Preview API.	200	Use this API to follow the default API limits.
The number of invoice lines that can be processed by the Void a Posted Invoice API.	2000	Use this API to follow the default API limits.
The number of invoices that can be processed by the Posted Invoice List Write-Off API.	300	Use this API to follow the default API limits.
The number of invoice lines that can be generated on an invoice by the Batch Invoice Scheduler (POST) API. The number of records that can be recovered from a failed invoice run by the Batch Invoice Run Recovery (POST) API.	2000	Use this API to support the creation or recovery of up to 2,000 invoice lines on a single invoice.
The number of invoice lines that's supported by the Batch Invoices Draft to Posted Status (POST) API.	2000	Use this API to support 2000 invoice lines with no limit on the number of supported invoices.
The number of invoices that's supported by the Tax Calculation API.	1	Use this API to follow the default API limits.
The number of invoice lines that's supported by the Tax Calculation API.	500	The request can include 500 invoice lines. To avoid limit-related issues, test your TaxEngineAdapter Apex interface's implementation to make sure that it adheres to the Apex limit for total heap size.

Limit	Value	Scale Recommendations
The number of invoice lines that's supported by the Tax Calculation API interface when used with the Invoice Creation API.	200	The request can include 200 invoice lines. To avoid limit-related issues, test your TaxEngineAdapter Apex interface's implementation to make sure that it adheres to the Apex limit for total heap size.
The number of invoice lines that's supported by the Tax Calculation API interface when used with the Invoice Batch Run API.	2000	The request can include 2000 invoice lines. To avoid limit-related issues, test your TaxEngineAdapter Apex interface's implementation to make sure that it adheres to the Apex limit for total heap size.
The number of records that's supported by the Payment Line Apply API.	1	Payment supports application for either an Invoice or InvoiceLine record based on the settlement-level preferences.
The number of records that's supported by the Payment Line Unapply API.	1	Payment supports unapplication for either a PaymentLineInvoice or PaymentLineInvoiceLine record based on the settlement-level preferences.

Resources

Learn more about the available Billing API resources.

Sequence Gap Reconciliation (POST)
: Restore a missing sequence value identified by using this API in gapless-enabled sequences. This sequence value can be used later in the subsequent sequence policy numbering, ensuring there are no gaps.

Sequence Assignment (POST)
: Assign sequence pattern values to objects based on the configured sequence policy.

Batch Invoices Document Generation (POST)
: Asynchronously generate PDF documents for the invoices that are in the `Draft` or `Posted` status and are associated with an invoice batch run record.

Batch Invoices Document Generation Retry (POST)
: Asynchronously regenerate PDF documents for the invoices that are in the `Draft` or `Posted` status and failed in an earlier invoice batch run.

Batch Invoices Draft to Posted Status (POST)
: Update a batch of invoices from `Draft` to `Posted` status for a credit memo application.

Batch Invoice Scheduler (POST, PUT)
: Create or update an invoice scheduler to automatically generate invoices. Use the criteria and filters of the invoice scheduler to set up the invoice run schedules based on your requirements.

Batch Payment Scheduler (POST)
: Create a payment scheduler to automate and process payment runs on a recurring basis.

Billing Arrangement (GET)

Retrieve a billing arrangement and its associated billing arrangement lines.

Billing Schedule Recovery List (POST)

Recover the latest generated invoice associated with the billing schedules in the `Error` or `Processing` status.

Create Billing Schedules for Orders (POST)

Generate billing schedules for orders by using context service.

Create Sequence Policy (POST)

Create a sequence policy to configure a unique, sequential number for posted invoices or credit memos.

Create Standalone Billing Schedules (POST)

Generate billing schedules from any internal or external transaction by using context service.

Create and Apply Credit Memo (POST)

Create a credit memo and apply it to an invoice. The credit memo can fully or partially credit the invoice.

Apply Credit Memo (POST)

Adjust or correct already issued invoices by applying an existing credit memo to an invoice.

Unapply Credit Memo (POST)

Unapply a credit memo from an invoice and return the invoice and the credit memo to their pre-application states.

Apply Credit Memo Line (POST)

Adjust or correct already issued invoices by applying an existing credit memo line to an invoice line.

Unapply Credit Memo Line (POST)

Unapply a credit memo line from an invoice line and return the invoice line and the credit memo line to their pre-application states.

Generate On-Demand Invoice Document (POST)

Generate an invoice document for a record, and update any junction object record.

Generate Account Statement (POST)

Generate comprehensive account statement with transaction history and balance information.

Invoice Creation (POST)

Create an invoice for an account, order, or a list of billing schedules.

Invoice Draft to Posted Status (POST)

Update the status of the invoice from Draft to Posted.

Invoice Ingestion (POST)

Ingest or generate an invoice from an internal or external billing transaction data.

Invoice Estimated Tax Calculation (POST)

Calculate estimated tax for invoices with invoice lines that have the `TaxProcessingStatus` as either `Pending` or `Estimated`.

Invoice Preview (POST)

Generate preview invoices, which includes the estimated tax amounts, for a billing transaction for the next two billing periods.

Invoice Run Recovery (POST)

Recover records associated with a failed invoice run. Recovery is required only when billing schedules remain in the `Processing`, `Void In Progress`, or `Error` status.

Negative Invoice Lines to Credit Conversion (POST)

Convert a list of invoice lines with a negative amount into a posted credit memo. This conversion is applicable for a single invoice at a time.

Payment Line Apply (POST)

Allocate the balance of a payment to reduce the balance of an invoice. The response includes an ID of the payment line invoice or payment line invoice line that represents the payment balance allocated against the invoice.

Payment Line Unapply (POST)

Revert the application of a payment line from an invoice, and return the payment and invoices to their preapplication state. Use this API to correct an input during the payment application process.

Payment Scheduler Update (PATCH)

Activate or deactivate a payment scheduler. You can set the status of a payment scheduler to `Active`, `Canceled`, `Draft`, or `Inactive`.

Post a Draft Memo (POST)

Post a draft credit memo to a credit memo record for review and approval.

Rules Application (POST)

Apply payments and credits to an account's invoices based on specified rules defined on the Billing Settings page.

Posted Invoice List Write-Off (POST)

Create credit memos with the total charge amount on the invoice as the write-off amount and close the invoice.

Void a Posted Invoice (POST)

Void a posted invoice to rebill the customer, if necessary.

Refund Line Apply (POST)

Make a refund transaction against a payment.

Send Emails for Posted Invoices (POST)

Send emails for the posted invoices of a specified invoice batch run ID.

Resume Billing (POST)

Resume billing for billing schedule groups or an account that's currently on hold.

Suspend Billing (POST)

Suspend billing for billing schedule groups or an account for a predefined period.

Standalone Credit Memo (POST)

Create a credit memo without applying it to an invoice. You can credit the invoice at a later date.

Tax Calculation (POST)

Calculate tax for a transaction.

Update Sequence Policy (PATCH)

Update the settings of a sequence policy that defines how unique, sequential numbers are generated by using specific patterns, values, and filters.

Void Posted Credit Memo (POST)

Void a credit memo in posted state.

Sequence Gap Reconciliation (POST)

Restore a missing sequence value identified by using this API in gapless-enabled sequences. This sequence value can be used later in the subsequent sequence policy numbering, ensuring there are no gaps.

Special Access Rules

You need the Billing Admin permission set to use this API.

Resource

```
/connect/sequences/gap-reconciliation
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/sequences/gap-reconciliation
```

Available version

65.0

HTTP methods

POST

Request body for POST

JSON example

This example shows a sample request that specifies the list of sequence policies for gap reconciliation.

```
{
  "sequencePolicyIds": [
    "1vdxx0000000abc",
    "1vdxx0000000def"
  ]
}
```

This example shows a sample request that specifies the target invoice object for gap reconciliation.

```
{
  "targetObjects": [
    "Invoice"
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`sequence PolicyIds`	String[]	List of IDs of the sequence policies.	Required if the `targetObjects` property isn't specified. You must not specify both properties.	65.0
`target Objects`	String[]	List of objects to which the policies are applied. Valid values are: • `Invoice` • `CreditMemo`—Available in API version 66.0 and later.	Required if the `sequencePolicyIds` property isn't specified. You must not specify both properties.	65.0

Response body for POST

Sequence Gap Reconciliation

Sequence Assignment (POST)

Assign sequence pattern values to objects based on the configured sequence policy.

Special Access Rules

You need the Billing Admin permission set to use this API.

Resource

```
/connect/sequences/actions/assign
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/sequences/actions/assign
```

Available version

65.0

HTTP methods

POST

Request body for POST

JSON example

```
{
  "targetObjectIds": [
    "3ttxx00000005nhAAA",
    "3ttxx00000006bhAAA"
  ],
  "sequencePolicyId": "1Vdxx0000004CFU"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
sequence PolicyId	String	ID of the sequence policy.	Optional	65.0
shouldPublish Platform Event	Boolean	Indicates whether to publish a platform event when a sequence is assigned to a target record (`true`) or not (`false`).	Optional	65.0
target ObjectIds	String[]	List of records to which the sequence pattern values are assigned.	Required	65.0

Response body for POST

Sequences Assignment

Batch Invoices Document Generation (POST)

Asynchronously generate PDF documents for the invoices that are in the `Draft` or `Posted` status and are associated with an invoice batch run record.

Special Access Rules

This API is available with Revenue Cloud Billing. To use this API, enable Document Generation for Billing. Additionally, you need either the Billing Operations User permission set or the Billing Admin permission set, along with the Docgen Designer permission set and Docgen Designer Standard User permission set.

Resource

```
/commerce/billing/invoices/invoice-batch-docgen/invoiceBatchRunId/actions/actionName
```

- The *invoiceBatchRunId* parameter is the ID of the invoice batch run record that created the `Draft` or `Posted` invoices.
- The *actionName* parameter is the name of the action you want to perform on the specified invoice batch run record.

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/billing/invoices/invoice-batch-docgen/5KPxx0025063GSmSAX/actions/run
```

Available version

63.0

HTTP methods

POST

Response body for POST

Batch Invoice Document Generation

Batch Invoices Document Generation Retry (POST)

Asynchronously regenerate PDF documents for the invoices that are in the `Draft` or `Posted` status and failed in an earlier invoice batch run.

Special Access Rules

This API is available with Revenue Cloud Billing. To use this API, enable Document Generation for Billing. Additionally, you need either the Billing Operations User permission set or the Billing Admin permission set, along with the Docgen Designer permission set and Docgen Designer Standard User permission set.

Resource

```
/commerce/billing/invoices/invoice-batch-docgen/invoiceBatchRunId/actions/actionName
```

- The *invoiceBatchRunId* parameter is the ID of the invoice batch run record that created the `Draft` or `Posted` invoices.
- The *actionName* parameter is the name of the action you want to perform on the specified invoice batch run record. In this case, the action is to retry generating the `Draft` or `Posted` invoices that failed earlier.

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/billing/invoices/invoice-batch-docgen/5IRxx0000004GSmGAM/actions/retry
```

Available version

63.0

HTTP methods

POST

Response body for POST

Batch Invoice Document Generation

Batch Invoices Draft to Posted Status (POST)

Update a batch of invoices from `Draft` to `Posted` status for a credit memo application.

Special Access Rules

To use this API, you need the Billing Operations User permission set.

Resource

```
/commerce/invoicing/invoice-batch-runs/invoiceBatchRunId/actions/draft-to-posted
```

This API posts the draft invoices and changes the status of the invoices from `Draft` to `Posted`.

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/invoicing/invoice-batch-runs/5IRNZ0000000cA94AI/actions/draft-to-posted
```

Available version

62.0

HTTP methods

POST

Path parameter for POST

Name	Type	Description	Required or Optional	Available Version
`invoiceBatchRunId`	String	ID of the invoice batch run record that creates the draft invoices.	Required	62.0

Response body for POST

Invoice Batch Draft To Posted

Batch Invoice Scheduler (POST, PUT)

Create or update an invoice scheduler to automatically generate invoices. Use the criteria and filters of the invoice scheduler to set up the invoice run schedules based on your requirements.

Special Access Rules

You need the Billing Operations User and Data Pipelines Base User permission sets to use this API. See Data Pipelines.

Resource

```
/commerce/invoicing/invoice-schedulers
```

```
/commerce/invoicing/invoice-schedulers/billingBatchSchedulerId
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/invoicing/invoice-schedulers
```

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/invoicing/invoice-schedulers/5BSxx0000004TwGGAU
```

Available version

62.0

HTTP methods

POST, PUT

PUT is supported in version 63.0 and later for invoice schedulers with `Draft` or `Inactive` status.

Request body for POST

JSON example

This example shows a sample request to create an invoice scheduler that generates invoices once.

```
{
  "schedulerName": "InvoiceScheduler",
  "startDate": "2024-05-06",
  "invoiceStatus": "POSTED",
  "preferredTime": "00:45",

        },
        {
            "operation": "InList",
            "value": "OneTime,Recurring",
            "criteriaSequence": 4,
            "objectName": "BillingSchedule",
            "fieldName": "BillingTermUnit"
        },
        {
            "operation": "Equals",
            "value": "USD",
            "criteriaSequence": 5,
            "objectName": "BillingSchedule",
            "fieldName": "Currency_Iso_code"
        }
```

```
    ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
endDate	String	End date of the invoice scheduler.	Optional	63.0
filter Criteria	Batch Invoice Filter Criteria Input[]	List of line items of the filter criteria.	Optional	62.0
frequency Cadence	String	Frequency to run the invoice scheduler. Valid values are: • Once • Daily • Weekly • Monthly	Required	62.0
frequency Cadence Options	Frequency Cadence Options	Frequency cadence options for the invoice scheduler.	Required	62.0
invoiceDate	String	Date shown on the invoice. This date is also used for tax calculations.	Required if the frequency Cadence property is set to Once.	62.0
invoiceDate Offset	Integer	Offset applied to the target date, which is the number of days added to or subtracted from the invoice date, to calculate the updated invoice date.	Required if the frequency Cadence property is set to Daily, Weekly, or Monthly.	62.0
invoice Status	String	Status of the invoice that specifies the expected invoice status from an invoice batch run. Valid values are: • Draft • Posted	Required	62.0
isInvoice DateFrom RunDate	Boolean	Indicates whether the invoice date is applicable from the date when the invoice scheduler is run (true) or not (false).	Optional	63.0
preferred Time	String	Preferred time for the invoice batch run.	Required	62.0

Name	Type	Description	Required or Optional	Available Version
scheduler Name	String	Name of the invoice scheduler, which must be unique in your org.	Required	62.0
startDate	String	Start date of the invoice scheduler.	Required	62.0
status	String	Status of the invoice scheduler. Valid values are: • Draft • Active • Inactive	Required	62.0
targetDate	String	Target date of the invoice batch run. Billing schedules having the next billing date before this date are picked up for invoicing. The target date must be less than or equal to the maximum allowed target date for the org.	Required if the frequency Cadence property is set to Once.	62.0
target DateOffset	Integer	Target date offset applied to the next invoice run date to calculate the target date. The offset is the number of days added to or subtracted from the next billing date.	Required if the frequency Cadence property is set to Daily, Weekly, or Monthly.	62.0
timezone	String	Time zone that's applicable for the invoice scheduler.	Optional	62.0

Response body for POST

Batch Invoice Scheduler

Batch Payment Scheduler (POST)

Create a payment scheduler to automate and process payment runs on a recurring basis.

Special Access Rules

You need the Payment Ops permission set to use this API.

Resource

```
/commerce/payments/payment-schedulers/
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/payments/payment-schedulers/
```

Available version

64.0

    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`criteria MatchType`	String	Match type for the criteria of the payment scheduler. Valid values are: • `Match Any` • `Match None`	Required if the `frequencyCadence` property is set to `Monthly`.	64.0

Name	Type	Description	Required or Optional	Available Version
endDate	String	End date of the payment scheduler.	Required if the frequencyCadence property is set to Monthly.	64.0
frequencyCadence	String	Frequency cadence of the payment scheduler. Valid values are: • Once • Daily • Weekly • Monthly	Required	64.0
filterCriteria	Payment Run Batch Filter Criteria Input	List of criteria that are used to filter the payment run details.	Required if the frequencyCadence property is set to Monthly.	64.0
preferredTime	String	Preferred time for the payment scheduler run.	Required	64.0
recursEveryMonthOnDay	String	Date when the payment scheduler recurs.	Required if the frequencyCadence property is set to Monthly.	64.0
schedulerName	String	Name of the payment scheduler.	Required	64.0
startDate	String	Start date of the payment scheduler.	Required	64.0
status	String	Status of the payment scheduler. Valid values are: • Active • Canceled • Draft • Inactive	Required	64.0

Response body for POST

Batch Payments Scheduler

Billing Arrangement (GET)

Retrieve a billing arrangement and its associated billing arrangement lines.

This API fetches billing information, including the split percentage allocation for accounts, the remainder percentage, and whether adjustments are applied to the owning account.

Resource

```
/revenue/billing/billing-arrangement/billingArrangementId
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/revenue/billing/billing-arrangement//revenue/billing/billing-arrangement/1bdxx000000004rAAA
```

Available version

66.0

HTTP methods

GET

Request parameter for GET

Parameter Name	Type	Description	Required or Optional	Available Version
billing ArrangementId	String	Unique ID of the billing arrangement to retrieve.	Required	66.0

Response body for GET

Billing Arrangement

Billing Schedule Recovery List (POST)

Recover the latest generated invoice associated with the billing schedules in the `Error` or `Processing` status.

Billing schedules include critical details such as the amount to be billed, next billing date, and status. An invoice can be associated with one or more billing schedules. When an invoice is generated or posted, the billing schedules are updated to reflect the accurate state of the invoice. The billing schedules associated with an invoice are marked in the `Error` status if any of the invoicing processes have errors. Use this API to recover the invoice associated with the billing schedules in the `Error` or `Processing` status.

Special Access Rules

You need the Manage Errors Using Invoice Error Recovery API permission set to use this API.

Resource

```
/commerce/invoicing/billing-schedules/collection/actions/recover
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/invoicing/billing-schedules/collection/actions/recover
```

Available version

62.0

HTTP methods

POST

Request body for POST

JSON example

```
{
  "billingScheduleIds": ["44bDU00000000XXYAY"]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
billing ScheduleIds	String[]	IDs of the billing schedules to recover the invoice for. You can recover one billing schedule per API request.	Required	62.0

Response body for POST

Billing Schedule Recovery List

Create Billing Schedules for Orders (POST)

Generate billing schedules for orders by using context service.

Special Access Rules

The org must have the standard billing context definition with the target mapping. This context definition is available in orgs with Billing enabled. Additionally, you need the Create Billing Schedules From Billing Transactions API permission set and the Context Service Runtime permission set to use this API.

See these requirements to learn more about the configuration prerequisites.

Resource

```
/commerce/invoicing/billing-schedules/actions/create
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/invoicing/billing-schedules/actions/create
```

Available version

62.0

HTTP methods

POST

Request body for POST

JSON example

```
{
    "billingTransactionIds": [ "801xx000003H1H9AAK"]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`billing Transaction Ids`	String[]	ID of the billing transaction. This property value is the ID of the order if the source of the billing request is for the Order object. If the order product associated with the specified order ID doesn't have an associated billing treatment ID, the API considers the default billing treatment ID. The generated billing schedule group has the default billing treatment ID. The API supports only one billing transaction ID in the input.	Required	62.0

Response body for POST

Context-Aware Billing Schedule

Create Sequence Policy (POST)

Create a sequence policy to configure a unique, sequential number for posted invoices or credit memos.

A sequence policy ensures unique identification and systematic tracking of financial transactions, supporting regulatory compliance and preventing fraud. You can create a sequence policy for invoices or credit memos only.

Special Access Rules

You need the Billing Admin permission set to use this API.

Resource

```
/connect/sequences/policy
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/sequences/policy
```

Available version

65.0

HTTP methods

POST

}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`dateStampFormat`	String	Format of the stamp date that's appended to the sequence number. You can't edit this property by using the Update Sequence Policy API.	Required	65.0
`description`	String	Additional details about the sequence policy.	Optional	65.0

Name	Type	Description	Required or Optional	Available Version
effectiveFrom DateTime	String	Date and time when the policy becomes effective. The default value is the current date.	Required	65.0
expiration DateTime	String	Date and time when the policy expires.	Optional	65.0
filter Criteria	String	Criteria to filter the target objects.	Required	65.0
increment Number	Integer	Value by which the sequence number increases until it reaches the maximum number. This value must be greater than or equal to 1. The default value is 1. You can't edit this property by using the Update Sequence Policy API.	Required	65.0
isActive	Boolean	Indicates whether the policy is active (true) or not (false). The default value is false.	Required	65.0
maximumSequence Number	Integer	Maximum number the sequence number can reach.	Optional	65.0
minimumSequence NumberWidth	Integer	Minimum number of digits a sequence number must have. You can't edit this property by using the Update Sequence Policy API.	Optional	65.0
name	String	Name of the sequence policy.	Required	65.0
selection Condition	Selection Condition Input[]	Criteria to determine which sequence policy is applied to a record. This property includes conditions based on any standard or custom fields of the record.	Optional	65.0
selection Logic	String	Logic that determines the objects that the sequence policy applies to.	Optional	65.0
sequenceMode	String	Specifies how sequence numbers are generated. Valid values are: • Basic—Assigns sequential numbers without gap reconciliation. • Gapless—Assigns sequential numbers with gap reconciliation. The usage of this value ensures that the posted invoices or credit memos don't have any numbering gaps for audits and compliance.	Required	65.0

Name	Type	Description	Required or Optional	Available Version
		You can't edit this property by using the Update Sequence Policy API.		
`sequencePattern`	String	Pattern structure that's followed for the sequence.	Required	65.0
`sequenceStartNumber`	Integer	Starting value of the sequence number, which must be greater than or equal to `0`. The default value is `1`. You can't edit this property by using the Update Sequence Policy API.	Required	65.0
`targetObject`	String	Object that the policy is applied to. Valid values are: • `Invoice` • `CreditMemo`—Available in API version 66.0 and later. You can't edit this property by using the Update Sequence Policy API.	Required	65.0
`timeZone`	String	Time zone that's applicable for the sequence policy.	Optional	65.0

Response body for POST

Sequence Policy

Create Standalone Billing Schedules (POST)

Generate billing schedules from any internal or external transaction by using context service.

You can create a billing schedule from any sObject such as WorkOrder, Cart, Order, Opportunity, and insurance policy. Or, you can also generate billing schedules from order items.

The Create Standalone Billing Schedules (POST) API uses the StandaloneBillingContext context definition to hydrate the context of the transaction. The context definition includes these mappings.

- The TransactionMapping maps the fields of the transaction to the attributes of the Transaction node.
- The BSGEntitiesMapping maps the attributes of the Billing Schedule node, the Billing Schedule Group node, and Billing Schedule Group Relationship node to the fields of the corresponding Salesforce objects.

For the StandaloneBillingContext context definition to hydrate all the required data, transaction data for the mandatory context tags are required. Here are the topics that mention the mandatory and optional tags, sample transaction details, and sample payloads for various types of transactions.

- One-Time New Sale Transaction on page 2600
- Term-Defined New Sale Transaction on page 2603
- Evergreen New Sale Transaction on page 2607
- New Sale Transaction With Bundled Products on page 2611

- New Sale Transaction With Ramped Products on page 2617
- New Sale Transaction With Usage Products on page 2622
- Amended Transaction on page 2626
- Renewal Transaction on page 2636
- Early Renewal Transaction on page 2641
- Canceled Transaction on page 2647

Special Access Rules

This API is available with the Revenue Cloud Billing license.

Create and Apply Credit Memo (POST)

Create a credit memo and apply it to an invoice. The credit memo can fully or partially credit the invoice.

Use this API to adjust an outstanding invoice balance or rectify errors in an invoice. In the API request, pass a list of invoice lines to credit. Keep these considerations in mind when you use this API.

- The request must contain at least one invoice line. Each invoice line must have the invoice line's ID, the amount to credit, and any optional tax details. The invoice lines must be a part of the invoice passed in the resource.
- The amount to credit must not exceed the charge or adjustment amount of an individual invoice line.
- The request body's credit amount inclusive of taxes must not exceed the target invoice line's amount inclusive of taxes, except for taxes calculated through an external tax service.
- The request body's total credit amount inclusive of taxes calculated through an external tax service must not exceed the outstanding invoice balance, which is also inclusive of taxes.

This API creates and posts a credit memo. The credit memo has one credit memo line for each invoice line passed in the API request. The invoice balance reduces by a value equal to the credit memo's balance. This API modifies the balance of a posted invoice or invoice line based on the specified credit application level for your org. See Apply Credits to Posted Invoices or Invoice Lines.

Special Access Rules

You need the Credit Memo Operations User permission set to use this API.

    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`description`	String	Description for the credit memo to be created.	Optional	62.0
`effective Date`	String	Date when the credit memo takes effect.	Optional	62.0
`invoiceLines`	Credit Invoice Line Input[]	List of the invoice lines to be credited. The invoice line IDs must be related to the invoice ID specified in the API request.	Required	62.0

Name	Type	Description	Required or Optional	Available Version
		If invoice lines aren't specified, the API request results in an error.		
taxEffective Date	String	Date when the tax takes effect to recalculate the taxes.	Optional	62.0
taxStrategy	String	Tax strategy to be applied across invoice lines. You can override the tax strategy at the individual invoice line level or at the tax line level. Valid values are: • Ignore—Specifies that the creation of tax lines must be ignored. • ManualOverride—Specifies that the provided tax values must be considered for taxes. • CopyFromInvoiceLine—Specifies that tax values must be copied from the invoice line. • Calculate—Specifies that tax must be calculated by using the API.	Required	62.0
type	String	Type of credit memo to be created. Valid values are Posted and Draft. Specify Draft as a value in your request to create draft credit memos.	Optional	62.0

Response body for POST

Revenue Async Line Level

Apply Credit Memo (POST)

Adjust or correct already issued invoices by applying an existing credit memo to an invoice.

Specify the credit memo ID and the amounts to be applied, with the total of all applied amounts not exceeding the credit memo's balance.

The credit amount for each invoice can't surpass the original charge or adjustment amount, and the overall credit amount must not exceed the invoice's outstanding balance. The exceptions include any taxes calculated by an external service.

For example, your organization sold 10 tablets at US$500 each, totaling $5000, to a vendor who later reported that 6 tablets were defective. Your accounts receivable team creates a $3000 credit memo by using the standalone Credit Memo API. Additionally, the team applies this credit to the original invoice by using the Apply Credit Memo API.

When the credit application level is Invoice Line, this API applies the credit memo amount to all invoice lines starting from the highest amount until the full credit is applied or all lines are settled.

Special Access Rules

You need the Credit Memo Operations User permission set to use this API.

Resource

```

Name	Type	Description	Required or Optional	Available Version
`documentTemplateId`	String	Document template ID to use for PDF generation. The document template	Optional	66.0

Name	Type	Description	Required or Optional	Available Version
		must be active with UsageType as `INVOICE` If you don't specify this value, the system auto-resolves by using the default template.		
`documentTitle`	String	Custom title for the generated document. If you don't specify a value, the value is auto-generated.	Optional	66.0
`recordId`	String	Record ID of the object the document is generated for. You can specify invoice ID only.	Required	66.0
`shouldForceRegenerate`	Boolean	Indicates whether to regenerate the document (`true`) or not (`false`). If set to `true`, this API generates a document, replacing any existing ones. If set to `false`, this API skips the generation of document if invoice already has an associated document. The default value is `false`.	Optional	66.0
`tokenData`	String	Token data to generate the document.	Optional	66.0

Response body for POST

On-Demand Document Generation Response

Generate Account Statement (POST)

Generate comprehensive account statement with transaction history and balance information.

An account statement includes these details.

- Transaction History—List of all financial transactions, such as invoices, credit memos, debit memos, payments, and refunds, within a specified date range.
- Open Balances—Non-zero balances for invoices and other transactions.
- Account Summary—Aggregated totals including beginning balance, total charges, total payments, and ending balance.
- Multi-currency Support—Transactions across multiple currencies.

```

Properties

Name	Type	Description	Required or Optional	Available Version
associatedAccountIds	String[]	List of associated account IDs from hierarchy to include in the statement. You can specify up to 50 accounts.	Optional	66.0
correlationId	String	Correlation ID for tracking the request across systems.	Optional	66.0
customFields	String	JSON string specifying custom fields to include in the statement. As a best practice, we recommend that you limit the number of custom fields up to 30 fields. Valid objects to specify the associated fields are:	Optional	67.0

Name	Type	Description	Required or Optional	Available Version
		• `Invoice` • `CreditMemo` • `Payment` • `DebitMemo` • `Refund` • `Account` Here's the expected format. `{"Invoice": ["field1", "field2"], "Account": {"base": ["field1"], "associated": ["field2"]}}`		
documentTemplateId	String	Document template ID to use for PDF generation. If you don't specify a value, the system auto-resolves by using the default template.	Optional	66.0
shouldShowOpenBalancesOnly	Boolean	Indicates whether to show open balances only (`true`) or not (`false`). If set to `true`, the API shows only accounts with non-zero balances. If set to `false`, this API shows complete transaction history within the date range from the start date.	Optional	66.0
sortBy	String	Criteria for sorting transactions. The default and valid value is `Date`.	Optional	66.0
sortingOrder	String	Sort order for transactions. Valid values are: • `Ascending` • `Descending` The default value is `Descending`.	Optional	66.0
startDate	String	Start date for the transaction history. The required format is `YYYY-MM-DD`. The system processes records up to 90 days from this date.	Required	66.0
transactionTypes	String[]	List of transaction types to include in the statement. If you don't specify a value or	Optional	66.0

Name	Type	Description	Required or Optional	Available Version
		the value is empty, all transaction types are included. Valid values are: • `All` • `CreditMemo` • `DebitMemo` • `Invoice` • `Payment` • `Refund`		

Response body for POST

Account Statement Response

Invoice Creation (POST)

Create an invoice for an account, order, or a list of billing schedules.

This API request creates billing period items for the matching billing schedules. The billing period items are created for the period between the next charge date of the billing schedule and the specified target date. Invoice lines are created by processing these billing period items. These invoice lines are then grouped into invoices based on the defined grouping criteria on the billing schedule.

This API also applies any available credits on an account to settle an invoice and to reduce it's balance. To apply available credits, ensure the **Apply Credits to Posted Invoices** setting from Billing Settings is turned on.

Special Access Rules

You need the Generate Invoices From Billing Schedule API, Billing Operations User, or Billing Customer Service permission set to use this API.

Resource

```
/commerce/invoicing/invoices/collection/actions/generate
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/invoicing/invoices/collection/actions/generate
```

POST

Request body for POST

Note: The `billingTransactionId` property takes precedence over the `accountId` property followed by the `billingScheduleIds` property when values for these properties are specified in the input request.

JSON example

```
{
  "accountId": "001SG00000mYtRWYA0",
```

```
  "action": "Posted",
  "billingScheduleIds": [
    "44bSG000000CVeMYAW"
  ],
  "billingTransactionId": "801SG00000mYtaXYAS",
  "correlationId": null,
  "invoiceDate": "2024-01-12",
  "targetDate": "2024-01-12"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`accountId`	String	ID of the account record to create the invoices for.	Required if the `billing ScheduleIds` or `billing TransactionId` property isn't specified.	63.0
`action`	String	Type of invoice to be created. Valid values are: • `Draft` • `Posted`	Required	62.0
`billing ScheduleIds`	String[]	List of billing schedule IDs that's used to create the invoices. You can specify a maximum of 200 billing schedules.	Required if the `accountId` or `billing TransactionId` property isn't specified.	62.0
`billing TransactionId`	String	ID of the billing transaction record, which is the order ID, to create the invoices for.	Required if the `accountId` or `billing ScheduleIds` property isn't specified.	63.0
`correlation Id`	String	Property that's tagged against the published `InvoiceProcessedEvent` event, if specified.	Optional	62.0
`invoiceDate`	String	Stamping date of the invoice in ISO 8601 format.	Required	62.0

Name	Type	Description	Required or Optional	Available Version
`targetDate`	String	Date in ISO 8601 format used to decide the billing periods that are included to create invoices.	Required	62.0

Response body for POST

[Revenue Async Response](#)

Invoice Draft to Posted Status (POST)

Update the status of the invoice from Draft to Posted.

This API calls an external tax engine or provides information to your tax adapter implementation to calculate taxes for the draft invoice, post the invoice, and update the related billing schedules and billing periods.

Special Access Rules

You need the Billing Operations User permission set to use this API.

POST

Request body for POST

JSON example

```
{
  "invoiceIds": ["3ttxx0000004CIjAAM"]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`correlationId`	String	Splunk correlation ID to track the messages that are related to the request and are logged in Splunk by the different services involved in the request. If the ID isn't specified, the service creates a random Universally Unique Identifier (UUID).	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
`invoiceIds`	String[]	IDs of the invoice records in `Draft` status to be posted. You can post one draft invoice per API request.	Required	62.0

Response body for POST

Revenue Async Response

Invoice Ingestion (POST)

Ingest or generate an invoice from an internal or external billing transaction data.

Create invoices from any external or internal transaction. For example, create invoices by using external orders, policies, quotes, or internal data, such as assets or quotes.

You can also perform these additional tasks.

- Ingest invoices from any external system into Billing to manage invoice operations such as issuing credits against an invoice or voiding an invoice.
- Generate invoices from debit memos from API version 66.0 and later.

Keep these considerations in mind when you use this API.

- If the Convert Negative Invoice Lines to Credit Memo Lines feature isn't enabled, use the Negative Invoice Lines to Credit Conversion API to create a credit memo against an ingested negative invoice line.
- Use the Apply Credit Action to apply a credit memo to an invoice.
- To ingest legacy invoices, create at least one invoice line.
- To generate invoices from debit memos, specify the debit memo ID as the `referenceEntityId` property value in the request body of this API. Make sure that the debit memo is in `Posted` status and is ready for invoice generation. The invoice is generated in `Draft` status.

Resource

```
/commerce/invoicing/invoices/collection/actions/ingest
```

Resource example

```

  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`invoices`	Invoice Ingestion Input[]	List of invoices to be generated or ingested, enabling the submission and processing of multiple invoices in a single request. This API supports one invoice per request. To send 25 requests at a time, see the Composite Batch request.	Required	63.0

Response body for POST

Invoice Ingestion

Invoice Estimated Tax Calculation (POST)

Calculate estimated tax for invoices with invoice lines that have the `TaxProcessingStatus` as either `Pending` or `Estimated`.

Resource

```
/commerce/invoicing/invoices/collection/actions/calculate-estimated-tax
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/invoicing/invoices/collection/actions/calculate-estimated-tax
```

Available version

63.0

HTTP methods

POST

Request body for POST

JSON example

```
{
  "invoiceIds": ["3ttxx0000004CIjAAM"]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
correlationId	String	Splunk correlation ID to track the messages that are related to the request and are logged in Splunk by the different services involved in the request. If the ID isn't specified, the service creates a random Universally Unique Identifier (UUID).	Optional	63.0
invoiceIds	String[]	IDs of the invoices for which the estimated tax must be calculated. You can specify one invoice per API request.	Required	63.0

Response body for POST

Revenue Async Response

Invoice Preview (POST)

Generate preview invoices, which includes the estimated tax amounts, for a billing transaction for the next two billing periods.

Invoice preview provides details of the upcoming invoices for orders or quotes within the system.

Special Access Rules

You need the Billing Operations User or Billing Customer Service permission set to use this API.

See these requirements to learn more about the configuration prerequisites.

Resource

```
/commerce/invoicing/invoices/collection/actions/preview
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/invoicing/invoices/collection/actions/preview
```

Available version

63.0

HTTP methods

POST

Request body for POST

JSON example

```
{
    "billingTransactionId": "801Z600000004LoIAI",
    "numberOfBillingPeriods": 2,
    "previewDate": "2024-12-04"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`billing TransactionId`	String	ID of the record to generate the preview invoices for.	Required	63.0
`numberOf BillingPeriods`	Integer	Number of billing periods that the invoice preview is generated for. If unspecified, the default value is `2`.	Optional	64.0
`previewDate`	String	The date on which the preview invoice is generated. For the first invoice, the preview date is the target date for generating the invoice. For the second invoice, the target date is calculated based on the preview date and the minimum billing frequency of the transactions. The default value is the current date.	Optional	63.0

Response body for POST

Invoice Preview

Invoice Run Recovery (POST)

Recover records associated with a failed invoice run. Recovery is required only when billing schedules remain in the `Processing`, `Void In Progress`, or `Error` status.

Special Access Rules

To use this API, you need the Invoice Scheduler API permission set.

Resource

```
/commerce/invoicing/invoice-batch-runs/invoiceBatchRunId/actions/recover
```

The *`invoiceBatchRunId`* parameter is the ID of the failed invoice batch run record whose details you want to retrieve.

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/invoicing/invoice-batch-runs/5IRxx0000004TwGGAU/actions/recover
```

Available version

62.0

HTTP methods

POST

Response body for POST

Invoice Batch Run Recovery on page 2739

Negative Invoice Lines to Credit Conversion (POST)

Convert a list of invoice lines with a negative amount into a posted credit memo. This conversion is applicable for a single invoice at a time.

Keep these considerations in mind when you use this API.

- All invoice lines must be related to the same invoice.
- The invoice line must have a negative amount.
- The invoice line must not be a previously converted credit memo.
- The invoice must have the `Posted` status.
- The invoice must not have any active settlements such as credit applications.

Special Access Rules

You need the Credit Memo Operations User permission set to use this API.

Resource

```
/commerce/invoicing/invoices/invoiceId/actions/convert-to-credit
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/invoicing/invoices/3ttxx00000000XtAAI/actions/convert-to-credit
```

Available version

62.0

HTTP methods

POST

Path parameter for POST

Name	Type	Description	Required or Optional	Available Version
`invoiceId`	String	ID of the invoice whose negative invoice lines must be converted into a posted credit memo.	Required	62.0

Request body for POST

JSON example

```
{
"invoiceLines": ["5TVxx0000004C92GAE", "5TVxx0000004C93GAE"],
"description": "Convert negative invoice lines into credit",
```

```
"effectiveDate":"2022-05-18"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`description`	String	Description stamped on the credit memo that's created after the negative invoice line conversion.	Optional	62.0
`effectiveDate`	String	Date stamped on the credit memo that's created after the negative invoice line conversion.	Required	62.0
`invoiceLines`	String[]	Complete list of the negative invoice lines along with the associated invoice line taxes. The specified negative invoice lines are converted into a posted credit memo.	Optional	62.0

Response body for POST

Convert Negative Invoice Lines

Payment Line Apply (POST)

Allocate the balance of a payment to reduce the balance of an invoice. The response includes an ID of the payment line invoice or payment line invoice line that represents the payment balance allocated against the invoice.

Use the Commerce Payments APIs to send your payment and refund details to external payment gateways for processing against a customer's bank. See Commerce Payments resources to check the APIs for payment gateways, payment captures, and payment authorizations.

Resource

```
/commerce/billing/payments/paymentId/actions/apply
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/billing/payments/1PLR000000000dDOAQ/actions/apply
```

Available version

64.0

HTTP methods

POST

Path parameter for POST

Name	Type	Description	Required or Optional	Available Version
`paymentId`	String	ID of the payment record.	Required	64.0

Request body for POST

JSON example

```
{
  "appliedToId": "3ttR000000001IkIAI",
  "amount": 10,
  "effectiveDate": "2020-08-11T07:53:15.000Z",
  "comments": "Apply payment",
  "associatedAccountId": "001R00000060AyuIAE"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
amount	Double	Amount that's applied. The amount must be less than the invoice line and payment balance.	Required	64.0
appliedToId	String	ID of the invoice line that this payment is applied to. Specify the IDs for these records. • Invoice • Invoice Line	Required	64.0
associatedAccountId	String	ID of the associated account.	Optional	64.0
comments	String	Comments that you can add to the payment line application.	Optional	64.0
effectiveDate	String	Date from which the payment line application takes effect.	Optional	64.0

Response body for POST

Payment Line Apply

Payment Line Unapply (POST)

Revert the application of a payment line from an invoice, and return the payment and invoices to their preapplication state. Use this API to correct an input during the payment application process.

For example, you can use this API to revert an incorrect payment that's applied to an invoice, or to rectify an incorrect amount.

Use the Commerce Payments APIs to send your payment and refund details to external payment gateways for processing against a customer's bank. See Commerce Payments resources to check the APIs for payment gateways, payment captures, and payment authorizations.

Resource

```
/commerce/billing/payments/paymentId/paymentlines/paymentLineId/actions/unapply
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/billing/payments/0aQ1j000000001O/paymentlines/1PLR000000000dDOAQ/actions/unapply
```

Available version

64.0

HTTP methods

POST

Path parameters for POST

Name	Type	Description	Required or Optional	Available Version
`paymentId`	String	ID of the payment record.	Required	64.0
`paymentLineId`	String	ID of the payment line record.	Required	64.0

Request body for POST

JSON example

```
{
  "effectiveDate": "2025-05-22T11:30:25.000Z",
  "comments": "Unapply payment"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`comments`	String	Comments that you can add when you revert a payment line application.	Optional	64.0
`effectiveDate`	String	Date from when the reversal of the payment line application is in effect.	Optional	64.0

Response body for POST

Payment Line Unapply

Payment Scheduler Update (PATCH)

Activate or deactivate a payment scheduler. You can set the status of a payment scheduler to `Active`, `Canceled`, `Draft`, or `Inactive`.

Special Access Rules

You need the Payment Ops permission set to use this API.

Resource

```
/commerce/payments/payment-schedulers/billingBatchSchedulerId
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/payments/payment-schedulers/5BSxx0000004TwGGAU
```

Available version

64.0

HTTP methods

PATCH

Path parameter for POST

Name	Type	Description	Required or Optional	Available Version
billingBatch SchedulerId	String	ID of the payment scheduler record.	Required	64.0

Request body for PATCH

JSON example

JSON example

```
{
  "status": "Active"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
status	String	Status that must be set to activate or deactivate a payment scheduler. Valid values are: • Active • Canceled • Draft • Inactive	Required	64.0

Response body for PATCH

Payments Scheduler Update

Post a Draft Memo (POST)

Post a draft credit memo to a credit memo record for review and approval.

Resource

```
/commerce/invoicing/credit/collection/actions/post
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v65.0/commerce/invoicing/credit/collection/actions/post
```

Available version

65.0

HTTP methods

POST

Request body for POST

JSON example

```
{
"creditMemoIds": ["50gDU00000001MnYAI"]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
correlationId	String	Splunk correlation ID to use to track messages that are related to the request and logged in Splunk by the different services involved in the request. If not specified, the service creates a random Universally Unique Identifier (UUID).	Optional	65.0
creditMemoIds	String[]	ID of the credit memo record in Draft status to be posted. You can post one draft credit memo per API request.	Required	65.0

Response body for POST

Credit Memo Post

Rules Application (POST)

Apply payments and credits to an account's invoices based on specified rules defined on the Billing Settings page.

This API uses predefined logic to allocate payments and credits, reducing any manual intervention and errors.

Resource

```
/revenue/billing/transactions/actions/apply
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/revenue/billing/transactions/actions/apply
```

Available version

66.0

HTTP methods

POST

Request body for POST

JSON example

```
{
  "accountId": "001xx000003DGbQAAW",
  "targetDate": "2024-01-15"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`accountId`	String	ID of the account to perform the settlement of payments and credits against invoices in adherence with the applied rules.	Required	66.0
`targetDate`	String	The date used to select invoices and invoice lines with a posted date equal to or later than the target date to apply payments and credits.	Optional	66.0

Response body for POST

Rules Application

Posted Invoice List Write-Off (POST)

Create credit memos with the total charge amount on the invoice as the write-off amount and close the invoice.

You can write off invoices to maintain accurate financial records and to prioritize invoices with a higher probability of payment, which is essential for compliance with accounting standards.

Special Access Rules

To use this API, you need the Billing Operations User or Credit Memo Operations User permission set.

Resource

```
/commerce/invoicing/invoices/actions/write-off
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/invoicing/invoices/actions/write-off
```

Available version

64.0

HTTP methods

POST

Request body for POST

JSON example

```
{
  "invoices": [
    {
      "invoiceId": "3ttxx00000000cjAAA",
      "reasonCode": "Bad Debt",
      "description": "Bad Debt"
    },
    {
      "invoiceId": "3ttxx00000000cjAAA",
      "reasonCode": "Concession",
      "description": "Concession"
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`invoices`	Posted Invoice Write-Off Input[]	Details of the invoices that you want to write off.	Required	64.0

Response body for POST

Posted Invoice List Write-Off

Void a Posted Invoice (POST)

Void a posted invoice to rebill the customer, if necessary.

This API request changes the invoice status from `Posted` to `Void In Progress`. The invoice remains in the `Void In Progress` status until the credit is applied and financial fields are recalculated on the invoice's related billing period items and billing schedule. The invoice status changes to `Voided` after all recalculations are completed.

Keep these considerations in mind when you use this API.

- The balance and total amount on the invoice must be equal. If these amounts aren't equal due to payments or credits, the API request fails.
- You can't call other APIs on an invoice with the `Void In Progress` status. You also can't update the invoice fields.
- You can void only the most recently posted invoice on a billing schedule.
- To void an invoice that has payments or credits, use the Credit Memo Unapply (POST) API.

Credit Memos

The void process creates a credit memo, which contains one credit memo line for each invoice line, including tax lines. For example, if the invoice line has a balance of US$20, the related credit memo line has a balance of $20. The credit memo's balance is then allocated to the invoice header's balance, reducing it to zero. A credit memo invoice application is created to record the details of the void process.

Negative Invoice Lines

If an invoice has negative invoice lines that aren't converted to a credit memo, you can use this endpoint to void the posted invoice.

Special Access Rules

You need the Void a Posted Invoice API permission set to use this API.

Resource

```
/commerce/invoicing/invoices/invoiceId/actions/void
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/invoicing/invoices/3ttxx00000000XtAAI/actions/void
```

Available version

62.0

HTTP methods

POST

Path parameter for POST

Properties

Name	Type	Description	Required or Optional	Available Version
`invoiceId`	String	ID of the posted invoice to be voided.	Required	62.0

Response body for POST

Revenue Async Response

Refund Line Apply (POST)

Make a refund transaction against a payment.

Resource

```
/commerce/billing/refunds/refundId/actions/apply
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/billing/refunds/0cbVc0000000G4nIAE/actions/apply
```

Available version

64.0

HTTP methods

POST

Path parameter for POST

Name	Type	Description	Required or Optional	Available Version
`refundId`	String	ID of the refund record.	Required	64.0

Request body for POST

JSON example

```
{
  "appliedToId": "0aQR00000004ZkKMAU",
  "amount": 10,
  "effectiveDate": "2020-08-11T07:53:15.000Z",
  "comments": "Payment application."
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`amount`	Double	Amount to refund.	Required	64.0
`appliedToId`	String	ID of a payment or credit memo record. The refund is applied to this object.	Required	64.0
`comments`	String	Additional details of the refund request.	Optional	64.0
`effectiveDate`	String	Date from when the refund is in effect.	Optional	64.0

Response body for POST

Refund Line Apply

Send Emails for Posted Invoices (POST)

Send emails for the posted invoices of a specified invoice batch run ID.

Each email includes a custom message template in the email body and an attachment of the Invoice Document PDF. The email template is based on the user preferences defined on the Billing Profile, Legal Entity, or Billing Settings page.

Special Access Rules

Enable the **Configure Email Delivery Settings** toggle from the Billing Settings page from Setup.

Resource

```
/commerce/invoicing/invoice-batch-runs/actions/send-email
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/invoicing/invoice-batch-runs/actions/send-email
```

Available version

65.0

HTTP methods

POST

Request body for POST

HTTP methods

POST

Request body for POST

JSON example

```
{
    "referenceIds":
    [
        {
          "referenceId": "001DU000001o2UwYAI",
          "resumeDate": "2024-11-27"
        }
    ]

}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`referenceIds`	Resume Billing Object Input[]	Input representation of the account or billing schedule group IDs to resume the billing operation for.	Required	63.0

Response body for POST

Suspend Resume Billing

Suspend Billing (POST)

Suspend billing for billing schedule groups or an account for a predefined period.

Resource

```
/commerce/invoicing/actions/suspend-billing
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/invoicing/actions/suspend-billing
```

Available version

63.0

Request body for POST

JSON example

```
{
    "referenceIds":
    [
        {
            "referenceId": "001DU000001o2UwYAI",
            "suspendDate": "2024-11-27",
            "resumeDate": "2024-12-27"
        }
    ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`referenceIds`	Suspend Billing Object Input[]	Input representation of the account or billing schedule group IDs to suspend the billing operation for.	Required	63.0

Response body for POST

Suspend Resume Billing

Standalone Credit Memo (POST)

Create a credit memo without applying it to an invoice. You can credit the invoice at a later date.

In the API request, specify the credit memo header information, charge parameters, adjustment parameters, and tax parameters. A credit memo requires at least one credit memo line. The credit memo line can be a charge or an adjustment.

Specify the credit memo lines that you want as lists of charges and adjustments. Each credit memo line must be related to a product.

Special Access Rules

You need the Credit Memo Operations User permission set to use this API.

Resource

```
/commerce/invoicing/credit-memos/actions/generate
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/invoicing/credit-memos/actions/generate
```

Available version

62.0

POST

Request body for POST

JSON example

This example shows a sample request with the `Ignore` tax strategy.

```
{
  "billingAccountId": "001j000000WCFB800x",
  "type": "Posted",
  "description": "Standalone credit memo with ignored tax.",
  "currencyIsoCode": "USD",
  "taxStrategy": "Ignore",
  "charges": [
    {
      "chargeAmount": 100,
      "productId": "01tR0000000njDiIAI"
    }
  ]
}
```

This example shows a sample request with the `ManualOverride` tax strategy.

```
{
  "billingAccountId": "001DU000001nhoPYAQ",
  "description": "creditmemo-1",
  "currencyIsoCode": "USD",
  "taxStrategy": "ManualOverride",
  "charges": [
    {
      "productId": "01tDU000000EpKkYAK",
```

```
      "chargeAmount": 1000,
      "taxes": [
        {
          "taxAmount": 7.25,
          "taxCode": "CA-94121",
          "taxName": "CALIFORNIA",
          "taxRate": 0.25
        }
      ]
    }
  ]
}
```

This example shows a sample request with the `Calculate` tax strategy for a charge line.

```
{
  "billingAccountId": "001DU000001nhoPYAQ",
  "description": "Standalone Credit Memo",
  "type": "Posted",
  "currencyIsoCode": "USD",
  "taxStrategy": "Ignore",
  "charges": [
    {
      "productId": "01tR0000000njDiIAI",
      "chargeAmount": 10,
      "taxStrategy": "Calculate",
      "treatmentId": "1ttxx00000001VZAAY"
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`billToContactId`	String	Contact related to the credit memo.	Optional	62.0
`billingAccountId`	String	ID of the account that the credit is issued to.	Required	62.0
`charges`	Standalone Credit Memo Charge Input[]	Charge lines of the credit memo. Requires at least one charge line.	Required	62.0
`currencyIsoCode`	String	ISO code currency of the new credit that's issued.	Optional	62.0
`description`	String	Description for the new credit that's issued.	Optional	62.0
`effectiveDate`	String	Effective date of the credit memo. If the value isn't specified, then it's null.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
externalReference	String	ID of the external reference for the credit memo.	Optional	62.0
externalReferenceDataSource	String	Source of the external reference for the credit memo.	Optional	62.0
taxEffectiveDate	String	Effective date of the credit memo tax. If the value isn't specified, then it's null.	Optional	62.0
taxStrategy	String	Specifies how tax lines must be created for the standalone credit memos. Valid values are: • `Ignore`—Specifies that the creation of tax lines must be ignored. • `Manual Override`—Specifies that the provided tax values must be considered for taxes. • `Calculate`—Specifies that tax must be calculated by using the API.	Required	62.0
type	String	Type of credit memo to be created. Valid values are `Posted` and `Draft`. Specify `Draft` as a value in your request to create draft credit memos.	Optional	62.0

Response body for POST

Revenue Async Response

Tax Calculation (POST)

Calculate tax for a transaction.

Special Access Rules

To use this API, you need the CalculateTaxes API permission set.

```

Properties

Name	Type	Description	Required or Optional	Available Version
addresses	Addresses	Address details for tax calculation.	Optional	62.0
currencyIsoCode	String	Currency ISO code that's used for tax calculation.	Optional	62.0
customerDetails	Customer Details	Customer details for determining the applicable tax.	Optional	62.0
description	String	Description of the tax transaction.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
documentCode	String	Unique identifier for the tax document. If the documentCode property isn't specified, the tax engine auto-generates it.	Optional	62.0
effectiveDate	String	Date when the tax rules are applied. If a tax rate changes on a specific date, the effectiveDate property ensures the correct rate is applied based on the transaction's timing. For credit-based tax callouts, specify the original invoice date.	Optional	62.0
isCommit	Boolean	Indicates whether to submit the transaction to the tax engine for reporting (true) or not (false). This property value is true for invoices and credit memos with the Posted status.	Optional	62.0
lineItems	Line Item Input []	Details of the line items for calculating the applicable tax.	Required	62.0
reference DocumentCode	String	Reference document code. For subsequent transactions such as a credit tax, this property value specifies the original document code. For credit-based tax callouts, specify the original invoice ID.	Optional	62.0
reference EntityId	String	ID of the related quote, invoice, and other transaction documents.	Optional	62.0
sellerDetails	Seller Details Input	Seller details for tax calculation.	Optional	62.0
shouldVoidTax	Boolean	Indicates whether to void the tax transaction associated with a document that's mentioned as the referenceDocumentCode property value with taxType property value as Actual and isCommit property value set to true. Keep these considerations in mind when you use this property.	Optional	65.0

Name	Type	Description	Required or Optional	Available Version
		• If the `shouldVoidTax` property value is set to `true`, then the operation returns a response with `documentCode` property value updated to `referenceDocumentCode` property value that was originally sent in the request payload. The response also includes the `taxTransactionType` property value as `Void`. This indicates that the document specified in the `referenceDocumentCode` property value is voided. • If document is locked or you can't void the tax transaction for any reason, then you can use the Tax Calculation request to perform another transaction such as a Credit Tax request. In this scenario, the response includes the `documentCode` property value that was sent in the request payload. • If the document that's mentioned in the `referenceDocumentCode` property value isn't available in the tax engine, then an error response occurs with ResultCode on page 1607 value as `ReferenceDocumentCodeMissing`.		
`taxEngineId`	String	ID of the tax engine that's used to calculate tax.	Required	62.0
`tax TransactionType`	String	Type of the tax transaction. Valid values are: • `Debit`—Increases tax liability for the seller, requiring the seller to pay tax on the transaction. • `Credit`—Decreases tax liability for the seller, resulting in a tax refund for the seller. • `Void`—Reserved for internal use. The default value is `Debit`.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
taxType	String	Type of the tax. Valid values are: • Actual—Exact tax amount that's calculated based on actual sales. • Estimated— Estimated tax amount, which is adjusted later to match actual tax calculations. For draft invoices and quote records, the tax type is marked as Estimated. After draft invoices are posted and the status changes to Posted, the tax type is updated to Actual. Similarly, when a quote record is finalized and converted into an actual order, the tax type is also updated to Actual.	Required	62.0
transactionDate	String	Date of the transaction that appears on the invoice, order, and other transaction documents.	Required	62.0

Response body for POST

Tax Calculation

Update Sequence Policy (PATCH)

Update the settings of a sequence policy that defines how unique, sequential numbers are generated by using specific patterns, values, and filters.

Special Access Rules

You need the Billing Admin permission set to use this API.

Request body for PATCH

JSON example

This example shows a sample request to create a sequence policy.

```
{
  "name": "Sample Sequence Policy",
  "description": "This is a sample sequence policy.",
  "effectiveFromDateTime": "2025-08-10",
  "expirationDateTime": "2025-09-20",
  "isActive": true,
  "sequenceMode": "Basic",
  "targetObject": "Invoice",
  "dateStampFormat": "Yyyy",
  "sequenceStartNumber": 1,
  "incrementNumber": 1,
  "maximumSequenceNumber": 1000,
  "minimumSequenceNumberWidth": 2,
  "filterCriteria": "Custom",
  "selectionLogic": "selectionLogic",
  "sequencePattern": "INV-{SequenceValue}-abc",
  "selectionCondition": [
    {
      "filterField": "AppType",
      "operator": "Equals",
      "filterValue": "RLM",
      "conditionNumber": 1
    },
    {
      "filterField": "Status",
      "operator": "Equals",
      "filterValue": "Posted",
      "conditionNumber": 2
    },
    {
      "filterField": "LegalEntity",
      "operator": "Equals",
      "filterValue": "US",
      "conditionNumber": 3
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
dateStamp Format	String	Format of the stamp date that's appended to the sequence number. You can't edit this property by using the Update Sequence Policy API.	Required	65.0
description	String	Additional details about the sequence policy.	Optional	65.0

Name	Type	Description	Required or Optional	Available Version
effectiveFrom DateTime	String	Date and time when the policy becomes effective. The default value is the current date.	Required	65.0
expiration DateTime	String	Date and time when the policy expires.	Optional	65.0
filter Criteria	String	Criteria to filter the target objects.	Required	65.0
increment Number	Integer	Value by which the sequence number increases until it reaches the maximum number. This value must be greater than or equal to 1. The default value is 1. You can't edit this property by using the Update Sequence Policy API.	Required	65.0
isActive	Boolean	Indicates whether the policy is active (true) or not (false). The default value is false.	Required	65.0
maximumSequence Number	Integer	Maximum number the sequence number can reach.	Optional	65.0
minimumSequence NumberWidth	Integer	Minimum number of digits a sequence number must have. You can't edit this property by using the Update Sequence Policy API.	Optional	65.0
name	String	Name of the sequence policy.	Required	65.0
selection Condition	Selection Condition Input[]	Criteria to determine which sequence policy is applied to a record. This property includes conditions based on any standard or custom fields of the record.	Optional	65.0
selection Logic	String	Logic that determines the objects that the sequence policy applies to.	Optional	65.0
sequenceMode	String	Specifies how sequence numbers are generated. Valid values are: • Basic—Assigns sequential numbers without gap reconciliation. • Gapless—Assigns sequential numbers with gap reconciliation. The usage of this value ensures that the posted invoices or credit memos don't have any numbering gaps for audits and compliance.	Required	65.0

Name	Type	Description	Required or Optional	Available Version
		You can't edit this property by using the Update Sequence Policy API.		
`sequencePattern`	String	Pattern structure that's followed for the sequence.	Required	65.0
`sequenceStartNumber`	Integer	Starting value of the sequence number, which must be greater than or equal to `0`. The default value is `1`. You can't edit this property by using the Update Sequence Policy API.	Required	65.0
`targetObject`	String	Object that the policy is applied to. Valid values are: • `Invoice` • `CreditMemo`—Available in API version 66.0 and later. You can't edit this property by using the Update Sequence Policy API.	Required	65.0
`timeZone`	String	Time zone that's applicable for the sequence policy.	Optional	65.0

Response body for PATCH

Sequence Policy

Void Posted Credit Memo (POST)

Void a credit memo in posted state.

The API response returns a unique identifier. In case of any asynchronous errors, a RevenueTransactionErrorLog record is created.

Resource

```
/commerce/billing/credit-memos/creditMemoId/actions/void
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/commerce/billing/credit-memos/50gVB0000003khRYAQ/actions/void
```

Available version

66.0

HTTP methods

POST

Path parameter for POST

Properties

Name	Type	Description	Required or Optional	Available Version
`creditMemoId`	String	ID of the posted credit memo to be voided.	Required	66.0

Request body for POST

As this API accepts a credit memo ID as a path parameter in the URL, specify an empty request body.

Response body for POST

Void Posted Credit Memo

Request Bodies

Learn more about the available request bodies of Billing APIs.

Address Input

Input representation of the details of an address.

Addresses Input

Input representation of the details of the addresses for calculating tax.

Batch Invoice Filter Criteria Input

Input representation of the filter criteria for an invoice batch run.

Batch Invoice Scheduler Input

Input representation of the details of the request to create an invoice scheduler.

Billing Schedule Recovery Input

Input representation of the details of the billing schedules to recover the associated invoice.

Context-Aware Billing Schedule

Input representation of the billing transaction details.

Standalone Billing Schedule Input

Input representation of the request to create a billing schedule based on transaction details. This representation includes the transaction and context service details.

Standalone Billing Schedule Metadata Input

Input representation of the metadata details to create a billing schedule. This representation includes the name of the context definition and context mapping along with the mapping details of the transaction, billing schedule, and billing schedule group.

Convert Negative Invoice Lines Input

Input representation of the details of the request to convert a list of negative invoice lines into a credit.

Credit Invoice Input

Input representation of the details of the request to create a credit memo.

Credit Invoice Line Input

Input representation of the details of the invoice lines to be credited.

Credit Invoice Line Tax Input

Input representation of the details of the tax lines to be created manually for the invoice line.

Credit Memo Addresses Input

Input representation of the details of the billing and shipping addresses.

Credit Memo Apply Input

Input representation of the request to apply a credit memo to an invoice.

Credit Memo Apply Application Input

Input representation of the request to specify one or more applications to apply a credit memo for, with each application representing an invoice.

Credit Memo Draft to Posted Input

Input representation of the request to post a draft credit memo.

Credit Memo Unapply Input

Input representation of the request to unapply a credit memo from an invoice.

Credit Memo Line Apply Input

Input representation of the details of the request to apply a credit memo line to an invoice line.

Credit Memo Line Application Input

Input representation of the request to specify one or more applications to apply a credit memo line for, with each application representing an invoice line.

Credit Memo Line Unapply Input

Input representation of the details of the request to unapply a credit memo line from an invoice line.

Customer Details Input

Input representation of the customer details for tax calculation.

Frequency Cadence Options

Input representation of the frequency cadence options for an invoice scheduler.

Graph Record for Invoice Ingestion

A Graph record is an object that's a part of the graph structure, representing both the fields and relationships among different objects. Each record in the graph can contain attributes, which are fields of the object, and references to other related records.

Invoice Draft To Posted Input

Input representation of the details of the draft invoice that's posted.

Invoice Estimated Tax Calculation Input

Details of the invoice for which the estimated tadsfsefx must be calculated.

Invoice Ingestion Input

Input representation of the details of the invoice to be processed. The details include the tax processing status, user preferences for tax callouts, and associated object graph representation.

Invoice Input for Ingestion

Input representation of the details of the invoice that must be generated for or ingested into Billing.

Invoice Input

Input representation of the details of the billing schedule.

Invoice Preview Input

Input representation of the details of the billing transaction that the preview invoices are generated for.

Line Item Input

Input representation of the details of the line item for tax calculation.

On-Demand Document Generation Input

Input representation of the details to generate a comprehensive on-demand document for specified record types.

Payment Line Apply Input

Input representation of the payment line details. This representation covers details on allocation of a payment to a specific invoice line. It also provides additional context through optional fields such as associated account and effective date.

Payment Line Unapply Input

Input representation of the payment line details. This representation covers fields that you can specify to revert a payment line application to their preapplication state.

Payment Run Batch Filter Criteria Input

Input representation of the filter criteria for an invoice batch run. This representation covers the criteria and sequence for filtering payment run details. It specifies the field and object names, comparison operations, and values to be used for filtering.

Payment Batch Scheduler Input

Input representation of the details of the request to create a payment scheduler. This representation sets the rules and timing for a payment scheduler, including match types, dates, frequency, and filter criteria.

Payment Scheduler Update Input

Input representation of the details of the request to update the status of a payment scheduler. This representation defines the status of a payment scheduler, which can be set to Active, Canceled, Draft, or Inactive.

Posted Invoice List Write-Off Input

Input representation of the request to write off a list of posted invoices. This representation includes the details of invoices that you want to write off.

Posted Invoice Write-Off Input

Input representation of the details of the request to write off a posted invoice. This representation includes invoice details such as invoice ID and reason for writing off invoices.

Refund Line Apply Input

Input representation of the details of a transaction refund request. This representation outlines the properties of a refund, including the refund amount and ID of the payment or credit memo record that the refund is applied to.

Resume Billing Input

Input representation of the details of the request to resume the billing operation for an account or a billing schedule group.

Resume Billing Object Input

Input representation of the details such as the ID of the account or billing schedule group along with the effective date. These details are used to start the billing operation.

Rules Application Input

Input representation for applying payments and credits to invoices based on rules.

Selection Condition Input

Input representation of the criteria that's used to determine which sequencing policy is applied to a record. The criteria stores the conditions based on any standard or custom fields of the record.

Seller Details Input

Input representation of the seller details for tax calculation.

Send Email Input

Input representation of the request to send an email for an invoice batch run.

Sequence Policy Input

Input representation of the configured rules and properties to generate unique, sequential numbers for objects.

Sequence Gap Reconciliation Input

Input representation of the details that are used to identify and reconcile gaps in sequence values based on the sequence policy or target object.

Sequences Assignment Input

Input representation of the details of the target objects to which the sequence pattern values are assigned.

Standalone Credit Memo Charge Input

Input representation of the details of the charge lines of a credit memo.

Standalone Credit Memo Input

Input representation of the details required to create a standalone credit memo.

Standalone Credit Memo Tax Input

Input representation of the details of the tax request.

Account Statement Input

Input representation of the details required to generate a comprehensive account statement with transaction history and balance information.

Suspend Billing Input

Input representation of the details of the request to suspend the billing operation for an account or a billing schedule group.

Suspend Billing Object Input

Input representation of the details such as the ID of the account or billing schedule group along with the effective dates. These details are used to suspend the billing operation.

Tax Calculation Input

Input representation of the details of the request to calculate tax.

Void Posted Credit Memo Input

Input representation of the details of a credit memo to be voided.

Void Posted Invoice Input

Input representation of the details of the invoice to be voided.

Address Input

Input representation of the details of an address.

JSON example

JSON example

```
"billingAddress": {
  "street": "1 Market St #300",
  "city": "San Francisco",
  "state": "CA",
  "country": "US",
  "postalCode": "94105",
  "latitude": "37.789901",
  "longitude": "-122.396923"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
city	String	Address city.	Optional	62.0
country	String	Address country.	Optional	62.0
latitude	Double	Latitude for the address.	Optional	62.0
locationCode	String	Location code for the address.	Optional	62.0
longitude	Double	Longitude for the address.	Optional	62.0
postalCode	String	Postal code for the address.	Optional	62.0
state	String	Address state.	Optional	62.0
street	String	Address street.	Optional	62.0

Addresses Input

Input representation of the details of the addresses for calculating tax.

JSON example

```
{
  "addresses": {
    "billTo": {
      "street": "123 Main Street",
      "city": "Bainbridge Island",
      "state": "WA",
      "postalCode": "98110",
      "country": "US"
    },
    "soldTo": {
      "street": "123 Main Street",
      "city": "Bainbridge Island",
      "state": "WA",
      "postalCode": "98110",
      "country": "US"
    },
    "shipFrom": {
      "street": "123 Alaskan Way",
      "city": "Seattle",
      "state": "WA",
      "country": "US",
      "postalCode": "98101"
    },
    "shipTo": {
      "street": "123 Main street",
      "city": "Bainbridge Island",
      "state": "WA",
      "postalCode": "98110",
```

```
        "country": "US"
      }
    }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
billTo	Address Input	Billing address of the item.	Optional	62.0
shipFrom	Address Input	Address that the item is shipped from.	Optional	62.0
shipTo	Address Input	Address that the item is shipped to.	Required	62.0
soldTo	Address Input	Address of the entity that the item is sold to.	Optional	62.0

Batch Invoice Filter Criteria Input

Input representation of the filter criteria for an invoice batch run.

JSON example

```
    "filterCriteria": [
        {
            "operation": "InList",
            "value": "Batch 2,Batch 3,Batch 4",
            "criteriaSequence": 1,
            "objectName": "BillingSchedule",
            "fieldName": "InvoiceRunMatchingValue"
        },
        {
            "operation": "Equals",
            "value": "001xx000003GZG5AAO",
            "criteriaSequence": 2,
            "objectName": "BillingSchedule",
            "fieldName": "BillingAccount"
        },
        {
            "operation": "Equals",
            "value": "0fwxx0000000001AAA",
            "criteriaSequence": 3,
            "objectName": "BillingScheduleGroup",
            "fieldName": "LegalEntity"
        },
        {
            "operation": "InList",
            "value": "OneTime,Recurring",
            "criteriaSequence": 4,
            "objectName": "BillingSchedule",
            "fieldName": "BillingTermUnit"
        },
        {
```

```
            "operation": "Equals",
            "value": "USD",
            "criteriaSequence": 5,
            "objectName": "BillingSchedule",
            "fieldName": "Currency_Iso_code"
        }
    ]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`fieldName`	String	Name of the field that this filter is applicable for. Valid values are: • `Currency_Iso_code`—If multiple currencies are enabled for the org, then this value is required. • `InvoiceRunMatchingValue` • `BillingAccount` • `LegalEntity` • `BillingTermUnit`	Required	62.0
`objectName`	Object	Name of the object that the filter is applicable for. Valid values are: • `BillingSchedule` • `BillingScheduleGroup`	Required	62.0
`operation`	String	Operation to be performed for comparison. Valid values are: • `Equals` • `InList`—This value supports only the `InvoiceRunMatchingValue` and `BillingTermUnit` fields with API version 62.0 and later. In addition, this value supports the `CurrencyIsoCode` field with API version 63.0 and later. • `NotEquals`	Required	62.0
`value`	String	Value for the filter criteria.	Required	62.0

Batch Invoice Scheduler Input

Input representation of the details of the request to create an invoice scheduler.

JSON example

This example shows a sample request to create an invoice scheduler that generates invoices once.

```
{
  "schedulerName": "InvoiceScheduler",
  "startDate": "2024-05-06",
  "invoiceStatus": "POSTED",
  "preferredTime": "00:45",
  "targetDate": "2024-05-22",
  "invoiceDate": "2024-05-22",
  "frequencyCadence": "Once",
  "frequencyCadenceOptions": {},
  "timezone": "Asia/Kolkata",
  "status": "Active",
  "filterCriteria": [
    {
      "operation": "InList",
      "value": "Batch 2,Batch 3,Batch 4",
      "criteriaSequence": 1,
      "objectName": "BillingSchedule",
      "fieldName": "InvoiceRunMatchingValue"
    },
    {
      "operation": "Equals",
      "value": "001xx000003GZG5AAO",
      "criteriaSequence": 2,
      "objectName": "BillingSchedule",
      "fieldName": "BillingAccount"
    },
    {
      "operation": "Equals",
      "value": "0fwxx0000000001AAA",
      "criteriaSequence": 3,
      "objectName": "BillingScheduleGroup",
      "fieldName": "LegalEntity"
    },
    {
      "operation": "InList",
      "value": "OneTime,Recurring",
      "criteriaSequence": 4,
      "objectName": "BillingSchedule",
      "fieldName": "BillingTermUnit"
    },
    {
      "operation": "Equals",
      "value": "USD",
      "criteriaSequence": 5,
      "objectName": "BillingSchedule",
      "fieldName": "Currency_Iso_code"
    }
  ]
}
```

This example shows a sample request to create an invoice scheduler that generates invoices daily.

```
{
  "schedulerName": "InvoiceScheduler",
  "startDate": "2024-05-06",
  "endDate": "2026-05-06",
  "invoiceStatus": "POSTED",
  "preferredTime": "00:45",
  "targetDateOffset": 0,
  "invoiceDateOffset": 0,
  "isInvoiceDateFromRunDate": true,
  "frequencyCadence": "Daily",
  "frequencyCadenceOptions": {},
  "timezone": "Asia/Kolkata",
  "status": "Active",
  "filterCriteria": [
    {
      "operation": "InList",
      "value": "Batch 2,Batch 3,Batch 4",
      "criteriaSequence": 1,
      "objectName": "BillingSchedule",
      "fieldName": "InvoiceRunMatchingValue"
    },
    {
      "operation": "Equals",
      "value": "001xx000003GZG5AAO",
      "criteriaSequence": 2,
      "objectName": "BillingSchedule",
      "fieldName": "BillingAccount"
    },
    {
      "operation": "Equals",
      "value": "0fwxx0000000001AAA",
      "criteriaSequence": 3,
      "objectName": "BillingScheduleGroup",
      "fieldName": "LegalEntity"
    },
    {
      "operation": "InList",
      "value": "OneTime,Recurring",
      "criteriaSequence": 4,
      "objectName": "BillingSchedule",
      "fieldName": "BillingTermUnit"
    },
    {
      "operation": "InList",
      "value": "USD",
      "criteriaSequence": 5,
      "objectName": "BillingSchedule",
      "fieldName": "Currency_Iso_code"
    }
  ]
}
```

This example shows a sample request to create an invoice scheduler that generates invoices weekly.

```
{
  "schedulerName": "InvoiceScheduler",
  "startDate": "2024-05-06",
  "endDate": "2026-05-06",
  "invoiceStatus": "POSTED",
  "preferredTime": "00:45",
  "targetDateOffset": 0,
  "invoiceDateOffset": 0,
  "isInvoiceDateFromRunDate": false,
  "frequencyCadence": "Weekly",
  "frequencyCadenceOptions": {
    "recursOnDay": "Sunday"
  },
  "timezone": "Asia/Kolkata",
  "status": "Active",
  "filterCriteria": [
    {
      "operation": "InList",
      "value": "Batch 2,Batch 3,Batch 4",
      "criteriaSequence": 1,
      "objectName": "BillingSchedule",
      "fieldName": "InvoiceRunMatchingValue"
    },
    {
      "operation": "Equals",
      "value": "001xx000003GZG5AAO",
      "criteriaSequence": 2,
      "objectName": "BillingSchedule",
      "fieldName": "BillingAccount"
    },
    {
      "operation": "Equals",
      "value": "0fwxx0000000001AAA",
      "criteriaSequence": 3,
      "objectName": "BillingScheduleGroup",
      "fieldName": "LegalEntity"
    },
    {
      "operation": "InList",
      "value": "OneTime,Recurring",
      "criteriaSequence": 4,
      "objectName": "BillingSchedule",
      "fieldName": "BillingTermUnit"
    },
    {
      "operation": "Equals",
      "value": "USD",
      "criteriaSequence": 5,
      "objectName": "BillingSchedule",
      "fieldName": "Currency_Iso_code"
    }
  ]
}
```

This example shows a sample request to create an invoice scheduler that generates invoices monthly on a specific date.

```
{
  "schedulerName": "InvoiceScheduler",
  "startDate": "2024-05-06",
  "endDate": "2026-05-06",
  "invoiceStatus": "POSTED",
  "preferredTime": "00:45",
  "targetDateOffset": 0,
  "invoiceDateOffset": 0,
  "isInvoiceDateFromRunDate": false,
  "frequencyCadence": "Monthly",
  "frequencyCadenceOptions": {
    "recurringSubType": "SpecificDate",
    "recursOnDate": "L-1",
    "shouldExcludeWkendAndHldy": true
  },
  "timezone": "Asia/Kolkata",
  "status": "Active",
  "filterCriteria": [
    {
      "operation": "InList",
      "value": "Batch 2,Batch 3,Batch 4",
      "criteriaSequence": 1,
      "objectName": "BillingSchedule",
      "fieldName": "InvoiceRunMatchingValue"
    },
    {
      "operation": "Equals",
      "value": "001xx000003GZG5AAO",
      "criteriaSequence": 2,
      "objectName": "BillingSchedule",
      "fieldName": "BillingAccount"
    },
    {
      "operation": "Equals",
      "value": "0fwxx0000000001AAA",
      "criteriaSequence": 3,
      "objectName": "BillingScheduleGroup",
      "fieldName": "LegalEntity"
    },
    {
      "operation": "InList",
      "value": "OneTime,Recurring",
      "criteriaSequence": 4,
      "objectName": "BillingSchedule",
      "fieldName": "BillingTermUnit"
    },
    {
      "operation": "Equals",
      "value": "USD",
      "criteriaSequence": 5,
      "objectName": "BillingSchedule",
      "fieldName": "Currency_Iso_code"
    }
```

```
  ]
}
```

This example shows a sample request to create an invoice scheduler that runs immediately.

```
{
    "schedulerName": "InvoiceScheduler",
    "status": "Draft",
    "invoiceStatus": "Posted",
    "frequencyCadenceOptions": {
        "shouldStartRunImmediately": true
    },
    "frequencyCadence": "Once",
    "targetDate": "2024-08-28",
    "invoiceDate": "2024-08-28",
    "filterCriteria": [
        {
            "operation": "InList",
            "value": "Batch 2,Batch 3,Batch 4",
            "criteriaSequence": 1,
            "objectName": "BillingSchedule",
            "fieldName": "InvoiceRunMatchingValue"
        },
        {
            "operation": "Equals",
            "value": "001xx000003GZG5AAO",
            "criteriaSequence": 2,
            "objectName": "BillingSchedule",
            "fieldName": "BillingAccount"
        },
        {
            "operation": "Equals",
            "value": "0fwxx0000000001AAA",
            "criteriaSequence": 3,
            "objectName": "BillingScheduleGroup",
            "fieldName": "LegalEntity"
        },
        {
            "operation": "InList",
            "value": "OneTime,Recurring",
            "criteriaSequence": 4,
            "objectName": "BillingSchedule",
            "fieldName": "BillingTermUnit"
        },
        {
            "operation": "Equals",
            "value": "USD",
            "criteriaSequence": 5,
            "objectName": "BillingSchedule",
            "fieldName": "Currency_Iso_code"
        }
    ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
endDate	String	End date of the invoice scheduler.	Optional	63.0
filterCriteria	Batch Invoice Filter Criteria Input[]	List of line items of the filter criteria.	Optional	62.0
frequencyCadence	String	Frequency to run the invoice scheduler. Valid values are: • Once • Daily • Weekly • Monthly	Required	62.0
frequencyCadenceOptions	Frequency Cadence Options	Frequency cadence options for the invoice scheduler.	Required	62.0
invoiceDate	String	Date shown on the invoice. This date is also used for tax calculations.	Required if the frequencyCadence property is set to Once.	62.0
invoiceDateOffset	Integer	Offset applied to the target date, which is the number of days added to or subtracted from the invoice date, to calculate the updated invoice date.	Required if the frequencyCadence property is set to Daily, Weekly, or Monthly.	62.0
invoiceStatus	String	Status of the invoice that specifies the expected invoice status from an invoice batch run. Valid values are: • Draft • Posted	Required	62.0
isInvoiceDateFromRunDate	Boolean	Indicates whether the invoice date is applicable from the date when the invoice scheduler is run (true) or not (false).	Optional	63.0
preferredTime	String	Preferred time for the invoice batch run.	Required	62.0
schedulerName	String	Name of the invoice scheduler, which must be unique in your org.	Required	62.0
startDate	String	Start date of the invoice scheduler.	Required	62.0

Name	Type	Description	Required or Optional	Available Version
`status`	String	Status of the invoice scheduler. Valid values are: • `Draft` • `Active` • `Inactive`	Required	62.0
`targetDate`	String	Target date of the invoice batch run. Billing schedules having the next billing date before this date are picked up for invoicing. The target date must be less than or equal to the maximum allowed target date for the org.	Required if the `frequency Cadence` property is set to `Once`.	62.0
`target DateOffset`	Integer	Target date offset applied to the next invoice run date to calculate the target date. The offset is the number of days added to or subtracted from the next billing date.	Required if the `frequency Cadence` property is set to `Daily`, `Weekly`, or `Monthly`.	62.0
`timezone`	String	Time zone that's applicable for the invoice scheduler.	Optional	62.0

Billing Schedule Recovery Input

Input representation of the details of the billing schedules to recover the associated invoice.

JSON example

```
{
  "billingScheduleIds": ["44bDU00000000XXYAY"]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`billing ScheduleIds`	String[]	IDs of the billing schedules to recover the invoice for. You can recover one billing schedule per API request.	Required	62.0

Context-Aware Billing Schedule

Input representation of the billing transaction details.

JSON example

```
{
    "billingTransactionIds": [ "801xx000003H1H9AAK"]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`billingTransactionIds`	String[]	ID of the billing transaction. This property value is the ID of the order if the source of the billing request is for the Order object. If the order product associated with the specified order ID doesn't have an associated billing treatment ID, the API considers the default billing treatment ID. The generated billing schedule group has the default billing treatment ID. The API supports only one billing transaction ID in the input.	Required	62.0

Standalone Billing Schedule Input

Input representation of the request to create a billing schedule based on transaction details. This representation includes the transaction and context service details.

The Create Standalone Billing Schedules (POST) API uses the StandaloneBillingContext context definition to hydrate the context of the transaction. The context definition includes these mappings.

- The TransactionMapping maps the fields of the transaction to the attributes of the Transaction node.
- The BSGEntitiesMapping maps the attributes of the Billing Schedule node, the Billing Schedule Group node, and Billing Schedule Group Relationship node to the fields of the corresponding Salesforce objects.

For the StandaloneBillingContext context definition to hydrate all the required data, transaction data for the mandatory context tags are required. Here are the topics that mention the mandatory and optional tags, sample transaction details, and sample payloads for various types of transactions.

- One-Time New Sale Transaction on page 2600
- Term-Defined New Sale Transaction on page 2603
- Evergreen New Sale Transaction on page 2607
- New Sale Transaction With Bundled Products on page 2611
- New Sale Transaction With Ramped Products on page 2617
- New Sale Transaction With Usage Products on page 2622
- Amended Transaction on page 2626
- Renewal Transaction on page 2636
- Early Renewal Transaction on page 2641
- Canceled Transaction on page 2647

JSON example

```
{
  "transactionDetails": "{\"nodeName\": [{\"id\":\"801Az00000aynKZIAY\",
\"businessSobjectType\": \"Order\"}]}",
  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "OrderTransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`transaction ContextDetails`	Standalone Billing Schedule Metadata Input[]	Details of the context definition and its mappings that are used to hydrate the transaction data and save it in the appropriate Billing fields.	Required	64.0
`transaction Details`	String	Input JSON data that includes the ID of the transaction record for which the billing schedule must be created and other additional transaction details. The API request supports a single mapping ID. You can send separate requests for line items and line details by using their respective mapping IDs. However, this approach can result in duplicate billing schedules for the same line items and line details.	Required	64.0

One-Time New Sale Transaction

Understand the required values and key considerations before you create a billing schedule for a new sale transaction with the OneTime selling model type.

Term-Defined New Sale Transaction

Understand the required values and key considerations before you create a billing schedule for a new sale transaction with the TermDefined selling model type.

Evergreen New Sale Transaction

Understand the required values and key considerations before you create a billing schedule for a new sale transaction with the Evergreen selling model type.

New Sale Transaction With Bundled Products

Understand the required values and key considerations before you create a billing schedule for a new sale transaction with bundled products.

New Sale Transaction With Ramped Products

Understand the required values and key considerations before you create a billing schedule for a new sale transaction with ramped products.

New Sale Transaction With Usage Products

Understand the required values and key considerations before you create a billing schedule for a new sale transaction with usage-based products.

Amended Transaction

Learn how amendments update quantity, price, and end date in billing schedules along with delta-only price transactions and billing-frequency changes at the billing schedule level.

Renewal Transaction

Create a renewal billing schedule for termed subscriptions that continues without a gap, starting the day after the current billing schedule group ends and running for the same term length.

Early Renewal Transaction

Early Renewal ends the current term at an effective date and starts a renewed term to a new end date, creating two billing schedules in one request. The request creates a negative segment for the remaining original term and a positive segment for the renewal term.

Canceled Transaction

Cancel an entire billing schedule from a specified date. Specify only the cancellation date and billing schedule group identifier. The API computes the logic to split the cancellation across overlapping billing schedules and creates one cancel transaction per segment.

One-Time New Sale Transaction

Understand the required values and key considerations before you create a billing schedule for a new sale transaction with the OneTime selling model type.

Considerations

Keep these important considerations in mind when you provide the details for new sale transactions with the OneTime selling model type.

- The `BillingActionType__std` value for any new sale transaction must be `Add`.
- When a new sale transaction is for the OneTime selling model type, the SellingModelType value must be `OneTime`.
- If you don't provide the `TaxTreatmentId__std` value, the `BillingTreatmentId__std` value, or the `LegalEntityId__std` value, the default `TaxTreatmentId` for the transaction, `BillingTreatmentId`, and `LegalEntityId` of your Salesforce org is considered. If your org doesn't have any default values, an error occurs.
- If your transaction is for an sObject record, only specify the record ID as the id value in the `transactionDetails` property value. All the other transaction details are automatically fetched from the sObject record if those details are mapped in the context definition.

JSON example

This example includes the transaction data for a new sale transaction with the OneTime selling model type.

```
{
  "Transaction": [
    {
      "id": "ot1",
      "SellingModelType__std": "OneTime",
      "ParentTransactionId__std": "sample",
      "TransactionId__std": "ot1",
```

```
      "ProductName__std": "OneTimeProduct",
      "StartDate__std": "2025-02-20",
      "UnitPrice__std": 10,
      "Quantity__std": 5,
      "TotalPrice__std": 50,
      "TaxTreatmentId__std": "1ttLT000000EV7DYAW",
      "BillingTreatmentId__std": "1BTLT00000008yT4AQ",
      "AccountId__std": "001LT00000dPVrlYAG",
      "BillingProfileId__std": "001LT00000dPVrlYAG",
      "BillingCity__std": "HYD",
      "ShippingCity__std": "VSKP",
      "BillingActionType__std": "Add",
      "CurrencyIsoCode__std": "USD"
    }
  ]
}
```

This example shows the request payload to create a billing schedule for a new sale transaction with the OneTime selling model type.

```
{
  "transactionDetails":
[illegible]

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

When you're creating a billing schedule for a new sale transaction with the OneTime selling model type, make sure that you specify the required values in the `transactionDetails` property value.

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`ParentTransactionId__std`	The ID of the parent transaction record. For example, if the transaction is at a level similar to that of an Order Item record, the parent transaction will be at a level similar to that of an Order record.	If the transaction is a child Order or Quote record, the ReferenceEntityId field on the BillingScheduleobject is populated. For other sObject records or external records, the Reference field on the BillingSchedule object is populated.	Optional

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`AccountId__std`	The ID of the Account record that's related to the transaction.	BillingAccountId field on the BillingScheduleGroup object	Required
`BillingProfileId__std`	The ID of the billing profile that’s related to the transaction, which is used to resolve billing configurations if not specified at transaction level. See Billing Profile requirements.	Not applicable.	Optional
`BillingCity__std`	The city in the billing address of the transaction.	BillingCity field on the BillingScheduleGroup object	Any one of the billing address fields is required.
`ShippingCity__std`	The city in the shipping address of the transaction.	ShippingCity field on the BillingScheduleGroup object	Any one of the shipping address fields is required.
`SellingModelType__std`	The selling model type indicates whether the transaction is for a one-time product, a term-defined product, or an evergreen product. Specify `OneTime` as the SellingModelType for the transaction that's related to a product that's sold once.	BillingMethod on the BillingSchedule object is populated as OrderAmount.	Required
`TransactionId__std`	The ID of the transaction that you want to create a billing schedule for.	If the transaction is an OrderItem, OrderItemAdjustmentLineItem, OrderItemDetail, QuoteLineDetail, or QuoteLineItem record, the ReferenceEntityItemId field on the BillingScheduleobject is populated. For other sObject records or external records, the ReferenceItem field on the BillingSchedule object is populated.	Required
`ProductName__std`	The name of the product that's related to the transaction that you want to create a billing schedule for.	ProductName field on the BillingScheduleGroup object	Either the ProductName or the ProductId is required
`StartDate__std`	The start date of the transaction.	BillingScheduleStartDate field on the BillingSchedule object	Required

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`Quantity__std`	The quantity of the transaction.	Quantity field on the BillingSchedule object	Required
`TaxTreatmentId__std`	The ID of the tax treatment that's used to calculate tax for the transaction. If you don't specify a TaxTreatmentId, the org-default TaxTreatmentId is considered.	TaxTreatmentId field on the BillingScheduleGroup object	Required
`BillingTreatmentId__std`	The ID of the billing treatment that's used to create the billing schedule for the transaction. If you don't specify a BillingTreatmentId, the org-default BillingTreatmentId is considered.	BillingTreatmentId field on the BillingScheduleGroup object	Required
`CurrencyIsoCode__std`	The currency code of the transaction amount if your Salesforce org has multi-currency enabled.	CurrencyIsoCode field on the BillingScheduleGroup object	Required for Salesforce orgs with multiple currencies enabled
`BillingActionType__std`	The action that you want to perform for the transaction. Valid value is `Add`.	Category field on the BillingSchedule object is populated as Original.	Required
`UnitPrice__std`	The unit price of the transaction.	UnitPrice field on the BillingSchedule object	Either the UnitPrice or the NetUnitPrice value is required
`TotalPrice__std`	The total price of the transaction.	TotalAmount field on the BillingSchedule object	Required

Term-Defined New Sale Transaction

Understand the required values and key considerations before you create a billing schedule for a new sale transaction with the TermDefined selling model type.

Considerations

Keep these important considerations in mind when you provide the details for new sale transactions with the TermDefined selling model type.

- The `BillingActionType__std` value for any new sale transaction must be `Add`.
- When a new sale transaction is for the TermDefined selling model type, the SellingModelType value must be `TermDefined`.

- When a new sale transaction is for the TermDefined selling model type, the `BillingTermUnit__std` and `PeriodBoundary__std` values are required.
- If you don't provide the `TaxTreatmentId__std` value, the `BillingTreatmentId__std` value, or the `LegalEntityId__std` value for the transaction, the default `TaxTreatmentId`, `BillingTreatmentId`, and `LegalEntityId` of your Salesforce org is considered. If your org doesn't have any default values, an error occurs.
- If your transaction is for an sObject record, only specify the record ID as the id value in the transactionDetails property value. All the other transaction details are automatically fetched from the sObject record if those details are mapped in the context definition.

JSON example

This example includes the transaction data for a new sale transaction with the TermDefined selling model type.

```
{
  "Transaction": [
    {
      "id": "ter1",
      "SellingModelType__std": "TermDefined",
      "ParentTransactionId__std": "sample",
      "TransactionId__std": "ter1",
      "ProductName__std": "TermedQuarterlyProduct",
      "StartDate__std": "2025-01-01",
      "EndDate__std": "2025-12-31",
      "PeriodBoundary__std": "DayOfPeriod",
      "BillingDayOfMonth__std": 1,
      "UnitPrice__std": 10,
      "Quantity__std": 5,
      "TotalPrice__std": 120,
      "TaxTreatmentId__std": "1ttLT000000EV7DYAW",
      "BillingTreatmentId__std": "1BTLT00000008yT4AQ",
      "AccountId__std": "001LT00000dPVrlYAG",
      "BillingProfileId__std": "001LT00000dPVrlYAG",
      "BillingCity__std": "HYD",
      "ShippingCity__std": "VSKP",
      "BillingTermUnit__std": "Month",
      "BillingActionType__std": "Add",
      "CurrencyIsoCode__std": "USD"
    }
  ]
}
```

This example shows the request payload to create a billing schedule for a new sale transaction with the TermDefined selling model type.

```
{
  "transactionDetails":
[illegible]

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

When you're creating a billing schedule for a new sale transaction with the TermDefined selling model type, make sure that you specify the mandatory values in the `transactionDetails` property value.

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`ParentTransactionId__std`	The ID of the parent transaction record. For example, if the transaction is at a level similar to that of an Order Item record, the parent transaction will be at a level similar to that of an Order record.	If the transaction is a child Order or Quote record, the ReferenceEntityId field on the BillingScheduleobject is populated. For other sObject records or external records, the Reference field on the BillingSchedule object is populated.	Required
`AccountId__std`	The ID of the Account record that's related to the transaction.	BillingAccountId field on the BillingScheduleGroup object	Required
`BillingProfileId__std`	The ID of the billing profile (Billing Account record) that's related to the transaction. See Billing Profile requirements.	BillingAccountId field on the BillingSchedule object	Optional
`BillingCity__std`	The city in the billing address of the transaction.	BillingCity field on the BillingScheduleGroup object	Any one of the billing address fields is required.
`ShippingCity__std`	The city in the shipping address of the transaction.	ShippingCity field on the BillingScheduleGroup object	Any one of the shipping address fields is required.
`SellingModelType__std`	The selling model type indicates whether the transaction is for a one-time product, a term-defined product, or an evergreen product. Specify `TermDefined` as the SellingModelType for the transaction that's related to a product that's sold for a specific term.	BillingMethod on the BillingSchedule object is populated as OrderAmount.	Required
`TransactionId__std`	The ID of the transaction that you want to create a billing schedule for.	If the transaction is an OrderItem, OrderItemAdjustmentLineItem, OrderItemDetail, QuoteLineDetail, or QuoteLineItem record, the ReferenceEntityItemId	Required

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
		field on the BillingScheduleobject is populated. For other sObject records or external records, the ReferenceItem field on the BillingSchedule object is populated.	
`ProductName__std`	The name of the product that's related to the transaction that you want to create a billing schedule for.	ProductName field on the BillingScheduleGroup object	Either the ProductName or the ProductId is required
`PeriodBoundary__std`	The period boundary determines the start and end date of the billing period. Valid values are: • `AlignToCalendar` • `Anniversary` • `DayOfPeriod` • `LastDayOfPeriod`	PeriodBoundary field on the BillingScheduleGroup object	Required
`BillingDayOfMonth__std`	The day of the month on which a recurring billing process is scheduled to occur for the transaction.	BillDayOfMonth field on the BillingScheduleGroup object	Required
`EndDate__std`	The end date of the transaction.	BillingScheduleEndDate field on the BillingSchedule object	Required
`StartDate__std`	The start date of the transaction.	BillingScheduleStartDate field on the BillingSchedule object	Required
`Quantity__std`	The quantity of the transaction.	Quantity field on the BillingSchedule object	Required
`TaxTreatmentId__std`	The ID of the tax treatment that's used to calculate tax for the transaction. If you don't specify a TaxTreatmentId, the org-default TaxTreatmentId is considered.	TaxTreatmentId field on the BillingScheduleGroup object	Required
`BillingTermUnit__std`	The unit of measurement of the billing term. Valid values are: • `Month` • `Quarter`	BillingTermUnit field on the BillingSchedule object	Required

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
	• Semi-Annual • Year		
BillingTreatmentId__std	The ID of the billing treatment that's used to create the billing schedule for the transaction. If you don't specify a BillingTreatmentId, the org-default BillingTreatmentId is considered.	BillingTreatmentId field on the BillingScheduleGroup object	Required
CurrencyIsoCode__std	The currency code of the transaction amount if your Salesforce org has multi-currency enabled.	CurrencyIsoCode field on the BillingScheduleGroup object	Required for Salesforce orgs with multiple currencies enabled
BillingActionType__std	The action that you want to perform for the transaction. Valid value is Add.	Category field on the BillingSchedule object is populated as Original.	Required
UnitPrice__std	The unit price of the transaction.	UnitPrice field on the BillingSchedule object	Either the UnitPrice or the NetUnitPrice value is required
TotalPrice__std	The total cost to the customer for the transaction, from the start date to the end date.	TotalAmount field on the BillingSchedule object	Required

Evergreen New Sale Transaction

Understand the required values and key considerations before you create a billing schedule for a new sale transaction with the Evergreen selling model type.

Considerations

Keep these important considerations in mind when you provide the details for new sale transactions with the Evergreen selling model type.

- The `BillingActionType__std` value for any new sale transaction must be `Add`.
- When a new sale transaction is for the Evergreen selling model type, the SellingModelType value must be `Evergreen`.
- When a new sale transaction is for the Evergreen selling model type, the BillingTermUnit and PeriodBoundary values are required.
- If you don't provide the `TaxTreatmentId__std` value, the `BillingTreatmentId__std` value, or the `LegalEntityId__std` value for the transaction, the default `TaxTreatmentId`, `BillingTreatmentId`, and `LegalEntityId` of your Salesforce org is considered. If your org doesn't have any default values, an error occurs.

- If your transaction is for an sObject record, only specify the record ID as the id value in the transactionDetails property value. All the other transaction details are automatically fetched from the sObject record if those details are mapped in the context definition.

JSON example

This example includes the transaction data for a new sale transaction with the Evergreen selling model type.

```
{
  "Transaction": [
    {
      "id": "evg1",
      "SellingModelType__std": "Evergreen",
      "ParentTransactionId__std": "sample",
      "TransactionId__std": "evg1",
      "ProductName__std": "EvergreenSemiAnnualProduct",
      "StartDate__std": "2025-01-01",
      "PeriodBoundary__std": "DayOfPeriod",
      "BillingDayOfMonth__std": 1,
      "BillingStartMonth__std": 3,
      "UnitPrice__std": 10,
      "Quantity__std": 1,
      "TotalPrice__std": 10,
      "TaxTreatmentId__std": "1ttLT000000EV7DYAW",
      "BillingTreatmentId__std": "1BTLT00000008yT4AQ",
      "AccountId__std": "001LT00000dPVrlYAG",
      "BillingProfileId__std": "001LT00000dPVrlYAG",
      "BillingCity__std": "HYD",
      "ShippingCity__std": "VSKP",
      "BillingTermUnit__std": "Semi-Annual",
      "BillingActionType__std": "Add",
      "CurrencyIsoCode__std": "USD"
    }
  ]
}
```

This example shows the request payload to create a billing schedule for a new sale transaction with the Evergreen selling model type.

```
{
  "transactionDetails":
[illegible]

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

When you're creating a billing schedule for a new sale transaction with the Evergreen selling model type, make sure that you specify the mandatory values in the `transactionDetails` property value.

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`ParentTransactionId__std`	The ID of the parent transaction record. For example, if the transaction is at a level similar to that of an Order Item record, the parent transaction will be at a level similar to that of an Order record.	If the transaction is a child Order or Quote record, the ReferenceEntityId field on the BillingScheduleobject is populated. For other sObject records or external records, the Reference field on the BillingSchedule object is populated.	Optional
`AccountId__std`	The ID of the Account record that's related to the transaction.	BillingAccountId field on the BillingScheduleGroup object	Required
`BillingProfileId__std`	The ID of the billing profile (Billing Account record) that's related to the transaction. See Billing Profile requirements.	BillingAccountId field on the BillingSchedule object	Optional
`BillingCity__std`	The city in the billing address of the transaction.	BillingCity field on the BillingScheduleGroup object	Any one of the billing address fields is required.
`ShippingCity__std`	The city in the shipping address of the transaction.	ShippingCity field on the BillingScheduleGroup object	Any one of the shipping address fields is required.
`SellingModelType__std`	The selling model type indicates whether the transaction is for a one-time product, a term-defined product, or an evergreen product. Specify `Evergreen` as the SellingModelType for the transaction that's related to a product that's sold for an indefinite term.	BillingMethod on the BillingSchedule object is populated as OrderAmount.	Required
`TransactionId__std`	The ID of the transaction that you want to create a billing schedule for.	If the transaction is an OrderItem, OrderItemAdjustmentLineItem, OrderItemDetail, QuoteLineDetail, or QuoteLineItem record, the ReferenceEntityItemId field on the BillingScheduleobject is populated. For other	Required

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
		sObject records or external records, the ReferenceItem field on the BillingSchedule object is populated.	
`ProductName__std`	The name of the product that's related to the transaction that you want to create a billing schedule for.	ProductName field on the BillingScheduleGroup object	Either the ProductName or the ProductId is required
`PeriodBoundary__std`	The period boundary determines the start and end date of the billing period. Valid values are: • `AlignToCalendar` • `Anniversary` • `DayOfPeriod` • `LastDayOfPeriod`	PeriodBoundary field on the BillingScheduleGroup object	Required
`BillingDayOfMonth__std`	The day of the month on which a recurring billing process is scheduled to occur for the transaction.	BillDayOfMonth field on the BillingScheduleGroup object	Required
`BillingStartMonth__std`	The month when billing begins for an annual subscription. This value can be any number from `1` through `12`. For example, if billing starts in January, the value is `1`. If billing starts in June, the value is `6`.	BillingStartMonth field on the BillingScheduleGroup object	Required
`StartDate__std`	The start date of the transaction.	BillingScheduleStartDate field on the BillingSchedule object	Required
`Quantity__std`	The quantity of the transaction.	Quantity field on the BillingSchedule object	Required
`TaxTreatmentId__std`	The ID of the tax treatment that's used to calculate tax for the transaction. If you don't specify a TaxTreatmentId, the org-default TaxTreatmentId is considered.	TaxTreatmentId field on the BillingScheduleGroup object	Required
`BillingTermUnit__std`	The unit of measurement of the billing term. Valid values are: • `Month` • `Quarter` • `Semi-Annual` • `Year`	BillingTermUnit field on the BillingSchedule object	Required

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
BillingTreatmentId__std	The ID of the billing treatment that's used to create the billing schedule for the transaction. If you don't specify a BillingTreatmentId, the org-default BillingTreatmentId is considered.	BillingTreatmentId field on the BillingScheduleGroup object	Required
CurrencyIsoCode__std	The currency code of the transaction amount if your Salesforce org has multi-currency enabled.	CurrencyIsoCode field on the BillingScheduleGroup object	Required for Salesforce orgs with multiple currencies enabled
BillingActionType__std	The action that you want to perform for the transaction. Valid value is `Add`.	Category field on the BillingSchedule object is populated as Original.	Required
UnitPrice__std	The unit price of the transaction.	UnitPrice field on the BillingSchedule object	Either the UnitPrice or the NetUnitPrice value is required
TotalPrice__std	The total cost to the customer for the transaction for each billing period, such as month, quarter, or year, based on the billing frequency.	TotalAmount field on the BillingSchedule object	Required

New Sale Transaction With Bundled Products

Understand the required values and key considerations before you create a billing schedule for a new sale transaction with bundled products.

Considerations

Keep these important considerations in mind when you provide the details for new sale transactions with bundled products.

- The `BillingActionType__std` value for any new sale transaction must be `Add`.
- For new sale transactions with bundled products, the `MainTransactionId__std` value is required for all the child transactions.
- If you don't provide the `TaxTreatmentId__std` value, the `BillingTreatmentId__std` value, or the `LegalEntityId__std` value for the transaction, the default `TaxTreatmentId`, `BillingTreatmentId`, and `LegalEntityId` of your Salesforce org is considered. If your org doesn't have any default values, an error occurs.
- If your transaction is for an sObject record, only specify the record ID as the id value in the `transactionDetails` property value. All the other transaction details are automatically fetched from the sObject record if those details are mapped in the context definition.
- To understand the requirements for the various selling model types, see these resources.

- One-Time New Sale Transaction on page 2600
- Term-Defined New Sale Transaction on page 2603
- Evergreen New Sale Transaction on page 2607

JSON example

This sample is for a new sale transaction for bundled products with two levels of nesting and with these selling model types.

- The main root product's selling model type is `OneTime`.
- The second root product's selling model type is `OneTime`.
- The child products' selling model types are `TermDefined` and `Evergreen`.

```

      "MainTransactionRole__std": "Bundle",
      "AssociatedTransactionRole__std": "BundleComponent",
      "MainTransactionId__std": "sample2"
    }
  ]
}
```

This example shows the request payload to create a billing schedule for a new sale transaction for bundled products.

```
{
  "transactionDetails":
[redacted]

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

When you're creating a billing schedule for a new sale transaction with bundled products, make sure that you specify the mandatory values in the `transactionDetails` property value.

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`BillToContactId__std`	The ID of the Contact record that's related to the transaction.	BillToContactId field on the BillingScheduleGroup object	Required
`ParentTransactionId__std`	The ID of the parent transaction record. For example, if the transaction is at a level similar to that of an Order Item record, the parent transaction will be at a level similar to that of an Order record.	If the transaction is a child Order or Quote record, the ReferenceEntityId field on the BillingScheduleobject is populated. For other sObject records or external records, the Reference field on the BillingSchedule object is populated.	Optional
`AccountId__std`	The ID of the Account record that's related to the transaction.	BillingAccountId field on the BillingScheduleGroup object	Required
`BillingCity__std`	The city in the billing address of the transaction.	BillingCity field on the BillingScheduleGroup object	Any one of the billing address fields is required.

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`BillingPostalCode__std`	The postal code in the billing address of the transaction.	BillingPostalCode field on the BillingScheduleGroup object	Any one of the billing address fields is required.
`ShippingCity__std`	The city in the shipping address of the transaction.	ShippingCity field on the BillingScheduleGroup object	Any one of the shipping address fields is required.
`SellingModelType__std`	The selling model type indicates whether the transaction is for a one-time product, a term-defined product, or an evergreen product. Specify `OneTime` as the SellingModelType for the transaction that's related to a product that's sold once.	BillingMethod on the BillingSchedule object is populated as OrderAmount.	Required
`TransactionId__std`	The ID of the transaction that you want to create a billing schedule for.	If the transaction is an OrderItem, OrderItemAdjustmentLineItem, OrderItemDetail, QuoteLineDetail, or QuoteLineItem record, the ReferenceEntityItemId field on the BillingScheduleobject is populated. For other sObject records or external records, the ReferenceItem field on the BillingSchedule object is populated.	Required
`ProductName__std`	The name of the product that's related to the transaction that you want to create a billing schedule for.	ProductName field on the BillingScheduleGroup object	Either the ProductName or the ProductId value is required
`PeriodBoundary__std`	The period boundary determines the start and end date of the billing period. Valid values are: • `AlignToCalendar` • `Anniversary` • `DayOfPeriod` • `LastDayOfPeriod`	PeriodBoundary field on the BillingScheduleGroup object	Required for child products with the `TermDefined` or `Evergreen` selling model types.
`BillingDayOfMonth__std`	The day of the month on which a recurring billing process is scheduled to occur for the transaction.	BillDayOfMonth field on the BillingScheduleGroup object	Required for child products with the `TermDefined` or

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
			`Evergreen` selling model types.
`BillingStartMonth__std`	The month when billing begins for an annual subscription. This value can be any number from `1` through `12`. For example, if billing starts in January, the value is `1`. If billing starts in June, the value is `6`.	BillingStartMonth field on the BillingScheduleGroup object	Required for child products with the `Evergreen` selling model type.
`EndDate__std`	The end date of the transaction.	BillingScheduleEndDate field on the BillingSchedule object	Required for child products with the `TermDefined` selling model type.
`StartDate__std`	The start date of the transaction.	BillingScheduleStartDate field on the BillingSchedule object	Required
`Quantity__std`	The quantity of the transaction.	Quantity field on the BillingSchedule object	Required
`TaxTreatmentId__std`	The ID of the tax treatment that's used to calculate tax for the transaction. If you don't specify a TaxTreatmentId, the org-default TaxTreatmentId is considered.	TaxTreatmentId field on the BillingScheduleGroup object	Required
`BillingTermUnit__std`	The unit of measurement of the billing term. Valid values are: • `Month` • `Quarter` • `Semi-Annual` • `Year`	BillingTermUnit field on the BillingSchedule object	Required for child products with the `TermDefined` or `Evergreen` selling model types.
`BillingTreatmentId__std`	The ID of the billing treatment that's used to create the billing schedule for the transaction. If you don't specify a BillingTreatmentId, the org-default BillingTreatmentId is considered.	BillingTreatmentId field on the BillingScheduleGroup object	Required
`CurrencyIsoCode__std`	The currency code of the transaction amount if your Salesforce org has multi-currency enabled.	CurrencyIsoCode field on the BillingScheduleGroup object	Required for Salesforce orgs with multiple currencies enabled.
`BillingActionType__std`	The action that you want to perform for the transaction. Valid value is `Add`.	Category field on the BillingSchedule object is populated as Original.	Required

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`UnitPrice__std`	The unit price of the transaction.	UnitPrice field on the BillingSchedule object	Either the UnitPrice or the NetUnitPrice value is required
`TotalPrice__std`	The total price of the transaction.	TotalAmount field on the BillingSchedule object	Required
`MainTransactionId__std`	When your transaction is part of a bundle, this value is the ID of the main transaction record for all the child transactions.	MainBsgId field on the BsgRelationship object	Required for all the child products.
`MainTransactionRole__std`	When your transaction is part of a bundle, this value is the role of the primary transaction in the bundle relationship. Valid values are: • `AddOn` • `Bundle` • `Set`	MainBsgRole field on the BsgRelationship object	Required for all the child products.
`AssociatedTransactionRole__std`	When your transaction is part of a bundle, this value is the role of the child transaction in the bundle relationship. Valid values are: • • `BundleComponent` • `ClassificationComponent`	AssociatedBsgRole field on the BsgRelationship object	Required for all the child products.
`AssociatedTransactionPricing__std`	When your transaction is part of a bundle, this value describes how the child transaction is priced in relation to the primary transaction. Valid values are: • `IncludedInBundlePrice` • `NotIncludedInBundlePrice`	AssociatedBsgPricing field on the BsgRelationship object	Required for all the child products.

New Sale Transaction With Ramped Products

Understand the required values and key considerations before you create a billing schedule for a new sale transaction with ramped products.

Considerations

Keep these important considerations in mind when you provide the details for new sale transactions with ramped products.

- The `BillingActionType__std` value for any new sale transaction must be `Add`.
- For new sale transactions with a ramped product, the `RampIdentifier__std` value is required.
- If you don't provide the `TaxTreatmentId__std` value, the `BillingTreatmentId__std` value, or the `LegalEntityId__std` value for the transaction, the default `TaxTreatmentId`, `BillingTreatmentId`, and `LegalEntityId` of your Salesforce org is considered. If your org doesn't have any default values, an error occurs.
- The billing schedules for transactions with the same `RampIdentifier__std` value are created for the same billing schedule group.
- To understand the requirements for the various selling model types, see these resources.
  - One-Time New Sale Transaction on page 2600
  - Term-Defined New Sale Transaction on page 2603
  - Evergreen New Sale Transaction on page 2607

JSON example

This example includes the transaction data for a new sale transaction with ramped products and a `TermDefined` selling model.

```
{
  "Transaction": [

  }
}
```

When you're creating a billing schedule for a new sale transaction with ramped products, make sure that you specify the mandatory values in the `transactionDetails` property value.

Name	Description	Mapped Field	Required or Optional
`ParentTransactionId__std`	The ID of the parent transaction record. For example, if the transaction is at a level similar to that of an Order Item record, the parent transaction will be at a level similar to that of an Order record.	If the transaction is a child Order or Quote record, the ReferenceEntityId field on the BillingScheduleobject is populated. For other sObject records or external records, the Reference field on the BillingSchedule object is populated.	Optional

Name	Description	Mapped Field	Required or Optional
`AccountId__std`	The ID of the Account record that's related to the transaction.	BillingAccountId field on the BillingScheduleGroup object	Required
`BillingProfileId__std`	The ID of the billing profile (Billing Account record) that's related to the transaction. See Billing Profile requirements.	BillingAccountId field on the BillingSchedule object	Optional
`BillingCity__std`	The city in the billing address of the transaction.	BillingCity field on the BillingScheduleGroup object	Any one of the billing address fields is required.
`ShippingCity__std`	The city in the shipping address of the transaction.	ShippingCity field on the BillingScheduleGroup object	Any one of the shipping address fields is required.
`SellingModelType__std`	The selling model type indicates whether the transaction is for a one-time product, a term-defined product, or an evergreen product. Specify `OneTime` as the SellingModelType for the transaction that's related to a product that's sold once.	BillingMethod on the BillingSchedule object is populated as OrderAmount.	Required
`TransactionId__std`	The ID of the transaction that you want to create a billing schedule for.	If the transaction is an OrderItem, OrderItemAdjustmentLineItem, OrderItemDetail, QuoteLineDetail, or QuoteLineItem record, the ReferenceEntityItemId field on the BillingScheduleobject is populated. For other sObject records or external records, the ReferenceItem field on the BillingSchedule object is populated.	Required
`ProductName__std`	The name of the product that's related to the transaction that you want to create a billing schedule for.	ProductName field on the BillingScheduleGroup object	Either the ProductName or the ProductId is required
`PeriodBoundary__std`	The period boundary determines the start and end date of the billing period. Valid values are: • `AlignToCalendar` • `Anniversary` • `DayOfPeriod` • `LastDayOfPeriod`	PeriodBoundary field on the BillingScheduleGroup object	Required for products with the `TermDefined` or `Evergreen` selling model types.

Name	Description	Mapped Field	Required or Optional
`BillingDayOfMonth__std`	The day of the month on which a recurring billing process is scheduled to occur for the transaction.	BillDayOfMonth field on the BillingScheduleGroup object	Required for products with the `TermDefined` or `Evergreen` selling model types.
`EndDate__std`	The end date of the transaction.	BillingScheduleEndDate field on the BillingSchedule object	Required for products with the `TermDefined` selling model type.
`StartDate__std`	The start date of the transaction.	BillingScheduleStartDate field on the BillingSchedule object	Required
`Quantity__std`	The quantity of the transaction.	Quantity field on the BillingSchedule object	Required
`TaxTreatmentId__std`	The ID of the tax treatment that's used to calculate tax for the transaction. If you don't specify a TaxTreatmentId, the org-default TaxTreatmentId is considered.	TaxTreatmentId field on the BillingScheduleGroup object	Required
`BillingTermUnit__std`	The unit of measurement of the billing term. Valid values are: • `Month` • `Quarter` • `Semi-Annual` • `Year`	BillingTermUnit field on the BillingSchedule object	Required for products with the `TermDefined` or `Evergreen` selling model types.
`BillingTreatmentId__std`	The ID of the billing treatment that's used to create the billing schedule for the transaction. If you don't specify a BillingTreatmentId, the org-default BillingTreatmentId is considered.	BillingTreatmentId field on the BillingScheduleGroup object	Required
`CurrencyIsoCode__std`	The currency code of the transaction amount if your Salesforce org has multi-currency enabled.	CurrencyIsoCode field on the BillingScheduleGroup object	Required for Salesforce orgs with multiple currencies enabled.
`RampIdentifier__std`	When the transaction is part of a ramp deal, the RampIdentifier value is a unique identifier for that ramp. All the transactions with the same RampIdentifier value are grouped to have billing schedules for the same billing schedule group.	This value isn't populated on any BillingSchedule or BillingScheduleGroup field.	Required
`BillingActionType__std`	The action that you want to perform for the transaction. Valid value is `Add`.	Category field on the BillingSchedule object is populated as Original.	Required

Name	Description	Mapped Field	Required or Optional
`UnitPrice__std`	The unit price of the transaction.	UnitPrice field on the BillingSchedule object	Either the UnitPrice or the NetUnitPrice value is required
`TotalPrice__std`	The total price of the transaction.	TotalAmount field on the BillingSchedule object	Required

New Sale Transaction With Usage Products

Understand the required values and key considerations before you create a billing schedule for a new sale transaction with usage-based products.

Considerations

Keep these important considerations in mind when you provide the details for new sale transactions with a usage-based product.

- The `BillingActionType__std` value for any new sale transaction must be `Add`.
- For new sale transactions with a usage-based product, the `ProductUsageModelType__std` and `BindingInstance__std` values are required.
- If you don't provide the `TaxTreatmentId__std` value, the `BillingTreatmentId__std` value, or the `LegalEntityId__std` value for the transaction, the default `TaxTreatmentId`, `BillingTreatmentId`, and `LegalEntityId` of your Salesforce org is considered. If your org doesn't have any default values, an error occurs.
- To understand the requirements for the various selling model types, see these resources.
  - One-Time New Sale Transaction on page 2600
  - Term-Defined New Sale Transaction on page 2603
  - Evergreen New Sale Transaction on page 2607

JSON example

This sample is for a new sale transaction for a usage-based product with a `TermDefined` selling model.

```
{
  "Transaction": [
    {
      "id": "termDefined",
      "SellingModelType__std": "TermDefined",
      "ParentTransactionId__std": "sample",
      "TransactionId__std": "onetimeUsage2",
      "StartDate__std": "2025-01-01",
      "EndDate__std": "2025-12-31",
      "PeriodBoundary__std": "DayOfPeriod",
      "BillingDayOfMonth__std": 1,
      "BillingTermUnit__std": "Month",
      "UnitPrice__std": 10,
      "Quantity__std": 1,
      "TotalPrice__std": 120,
      "AccountId__std": "001xx000003GgEJAA0",
      "BillingProfileId__std": "001LT00000dPVrlYAG",
      "BillingActionType__std": "Add",
      "CurrencyIsoCode__std": "USD",
```

```
        "BillingCity__std": "Hyderabad",
        "ShippingCity__std": "SFO",
        "ProductUsageModelType__std": "Anchor",
        "BindingInstance__std": "001xx000003GgChAAK",
        "ProductId__std": "01txx0000006i3DAAQ"
      }
    ]
}
```

This example shows the request payload to create a billing schedule for a new sale transaction for usage-based products with a `TermDefined` selling model.

```
{
  "transactionDetails":
[illegible]

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

Before using the Create Standalone Billing Schedules API for usage-based products, Create a Usage Product Grant Binding Policy record with the grant binding type as `Target`.

When you're creating a billing schedule for a new sale transaction with a usage-based product, make sure that you specify the mandatory values in the `transactionDetails` property value.

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`ParentTransactionId__std`	The ID of the parent transaction record. For example, if the transaction is at a level similar to that of an Order Item record, the parent transaction will be at a level similar to that of an Order record.	If the transaction is a child Order or Quote record, the ReferenceEntityId field on the BillingScheduleobject is populated. For other sObject records or external records, the Reference field on the BillingSchedule object is populated.	Optional
`AccountId__std`	The ID of the Account record that's related to the transaction.	BillingAccountId field on the BillingScheduleGroup object	Required

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`BillingProfileId__std`	The ID of the billing profile (Billing Account record) that's related to the transaction. See Billing Profile requirements.	BillingAccountId field on the BillingSchedule object	Optional
`BillingCity__std`	The city in the billing address of the transaction.	BillingCity field on the BillingScheduleGroup object	Any one of the billing address fields is required.
`ShippingCity__std`	The city in the shipping address of the transaction.	ShippingCity field on the BillingScheduleGroup object	Any one of the shipping address fields is required.
`SellingModelType__std`	The selling model type indicates whether the transaction is for a one-time product, a term-defined product, or an evergreen product. Specify `OneTime` as the SellingModelType for the transaction that's related to a product that's sold once.	BillingMethod on the BillingSchedule object is populated as OrderAmount.	Required
`TransactionId__std`	The ID of the transaction that you want to create a billing schedule for.	If the transaction is an OrderItem, OrderItemAdjustmentLineItem, OrderItemDetail, QuoteLineDetail, or QuoteLineItem record, the ReferenceEntityItemId field on the BillingScheduleobject is populated. For other sObject records or external records, the ReferenceItem field on the BillingSchedule object is populated.	Required
`ProductId__std`	The ID of the product that's related to the transaction that you want to create a billing schedule for.	Product2Id field on the BillingScheduleGroup object	Either the ProductName or the ProductId is required
`PeriodBoundary__std`	The period boundary determines the start and end date of the billing period. Valid values are: • `AlignToCalendar` • `Anniversary` • `DayOfPeriod` • `LastDayOfPeriod`	PeriodBoundary field on the BillingScheduleGroup object	Required for products with the `TermDefined` or `Evergreen` selling model types.

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`BillingDayOfMonth__std`	The day of the month on which a recurring billing process is scheduled to occur for the transaction.	BillDayOfMonth field on the BillingScheduleGroup object	Required for products with the `TermDefined` or `Evergreen` selling model types.
`EndDate__std`	The end date of the transaction.	BillingScheduleEndDate field on the BillingSchedule object	Required for products with the `TermDefined` selling model type.
`StartDate__std`	The start date of the transaction.	BillingScheduleStartDate field on the BillingSchedule object	Required
`Quantity__std`	The quantity of the transaction.	Quantity field on the BillingSchedule object	Required
`BillingTermUnit__std`	The unit of measurement of the billing term. Valid values are: • `Month` • `Quarter` • `Semi-Annual` • `Year`	BillingTermUnit field on the BillingSchedule object	Required for products with the `TermDefined` or `Evergreen` selling model types.
`CurrencyIsoCode__std`	The currency code of the transaction amount if your Salesforce org has multi-currency enabled.	CurrencyIsoCode field on the BillingScheduleGroup object	Required for Salesforce orgs with multiple currencies enabled.
`BillingActionType__std`	The action that you want to perform for the transaction. Valid value is `Add`.	Category field on the BillingSchedule object is populated as Original.	Required
`UnitPrice__std`	The unit price of the transaction.	UnitPrice field on the BillingSchedule object	Either the UnitPrice or the NetUnitPrice value is required
`TotalPrice__std`	The total price of the transaction.	TotalAmount field on the BillingSchedule object	Required
`ProductUsageModelType__std`	The type of usage model for the transaction product or service. Valid values are: • `Anchor`—Anchor is the main subscription product or service.	BillingMethod value field on the BillingSchedule object is populated as OrderAmount.	Required

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
	• `Pack`—Pack is the add-on product or service that grants additional usage resources for consumption.		
`BindingInstance__std`	The ID of the Asset record or custom object record that's related to the transaction.	BindingInstanceId on the BillingScheduleGroup object	Required

Amended Transaction

Learn how amendments update quantity, price, and end date in billing schedules along with delta-only price transactions and billing-frequency changes at the billing schedule level.

Considerations

Keep these important considerations in mind when providing the details for amended transactions.

- The `BillingActionType__std` value for any amended transaction must be `Amend`.
- When you provide a negative quantity, make sure that it's less than the total quantity of the related transaction.
- If your transaction is for an sObject record, only specify the record ID as the id value in the `transactionDetails` property value. All the other transaction details are automatically fetched from the sObject record if those details are mapped in the context definition.

Amendment Payload Types

The Create Standalone Billing Schedules API accepts two amendment payload types in the `transactionDetails` node. Use the type that matches the level of detail you want to provide in the request.

Simplified amendment payloads support these scenarios.

- Negative amendment to reduce quantity
- Positive amendment to add quantity
- Price amendment to change net or unit price from an effective date
- End date change to extend or shorten the subscription term
- Delta price change to pass a price delta as a single adjustment
- Billing frequency update at the billing schedule group level

Detailed amendment payloads cover the same business outcomes when you specify all transaction details and financial fields.

Simplified amendment payload

Set `BillingActionType__std` to `Amend`. Set `BillingSubActionType__std` to `QuantityAmend`, `PriceAmend`, `EndDateChange`, `DeltaPriceAmend`, or `BillingFrequencyChange` depending on the scenario. Include `TransactionId__std` and `StartDate__std`. Identify the source with either `RelatedTransactionId__std` (one billing schedule) or `BillingScheduleGroupId__std` (a billing schedule group). The examples in the scenario-specific sections in this topic use `RelatedTransactionId__std`. For amendments by using a billing schedule group as source, use `BillingScheduleGroupId__std` instead.

Negative amendment (QuantityAmend)

Reduce quantity from a start date by specifying the reduction quantity as a negative number along with the start date.

If you specify a related transaction, the reduction is applied against that transaction's billing schedules. If you specify a billing schedule group ID, the API applies reductions in Last In, First Out (LIFO) order within that billing schedule group.

The API determines which billing schedules to reduce, validates that sufficient net quantity exists, and checks whether price can be derived through proration or whether `TotalPrice` can be accepted when specified.

This sample includes a negative `Quantity__std` for the quantity to remove from the effective date.

```
{
  "Transaction": [
    {
      "TransactionId__std": "a2",
      "RelatedTransactionId__std": "a1",
      "StartDate__std": "2025-05-01",
      "Quantity__std": -2,
      "BillingActionType__std": "Amend",
      "BillingSubActionType__std": "QuantityAmend"
    }
  ]
}
```

This sample shows the request payload for the same negative quantity amendment.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"TransactionId__std\":\"a2\",\"RelatedTransactionId__std\":\"a1\",\"StartDate__std\":\"2025-05-01\",\"Quantity__std\":-2,\"BillingActionType__std\":\"Amend\",\"BillingSubActionType__std\":\"QuantityAmend\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

This sample shows the transaction data that references a billing schedule group.

```
{
  "Transaction": [
    {
      "TransactionId__std": "a2",
      "BillingScheduleGroupId__std": "9Ws00000AXB00AAI",
      "StartDate__std": "2025-05-01",
      "Quantity__std": -2,
      "BillingActionType__std": "Amend",
     "BillingSubActionType__std": "QuantityAmendment"
    }
  ]
}
```

This sample shows the request payload when billing schedule group is used as a reference.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"TransactionId__std\":\"a2\",\"BillingScheduleGroupId__std\":\"9Ws00000AXB00AAI\",\"StartDate__std\":\"2025-05-01\",\"Quantity__std\":-2,\"BillingActionType__std\":\"Amend\",\"BillingSubActionType__std\":\"QuantityAmendment\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

Positive amendment (QuantityAmend)

Add quantity from a start date. Specify minimal information in the payload. The API derives the billing schedule to amend and, if not specified, the unit price and total price. Use a positive `Quantity__std` for the quantity to add from the effective date.

```
{
  "Transaction": [
    {
      "TransactionId__std": "a2",
      "RelatedTransactionId__std": "a1",
      "StartDate__std": "2025-05-01",
      "Quantity__std": 2,
      "BillingActionType__std": "Amend",
      "BillingSubActionType__std": "QuantityAmend"
    }
  ]
}
```

This sample shows the request payload for the same positive quantity amendment.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"TransactionId__std\":\"a2\",\"RelatedTransactionId__std\":\"a1\",\"StartDate__std\":\"2025-05-01\",\"Quantity__std\":2,\"BillingActionType__std\":\"Amend\",\"BillingSubActionType__std\":\"QuantityAmend\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

This sample shows the transaction data that references a billing schedule group.

```
{
  "Transaction": [
    {
      "TransactionId__std": "a2",
      "BillingScheduleGroupId__std": "9Ws00000AXB00AAI",
      "StartDate__std": "2025-05-01",
      "Quantity__std": 2,
      "BillingActionType__std": "Amend",
      "BillingSubActionType__std": "QuantityAmendment"
```

```
    }
  ]
}
```

This sample shows the request payload when billing schedule group is used as a reference.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"TransactionId__std\":\"ter2\",\"BillingScheduleGroupId__std\":\"9s600XX00A\",\"StartDate__std\":\"2025-05-01\",\"Quantity__std\":2,\"BillingActionType__std\":\"Amend\",\"BillingSubActionType__std\":\"QuantityAmend\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

Price amendment (PriceAmend)

Change the price from a given start date. For example, apply a new net unit price or unit price. The API cancels the existing billing schedule(s) from that date and creates new positive amendment billing schedule with the updated price . Specify the new `NetUnitPrice__std` or `UnitPrice__std` effective on `StartDate__std`. This sample uses net unit price.

```
{
  "Transaction": [
    {
      "TransactionId__std": "ter3",
      "RelatedTransactionId__std": "ter1",
      "StartDate__std": "2026-04-01",
      "NetUnitPrice__std": 20,
      "BillingActionType__std": "Amend",
      "BillingSubActionType__std": "PriceAmend"
    }
  ]
}
```

This sample shows the request payload for the same price amendment.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"TransactionId__std\":\"ter3\",\"RelatedTransactionId__std\":\"ter1\",\"StartDate__std\":\"2026-04-01\",\"NetUnitPrice__std\":20,\"BillingActionType__std\":\"Amend\",\"BillingSubActionType__std\":\"PriceAmend\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

This sample shows the transaction data that references a billing schedule group with delta quantity to amend price on an entire billing schedule group.

```
{
  "Transaction": [
    {
```

```
      "TransactionId__std": "ter4",
      "BillingScheduleGroupId__std": "9Wsxx000000026fCAA",
      "StartDate__std": "2026-06-01",
      "NetUnitPrice__std": 30,
      "Quantity__std": 1,
      "BillingActionType__std": "Amend",
      "BillingSubActionType__std": "PriceAmend"
    }
  ]
}
```

This sample shows the request payload when billing schedule group is used as a reference.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"TransactionId__std\":\"ter4\",\"BillingScheduleGroupId__std\":\"9Wsxx000000026fCAA\",\"StartDate__std\":\"2026-06-01\",\"NetUnitPrice__std\":30,\"Quantity__std\":1,\"BillingActionType__std\":\"Amend\",\"BillingSubActionType__std\":\"PriceAmend\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

End date change (EndDateChange)

Change the end date of the subscription or of a specific billing schedule under a billing schedule group from a specified start date. The API cancels the existing billing schedule(s) from that start date and creates a new positive amendment billing schedule from the start date to the new end date.

Specify `StartDate__std` to specify when the change is effective and `EndDate__std` for the new end of the term.

```
{
  "Transaction": [
    {
      "TransactionId__std": "ter3",
      "RelatedTransactionId__std": "ter1",
      "StartDate__std": "2026-05-01",
      "EndDate__std": "2026-09-01",
      "BillingActionType__std": "Amend",
      "BillingSubActionType__std": "EndDateChange"
    }
  ]
}
```

This sample shows the request payload for the same end date change on one billing schedule by using related transaction ID.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"TransactionId__std\":\"ter3\",\"RelatedTransactionId__std\":\"ter1\",\"StartDate__std\":\"2026-05-01\",\"EndDate__std\":\"2026-09-01\",\"BillingActionType__std\":\"Amend\",\"BillingSubActionType__std\":\"EndDateChange\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
```

```
  }
}
```

This sample shows the transaction data that references a billing schedule group for end date change on one billing schedule group.

```
{
  "Transaction": [
    {
      "TransactionId__std": "ter3",
      "BillingScheduleGroupId__std": "9Wsxx000000026fCAA",
      "StartDate__std": "2026-05-01",
      "EndDate__std": "2026-09-01",
      "BillingActionType__std": "Amend",
      "BillingSubActionType__std": "ChangeEndDate"
    }
  ]
}
```

This sample shows the request payload when billing schedule group is used as a reference.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"TransactionId__std\":\"ter3\",\"BillingScheduleGroupId__std\":\"9Wsxx000000026fCAA\",\"StartDate__std\":\"2026-05-01\",\"EndDate__std\":\"2026-09-01\",\"BillingActionType__std\":\"Amend\",\"BillingSubActionType__std\":\"ChangeEndDate\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

Delta price change (DeltaPriceAmend)

Change a subscription's price mid-term. For example, manage modifications such as add or remove features, or apply special discounts and price uplifts.

Send `Quantity__std` as `0` with `TotalPrice__std` set to the delta amount, or send a non-zero quantity with `NetUnitPrice__std` as the delta net unit price. This sample shows the zero-quantity delta total price pattern.

```
{
  "Transaction": [
    {
      "TransactionId__std": "amendmentSampleId1",
      "RelatedTransactionId__std": "ter1",
      "StartDate__std": "2025-07-01",
      "TotalPrice__std": 600,
      "Quantity__std": 0,
      "BillingActionType__std": "Amend",
      "BillingSubActionType__std": "DeltaPriceAmend"
    }
  ]
}
```

This sample shows the request payload for the same delta price change.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"TransactionId__std\":\"amendDeltaSample1\",\"RelatedTransactionId__std\":\"ter1\",\"StartDate__std\":\"2025-07-01\",\"DeltaPrice__std\":60,\"Quantity__std\":1,\"BillingActionType__std\":\"Amend\",\"BillingSubActionType__std\":\"DeltaPriceAmend\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

Billing frequency update at billing schedule group (BillingFrequencyChange)

Change how often the subscription bills for all billing schedules in a billing schedule group. Set `BillingSubActionType__std` to `BillingFrequencyChange`, identify the group with `BillingScheduleGroupId__std`, set `BillingTermUnit__std` to the new term unit (for example, `Quarter`), and set `StartDate__std` when the new frequency is effective. Include `TransactionId__std`. Optionally, include `BillingStartMonth__std` when the billing selling model requires it for that term unit.

```
{
  "Transaction": [
    {
      "TransactionId__std": "bfTer1",
      "BillingScheduleGroupId__std": "9Ws00000AXB00AAI",
      "StartDate__std": "2025-05-01",
      "BillingTermUnit__std": "Quarter",
      "BillingActionType__std": "Amend",
      "BillingSubActionType__std": "BillingFrequencyChange"
    }
  ]
}
```

This sample shows the request payload for the same billing frequency update.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"TransactionId__std\":\"bfTer1\",\"BillingScheduleGroupId__std\":\"9Ws00000AXB00AAI\",\"StartDate__std\":\"2025-05-01\",\"BillingTermUnit__std\":\"Quarter\",\"BillingActionType__std\":\"Amend\",\"BillingSubActionType__std\":\"BillingFrequencyChange\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

Detailed amendment payload

Send each amendment as its own transaction with `BillingActionType__std` set to `Amend`. Include identifiers, `RelatedTransactionId__std`, and the financial fields for each line. Use this payload type when you already computed quantities, unit prices, and total prices. This sample includes one positive amendment and two negative amendments for the same related transaction.

This sample includes the transaction data for an amendment.

```
{
  "Transaction": [
    {
      "id": "sampleA1",
      "ParentTransactionId__std": "sample",
      "TransactionId__std": "sampleA1",
      "RelatedTransactionId__std": "ter1",
      "StartDate__std": "2025-04-01",
      "UnitPrice__std": 10,
      "Quantity__std": 1,
      "TotalPrice__std": 90,
      "BillingActionType__std": "Amend"
    },
    {
      "id": "sampleA2",
      "ParentTransactionId__std": "sample",
      "TransactionId__std": "sampleA2",
      "RelatedTransactionId__std": "ter1",
      "StartDate__std": "2025-03-01",
      "UnitPrice__std": 10,
      "Quantity__std": -2,
      "TotalPrice__std": -200,
      "BillingActionType__std": "Amend"
    },
    {
      "id": "sampleA3",
      "ParentTransactionId__std": "sample",
      "TransactionId__std": "sampleA3",
      "RelatedTransactionId__std": "ter1",
      "StartDate__std": "2025-03-01",
      "UnitPrice__std": 10,
      "Quantity__std": -1,
      "TotalPrice__std": -100,
      "BillingActionType__std": "Amend"
    }
  ]
}
```

This sample shows the request payload to create a billing schedule for an amendment.

```
{
  "transactionDetails":
[illegible]

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

When you're creating a billing schedule for an amended transaction, make sure that you specify the mandatory values in the transactionDetails property value.

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`ParentTransactionId__std`	The ID of the parent transaction record. For example, if the transaction is at a level similar to that of an Order Item record, the parent transaction will be at a level similar to that of an Order record.	If the transaction is a child Order or Quote record, the ReferenceEntityId field on the BillingScheduleobject is populated. For other sObject records or external records, the Reference field on the BillingSchedule object is populated.	Optional
`TransactionId__std`	The unique identifier reference to apply to the billing schedule with amendment or updated billing frequency. The Reference and ReferenceItem field on a billing schedule has this value appended with a unique ID generated string.	If the transaction is an OrderItem, OrderItemAdjustmentLineItem, OrderItemDetail, QuoteLineDetail, or QuoteLineItem record, the ReferenceEntityItemId field on the BillingScheduleobject is populated. For other sObject records or external records, the ReferenceItem field on the BillingSchedule object is populated.	Required
`BillingStartMonth__std`	The month when billing begins for an annual subscription. This value can be any number from `1` through `12`. For example, if billing starts in January, the value is `1`. If billing starts in June, the value is `6`.	BillingStartMonth field on the BillingScheduleGroup object	Optional. Required if the billing term unit is Quarter, Semi-Annual, or Annual.
`EndDate__std`	The end date of the transaction.	BillingScheduleEndDate field on the BillingSchedule object	Optional. Required in case of an end date change of a subscription.
`StartDate__std`	The start date of the transaction.	BillingScheduleStartDate field on the BillingSchedule object	Required
`Quantity__std`	The quantity of the transaction.	Quantity field on the BillingSchedule object	Required

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`BillingTermUnit__std`	The unit of measurement of the billing term. Valid values are: • `Month` • `Quarter` • `Semi-Annual` • `Year`	BillingTermUnit field on the BillingSchedule object	Optional
`RelatedTransactionId__std`	The ID of the related transaction that must be referenced for an amendment.	This value isn't populated on any BillingSchedule or BillingScheduleGroup field.	Required
`BillingScheduleGroupId__std`	ID of the billing schedule group that must be referenced for an amendment.	Not applicable.	Specify either `RelatedTransactionId__std` or `BillingScheduleGroupId__std` in your request if you're sending a simplified payload.
`BillingActionType__std`	The action that you want to perform for the transaction. Specify `Amend` as the BillingActionType for amended transactions.	Category field on the BillingSchedule object is populated as AmendQuantity.	Required
`BillingSubActionType__std`	The sub-action that you want to perform for the transaction. Specify `PriceAmend`, `QuantityAmend`, or `DeltaPriceAmend` as the BillingActionType to specify minimal details in the payload for a price, quantity, or delta price amendment respectively. Specify `EndDateChange` as the BillingActionType to change the end date of a subscription. Specify `BillingFrequencyChange` as the BillingActionType to update the billing frequency at the billing schedule group level. Available in API version 67.0 and later.	SubCategory field on the BillingSchedule object	Optional
`UnitPrice__std`	The unit price of the transaction.	UnitPrice field on the BillingSchedule object	Either the UnitPrice or the NetUnitPrice value is required

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`TotalPrice__std`	The total price of the transaction.	TotalAmount field on the BillingSchedule object	Required
`NetUnitPrice__std`	The net unit price of the transaction.	NetUnitPrice field on the BillingSchedule object	Either the UnitPrice or the NetUnitPrice value is required

Renewal Transaction

Create a renewal billing schedule for termed subscriptions that continues without a gap, starting the day after the current billing schedule group ends and running for the same term length.

Considerations

Keep these important considerations in mind when you specify the details for renewal transactions.

- The `BillingActionType__std` value for renewal transactions must be `Renew`.
- The quantity for renewal transactions must be a nonzero positive number.
- The start date of the renewal transaction must be before the maximum end date of all the existing billing schedules associated with the billing schedule group.
- The end date of the renewal transaction must be after the maximum end date of all the existing transactions associated with the billing schedule group of the related transaction.
- Specify a `RelatedTransactionId__std` value with a positive quantity.
- For a particular RelatedTransactionId, you can create a billing schedule only for a single renewal transaction.
- For renewal transactions, the `TaxTreatmentId__std` value, the `BillingTreatmentId__std` value, and the `LegalEntityId__std` value of the related transaction are considered.

Renewal Payload Types

The Create Standalone Billing Schedules API accepts two renewal payload types in the `transactionDetails` node. Use the type that matches the level of detail you want to provide in the request.

Simplified renewal payloads support these scenarios.

- Renewal to start a new term after the related transaction or billing schedule group reaches its end
- As-is renewal to renew each existing billing schedule at its own quantity and net unit price

Detailed renewal payloads cover the same outcomes when you specify all transaction details and financial fields.

Simplified renewal payload

Set `BillingActionType__std` to `Renew`. Set `BillingSubActionType__std` to `SimplifiedRenewal` for a standard renewal, or to `AsIsRenewal` for an as-is renewal. Include `TransactionId__std`. Identify the source with either `RelatedTransactionId__std` (one billing schedule) or `BillingScheduleGroupId__std` (a billing schedule group). For a standard renewal, you can omit dates and pricing. The API can derive start date, end date, quantity, and price from the related transaction record or billing schedule group. You can add optional dates or pricing when you want to override derived values.

The examples in this topic use `RelatedTransactionId__std`. For renewals with billing schedule group as source, use `BillingScheduleGroupId__std` instead.

Renewal (SimplifiedRenewal)

Use this payload structure when the new term begins after the prior term ends. This sample shows the minimum fields. Keep these considerations in mind when you specify a simplified payload.

- If you specify a billing schedule group ID, start date is required. If you omit the start date and specify a related transaction ID, the API sets the start date to a day after the end date of the related billing schedule.
- If you specify a billing schedule group ID, end date is required. If you omit the end date and specify a related transaction ID, the API sets the end date by adding one full billing schedule term to that billing schedule's end date (plus one day).
- If you specify a billing schedule group ID, unit price and net unit price are required. If you omit the unit price and net unit price, and specify a related transaction ID, the API sets the unit price and net unit price values from the related billing schedule.
- If you specify a billing schedule group ID, quantity is required. If you omit the quantity and specify a related transaction ID, the API sets the renewal quantity from the related billing schedule.

This sample shows the transaction data for the simplified renewal with related transaction ID as a reference.

```
{
  "Transaction": [
    {
      "TransactionId__std": "ren1",
      "RelatedTransactionId__std": "ter1",
      "BillingActionType__std": "Renew",
      "BillingSubActionType__std": "SimplifiedRenewal"
    }
  ]
}
```

This sample shows the request payload for the simplified renewal with related transaction ID as a reference.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"TransactionId__std\":\"ren1\",\"RelatedTransactionId__std\":\"ter1\",\"BillingActionType__std\":\"Renew\",\"BillingSubActionType__std\":\"SimplifiedRenewal\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

This sample shows the transaction data for the simplified renewal with billing schedule group ID as a reference.

```
{
  "Transaction": [
    {
      "TransactionId__std": "ter3",
      "BillingScheduleGroupId__std": "9Ws00000AXB00AAI",
      "BillingActionType__std": "Renew",
      "BillingSubActionType__std": "SimplifiedRenewal",
      "Quantity__std": 5,
      "UnitPrice__std": 10,
      "StartDate__std": "2025-12-15",
```

```
      "EndDate__std": "2026-12-14"
    }
  ]
}
```

This sample shows the request payload for the simplified renewal with billing schedule group ID as a reference.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"TransactionId__std\":\"ter3\",\"BillingScheduleGroupId__std\":\"9Ws00000AXB00AAI\",\"BillingActionType__std\":\"Renew\",\"BillingSubActionType__std\":\"SimplifiedRenewal\",\"Quantity__std\":\"5\",\"UnitPrice__std\":\"10\",\"StartDate__std\":\"2025-12-15\",\"EndDate__std\":\"2026-12-14\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

As-is renewal (AsIsRenewal)

Use this payload structure when multiple billing schedules under the reference have different quantities or net unit prices and you want one renewal billing schedule per source schedule.

```
{
  "Transaction": [
    {
      "TransactionId__std": "asIsRen1",
      "RelatedTransactionId__std": "ter1",
      "BillingActionType__std": "Renew",
      "BillingSubActionType__std": "AsIsRenewal"
    }
  ]
}
```

This sample shows the request payload for the same as-is renewal.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"TransactionId__std\":\"asIsRen1\",\"RelatedTransactionId__std\":\"ter1\",\"BillingActionType__std\":\"Renew\",\"BillingSubActionType__std\":\"AsIsRenewal\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

This sample shows the request payload for the as-is renewal with billing schedule group ID as a reference.

```
{
  "Transaction": [
    {
      "TransactionId__std": "asIsRenew2",
      "BillingScheduleGroupId__std": "9Ws00000AXB00AAI",
      "BillingActionType__std": "Renew",
```

```
      "BillingSubActionType__std": "AsIsRenewal"
    }
  ]
}
```

This sample shows the request payload for the as-is renewal with billing schedule group ID as a reference.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"TransactionId__std\":\"asIsRenew2\",\"BillingScheduleGroupId__std\":\"9s000000AX0AA1\",\"BillingActionType__std\":\"Renew\",\"BillingSubActionType__std\":\"AsIsRenewal\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

Detailed renewal payload

Send each renewal row with `BillingActionType__std` set to `Renew` and include identifiers, related transaction, dates, quantity, unit price, and total price. Use this payload type when you already computed the renewal lines yourself.

This sample includes the transaction data for a standard renewal after the end date.

```
{
  "Transaction": [
    {
      "id": "temp1001",
      "TotalPrice__std": 10,
      "Quantity__std": 1,
      "UnitPrice__std": 10,
      "StartDate__std": "2026-03-01",
      "EndDate__std": "2027-12-31",
      "TransactionId__std": "temp1001",
      "BillingActionType__std": "Renew",
      "RelatedTransactionId__std": "temp1"
    }
  ]
}
```

This sample shows the request payload to create a billing schedule for a renewal.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"id\":\"temp1001\",\"TotalPrice__std\":10,\"Quantity__std\":1,\"UnitPrice__std\":10,\"StartDate__std\":\"2026-03-01\",\"EndDate__std\":\"2027-12-31\",\"TransactionId__std\":\"temp1001\",\"BillingActionType__std\":\"Renew\",\"RelatedTransactionId__std\":\"temp1\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

When you renew a new-sale transaction after its end date, those transactions are called renewal transactions. For example, a new-sale transaction starts on 01/01/2025 and ends on 12/31/2025, and you renew it to start on 03/01/2026 and end on 12/31/2026.

When you're creating a billing schedule for a renewal transaction, make sure that you provide the mandatory values in the `transactionDetails` property value.

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`TransactionId__std`	The unique identifier reference to apply to the renewal billing schedule. The Reference and ReferenceItem field on a billing schedule has this value appended with a unique ID generated string.	If the transaction is an OrderItem, OrderItemAdjustmentLineItem, OrderItemDetail, QuoteLineDetail, or QuoteLineItem record, the ReferenceEntityItemId field on the BillingScheduleobject is populated. For other sObject records or external records, the ReferenceItem field on the BillingSchedule object is populated.	Required
`EndDate__std`	The end date of the transaction.	BillingScheduleEndDate field on the BillingSchedule object	Required
`StartDate__std`	The start date of the transaction.	BillingScheduleStartDate field on the BillingSchedule object	Required
`Quantity__std`	The quantity of the transaction.	Quantity field on the BillingSchedule object	Required
`RelatedTransactionId__std`	The ID of the original transaction that's related to the renewal transaction.	This value isn't populated on any BillingSchedule or BillingScheduleGroup field.	Required
`BillingScheduleGroupId__std`	ID of the billing schedule group that must be referenced to renew the billing schedule group.	Not applicable.	Specify either `RelatedTransactionId__std` or `BillingScheduleGroupId__std` in your request if you're sending a simplified payload.

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`BillingActionType__std`	The action that you want to perform for the transaction. Specify `Renew` as the BillingActionType for renewal transactions.	Category field on the BillingSchedule object is populated as Renewal.	Required
`BillingSubActionType__std`	The sub-action that you want to perform for the transaction. Specify `AsIsRenewal` as the BillingActionType to specify minimal details in the payload for an as-is renewal. Specify `SimplifiedRenewal` as the BillingActionType to specify minimal details in the payload for a renewal or an early renewal. Available in API version 67.0 and later.	SubCategory field on the BillingSchedule object	Optional
`UnitPrice__std`	The unit price of the transaction.	UnitPrice field on the BillingSchedule object	Either the UnitPrice or the NetUnitPrice value is required
`TotalPrice__std`	The total price of the transaction.	TotalAmount field on the BillingSchedule object	Required

Early Renewal Transaction

Early Renewal ends the current term at an effective date and starts a renewed term to a new end date, creating two billing schedules in one request. The request creates a negative segment for the remaining original term and a positive segment for the renewal term.

Considerations

Keep these important considerations in mind when you specify the details for early renewal transactions.

- The `BillingActionType__std` value for early renewal transactions must be `Renew`.
- When you're creating billing schedules for early renewal transactions, your input payload must have details for two transactions.
  - A transaction to cancel the existing new-sale transaction. The details of this transaction must include a negative quantity to cancel billing for the remaining period. The quantity for this transaction must be the negative equivalent of the total quantity of all the existing billing schedules associated with the same billing schedule group.
  - Another transaction that specifies the early renewal details, which must have a positive quantity.
  - The `BillingActionType__std` value for both these transactions must be `Renew`.
- The start date of the early renewal transaction must be:
  - Before the end date of the related transaction.
  - Before the maximum end date of all the existing billing schedules associated with the billing schedule group of the related transaction.

- The same as the start date of all the existing billing schedules associated with the same billing schedule group or after it.

- The end date for the early renewal transaction must be after the maximum end date of all the existing transactions associated with the billing schedule group of the related transaction.
- For early renewal transactions, the `TaxTreatmentId__std` value, the `BillingTreatmentId__std` value, and the `LegalEntityId__std` value of the related transaction are considered.

Early Renewal Payload Types

The Create Standalone Billing Schedules API accepts two early renewal payload types in the `transactionDetails` node. Use the type that matches the level of detail you want to provide in the request.

Simplified early renewal payloads support these scenarios.

- Early renewal by related transaction by using `SimplifiedRenewal` sub-action type with an effective start date before the current term end and a new end date.
- Early renewal by billing schedule group by using `SimplifiedRenewal` sub-action type with the same date rules at the group level
- Early as-is renewal by using `AsIsRenewal` sub-action type when each underlying billing schedule should renew at its own quantity and net unit price from an effective date before the group end.

For renewal that begins after the prior term or billing schedule group ends, see Renewal Transaction on page 2636.

Detailed early renewal payloads use separate cancel and renewal rows when you supply full transaction and financial fields yourself.

Simplified early renewal payload

Set `BillingActionType__std` to `Renew`. Set `BillingSubActionType__std` to `SimplifiedRenewal` for a blended early renewal, or to `AsIsRenewal` for an early as-is renewal. Include `TransactionId__std`, `StartDate__std` (before the related transaction or group end), and `EndDate__std` for the new term. Identify the source with either `RelatedTransactionId__std` (one billing schedule) or `BillingScheduleGroupId__std` (a billing schedule group). The API can derive quantity and pricing when you omit those fields.

Early renewal by related transaction (SimplifiedRenewal)

```
{
  "Transaction": [
    {
      "TransactionId__std": "earlyRen1",
      "RelatedTransactionId__std": "ter1",
      "StartDate__std": "2025-12-15",
      "EndDate__std": "2026-12-14",
      "BillingActionType__std": "Renew",
      "BillingSubActionType__std": "SimplifiedRenewal"
    }
  ]
}
```

This sample shows the request payload for the same simplified early renewal by using related transaction ID.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"TransactionId__std\":\"earlyRen1\",\"RelatedTransactionId__std\":\"ter1\",\"StartDate__std\":\"2025-12-15\",\"EndDate__std\":\"2026-12-14\",\"BillingActionType__std\":\"Renew\",\"BillingSubActionType__std\":\"SimplifiedRenewal\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
```

```
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

Early renewal by billing schedule group (SimplifiedRenewal)

```
{
  "Transaction": [
    {
      "TransactionId__std": "earlyRen2",
      "BillingScheduleGroupId__std": "9Wsxx00000001ovCAA",
      "BillingActionType__std": "Renew",
      "BillingSubActionType__std": "SimplifiedRenewal",
      "Quantity__std": 5,
      "UnitPrice__std": 10,
      "StartDate__std": "2025-12-15",
      "EndDate__std": "2026-12-14"
    }
  ]
}
```

This sample shows the request payload for the same simplified early renewal by using billing schedule group.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"TransactionId__std\":\"earlyRen2\",\"BillingScheduleGroupId__std\":\"9Wsxx00000001ovCAA\",\"BillingActionType__std\":\"Renew\",\"BillingSubActionType__std\":\"SimplifiedRenewal\",\"Quantity__std\":5,\"UnitPrice__std\":10,\"StartDate__std\":\"2025-12-15\",\"EndDate__std\":\"2026-12-14\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

Early as-is renewal (AsIsRenewal)

Use this pattern when the billing schedule group has multiple billing schedules with different quantities or net unit prices and the renewal effective date is before the group end.

```
{
  "Transaction": [
    {
      "TransactionId__std": "asIsEarly1",
      "BillingScheduleGroupId__std": "9Wsxx00000001ovCAA",
      "StartDate__std": "2025-12-15",
      "EndDate__std": "2026-12-14",
      "BillingActionType__std": "Renew",
      "BillingSubActionType__std": "AsIsRenewal"
    }
  ]
}
```

This sample shows the request payload for the same early as-is renewal.

```
{
  "transactionDetails":
[illegible]

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

Detailed early renewal payload

Send two transactions with `BillingActionType__std` set to `Renew` for each row. The first transaction ends billing for the remainder of the current term with a negative quantity. The second transaction starts the new term with a positive quantity. Include identifiers, related transaction, dates, unit price, and total price for each row.

This sample includes the transaction data for an early renewal.

```
{
  "Transaction": [
    {
      "id": "temp71",
      "TotalPrice__std": -10,
      "Quantity__std": -1,
      "UnitPrice__std": 10,
      "StartDate__std": "2026-12-31",
      "EndDate__std": "2027-12-31",
      "TransactionId__std": "temp71",
      "BillingActionType__std": "Renew",
      "RelatedTransactionId__std": "test21"
    },
    {
      "id": "temp72",
      "TotalPrice__std": 10,
      "Quantity__std": 1,
      "UnitPrice__std": 10,
      "StartDate__std": "2026-12-31",
      "EndDate__std": "2027-12-31",
      "TransactionId__std": "temp72",
      "BillingActionType__std": "Renew",
      "RelatedTransactionId__std": "test21"
    }
  ]
}
```

This sample shows the request payload to create a billing schedule for an early renewal.

```
{
  "transactionDetails":
[illegible]

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
```

```
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

When you renew a new-sale transaction before its end date, those transactions are called early renewal transactions. For example, a new-sale transaction starts on 01/01/2025 and ends on 12/31/2025, and you renew it to start on 12/01/2025 and end on 12/31/2026.

When a billing schedule is created for an early renewal transaction, it results in these updates.

- The cancellation date on the original billing schedule is populated.
- A billing schedule with a negative quantity is created and can be used for a refund.
- A billing schedule with a positive quantity is created for the early renewal transaction.

When you're creating a billing schedule for an early renewal transaction, make sure that you provide the mandatory values in the `transactionDetails` property value.

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`TransactionId__std`	The unique identifier reference to apply to the renewal billing schedule. The Reference and ReferenceItem field on a billing schedule has this value appended with a unique ID generated string.	If the transaction is an OrderItem, OrderItemAdjustmentLineItem, OrderItemDetail, QuoteLineDetail, or QuoteLineItem record, the ReferenceEntityItemId field on the BillingScheduleobject is populated. For other sObject records or external records, the ReferenceItem field on the BillingSchedule object is populated.	Required
`EndDate__std`	The end date of the transaction.	BillingScheduleEndDate field on the BillingSchedule object	Required for a positive transaction. Optional for a negative transaction.
`StartDate__std`	The start date of the transaction.	BillingScheduleStartDate field on the BillingSchedule object	Required
`Quantity__std`	The quantity of the transaction.	Quantity field on the BillingSchedule object	Required

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`RelatedTransactionId__std`	The ID of the transaction against which you're doing an early renewal. This transaction must have a positive quantity.	This value isn't populated on any BillingSchedule or BillingScheduleGroup field.	Required
`BillingScheduleGroupId__std`	ID of the billing schedule group that must be referenced to renew each billing schedule in the billing schedule group early.	Not applicable.	Specify either `RelatedTransactionId__std` or `BillingScheduleGroupId__std` in your request if you're sending a simplified payload.
`BillingScheduleGroupId__std`	ID of the billing schedule group that must be referenced to renew each billing schedule in the billing schedule group early.	Not applicable.	Specify either `RelatedTransactionId__std` or `BillingScheduleGroupId__std` in your request if you're sending a simplified payload.
`BillingActionType__std`	The action that you want to perform for the transaction. Specify `Renew` as the BillingActionType for early renewal transactions.	Category field on the BillingSchedule object is populated as Renewal.	Required
`BillingSubActionType__std`	The sub-action that you want to perform for the transaction. Specify `AsIsRenewal` as the BillingActionType to specify minimal details in the payload for an as-is renewal. Specify `SimplifiedRenewal` as the BillingActionType to specify minimal details in the payload for a renewal or an early renewal. Available in API version 67.0 and later.	SubCategory field on the BillingSchedule object	Optional
`UnitPrice__std`	The unit price of the transaction.	UnitPrice field on the BillingSchedule object	Either the UnitPrice or the NetUnitPrice value is required
`TotalPrice__std`	The total price of the transaction.	TotalAmount field on the BillingSchedule object	Required

Canceled Transaction

Cancel an entire billing schedule from a specified date. Specify only the cancellation date and billing schedule group identifier. The API computes the logic to split the cancellation across overlapping billing schedules and creates one cancel transaction per segment.

Considerations

Keep these important considerations in mind when you provide the details for canceled transactions.

- The `BillingActionType__std` value for any amended transaction must be `Cancel`.
- If you provide a quantity, make sure that it matches the total quantity of the related transaction.
- If there are multiple canceled transactions associated with the same related transaction, specify the same start date for all of these transactions.
- Specify the canceled transaction details for all the billing schedules that are associated with the same billing schedule group.
- If your transaction is for an sObject record, only specify the record ID as the id value in the `transactionDetails` property value. All the other transaction details are automatically fetched from the sObject record if those details are mapped in the context definition.

Cancellation Payload Types

The Create Standalone Billing Schedules API accepts two cancellation payload types in `transactionDetails` node. Use the type that matches the level of details you want to provide in the request.

Simplified cancellation payload

Send a single transaction in the `Transaction` array. Set `BillingActionType__std` to `Cancel` and `BillingSubActionType__std` to `SimplifiedCancel`. Identify the source to cancel with `RelatedTransactionId__std` (one billing schedule) or `BillingScheduleGroupId__std` (a billing schedule group), and include `TransactionId__std` and `StartDate__std` for the effective cancellation date.

This sample shows the transaction data with `BillingScheduleGroupId__std` to cancel a billing schedule group.

```
{
  "Transaction": [
    {
      "TransactionId__std": "cTer5",
      "BillingScheduleGroupId__std": "9Wsxx000000009hCAA",
      "StartDate__std": "2026-08-01",
      "BillingActionType__std": "Cancel",
      "BillingSubActionType__std": "SimplifiedCancel"
    }
  ]
}
```

This sample shows a simplified cancellation request.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"TransactionId__std\":\"cTer5\",\"BillingScheduleGroupId__std\":\"9Wsxx000000009hCAA\",\"StartDate__std\":\"2026-08-01\",\"BillingActionType__std\":\"Cancel\",\"BillingSubActionType__std\":\"SimplifiedCancel\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
```

```
  }
}
```

This sample shows the transaction data with `RelatedTransactionId__std` to cancel a billing schedule.

```
{
  "Transaction": [
    {
      "TransactionId__std": "ter4",
      "RelatedTransactionId__std": "evg1",
      "StartDate__std": "2026-02-01",
      "BillingActionType__std": "Cancel",
      "BillingSubActionType__std": "SimplifiedCancel"
    }
  ]
}
```

This sample shows a simplified cancellation request.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"TransactionId__std\":\"ter4\",\"RelatedTransactionId__std\":
\"evg1\",\"StartDate__std\":\"2026-02-01\",\"BillingActionType__std\":
\"Cancel\",\"BillingSubActionType__std\":\"SimplifiedCancel\"}]}",
  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

Detailed cancellation payload

Send one cancel transaction for each positive billing schedule that you want to end. Each transaction uses `BillingActionType__std` set to `Cancel`. You specify `RelatedTransactionId__std` and the financial fields, such as quantity, unit price, and total price, for each line. Use this sample structure when you already computed the cancel lines and amounts yourself.

This sample shows a detailed cancellation for a single billing schedule. It uses a compact set of fields and does not use `SimplifiedCancel` sub-action type. For a detailed cancellation with multiple transactions, see the following sample.

This sample includes the transaction data for a cancellation.

```
{
  "Transaction": [
    {
      "id": "termedCancel1",
      "ParentTransactionId__std": "sample",
      "TransactionId__std": "termedCancel1",
      "RelatedTransactionId__std": "ot1",
      "StartDate__std": "2025-03-01",
      "UnitPrice__std": 10,
      "TotalPrice__std": -50,
      "BillingActionType__std": "Cancel"
    }
  ]
}
```

This sample shows the request payload to create a billing schedule for a cancellation.

```
{
  "transactionDetails":
"{\"Transaction\":[{\"id\":\"createCancel1\",\"ParentTransactionId__std\":\"sample\",\"TransactionId__std\":\"createCancel1\",\"ReferenceTransactionId__std\":\"01\",\"StartDate__std\":\"2025-03-01\",\"UnitPrice__std\":\"10\",\"TotalPrice__std\":\"50\",\"BillingActionType__std\":\"Cancel\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext__stdctx",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "TransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

When you're creating a billing schedule for a canceled transaction, make sure that you specify the mandatory values in the `transactionDetails` property value.

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`ParentTransactionId__std`	The ID of the parent transaction record. For example, if the transaction is at a level similar to that of an Order Item record, the parent transaction will be at a level similar to that of an Order record.	If the transaction is a child Order or Quote record, the ReferenceEntityId field on the BillingScheduleobject is populated. For other sObject records or external records, the Reference field on the BillingSchedule object is populated.	Optional
`TransactionId__std`	The unique identifier reference to apply to the canceled billing schedule. The Reference and ReferenceItem field on a billing schedule has this value appended with a unique ID generated string.	If the transaction is an OrderItem, OrderItemAdjustmentLineItem, OrderItemDetail, QuoteLineDetail, or QuoteLineItem record, the ReferenceEntityItemId field on the BillingScheduleobject is populated. For other sObject records or external records, the ReferenceItem field on the BillingSchedule object is populated.	Optional if you're sending a simplified payload. If you don't specify this value, the API creates unique transaction IDs.

Context Tag in the Transaction Node of the StandaloneBillingContext Context Definition	Description	Mapped Field	Required or Optional
`StartDate__std`	The start date of the transaction.	BillingScheduleStartDate field on the BillingSchedule object	Required
`RelatedTransactionId__std`	The ID of the related transaction that must be referenced to cancel one billing schedule.	This value isn't populated on any BillingSchedule or BillingScheduleGroup field.	Required
`BillingScheduleGroupId__std`	ID of the billing schedule group that must be referenced to cancel the billing schedule group.	Not applicable.	Specify either `RelatedTransactionId__std` or `BillingScheduleGroupId__std` in your request if you're sending a simplified payload.
`BillingActionType__std`	The action that you want to perform for the transaction. Specify `Cancel` as the BillingActionType for canceled transactions.	Category field on the BillingSchedule object is populated as Cancellation.	Required
`BillingSubActionType__std`	The sub-action that you want to perform for the transaction. Specify `SimplifiedCancel` as the BillingActionType to specify minimal details in the payload for canceled transactions. Available in API version 67.0 and later.	SubCategory field on the BillingSchedule object	Optional
`UnitPrice__std`	The unit price of the transaction.	UnitPrice field on the BillingSchedule object	Either the UnitPrice or the NetUnitPrice value is required
`TotalPrice__std`	The total price of the transaction.	TotalAmount field on the BillingSchedule object	Required
`NetUnitPrice__std`	The net unit price of the transaction.	NetUnitPrice field on the BillingSchedule object	Either the UnitPrice or the NetUnitPrice value is required

Standalone Billing Schedule Metadata Input

Input representation of the metadata details to create a billing schedule. This representation includes the name of the context definition and context mapping along with the mapping details of the transaction, billing schedule, and billing schedule group.

JSON example

```
{
  "transactionDetails": "{\"nodeName\": [{\"id\":\"001SG000004FvlGYAS\",
\"businessSobjectType\": \"Account\", \"Quantity\":\"4\" , \"Name\": \"TestAccount\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "StandaloneBillingContext",
    "intraContextCustomMappingName": "CustomContextMapping",
    "readContextMappingName": "OrderTransactionMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

This example shows a sample request to generate billing schedules from order items by specifying the BillingContext standard context definition as the context definition name.

```
{
  "transactionDetails": "{\"nodeName\": [{\"id\":\"001SG000004FvlGYAS\",
\"businessSobjectType\": \"Account\", \"Quantity\":\"4\" , \"Name\": \"TestAccount\"}]}",

  "transactionContextDetails": {
    "contextDefinitionName": "BillingContext__stdctx",
    "readContextMappingName": "OrderEntitiesMapping",
    "saveContextMappingName": "BSGEntitiesMapping"
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`contextDefinitionName`	String	Name of the context definition that's used to hydrate the context to generate the billing schedule. To generate billing schedules from order items, specify the BillingContext standard context definition as the context definition name. Applicable from API version 66.0 and later.	Required	64.0
`intraContextCustomMappingName`	String	Name of the cross-context custom mapping that's used to map Billing fields to Transaction fields. Use this mapping to populate the Billing fields with the values stored in custom transaction fields.	Optional	65.0
`readContextMappingName`	String	Name of the context mapping with the mapping for the transaction.	Required	64.0

Name	Type	Description	Required or Optional	Available Version
saveContextMappingName	String	Name of the context mapping with the mapping for the billing schedule and billing schedule group.	Required	64.0

Convert Negative Invoice Lines Input

Input representation of the details of the request to convert a list of negative invoice lines into a credit.

JSON example

```
{
"invoiceLines": ["5TVxx0000004C92GAE", "5TVxx0000004C93GAE"],
"description": "Convert negative invoice lines into credit",
"effectiveDate":"2022-05-18"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
description	String	Description stamped on the credit memo that's created after the negative invoice line conversion.	Optional	62.0
effectiveDate	String	Date stamped on the credit memo that's created after the negative invoice line conversion.	Required	62.0
invoiceLines	String[]	Complete list of the negative invoice lines along with the associated invoice line taxes. The specified negative invoice lines are converted into a posted credit memo.	Optional	62.0

Credit Invoice Input

Input representation of the details of the request to create a credit memo.

JSON example

This example shows a sample request with the `Calculate` tax strategy.

```
{
  "type": "POSTED",
  "taxStrategy": "Calculate",
  "taxEffectiveDate": "2024-07-20",
  "effectiveDate": "2024-07-20",
  "description": "Credit Invoice",
  "invoiceLines": [
    {
      "invoiceLineId": "5TVR00000004SiqOBE",
```

```
      "amountToCredit": 5
    }
  ]
}
```

This example shows a sample request with the `CopyFromInvoiceLine` tax strategy.

```
{
  "type": "POSTED",
  "taxStrategy": "CopyFromInvoiceLine",
  "effectiveDate": "2020-05-22",
  "description": "Credit Invoice",
  "invoiceLines": [
    {
      "invoiceLineId": "5TVR00000004SiqOBE",
      "amountToCredit": "5",
      "taxStrategy": "CopyFromInvoiceLine"
    }
  ]
}
```

This example shows a sample request with the `ManualOverride` and `CopyFromInvoiceLine` tax strategies.

```
{
  "type": "POSTED",
  "taxStrategy": "ManualOverride",
  "taxEffectiveDate": "2021-08-01",
  "effectiveDate": "2021-08-01",
  "description": "Credit issued because product was malfunctioning.",
  "invoiceLines": [
    {
      "invoiceLineId": "5TVR00000004SiqOBE",
      "amountToCredit": 100,
      "taxStrategy": "ManualOverride",
      "taxEffectiveDate": "2021-08-01T21:22:41.000Z",
      "taxes": [
        {
          "taxAmount": 15,
          "taxName": "abc",
          "taxCode": "taxCode",
          "taxRate": 7
        }
      ],
      "addresses": {
        "billingAddress": {
          "street": "1 Market St #300",
          "city": "San Francisco",
          "state": "CA",
          "country": "US",
          "postalCode": "94105",
          "latitude": "37.789901",
          "longitude": "-122.396923"
        },
        "shippingAddress": {
          "street": "415 Mission St",
```

```
          "city": "San Francisco",
          "state": "CA",
          "country": "US",
          "postalCode": "94105",
          "latitude": "37.789901",
          "longitude": "-122.396923"
        }
      }
    },
    {
      "invoiceLineId": "5TVR00000004SiqOAE",
      "amountToCredit": 200,
      "taxStrategy": "CopyFromInvoiceLine"
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`description`	String	Description for the credit memo to be created.	Optional	62.0
`effectiveDate`	String	Date when the credit memo takes effect.	Optional	62.0
`invoiceLines`	Credit Invoice Line Input[]	List of the invoice lines to be credited. The invoice line IDs must be related to the invoice ID specified in the API request. If invoice lines aren't specified, the API request results in an error.	Required	62.0
`taxEffectiveDate`	String	Date when the tax takes effect to recalculate the taxes.	Optional	62.0
`taxStrategy`	String	Tax strategy to be applied across invoice lines. You can override the tax strategy at the individual invoice line level or at the tax line level. Valid values are: • `Ignore`—Specifies that the creation of tax lines must be ignored. • `ManualOverride`—Specifies that the provided tax values must be considered for taxes. • `CopyFromInvoiceLine`—Specifies that tax values must be copied from the invoice line. • `Calculate`—Specifies that tax must be calculated by using the API.	Required	62.0

Name	Type	Description	Required or Optional	Available Version
`type`	String	Type of credit memo to be created. Valid values are `Posted` and `Draft`. Specify `Draft` as a value in your request to create draft credit memos.	Optional	62.0

Credit Invoice Line Input

Input representation of the details of the invoice lines to be credited.

JSON example

```
"invoiceLines": [
  {
    "invoiceLineId": "5TVR00000004SiqOBE",
    "amountToCredit": 100,
    "taxStrategy": "ManualOverride",
    "taxEffectiveDate": "2021-08-01T21:22:41.000Z",
    "taxes": [
      {
        "taxAmount": 15,
        "taxName": "abc",
        "taxCode": "taxCode",
        "taxRate": 7
      }
    ],
    "addresses": {
      "billingAddress": {
        "street": "1 Market St #300",
        "city": "San Francisco",
        "state": "CA",
        "country": "US",
        "postalCode": "94105",
        "latitude": "37.789901",
        "longitude": "-122.396923"
      },
      "shippingAddress": {
        "street": "415 Mission St",
        "city": "San Francisco",
        "state": "CA",
        "country": "US",
        "postalCode": "94105",
        "latitude": "37.789901",
        "longitude": "-122.396923"
      }
    }
  },
  {
    "invoiceLineId": "5TVR00000004SiqOAE",
    "amountToCredit": 200,
    "taxStrategy": "CopyFromInvoiceLine"
```

```
    }
]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`addresses`	Credit Memo Addresses Input[]	Addresses to be created manually for this invoice line and the overridden tax lines. These addresses are only applicable if this invoice line is using the `ManualOverride` tax strategy.	Optional	62.0
`amountToCredit`	Double	Amount to be credited from this invoice line.	Required	62.0
`invoiceLineId`	String	ID of the invoice line record to be credited. The invoice line ID must be related to the invoice ID specified in the API request.	Required	62.0
`isTaxOnlyCredit`	Boolean	Indicates whether the applicable tax amount is credited for the charge or adjustment amount (`true`), or the applicable tax amount is credited along with the charge or adjustment amount (`false`). The default value is `false`.	Optional	62.0
`taxEffectiveDate`	String	Date when the tax takes effect and the invoice line is credited.	Optional	62.0
`taxStrategy`	String	Tax strategy for crediting the invoice line. This tax strategy takes precedence over the `taxStrategy` property value specified in the Credit Invoice Input. Valid values are: • `Ignore`—Specifies that the creation of tax lines must be ignored. • `ManualOverride`—Specifies that the provided tax values must be considered for taxes. • `CopyFromInvoiceLine`—Specifies that tax values must be copied from the invoice line. • `Calculate`—Specifies that tax must be calculated by using the API.	Optional	62.0
`taxes`	Credit Invoice Line Tax Input[]	List of tax lines to be created manually for this invoice line.	Required if the `taxStrategy` property value is `ManualOverride`.	62.0

Credit Invoice Line Tax Input

Input representation of the details of the tax lines to be created manually for the invoice line.

JSON example

```
      "taxes": [
        {
          "taxAmount": 15,
          "taxName": "abc",
          "taxCode": "taxCode",
          "taxRate": 7
        }
      ]
```

Properties

Name	Type	Description	Required or Optional	Available Version
taxAmount	Double	Amount of tax to be applied related to this invoice line.	Required	62.0
taxCode	String	Tax code to be applied related to this invoice line to create the tax line.	Optional	62.0
taxName	String	Name of tax to be applied related to this invoice line.	Optional	62.0
taxRate	Double	Tax rate used to create the tax line.	Optional	62.0

Credit Memo Addresses Input

Input representation of the details of the billing and shipping addresses.

JSON example

```
{
  "billingAddress": {
    "street": "1 Market St #300",
    "city": "San Francisco",
    "state": "CA",
    "country": "US",
    "postalCode": "94105",
    "latitude": "37.789901",
    "longitude": "-122.396923"
  },
  "shippingAddress": {
    "street": "415 Mission St",
    "city": "San Francisco",
    "state": "CA",
    "country": "US",
    "postalCode": "94105",
    "latitude": "37.789901",
    "longitude": "-122.396923"
```

```
    }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`billing Address`	Address Input[]	Billing address for charge or adjustment line.	Optional	62.0
`shipping Address`	Address Input[]	Shipping address for charge or adjustment line.	Optional	62.0

Credit Memo Apply Input

Input representation of the request to apply a credit memo to an invoice.

JSON example

```
{
  "applications": [
    {
      "appliedToId": "3ttxx000000003FAAQ",
      "amount": 10,
      "description": "Apply to invoice for refund",
      "effectiveDate": "2024-07-01"
    },
    {
      "appliedToId": "3ttxx0000000001AAA",
      "amount": 100
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`applications`	Credit Memo Apply Application Input[]	List of one or more applications to apply the credit memo for. Each application represents an invoice that's credited by using the balance of the specified credit memo.	Required	62.0

Credit Memo Apply Application Input

Input representation of the request to specify one or more applications to apply a credit memo for, with each application representing an invoice.

JSON example

```
"applications": [
  {
    "appliedToId": "3ttxx000000003FAAQ",
    "amount": 10,
    "description": "Apply to invoice for refund",
    "effectiveDate": "2024-07-01"
  },
  {
    "appliedToId": "3ttxx0000000001AAA",
    "amount": 100
  }
]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`amount`	Double	Credit amount to be applied to the invoice.	Required	62.0
`appliedToId`	String	ID of the invoice record to apply the credit for.	Required	62.0
`description`	String	Explanation or reason for applying the credit memo.	Optional	62.0
`effectiveDate`	String	Effective date for the credit memo.	Optional	62.0

Credit Memo Draft to Posted Input

Input representation of the request to post a draft credit memo.

JSON example

```
{
"creditMemoIds": ["50gDU00000001MnYAI"]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`correlationId`	String	Splunk correlation ID to use to track messages that are related to the request and logged in Splunk by the different services involved in the request. If not specified, the service creates a random Universally Unique Identifier (UUID).	Optional	65.0

Name	Type	Description	Required or Optional	Available Version
creditMemoIds	String[]	ID of the credit memo record in Draft status to be posted. You can post one draft credit memo per API request.	Required	65.0

Credit Memo Unapply Input

Input representation of the request to unapply a credit memo from an invoice.

JSON example

```
{
  "description": "Unapply credit memo from invoice to revert an error",
  "effectiveDate": "2024-07-01"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
description	String	Explanation or reason for unapplying the credit memo.	Optional	62.0
effectiveDate	String	Effective date for the credit memo.	Optional	62.0

Credit Memo Line Apply Input

Input representation of the details of the request to apply a credit memo line to an invoice line.

JSON example

```
{
 "applyCreditDetails": [
 {
 "invoiceLineId": "5TVSG0000002ZJR4A2",
 "appliedAmount": 5,
 "description": "Apply to invoice line 1",
 "effectiveDate": "2024-07-01"
 },
 {
 "invoiceLineId": "5TVSG0000002ZJS4A2",
 "appliedAmount": 10,
 "description": "Apply to invoice line 2",
 "effectiveDate": "2024-07-01"
 }
 ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
applyCredit Details	Credit Memo Line Application Input[]	List of one or more applications to apply the credit memo line for. Each application represents an invoice line that's credited by using the balance of the specified credit memo line.	Required	62.0

Credit Memo Line Application Input

Input representation of the request to specify one or more applications to apply a credit memo line for, with each application representing an invoice line.

JSON example

```
"applyCreditDetails": [
{
"invoiceLineId": "5TVSG0000002ZJR4A2",
"appliedAmount": 5,
"description": "Apply to invoice line 1",
"effectiveDate": "2024-07-01"
},
{
"invoiceLineId": "5TVSG0000002ZJS4A2",
"appliedAmount": 10,
"description": "Apply to invoice line 2",
"effectiveDate": "2024-07-01"
}
]
```

Properties

Name	Type	Description	Required or Optional	Available Version
appliedAmount	Double	Credit amount to be applied to the invoice line.	Required	62.0
description	String	Explanation or reason for applying the credit memo line.	Optional	62.0
effectiveDate	String	Effective date for the credit memo line.	Optional	62.0
invoiceLineId	String	ID of the invoice line record to apply the credit for.	Required	62.0

Credit Memo Line Unapply Input

Input representation of the details of the request to unapply a credit memo line from an invoice line.

JSON example

```
{
 "description": "Unapply a credit memo line from invoice line 1",
 "effectiveDate": "2024-07-01"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
description	String	Explanation or reason for unapplying the credit memo line.	Optional	62.0
effectiveDate	String	Effective date for the credit memo line.	Optional	62.0

Customer Details Input

Input representation of the customer details for tax calculation.

JSON example

```
{
    "accountId": "001R000000000zSMAQ"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
accountId	String	Salesforce account ID of the customer.	Optional	62.0

Frequency Cadence Options

Input representation of the frequency cadence options for an invoice scheduler.

JSON example

```
  "frequencyCadenceOptions": {
        "recurringSubType" : "Every",
        "recursOn" : "First",
        "recursOnDay" : "Sunday",
        "shouldExcludeWkendAndHldy": true
    }
```

Properties

Name	Type	Description	Required or Optional	Available Version
`recurringSub Type`	String	Subtype of the recurring frequency for the invoice run. Valid values are: • `Every`—Specifies if the invoice scheduler must generate the invoices on a recurring frequency on a specific cadence. Use this value to generate invoices on a specific day of the month. For example, you can specify that the invoice scheduler must generate the invoices every first Monday of the month. • `SpecificDate`—Specifies if the invoice scheduler must generate the invoices on a recurring frequency on a specific date. Use this value to generate invoices on a monthly basis on a specific date.	Required if the `frequency Cadence` property is set to `Monthly`.	62.0
`recursOn`	String	Cadence that specifies when the invoice scheduler must generate the invoices on a recurring frequency. For example, you can specify that the invoice scheduler must generate the invoices every first Monday of the month. Valid values are: • `First` • `Second` • `Third` • `Fourth` • `Last`	Required if the `frequency Cadence` property is set to `Monthly`.	62.0
`recursOnDate`	String	Date when the invoice scheduler must generate the invoices on a specific date. The supported values are: • 1 through 28—Specify any date from 1 through 28. • `L`—Specifies that the invoice scheduler must generate the invoices on the last day of the month. • `L-1`—Specifies that the invoice scheduler must generate the invoices on the second to last day of the month.	Required if the `recurringSub Type` property is set to `SpecificDate`.	62.0

Name	Type	Description	Required or Optional	Available Version
		• L-2—Specifies that the invoice scheduler must generate the invoices on the third to last day of the month.		
recursOnDay	String	Day of the week when the invoice scheduler must generate the invoices on a recurring frequency. For example, you can specify that the invoice scheduler must generate the invoices every Monday or every first Monday of a month. Valid values are: • Sunday • Monday • Tuesday • Wednesday • Thursday • Friday • Saturday	Required if the frequency Cadence property is set to Weekly or Monthly.	62.0
shouldExclude WkendAndHldy	Boolean	Indicates whether to exclude weekends and holidays from the billing schedule (true) or not (false).	Required if the frequency Cadence property is set to Monthly.	62.0

Graph Record for Invoice Ingestion

A Graph record is an object that's a part of the graph structure, representing both the fields and relationships among different objects. Each record in the graph can contain attributes, which are fields of the object, and references to other related records.

Invoice ingestion supports a Graph record count of 500. The supported Graph attribute types for invoice ingestion are Account, Contact, Invoice, InvoiceLine, InvoiceLineTax, and InvoiceAddressGroup.

A Graph record has these properties and associated fields.

Field	Description
referenceId	Unique identifier of the record that's used to reference the record in the graph.
record	Object containing the actual data for the record.
record.attributes.type	Standard object of the referenced record. In this scenario, this field indicates an InvoiceAddressGroup attribute type.
record.attributes.method	Method that defines the operation on the record. For example, POST to create a record, PUT to update a record, or GET to get record data.

JSON example

```
{
  "referenceId": "refBillingAddress",
  "record": {
    "attributes": {
      "type": "InvoiceAddressGroup",
      "method": "POST"
    },
    //Contains the actual data
  }
}
```

Account Record

Keep these considerations in mind when you specify an Account record as the Graph attribute type.

- The supported Graph attribute method is GET only.
- The supported record count that you can specify for each account is one only.
- The id field on attributes is the value of the externalId field API Name in Account. Use this field to resolve the Salesforce Account ID from the custom external ID field. See Use an 'External ID' to set the values for audit fields.

JSON example

```
{
  "referenceId": "refAccount",
  "record": {
    "attributes": {
      "type": "Account",
      "method": "GET",
      "id": "AccountId__c/7661eaaf-f527-4dcf-beb3-301f3eddcd9e"
    }
  }
}
```

Contact Record

Keep these considerations in mind when you specify a Contact record as the Graph attribute type.

- The supported Graph attribute method is GET only.
- The supported record count that you can specify for Contact is one only.
- The id field on attributes is the value of the externalId field API Name in Contact. Use this field to resolve the Salesforce Contact ID from the custom external ID field. See Use an 'External ID' to set the values for audit fields.

JSON example

```
{
  "referenceId": "refContact",
  "record": {
    "attributes": {
      "type": "Contact",
      "method": "GET",
      "id": "ContactId__c/7661eaaf-f527-4dcf-beb3-301f3eddcd9e"
    }
```

```
  }
}
```

Invoice Record

Keep these considerations in mind when you specify an Invoice record as the Graph attribute type.

- The supported Graph attribute method is POST only.
- The supported record count that you can specify for Invoice is one only.
- An invoice with `Draft` status can't have a posted date.
- You can't use an invoice with `Draft` status when the `taxCalculationStatus` property value is `Posted`. The `taxCalculationStatus` property must be `Estimated` or `Pending`.
- You can't use an invoice with `Posted` status when the `shouldCalculateTax` property is `true`.
- An invoice with `Posted` status can't include the `Estimated` or `Pending` as the `taxCalculationStatus` property values. The tax processing status must be `Posted`.
- An invoice with `Posted` status with an invoice line marked as `taxable` must include an `invoiceLineTax` for that invoice line.
- An invoice with `Posted` status with an invoice line marked as `nontaxable` must not include an `invoiceLineTax` for that invoice line.
- The `invoice.CreationMode` field value is `External`. This field differentiates the invoices created from a billing schedule or an invoice ingestion. For invoices created from a billing schedule, the value is Salesforce. For invoices created from an invoice ingestion, the value is `External`.
- The due date of an invoice graph is in the future or with a valid payment term, or your Salesforce org has a default payment term set.

JSON example

```
{
  "referenceId": "refInvoice",
  "record": {
    "attributes": {
      "type": "Invoice",
      "method": "POST"
    },
    "invoiceDate": "2024-01-01",
    "billingAccountId": "001xx000003Dzo9AAC",
    "billToContactId": "003xx000004TzFoAAI",
    "paymentTermId": "2OXxx0000004CFUGA2",
    "referenceEntityId": "801xx000003GeQQAA0",
    "status": "Draft",
    "currencyIsoCode": "USD",
    "dueDate": "2024-02-01",
    "postedDate": "2024-01-02",
    "invoiceNumber": "INV-12345",
    "uniqueIdentifier": "1a9380c1-8042-422d-bcc5-70c3f51c2588",
    "description": "Consulting Services"
  }
}
```

Table 16: Properties

NAME	Standard Object Field	Description	Required or Optional
`invoiceDate`	Invoice.invoiceDate	Date when the invoice was created or issued.	Required
`billingAccountId`	Invoice.billingAccountId	Billing account associated with this invoice, which you can resolve with the `externalId` field by using the GET method.	Required
`billToContactId`	Invoice.billToContactId	Contact to whom the invoice is billed, which you can resolve with the `externalId` field by using the GET method.	Required
`paymentTermId`	Invoice.paymentTermId	Payment term associated with the invoice. If a value isn't specified, then the default payment term ID is used.	Optional
`referenceEntityId`	Invoice.referenceEntityId	Reference to a related object, if applicable. To generate invoices from debit memos, specify the debit memo ID as the property value. Make sure that the debit memo is in `Posted` status. Available in API version 66.0 and later. The invoice is generated in `Draft` status.	Optional
`status`	Invoice.status	Status of the invoice. Valid values are: • `Draft` • `Posted`. The default value is `Draft`.	Optional
`currencyIsoCode`	Invoice.currencyIsoCode	ISO code representing the currency of the invoice. This property must be specified if multi-currency is enabled in the organization.	Optional
`dueDate`	Invoice.dueDate	Due date for the invoice payment. If a value isn't specified, then this value is set based on the payment term.	Optional
`postedDate`	Invoice.postedDate	Date the invoice was posted to the system. Until API version 64.0, the default value is the current date irrespective of the value that's specified in the input payload. In API version 65.0 and later, the posted date specified in the input payload is considered.	Required in API version 65.0 and later.
`invoiceNumber`	Invoice.invoiceNumber	Unique identifier for the invoice.	Optional
`uniqueIdentifier`	Invoice.uniqueIdentifier	Unique identifier for the invoice. This property is used as the idempotency key to avoid duplicate invoice generation.	Optional

NAME	Standard Object Field	Description	Required or Optional
description	Invoice.description	Short description of the invoice or the billed items.	Optional

Invoice Line Record

Keep these considerations in mind when you specify an Invoice Line record as the Graph attribute type.

- The supported Graph attribute method is POST only.
- The Graph must include at least one Graph record with the InvoiceLine attribute type.
- The invoice line end date must be greater than or equal to the invoice line start date.

JSON example

```
{
  "referenceId": "refInvoiceLine",
  "record": {
    "attributes": {
      "type": "InvoiceLine",
      "method": "POST"
    },
    "name": "Parle G",
    "invoiceLineStartDate": "2024-01-01",
    "invoiceLineEndDate": "2024-01-31",
    "quantity": 10,
    "unitPrice": 25,
    "chargeAmount": 250,
    "invoiceId": "@{refInvoice.id}",
    "shippingAddressId": "@{refShippingAddress.id}",
    "billingAddressId": "@{refBillingAddress.id}",
    "referenceEntityItemId": "802xx000001neB9AAI",
    "taxTreatmentId": "1ttxx0000000BOTAA2",
    "legalEntityId": "0fwxx0000000001AAA",
    "legalEntityAccountingPeriodId": "1HLxx0000004C92GAE",
    "product2Id": "01txx0000006ic4AAA",
    "usageProductId": "01txx0000006ic5AAA",
    "isUsageBasedInvoiceLine": false,
    "usageOverageQuantity": 5,
    "unitOfMeasureId": "0hExx0000000001EAA",
    "description": "Sample product description"
  }
}
```

Table 17: Properties

NAME	Standard Object Field	Description	Required or Optional
name	InvoiceLine.name	Name or description of the invoice line item.	Required
invoiceLineStartDate	InvoiceLine.invoiceLineStartDate	Start date for the invoice line period. For example, the date when the product or service is provided.	Required

NAME	Standard Object Field	Description	Required or Optional
`invoiceLineEndDate`	InvoiceLine.invoiceLineEndDate	End date for the invoice line period. For example, the date when the product or service ends.	Required
`quantity`	InvoiceLine.quantity	Quantity of the product or billed service in this invoice line.	Required
`unitPrice`	InvoiceLine.unitPrice	Price per unit of the product or billed service.	Required
`chargeAmount`	InvoiceLine.chargeAmount	Total charge amount for this invoice line, which is calculated as quantity * unit price.	Required
`invoiceId`	InvoiceLine.invoiceId	Reference to the invoice that this invoice line is associated with.	Required
`shippingAddressId`	InvoiceLine.shippingAddressId	Shipping address associated with this invoice line.	Required
`billingAddressId`	InvoiceLine.billingAddressId	Billing address associated with this invoice line.	Required
`referenceEntityItemId`	InvoiceLine.referenceEntityItemId	Reference to a related object record for this invoice line.	Optional
`taxTreatmentId`	InvoiceLine.taxTreatmentId	Tax treatment applied to this invoice line such as taxable or nontaxable. If the `TaxTreatmentId` property isn't specified in the request, it's retrieved from the organization's default values. If the organization's defaults aren't set, an error is thrown.	Optional
`legalEntityId`	InvoiceLine.legalEntityId	Legal entity that this invoice line belongs to. If the `LegalEntityId` property isn't specified in the request, it's retrieved from the organization's default values. If the organization's defaults aren't set, an error is thrown.	Optional
`legalEntityAccountingPeriodId`	InvoiceLine.legalEntityAccountingPeriodId	Accounting period for the legal entity that this invoice line belongs to.	Optional
`product2Id`	InvoiceLine.product2Id	Identifier for the product that's billed in this invoice line.	Optional
`usageProductId`	InvoiceLine.usageProductId	Identifier for the usage-based product if this invoice line is for usage-based billing.	Optional
`isUsageBasedInvoiceLine`	InvoiceLine.isUsageBasedInvoiceLine	Boolean value that indicates whether this invoice line is for a usage-based product (`true`) or not (`false`).	Optional
`usageOverageQuantity`	InvoiceLine.usageOverageQuantity	Quantity of usage overage for this invoice line, if applicable.	Optional
`unitOfMeasureId`	InvoiceLine.unitOfMeasureId	Identifier for the unit of measure for the product or service, such as each, kg, or lb.	Optional

NAME	Standard Object Field	Description	Required or Optional
description	InvoiceLine.description	Description of the invoice line item with additional details.	Optional

Tax Record

Keep these considerations in mind when you specify a Tax record as the Graph attribute type.

- The supported Graph attribute method is POST only.
- The associated standard object is InvoiceLineTax.
- The invoiceLineTax graph record must not include the `taxCalculationStatus` property value as `Pending`.

JSON example

```
{
    "referenceId": "refInvoiceLineTax",
    "record": {
        "attributes": {
            "type": "InvoiceLineTax",
            "method": "POST"
        },
        "taxTransactionNumber": "TX123456789",
        "taxAmount": 15.00,
        "taxRate": 0.08,
        "taxName": "Sales Tax",
        "taxCode": "TX-SALES",
        "taxEffectiveDate": "2024-01-01",
        "invoiceLine": "@{refInvoiceLine.id}",
        "taxDocumentNumber": "TAXDOC987654",
        "taxExemptAmount": 0.00,
        "description": "Exempt from VAT"
    }
}
```

Table 18: Properties

NAME	Standard Object Field	Description	Required or Optional
taxTransactionNumber	InvoiceLineTax.taxTransactionNumber	Unique identifier of the tax transaction related to this invoice line tax.	Required
taxAmount	InvoiceLineTax.taxAmount	Total tax amount applied to the invoice line.	Required
taxRate	InvoiceLineTax.taxRate	Rate at which the tax is applied on the invoice line.	Required
taxName	InvoiceLineTax.taxName	Name of the tax applied on the invoice line, such as Sales Tax or Value Added Tax (VAT).	Required
taxCode	InvoiceLineTax.taxCode	Tax code that corresponds to the applied tax rate.	Required
taxEffectiveDate	InvoiceLineTax.taxEffectiveDate	Effective date from which the tax rate applies.	Required

NAME	Standard Object Field	Description	Required or Optional
invoiceLine	InvoiceLineTax.invoiceLine	Reference to the invoice line this tax record is associated with.	Required
taxDocumentNumber	InvoiceLineTax.taxDocumentNumber	Document number associated with the tax transaction, such as tax return document or government filing number.	Required
taxExemptAmount	InvoiceLine.billingAddressId	Billing address associated with this invoice line.	Required
description	InvoiceLineTax.description	Additional details about the tax.	Optional

Shipping Address Record

Keep these considerations in mind when you specify a Shipping Address record as the Graph attribute type.

- The supported Graph attribute method is POST only.
- The associated standard object is InvoiceAddressGroup.

JSON example

```
{
    "referenceId": "refShippingAddress",
    "record": {
        "attributes": {
            "type": "InvoiceAddressGroup",
            "method": "POST"
        },
        "street": "456 Elm St",
        "city": "Springfield",
        "postalCode": "62701",
        "state": "IL",
        "country": "USA",
        "longitude": "-89.6501",
        "latitude": "39.7817",
        "invoiceId": "@{refInvoice.id}"
    }
}
```

Table 19: Properties

NAME	Standard Object Field	Description	Required or Optional
invoiceId	InvoiceAddressGroup.invoice	Unique identifier of the invoice associated with this shipping address.	Required
street	InvoiceAddressGroup.street	Street address where the goods or services are shipped to.	Required
city	InvoiceAddressGroup.city	City where the shipment is delivered.	Required
postalCode	InvoiceAddressGroup.postalCode	Postal or ZIP code for the shipping address.	Required

NAME	Standard Object Field	Description	Required or Optional
state	InvoiceAddressGroup.state	State or province of the delivery location.	Required
country	InvoiceAddressGroup.country	Country where the shipment is delivered.	Required
longitude	InvoiceAddressGroup.longitude	Geographic longitude of the shipping address location for mapping purposes.	Optional
latitude	InvoiceAddressGroup.latitude	Geographic latitude of the shipping address location for mapping purposes.	Optional

Billing Address Record

Keep these considerations in mind when you specify a Billing Address record as the Graph attribute type.

- The supported Graph attribute method is POST only.
- The associated standard object is InvoiceAddressGroup.

JSON example

```
{
    "referenceId": "refBillingAddress",
    "record": {
        "attributes": {
            "type": "InvoiceAddressGroup",
            "method": "POST"
        },
        "street": "789 Oak St",
        "city": "Los Angeles",
        "postalCode": "90001",
        "state": "CA",
        "country": "USA",
        "longitude": "-118.2437",
        "latitude": "34.0522",
        "invoiceId": "@{refInvoice.id}"
    }
}
```

Table 20: Properties

NAME	Standard Object Field	Description	Required or Optional
invoiceId	InvoiceAddressGroup.invoice	Unique identifier of the invoice associated with this billing address.	Required
street	InvoiceAddressGroup.street	Street address for billing purposes.	Required
city	InvoiceAddressGroup.city	City for billing address.	Required
postalCode	InvoiceAddressGroup.postalCode	Postal or ZIP code for the billing address.	Required
state	InvoiceAddressGroup.state	State or province for the billing address.	Required
country	InvoiceAddressGroup.country	Country for the billing address.	Required

NAME	Standard Object Field	Description	Required or Optional
`longitude`	InvoiceAddressGroup.longitude	Geographic longitude of the billing address location for mapping purposes.	Optional
`latitude`	InvoiceAddressGroup.latitude	Geographic latitude of the billing address location for mapping purposes.	Optional

Invoice Draft To Posted Input

Input representation of the details of the draft invoice that's posted.

JSON example

```
{
  "invoiceIds": ["3ttxx0000004CIjAAM"]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`correlationId`	String	Splunk correlation ID to track the messages that are related to the request and are logged in Splunk by the different services involved in the request. If the ID isn't specified, the service creates a random Universally Unique Identifier (UUID).	Optional	62.0
`invoiceIds`	String[]	IDs of the invoice records in `Draft` status to be posted. You can post one draft invoice per API request.	Required	62.0

Invoice Estimated Tax Calculation Input

Details of the invoice for which the estimated tadsfsefx must be calculated.

JSON example

```
{
  "invoiceIds": ["3ttxx0000004CIjAAM"]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`correlationId`	String	Splunk correlation ID to track the messages that are related to the request and are	Optional	63.0

Name	Type	Description	Required or Optional	Available Version
		logged in Splunk by the different services involved in the request. If the ID isn't specified, the service creates a random Universally Unique Identifier (UUID).		
`invoiceIds`	String[]	IDs of the invoices for which the estimated tax must be calculated. You can specify one invoice per API request.	Required	63.0

Invoice Ingestion Input

Input representation of the details of the invoice to be processed. The details include the tax processing status, user preferences for tax callouts, and associated object graph representation.

JSON example to ingest a draft invoice with a tax callout

```
{
  "invoices": [
    {
      "shouldCalculateTax": true,
      "taxCalculationStatus": "Estimated",
      "graph": {
        "graphId": "CreateInvoice",
        "records": [
          {

}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`correlationId`	String	Splunk correlation ID to track the messages that are related to the request and are logged in Splunk by the different services involved in the request. If the ID isn't specified, the service creates a random Universally Unique Identifier (UUID).	Optional	63.0
`graph`	Object Graph Input	Graph that represents the invoice structure for invoice ingestion or generation. The supported Graph attribute types for invoice ingestion are Account, Contact, Invoice, InvoiceLine, InvoiceLineTax, and InvoiceAddressGroup. See Graph Record for Invoice Ingestion.	Required	63.0
`shouldCalculateTax`	Boolean	Indicates whether the estimated tax must be calculated for the ingested invoice (`true`) or not (`false`). The default value is `false`.	Optional	63.0
`taxCalculationStatus`	String	Status of the tax calculation, which is saved on the invoice line. Valid values are: • `Estimated` • `Pending` • `Posted` The default value is `Pending`.	Optional	63.0

Invoice Input for Ingestion

Input representation of the details of the invoice that must be generated for or ingested into Billing.

JSON example to ingest a draft invoice with a tax callout

```
{
  "invoices": [

```

Properties

Name	Type	Description	Required or Optional	Available Version
invoices	Invoice Ingestion Input[]	List of invoices to be generated or ingested, enabling the submission and processing of multiple invoices in a single request. This API supports one invoice per request. To send 25 requests at a time, see the Composite Batch request.	Required	63.0

Invoice Input

Input representation of the details of the billing schedule.

JSON example

```
{
  "accountId": "001SG00000mYtRWYA0",
  "action": "Posted",
  "billingScheduleIds": [
    "44bSG000000CVeMYAW"
  ],
  "billingTransactionId": "801SG00000mYtaXYAS",
  "correlationId": null,
  "invoiceDate": "2024-01-12",
  "targetDate": "2024-01-12"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
accountId	String	ID of the account record to create the invoices for.	Required if the billing ScheduleIds or billing	63.0

Name	Type	Description	Required or Optional	Available Version
			TransactionId property isn't specified.	
action	String	Type of invoice to be created. Valid values are: • Draft • Posted	Required	62.0
billing ScheduleIds	String[]	List of billing schedule IDs that's used to create the invoices. You can specify a maximum of 200 billing schedules.	Required if the accountId or billing TransactionId property isn't specified.	62.0
billing TransactionId	String	ID of the billing transaction record, which is the order ID, to create the invoices for.	Required if the accountId or billing ScheduleIds property isn't specified.	63.0
correlationId	String	Property that's tagged against the published InvoiceProcessedEvent event, if specified.	Optional	62.0
invoiceDate	String	Stamping date of the invoice in ISO 8601 format.	Required	62.0
targetDate	String	Date in ISO 8601 format used to decide the billing periods that are included to create invoices.	Required	62.0

Invoice Preview Input

Input representation of the details of the billing transaction that the preview invoices are generated for.

JSON example

```
{
    "billingTransactionId": "801Z600000004LoIAI",
    "numberOfBillingPeriods": 2,
    "previewDate": "2024-12-04"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
billing TransactionId	String	ID of the record to generate the preview invoices for.	Required	63.0
numberOf BillingPeriods	Integer	Number of billing periods that the invoice preview is generated for. If unspecified, the default value is 2.	Optional	64.0
previewDate	String	The date on which the preview invoice is generated. For the first invoice, the preview date is the target date for generating the invoice. For the second invoice, the target date is calculated based on the preview date and the minimum billing frequency of the transactions. The default value is the current date.	Optional	63.0

Line Item Input

Input representation of the details of the line item for tax calculation.

JSON example

```
{
  "lineItems": [
    {
      "quantity": 1,
      "amount": 100,
      "taxCode": "TX0001",
      "productCode": "Y0001",
      "productSKU": "PRES-RX-12896745",
      "description": "New Product",
      "effectiveDate": "2022-03-09T10:30:41.000Z",
      "lineNumber": "5TVxx0000004C92GAE",
      "addresses": {
        "shipFrom": {
          "street": "123 Alaskan Way",
          "city": "Seattle",
          "state": "WA",
          "country": "US",
          "postalCode": "98101",
          "latitude": 45.12,
          "longitude": 45.12
        },
        "shipTo": {
          "street": "123 Auburn Blvd",
          "city": "Sacramento",
          "state": "CA",
```

```
          "country": "US",
          "postalCode": "95841",
          "latitude": 45.12,
          "longitude": 45.12
        },
        "soldTo": {
          "street": "123 Auburn Blvd",
          "city": "Sacramento",
          "state": "CA",
          "country": "US",
          "postalCode": "95841",
          "latitude": 45.12,
          "longitude": 45.12
        },
        "billTo": {
          "street": "123 Auburn Blvd",
          "city": "Sacramento",
          "state": "CA",
          "country": "US",
          "postalCode": "95841",
          "latitude": 45.12,
          "longitude": 45.12
        }
      }
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
addresses	Addresses Input	Address types that specify different locations associated with the transaction of the line item.	Optional	62.0
amount	Double	Total amount for the line item.	Required	62.0
description	String	Description of the line item.	Optional	62.0
effectiveDate	String	Date that tax rules are applicable from. This property value overrides the global effective date.	Optional	62.0
legalEntity	String	Legal entity that's related to the tax treatment.	Optional	63.0
lineNumber	String	Unique identifier for the line item.	Required	62.0
productCode	String	Product code of the line item according to the tax treatment rules of the tax engine.	Optional	62.0
productId	String	ID of the product.	Optional	63.0

Name	Type	Description	Required or Optional	Available Version
productSKU	String	Unique identifier of a product that can be used to identify products that are exempted from tax.	Optional	64.0
quantity	Double	Quantity of the line item.	Required	62.0
taxCode	String	Tax code of the line item according to the tax treatment rules of the tax engine.	Optional	62.0
unitPrice	Double	Unit price of the product.	Optional	63.0

On-Demand Document Generation Input

Input representation of the details to generate a comprehensive on-demand document for specified record types.

JSON example

```
{
  "recordId": "3ttasd98776266777",
  "shouldForceRegenerate": true,
  "documentTemplateId": "0694x000000XyzABC",
  "documentTitle": "DOC-00000012",
  "tokenData":
[illegible]
 Market
St\",\"CompanyName\":\"260.1\",\"TotalAmt\":\"$7.99\",\"TotalTax\":\"$0.00\",\"InvoiceDueDate\":\"10/08/2025\",\"CompanyPostalCode\":\"94105\",\"InvoiceDate\":\"09/08/2025\",\"CompanyCity\":\"San
 Francisco\",\"CompanyCountry\":\"US\",\"AccountName\":\"Sonia BAT Account\"}"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
documentTemplateId	String	Document template ID to use for PDF generation. The document template must be active with UsageType as `INVOICE` If you don't specify this value, the system auto-resolves by using the default template.	Optional	66.0
documentTitle	String	Custom title for the generated document. If you don't specify a value, the value is auto-generated.	Optional	66.0
recordId	String	Record ID of the object the document is generated for. You can specify invoice ID only.	Required	66.0

Name	Type	Description	Required or Optional	Available Version
shouldForceRegenerate	Boolean	Indicates whether to regenerate the document (`true`) or not (`false`). If set to `true`, this API generates a document, replacing any existing ones. If set to `false`, this API skips the generation of document if invoice already has an associated document. The default value is `false`.	Optional	66.0
tokenData	String	Token data to generate the document.	Optional	66.0

Payment Line Apply Input

Input representation of the payment line details. This representation covers details on allocation of a payment to a specific invoice line. It also provides additional context through optional fields such as associated account and effective date.

JSON example

```
{
  "appliedToId": "3ttR000000001IkIAI",
  "amount": 10,
  "effectiveDate": "2020-08-11T07:53:15.000Z",
  "comments": "Apply payment",
  "associatedAccountId": "001R00000060AyuIAE"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
amount	Double	Amount that's applied. The amount must be less than the invoice line and payment balance.	Required	64.0
appliedToId	String	ID of the invoice line that this payment is applied to. Specify the IDs for these records. • Invoice • Invoice Line	Required	64.0
associated AccountId	String	ID of the associated account.	Optional	64.0
comments	String	Comments that you can add to the payment line application.	Optional	64.0
effectiveDate	String	Date from which the payment line application takes effect.	Optional	64.0

Payment Line Unapply Input

Input representation of the payment line details. This representation covers fields that you can specify to revert a payment line application to their preapplication state.

JSON example

```
{
  "effectiveDate": "2025-05-22T11:30:25.000Z",
  "comments": "Unapply payment"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
comments	String	Comments that you can add when you revert a payment line application.	Optional	64.0
effectiveDate	String	Date from when the reversal of the payment line application is in effect.	Optional	64.0

Payment Run Batch Filter Criteria Input

Input representation of the filter criteria for an invoice batch run. This representation covers the criteria and sequence for filtering payment run details. It specifies the field and object names, comparison operations, and values to be used for filtering.

JSON example

```
  "filterCriteria": [
    {
      "objectName": "PaymentScheduleItem",
      "fieldName": "PaymentRunMatchingValue",
      "operation": "Equals",
      "value": "1",
      "criteriaSequence": 1
    },
    {
      "objectName": "PaymentScheduleItem",
      "fieldName": "PaymentRunMatchingValue",
      "operation": "Equals",
      "value": "2",
      "criteriaSequence": 2
    },
    {
      "objectName": "PaymentScheduleItem",
      "fieldName": "PaymentRunMatchingValue",
      "operation": "Equals",
      "value": "3",
      "criteriaSequence": 3
    }
  ]
```

Properties

Name	Type	Description	Required or Optional	Available Version
criteriaSequence	Integer	Sequence that's used to filter the payment run details.	Required	64.0
fieldName	String	Name of the field that this filter is applicable for. Valid value is PaymentRunMatchingValue.	Required	64.0
objectName	Object	Name of the object that the filter is applicable for. Valid value is PaymentScheduleItem.	Required	64.0
operation	String	Operation that's used for comparison. Valid values are: • Equals • InList • NotEquals	Required	64.0
value	String	Value that's used for the filter criteria.	Required	64.0

Payment Batch Scheduler Input

Input representation of the details of the request to create a payment scheduler. This representation sets the rules and timing for a payment scheduler, including match types, dates, frequency, and filter criteria.

JSON example

JSON example

```
{
  "schedulerName": "Payment Scheduler",
  "startDate": "2022-01-01",
  "endDate": "2022-12-31",
  "preferredTime": "02:05:00.000",
  "frequencyCadence": "Monthly",
  "recursEveryMonthOnDay": "28",
  "criteriaMatchType": "MatchAny",
  "status": "Active",
  "filterCriteria": [
    {
      "objectName": "PaymentScheduleItem",
      "fieldName": "PaymentRunMatchingValue",
      "operation": "Equals",
      "value": "1",
      "criteriaSequence": 1
    },
    {
      "objectName": "PaymentScheduleItem",
```

```
        "fieldName": "PaymentRunMatchingValue",
        "operation": "Equals",
        "value": "2",
        "criteriaSequence": 2
      },
      {
        "objectName": "PaymentScheduleItem",
        "fieldName": "PaymentRunMatchingValue",
        "operation": "Equals",
        "value": "3",
        "criteriaSequence": 3
      }
    ]
  }
```

Properties

Name	Type	Description	Required or Optional	Available Version
criteria MatchType	String	Match type for the criteria of the payment scheduler. Valid values are: • Match Any • Match None	Required if the frequencyCadence property is set to Monthly.	64.0
endDate	String	End date of the payment scheduler.	Required if the frequencyCadence property is set to Monthly.	64.0
frequency Cadence	String	Frequency cadence of the payment scheduler. Valid values are: • Once • Daily • Weekly • Monthly	Required	64.0
filter Criteria	Payment Run Batch Filter Criteria Input	List of criteria that are used to filter the payment run details.	Required if the frequencyCadence property is set to Monthly.	64.0
preferredTime	String	Preferred time for the payment scheduler run.	Required	64.0
recursEvery MonthOnDay	String	Date when the payment scheduler recurs.	Required if the frequencyCadence property is set to Monthly.	64.0

Name	Type	Description	Required or Optional	Available Version
schedulerName	String	Name of the payment scheduler.	Required	64.0
startDate	String	Start date of the payment scheduler.	Required	64.0
status	String	Status of the payment scheduler. Valid values are: • Active • Canceled • Draft • Inactive	Required	64.0

Payment Scheduler Update Input

Input representation of the details of the request to update the status of a payment scheduler. This representation defines the status of a payment scheduler, which can be set to Active, Canceled, Draft, or Inactive.

JSON example

JSON example

```
{
  "status": "Active"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
status	String	Status that must be set to activate or deactivate a payment scheduler. Valid values are: • Active • Canceled • Draft • Inactive	Required	64.0

Posted Invoice List Write-Off Input

Input representation of the request to write off a list of posted invoices. This representation includes the details of invoices that you want to write off.

JSON example

```
{
  "invoices": [
    {
      "invoiceId": "3ttxx00000000cjAAA",
      "reasonCode": "Bad Debt",
      "description": "Bad Debt"
    },
    {
      "invoiceId": "3ttxx00000000cjAAA",
      "reasonCode": "Concession",
      "description": "Concession"
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`invoices`	Posted Invoice Write-Off Input[]	Details of the invoices that you want to write off.	Required	64.0

Posted Invoice Write-Off Input

Input representation of the details of the request to write off a posted invoice. This representation includes invoice details such as invoice ID and reason for writing off invoices.

JSON example

```
{
  "invoices": [
    {
      "invoiceId": "3ttxx00000000cjAAA",
      "reasonCode": "Bad Debt",
      "description": "Bad Debt"
    },
    {
      "invoiceId": "3ttxx00000000cjAAA",
      "reasonCode": "Concession",
      "description": "Concession"
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`invoiceId`	String	ID of the invoice record that you want to write off.	Required	64.0

Name	Type	Description	Required or Optional	Available Version
reason	String	Reason for writing off invoices.	Optional	64.0
reasonCode	String	Code that categorizes the write-off reason. For example, if the reason for the invoice write-off is a disputed amount, the reason code can be Disputed Amount (DA).	Required	64.0

Refund Line Apply Input

Input representation of the details of a transaction refund request. This representation outlines the properties of a refund, including the refund amount and ID of the payment or credit memo record that the refund is applied to.

JSON example

```
{
  "appliedToId": "0aQR00000004ZkKMAU",
  "amount": 10,
  "effectiveDate": "2020-08-11T07:53:15.000Z",
  "comments": "Payment application."
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
amount	Double	Amount to refund.	Required	64.0
appliedToId	String	ID of a payment or credit memo record. The refund is applied to this object.	Required	64.0
comments	String	Additional details of the refund request.	Optional	64.0
effectiveDate	String	Date from when the refund is in effect.	Optional	64.0

Resume Billing Input

Input representation of the details of the request to resume the billing operation for an account or a billing schedule group.

JSON example

```
{
    "referenceIds":
    [
        {
          "referenceId": "001DU000001o2UwYAI",
          "resumeDate": "2024-11-27"
        }
    ]
```

```
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
referenceIds	Resume Billing Object Input[]	Input representation of the account or billing schedule group IDs to resume the billing operation for.	Required	63.0

Resume Billing Object Input

Input representation of the details such as the ID of the account or billing schedule group along with the effective date. These details are used to start the billing operation.

JSON example

```
{
    "referenceIds":
    [
        {
          "referenceId": "001DU000001o2UwYAI",
          "resumeDate": "2024-11-27"
        }
    ]

}
```

Properties

Name	Type	Description	Required or Optional	Available Version
referenceId	String	ID of the account or billing schedule group to resume the billing operation for.	Required	63.0
resumeDate	String	Date when the billing operation is resumed. If a date isn't specified, the default value is today's date. The billing operation starts immediately and any future suspension dates aren't applicable.	Required	63.0

Rules Application Input

Input representation for applying payments and credits to invoices based on rules.

JSON example

```
{
  "accountId": "001xx000003DGbQAAW",
```

```
  "targetDate": "2024-01-15"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`accountId`	String	ID of the account to perform the settlement of payments and credits against invoices in adherence with the applied rules.	Required	66.0
`targetDate`	String	The date used to select invoices and invoice lines with a posted date equal to or later than the target date to apply payments and credits.	Optional	66.0

Selection Condition Input

Input representation of the criteria that's used to determine which sequencing policy is applied to a record. The criteria stores the conditions based on any standard or custom fields of the record.

JSON example

```
{
  "selectionCondition": [
    {
      "filterField": "AppType",
      "operator": "Equals",
      "filterValue": "RLM",
      "conditionNumber": 1
    },
    {
      "filterField": "Status",
      "operator": "Equals",
      "filterValue": "Posted",
      "conditionNumber": 2
    },
    {
      "filterField": "LegalEntity",
      "operator": "Equals",
      "filterValue": "US",
      "conditionNumber": 3
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`conditionNumber`	Integer	Unique number that's assigned to a condition in a sequence policy.	Required	65.0
`filterField`	String	Field used in the filter condition.	Required	65.0
`filterValue`	String	Value in the filter condition.	Required	65.0
`operator`	String	Relational operator that's used to compare the filter field with the filter value. Valid values are: • `Equals` • `NotEquals`	Required	65.0

Seller Details Input

Input representation of the seller details for tax calculation.

JSON example

```
{
  "code": "ADIDAS"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`code`	String	Seller code as specified in the tax engine.	Required	62.0

Send Email Input

Input representation of the request to send an email for an invoice batch run.

JSON example

```
{
  "invoiceBatchRunId": "5IRLT000001SIJB4A4"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
invoiceBatchRunId	String	ID of the invoice batch run record to send emails for the posted invoices of an invoice batch run.	Required	65.0

Sequence Policy Input

Input representation of the configured rules and properties to generate unique, sequential numbers for objects.

JSON example

This example shows a sample request to create a sequence policy.

```
{
  "name": "Sample Sequence Policy",
  "description": "This is a sample sequence policy.",
  "effectiveFromDateTime": "2025-08-10",
  "expirationDateTime": "2025-09-20",
  "isActive": true,
  "sequenceMode": "Basic",
  "targetObject": "Invoice",
  "dateStampFormat": "Yyyy",
  "sequenceStartNumber": 1,
  "incrementNumber": 1,
  "maximumSequenceNumber": 1000,
  "minimumSequenceNumberWidth": 2,
  "filterCriteria": "Custom",
  "selectionLogic": "selectionLogic",
  "sequencePattern": "INV-{SequenceValue}-abc",
  "selectionCondition": [
    {
      "filterField": "AppType",
      "operator": "Equals",
      "filterValue": "RLM",
      "conditionNumber": 1
    },
    {
      "filterField": "Status",
      "operator": "Equals",
      "filterValue": "Posted",
      "conditionNumber": 2
    },
    {
      "filterField": "LegalEntity",
      "operator": "Equals",
      "filterValue": "US",
      "conditionNumber": 3
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
dateStamp Format	String	Format of the stamp date that's appended to the sequence number. You can't edit this property by using the Update Sequence Policy API.	Required	65.0
description	String	Additional details about the sequence policy.	Optional	65.0
effectiveFrom DateTime	String	Date and time when the policy becomes effective. The default value is the current date.	Required	65.0
expiration DateTime	String	Date and time when the policy expires.	Optional	65.0
filter Criteria	String	Criteria to filter the target objects.	Required	65.0
increment Number	Integer	Value by which the sequence number increases until it reaches the maximum number. This value must be greater than or equal to `1`. The default value is `1`. You can't edit this property by using the Update Sequence Policy API.	Required	65.0
isActive	Boolean	Indicates whether the policy is active (`true`) or not (`false`). The default value is `false`.	Required	65.0
maximumSequence Number	Integer	Maximum number the sequence number can reach.	Optional	65.0
minimumSequence NumberWidth	Integer	Minimum number of digits a sequence number must have. You can't edit this property by using the Update Sequence Policy API.	Optional	65.0
name	String	Name of the sequence policy.	Required	65.0
selection Condition	Selection Condition Input[]	Criteria to determine which sequence policy is applied to a record. This property includes conditions based on any standard or custom fields of the record.	Optional	65.0
selection Logic	String	Logic that determines the objects that the sequence policy applies to.	Optional	65.0
sequenceMode	String	Specifies how sequence numbers are generated. Valid values are:	Required	65.0

Name	Type	Description	Required or Optional	Available Version
		• `Basic`—Assigns sequential numbers without gap reconciliation. • `Gapless`—Assigns sequential numbers with gap reconciliation. The usage of this value ensures that the posted invoices or credit memos don't have any numbering gaps for audits and compliance. You can't edit this property by using the Update Sequence Policy API.		
`sequencePattern`	String	Pattern structure that's followed for the sequence.	Required	65.0
`sequenceStartNumber`	Integer	Starting value of the sequence number, which must be greater than or equal to `0`. The default value is `1`. You can't edit this property by using the Update Sequence Policy API.	Required	65.0
`targetObject`	String	Object that the policy is applied to. Valid values are: • `Invoice` • `CreditMemo`—Available in API version 66.0 and later. You can't edit this property by using the Update Sequence Policy API.	Required	65.0
`timeZone`	String	Time zone that's applicable for the sequence policy.	Optional	65.0

Sequence Gap Reconciliation Input

Input representation of the details that are used to identify and reconcile gaps in sequence values based on the sequence policy or target object.

JSON example

This example shows a sample request that specifies the list of sequence policies for gap reconciliation.

```
{
  "sequencePolicyIds": [
    "1vdxx0000000abc",
    "1vdxx0000000def"
  ]
}
```

This example shows a sample request that specifies the target invoice object for gap reconciliation.

```
{
  "targetObjects": [
    "Invoice"
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
sequence PolicyIds	String[]	List of IDs of the sequence policies.	Required if the targetObjects property isn't specified. You must not specify both properties.	65.0
targetObjects	String[]	List of objects to which the policies are applied. Valid values are: • Invoice • CreditMemo—Available in API version 66.0 and later.	Required if the sequencePolicyIds property isn't specified. You must not specify both properties.	65.0

Sequences Assignment Input

Input representation of the details of the target objects to which the sequence pattern values are assigned.

JSON example

```
{
  "targetObjectIds": [
    "3ttxx00000005nhAAA",
    "3ttxx00000006bhAAA"
  ],
  "sequencePolicyId": "1Vdxx0000004CFU"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
sequence PolicyId	String	ID of the sequence policy.	Optional	65.0
shouldPublish PlatformEvent	Boolean	Indicates whether to publish a platform event when a sequence is assigned to a target record (true) or not (false).	Optional	65.0

Name	Type	Description	Required or Optional	Available Version
`target ObjectIds`	String[]	List of records to which the sequence pattern values are assigned.	Required	65.0

Standalone Credit Memo Charge Input

Input representation of the details of the charge lines of a credit memo.

JSON example

```
"charges": [
  {
    "chargeAmount": 100,
    "productId": "01tR0000000njDiIAI"
  }
]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`addresses`	Credit Memo Addresses Input	Details of the billing and shipping addresses.	Optional	62.0
`chargeAmount`	Double	Charge amount for the credit memo.	Required	62.0
`description`	String	Description of the created credit memo charge line.	Optional	62.0
`endDate`	String	End date of the credit memo charge line.	Optional	62.0
`isTax OnlyCredit`	Boolean	Indicates whether the credit is for tax only (`true`) or not (`false`).	Optional	62.0
`productId`	String	ID of the product record that the credit memo is issued on.	Optional	62.0
`productName`	String	Name of the product that the credit memo is issued on.	Optional	62.0
`startDate`	String	Start date of the credit memo charge line.	Optional	62.0
`taxEffective Date`	String	Date from when the tax is applicable.	Optional	62.0
`taxes`	Standalone Credit Memo Tax Input[]	List of credit memo tax lines.	Optional	62.0
`taxStrategy`	String	Tax strategy to be applied to this credit memo charge line, child treatment lines, and tax lines. You can override the tax	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
		strategy at the individual credit memo lines or tax lines level. Valid values are: • `Ignore`—Specifies that the creation of tax lines must be ignored. • `Manual Override`—Specifies that the provided tax values must be considered for taxes. • `Calculate`—Specifies that tax must be calculated by using the API.		
`treatmentId`	String	ID of the tax treatment record that's used to calculate tax.	Optional	62.0

Standalone Credit Memo Input

Input representation of the details required to create a standalone credit memo.

JSON example

This example shows a sample request with the `Ignore` tax strategy.

```
{
  "billingAccountId": "001j000000WCFB800x",
  "type": "Posted",
  "description": "Standalone credit memo with ignored tax.",
  "currencyIsoCode": "USD",
  "taxStrategy": "Ignore",
  "charges": [
    {
      "chargeAmount": 100,
      "productId": "01tR0000000njDiIAI"
    }
  ]
}
```

This example shows a sample request with the `ManualOverride` tax strategy.

```
{
  "billingAccountId": "001DU000001nhoPYAQ",
  "description": "creditmemo-1",
  "currencyIsoCode": "USD",
  "taxStrategy": "ManualOverride",
  "charges": [
    {
      "productId": "01tDU000000EpKkYAK",
      "chargeAmount": 1000,
      "taxes": [
        {
          "taxAmount": 7.25,
          "taxCode": "CA-94121",
```

```
            "taxName": "CALIFORNIA",
            "taxRate": 0.25
          }
        ]
      }
    ]
}
```

This example shows a sample request with the `Calculate` tax strategy for a charge line.

```
{
  "billingAccountId": "001DU000001nhoPYAQ",
  "description": "Standalone Credit Memo",
  "type": "Posted",
  "currencyIsoCode": "USD",
  "taxStrategy": "Ignore",
  "charges": [
    {
      "productId": "01tR0000000njDiIAI",
      "chargeAmount": 10,
      "taxStrategy": "Calculate",
      "treatmentId": "1ttxx00000001VZAAY"
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`billToContactId`	String	Contact related to the credit memo.	Optional	62.0
`billingAccountId`	String	ID of the account that the credit is issued to.	Required	62.0
`charges`	Standalone Credit Memo Charge Input[]	Charge lines of the credit memo. Requires at least one charge line.	Required	62.0
`currencyIsoCode`	String	ISO code currency of the new credit that's issued.	Optional	62.0
`description`	String	Description for the new credit that's issued.	Optional	62.0
`effectiveDate`	String	Effective date of the credit memo. If the value isn't specified, then it's null.	Optional	62.0
`externalReference`	String	ID of the external reference for the credit memo.	Optional	62.0
`externalReferenceDataSource`	String	Source of the external reference for the credit memo.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
taxEffectiveDate	String	Effective date of the credit memo tax. If the value isn't specified, then it's null.	Optional	62.0
taxStrategy	String	Specifies how tax lines must be created for the standalone credit memos. Valid values are: • Ignore—Specifies that the creation of tax lines must be ignored. • Manual Override—Specifies that the provided tax values must be considered for taxes. • Calculate—Specifies that tax must be calculated by using the API.	Required	62.0
type	String	Type of credit memo to be created. Valid values are Posted and Draft. Specify Draft as a value in your request to create draft credit memos.	Optional	62.0

Standalone Credit Memo Tax Input

Input representation of the details of the tax request.

JSON example

```
[
  {
    "taxAmount": 200,
    "taxName": "Federal Tax",
    "taxRate": 1
  },
  {
    "taxAmount": 500,
    "taxName": "State Tax",
    "taxRate": 1
  }
]
```

Properties

Name	Type	Description	Required or Optional	Available Version
taxAmount	Double	Amount of tax to be applied.	Required	62.0
taxCode	String	Tax code to be used to create the tax line.	Optional	62.0
taxName	String	Name of tax to be applied.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
taxRate	Double	Tax rate to be used to create the tax line.	Optional	62.0

Account Statement Input

Input representation of the details required to generate a comprehensive account statement with transaction history and balance information.

JSON example

```
{
  "shouldShowOpenBalancesOnly": false,
  "startDate": "2025-09-01",
  "transactionTypes": {
    "transactionTypes": [
      "Invoice"
    ]
  },
  "sortBy": "DueDate",
  "sortingOrder": "Ascending",
  "associatedAccountIds": {
    "associatedAccountIds": [
      "001xx000003DGb5AAG",
      "001xx000003DGb6AAG"
    ]
  },
  "documentTemplateId": "0TRxx000000002YGAQ",
  "correlationId": "monthly-statement-sept-2025",
  "customFields": "{\"Invoice\": [\"TotalAmountWithTax\"], \"Account\": {\"base\":
[\"Phone\", \"Fax\"], \"associated\": [\"Website\"]}}}"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
associatedAccountIds	String[]	List of associated account IDs from hierarchy to include in the statement. You can specify up to 50 accounts.	Optional	66.0
correlationId	String	Correlation ID for tracking the request across systems.	Optional	66.0
customFields	String	JSON string specifying custom fields to include in the statement. As a best practice, we recommend that you limit the number of custom fields up to 30 fields. Valid objects to specify the associated fields are:	Optional	67.0

Name	Type	Description	Required or Optional	Available Version
		• `Invoice` • `CreditMemo` • `Payment` • `DebitMemo` • `Refund` • `Account` Here's the expected format. `{"Invoice": ["field1", "field2"], "Account": {"base": ["field1"], "associated": ["field2"]}}`		
`documentTemplateId`	String	Document template ID to use for PDF generation. If you don't specify a value, the system auto-resolves by using the default template.	Optional	66.0
`shouldShowOpenBalancesOnly`	Boolean	Indicates whether to show open balances only (`true`) or not (`false`). If set to `true`, the API shows only accounts with non-zero balances. If set to `false`, this API shows complete transaction history within the date range from the start date.	Optional	66.0
`sortBy`	String	Criteria for sorting transactions. The default and valid value is `Date`.	Optional	66.0
`sortingOrder`	String	Sort order for transactions. Valid values are: • `Ascending` • `Descending` The default value is `Descending`.	Optional	66.0
`startDate`	String	Start date for the transaction history. The required format is `YYYY-MM-DD`. The system processes records up to 90 days from this date.	Required	66.0
`transactionTypes`	String[]	List of transaction types to include in the statement. If you don't specify a value or	Optional	66.0

Name	Type	Description	Required or Optional	Available Version
		the value is empty, all transaction types are included. Valid values are: • `All` • `CreditMemo` • `DebitMemo` • `Invoice` • `Payment` • `Refund`		

Suspend Billing Input

Input representation of the details of the request to suspend the billing operation for an account or a billing schedule group.

JSON example

```
{
    "referenceIds":
    [
        {
            "referenceId": "001DU000001o2UwYAI",
            "suspendDate": "2024-11-27",
            "resumeDate": "2024-12-27"
        }
    ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`referenceIds`	Suspend Billing Object Input[]	Input representation of the account or billing schedule group IDs to suspend the billing operation for.	Required	63.0

Suspend Billing Object Input

Input representation of the details such as the ID of the account or billing schedule group along with the effective dates. These details are used to suspend the billing operation.

JSON example

```
{
    "referenceIds":
    [
        {
            "referenceId": "001DU000001o2UwYAI",
```

```
            "suspendDate": "2024-11-27",
            "resumeDate": "2024-12-27"
        }
    ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`referenceId`	String	ID of the account or billing schedule group to suspend the billing operation for.	Required	63.0
`resumeDate`	String	Date until when the account or billing schedule group is suspended for billing.	Required	63.0
`suspendDate`	String	Date when the account or billing schedule group is suspended for billing.	Required	63.0

Tax Calculation Input

Input representation of the details of the request to calculate tax.

JSON example

This example shows a tax request for a specified invoice as the reference entity.

```
{

Properties

Name	Type	Description	Required or Optional	Available Version
addresses	Addresses	Address details for tax calculation.	Optional	62.0
currencyIsoCode	String	Currency ISO code that's used for tax calculation.	Optional	62.0
customerDetails	Customer Details	Customer details for determining the applicable tax.	Optional	62.0
description	String	Description of the tax transaction.	Optional	62.0
documentCode	String	Unique identifier for the tax document. If the documentCode property isn't specified, the tax engine auto-generates it.	Optional	62.0
effectiveDate	String	Date when the tax rules are applied. If a tax rate changes on a specific date, the effectiveDate property ensures the correct rate is applied based on the transaction's timing. For credit-based tax callouts, specify the original invoice date.	Optional	62.0
isCommit	Boolean	Indicates whether to submit the transaction to the tax engine for reporting (true) or not (false). This property value is true for invoices and credit memos with the Posted status.	Optional	62.0
lineItems	Line Item Input []	Details of the line items for calculating the applicable tax.	Required	62.0
reference DocumentCode	String	Reference document code. For subsequent transactions such as a credit tax, this property value specifies the original document code.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
		For credit-based tax callouts, specify the original invoice ID.		
`referenceEntityId`	String	ID of the related quote, invoice, and other transaction documents.	Optional	62.0
`sellerDetails`	Seller Details Input	Seller details for tax calculation.	Optional	62.0
`shouldVoidTax`	Boolean	Indicates whether to void the tax transaction associated with a document that's mentioned as the `referenceDocumentCode` property value with `taxType` property value as `Actual` and `isCommit` property value set to `true`. Keep these considerations in mind when you use this property. • If the `shouldVoidTax` property value is set to `true`, then the operation returns a response with `documentCode` property value updated to `referenceDocumentCode` property value that was originally sent in the request payload. The response also includes the `taxTransactionType` property value as `Void`. This indicates that the document specified in the `referenceDocumentCode` property value is voided. • If document is locked or you can't void the tax transaction for any reason, then you can use the Tax Calculation request to perform another transaction such as a Credit Tax request. In this scenario, the response includes the `documentCode` property value that was sent in the request payload. • If the document that's mentioned in the `referenceDocumentCode` property value isn't available in the tax engine, then an error response occurs with ResultCode on page 1607 value as `ReferenceDocumentCodeMissing`.	Optional	65.0

Name	Type	Description	Required or Optional	Available Version
`taxEngineId`	String	ID of the tax engine that's used to calculate tax.	Required	62.0
`tax TransactionType`	String	Type of the tax transaction. Valid values are: • `Debit`—Increases tax liability for the seller, requiring the seller to pay tax on the transaction. • `Credit`—Decreases tax liability for the seller, resulting in a tax refund for the seller. • `Void`—Reserved for internal use. The default value is `Debit`.	Optional	62.0
`taxType`	String	Type of the tax. Valid values are: • `Actual`—Exact tax amount that's calculated based on actual sales. • `Estimated`— Estimated tax amount, which is adjusted later to match actual tax calculations. For draft invoices and quote records, the tax type is marked as `Estimated`. After draft invoices are posted and the status changes to `Posted`, the tax type is updated to `Actual`. Similarly, when a quote record is finalized and converted into an actual order, the tax type is also updated to `Actual`.	Required	62.0
`transactionDate`	String	Date of the transaction that appears on the invoice, order, and other transaction documents.	Required	62.0

Void Posted Credit Memo Input

Input representation of the details of a credit memo to be voided.

Properties

Name	Type	Description	Required or Optional	Available Version
`creditMemoId`	String	ID of the posted credit memo to be voided.	Required	66.0

Void Posted Invoice Input

Input representation of the details of the invoice to be voided.

Properties

Name	Type	Description	Required or Optional	Available Version
`invoiceId`	String	ID of the posted invoice to be voided.	Required	62.0

Response Bodies

Learn more about the available response bodies of Billing APIs.

Addresses
Output representation of the details of the addresses that are used for calculating tax.

Address
Output representation of the location code associated with an address.

Batch Invoice Document Generation
Output representation of the request to generate or regenerate the PDF documents for the invoices that are in the `Draft` or `Posted` status.

Error Response
Output representation of the error details encountered during the API request.

Error Response for Batch Invoice Document Generation
Output representation of the error details associated with the Batch Invoice Document Generation API.

Batch Invoice Scheduler
Output representation of the details of an invoice scheduler.

Batch Payment Scheduler
Output representation of the details of a payment scheduler.

Billing Arrangement
Output representation that contains the details of a billing arrangement, including its status, configuration settings, and associated lines.

Billing Arrangement Line
Output representation that contains the details of a specific line item within a billing arrangement, defining how charges are split for an account.

Billing Batch Scheduler
Output representation of the details of a created invoice or payment scheduler.

Billing Schedule Recovery List
Output representation of the recovered details of the billing schedules and associated invoice.

Billing Schedule Recovery
Output representation of the details of the recovered billing schedules.

Context-Aware Billing Schedule
Output representation of the context-aware billing schedule.

Context-Aware Billing Schedule Error

Output representation of the error response related to the generation of the billing schedule.

Convert Negative Invoice Lines

Output representation of the details of the created memo along with the status of the request.

Credit Memo Apply

Output representation of the list of applied credit memo results.

Credit Memo Apply List

Output representation of the list of applied credit memo results.

Credit Memo Post

Output representation of the request to post a credit memo.

Credit Memo Unapply

Output representation of the details of the credit memo invoice application record with the status of the request.

Credit Memo Line Applied

Output representation of the list of applied credit memo line results.

Credit Memo Line Applied Response

Output representation of the list of applied credit memo line results.

Credit Memo Line Unapplied

Output representation of the details of the credit memo line invoice line record with the status of the request.

Document Details

Output representation of the details of the generated document.

Invoice Batch Draft To Posted

Output representation of the batch update details of the invoices from `Draft` to `Posted` status.

Invoice Batch Run Recovery

Output representation of the details of the invoice batch run recovery record.

Invoice Ingestion

Output representation of the details of the generated invoices.

Invoice Ingestion Details

Output representation of the details of a generated invoice.

Invoice Ingestion Output Error

Output representation of the details of an invoice generation error.

Invoice Line Preview

Output representation of the invoice line preview result.

Invoice Preview

Output representation of the invoice preview result.

Invoice Preview Result

Output representation of the list of preview invoices that are generated for the billing transaction.

Invoice Recovery

Output representation of the details of the recovered invoice and billing schedules.

Line Item

Output representation of the details of the line item.

[On-Demand Document Generation Response]

Output representation of the details of the generated document along with error response.

[Payment Line Apply]

Output representation of the details of the applied payment line. The details include the ID of the payment record and date when the payment line was applied.

[Payment Line Unapply]

Output representation of the details of the reversed payment line application. The details include the ID of the payment line record and date when the payment line application was reversed.

[Payment Scheduler Update]

Output representation of the details of the updated payment scheduler. This representation covers the updated status value of the specified payment scheduler.

[Posted Invoice List Write-Off]

Output representation of the list of invoices that are written off.

[Posted Invoice Write-Off]

Output representation of the details of a posted invoice that's written off.

[Posted Invoice Write-Off Error]

Output representation of the error response that's associated with a request to write off a posted invoice.

[Reference Line Error]

Output representation of the details of the line level errors.

[Refund Line Applied Response]

Output representation of the details of an applied refund. This representation includes the properties of a refund line, such as the date when the refund is applied against a payment and ID of the refund line record.

[Revenue Async Line Level]

Output representation of the result of the API request for the async line level operations.

[Revenue Async Response]

Output representation of the result of the API request with the request identifier.

[Rules Application]

Output representation of the details of rules application.

[Rules Application Error]

Output representation of the error details for rules application failure.

[Rules Application Summary]

Output representation of the summary of the application rule. This includes the number of payments and credit memos for the account, the total number of payments and credit memos that's applied to invoices, and whether all invoices for an account are considered (true) or not (false).

[Send Email Error]

Output representation of the error response of the API request to send emails for posted invoices.

[Send Email Response]

Output representation of the API request to send emails for posted invoices.

[Sequence Error]

Output representation of the error response that's associated with a request to create or update a sequence policy, or assign sequences.

Sequence Gap Reconciliation Error

Output representation of the errors encountered during the processing of the API request.

Sequence Gap Reconciliation

Output representation of the details of the sequence gap reconciliation.

Sequence Policy

Output representation that shows the status of the assigned sequence pattern values.

Sequences Assignment

Output representation with the status of the assigned sequence pattern values.

Sequences Assignment Result

Output representation of the details of the assigned sequence values to target objects.

Statement of Account

Output representation of the details of the generated account statement with async tracking details.

Suspend Resume Billing

Output representation of the list of accounts and billing schedule groups, which are suspended or resumed for billing operations.

Suspend Resume Billing Object

Output representation of the details of accounts and billing schedule groups, which are suspended or resumed for billing operations, along with the status of the API request.

Tax Amount Details

Output representation of the details of the tax amount.

Tax Calculation

Output representation of the details of the calculated tax.

Tax Details

Output representation of the tax details for each line item.

Tax Engine Log

Output representation of the logs that the tax engine generates.

Tax Imposition

Output representation of the details of the imposed tax.

Tax Jurisdiction

Output representation of the details of the tax jurisdiction for the tax line.

Void Posted Credit Memo

Output representation of the request to void a posted credit memo.

Addresses

Output representation of the details of the addresses that are used for calculating tax.

JSON example

```
{
  "addresses": {
    "shipFrom": {
      "locationCode": "67890"
    },
    "shipTo": {
```

```
      "locationCode": "12345"
    },
    "soldTo": {
      "locationCode": "12345"
    }
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
shipFrom	Address on page 2726	Address that the item is shipped from.	Big, 62.0	62.0
shipTo	Address on page 2726	Address that the item is shipped to.	Big, 62.0	62.0
soldTo	Address on page 2726	Address that the item is sold to.	Big, 62.0	62.0

Address

Output representation of the location code associated with an address.

JSON example

```
{
    "locationCode": "123456789"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
locationCode	String	Unique location code of the address.	Big, 62.0	62.0

Batch Invoice Document Generation

Output representation of the request to generate or regenerate the PDF documents for the invoices that are in the `Draft` or `Posted` status.

JSON example

```
{
  "errors": [
    {
      "errorCode": "API_DISABLED_FOR_ORG",
      "errorMessage": "Document Generation is not enabled for this org!"
    },
    {
      "errorCode": "INVALID_API_INPUT",
      "errorMessage": "Invalid Invoice Batch Run Id"
    }
  ],
  "requestIdentifier": "5IRDU000000009i4AA",
  "success": false
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Batch Invoice Document Generation Error []	Details of the error if the operation fails.	Big, 63.0	63.0
`requestIdentifier`	String	Unique ID that's associated with the specific error, and is used for tracking and referencing the request.	Big, 63.0	63.0
`success`	Boolean	Indicates whether the operation is successful (`true`) or not (`false`).	Big, 63.0	63.0

Error Response

Output representation of the error details encountered during the API request.

JSON example

This example shows a sample error response.

```
{
  "errors": [
    {
      "errorCode": "INVALID_STATUS",
      "message": "CreditMemo 50gxx00000000XtAAI is not in the Posted status."
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Code that indicates the type of error.	Big, 66.0	66.0
`message`	String	Message stating the reason for error, if any.	Big, 66.0	66.0

Error Response for Batch Invoice Document Generation

Output representation of the error details associated with the Batch Invoice Document Generation API.

JSON example

```
  "errors": {
    "errorCode": "API_DISABLED_FOR_ORG",
    "message": "Document Generation is not enabled for this org!"
  }
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Code for the resultant error.	Big, 63.0	63.0

Property Name	Type	Description	Filter Group and Version	Available Version
`errorMessage`	String	Error message for the resultant error.	Big, 63.0	63.0

Batch Invoice Scheduler

Output representation of the details of an invoice scheduler.

JSON example

```
{
    "billingBatchScheduler": {
        "id": "5BSxx0000004TwGGAU"
    }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`billingBatch Scheduler`	Billing Batch Scheduler[]	Details of the created invoice scheduler.	Big, 62.0	62.0

Batch Payment Scheduler

Output representation of the details of a payment scheduler.

JSON example

```
{
  "billingBatchScheduler": {
    "id": "5BSxx0000004TwGGAU"
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`billingBatch Scheduler`	Billing Batch Scheduler	Details of the payment scheduler.	Big, 64.0	64.0

Billing Arrangement

Output representation that contains the details of a billing arrangement, including its status, configuration settings, and associated lines.

JSON example

```
{
  "billingArrangementId": "1bdxx000000004rAAA",
  "name": "Acme Shared Billing Definition",
  "isAdjustmentToOwnAccount": true,
  "remainderPercentage": 15,
```

```
  "versionNumber": 1,
  "numOfAssociatedBSGs": 5,
  "status": "Active",
  "billingArrangementLines": [
    {
      "billingArrangementLineId": "1blxx000000006TAAQ",
      "accountId": "accId1",
      "billingAccountId": "bAccId1",
      "isRemainderAdjustmentAccount": false,
      "percentage": 60
    },
    {
      "billingArrangementLineId": "1blxx000000001dAAA",
      "accountId": "accId2",
      "billingAccountId": "bAccId2",
      "isRemainderAdjustmentAccount": false,
      "percentage": 25
    }
  ],
  "isSuccess": true,
  "error": null
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`billing ArrangementId`	String	Unique ID of the billing arrangement.	Big, 66.0	66.0
`billing ArrangementLines`	Billing Arrangement Line[]	List of billing arrangement lines associated with the latest version of the billing arrangement.	Big, 66.0	66.0
`error`	Error Response Output	Error details if the request was unsuccessful.	Big, 66.0	66.0
`isAdjustment ToOwnAccount`	Boolean	Indicates whether the remainder of the bill is adjusted to the owning account (`true`) or not (`false`).	Big, 66.0	66.0
`isSuccess`	Boolean	Indicates whether the request was successfully processed (`true`) or not (`false`).	Big, 66.0	66.0
`name`	String	Name of the billing arrangement.	Big, 66.0	66.0
`numOf AssociatedBSGs`	Integer	Total number of billing schedule groups associated with the billing arrangement.	Big, 66.0	66.0
`remainderPercentage`	Double	Remaining percentage of the bill after all line allocations are calculated.	Big, 66.0	66.0

Property Name	Type	Description	Filter Group and Version	Available Version
`status`	String	Status of the billing arrangement. Valid values are: • `Draft` • `Active` • `Inactive`	Big, 66.0	66.0
`versionNumber`	Integer	Current version number of the billing arrangement.	Big, 66.0	66.0

Billing Arrangement Line

Output representation that contains the details of a specific line item within a billing arrangement, defining how charges are split for an account.

JSON example

```
{
  "billingArrangementLineId": "1blxx000000006TAAQ",
  "accountId": "accId1",
  "billingAccountId": "bAccId1",
  "isRemainderAdjustmentAccount": false,
  "percentage": 60.00
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`accountId`	String	ID of the account associated with the billing line.	Big, 66.0	66.0
`billing AccountId`	String	ID of the billing account responsible for this portion of the bill.	Big, 66.0	66.0
`billingArrangement LineId`	String	Unique ID of the billing arrangement line.	Big, 66.0	66.0
`isRemainder AdjustmentAccount`	Boolean	Indicates whether the specific line is designated as the adjustment account for any remainder (`true`) or not (`false`).	Big, 66.0	66.0
`percentage`	Double	Percentage of the charge allocated to this line.	Big, 66.0	66.0

Billing Batch Scheduler

Output representation of the details of a created invoice or payment scheduler.

JSON example

```
    "billingBatchScheduler": {
        "id": "5BSxx0000004TwGGAU"
    }
```

Property Name	Type	Description	Filter Group and Version	Available Version
id	String	ID of the invoice or payment scheduler.	Big, 62.0	62.0

Billing Schedule Recovery List

Output representation of the recovered details of the billing schedules and associated invoice.

JSON example

```
{
  "recoveryResults": [
    {
      "billingSchedules": [
        {
          "billingScheduleId": "44bDU00000000XX",
          "billingScheduleStatus": "ReadyForInvoicing"
        }
      ],
      "invoiceErrors": [],
      "invoiceId": null,
      "success": true
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
recovery Results	Invoice Recovery[]	Details of the recovered invoice and billing schedules.	Big, 62.0	62.0

Billing Schedule Recovery

Output representation of the details of the recovered billing schedules.

JSON example

```
    "billingSchedules": [
        {
          "billingScheduleId": "44bDU00000000XX",
          "billingScheduleStatus": "ReadyForInvoicing"
        }
    ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
billing ScheduleId	String	ID of the billing schedule.	Big, 62.0	62.0
billing Schedule Status	String	Flag that indicates the billing schedule status.	Big, 62.0	62.0

Context-Aware Billing Schedule

Output representation of the context-aware billing schedule.

JSON example

This request shows a sample success response.

```
{
    "errors": null,
    "requestIdentifier": "16Pxx0000004CaS",
   "statusURL": "/services/data/v67.0/sobjects/AsyncOperationTracker/16Pxx0000004CaSEAU",

    "success": true
}
```

This request shows a sample error response.

```
{
    "errors": [
        {
            "errorCode": "REQUIRED_FIELD_MISSING",
            "errorMessage": "Required fields are missing: billToContact",
            "referenceId": "802xx000001nmb5"
        }
    ],
    "requestIdentifier": "16Pxx0000004CYq",
   "statusURL": "/services/data/v67.0/sobjects/AsyncOperationTracker/16Pxx0000004CYqEAM",

    "success": false
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
errors	Context Aware Billing Schedule Error[]	Error response if the generation of the billing schedule fails.	Big, 62.0	62.0
request Identifier	String	Unique request identifier that you can use to poll the asynchronous request.	Big, 62.0	62.0
statusURL	String	Status URL to track the operation.	Big, 62.0	62.0

Property Name	Type	Description	Filter Group and Version	Available Version
`success`	Boolean	Indicates whether the processing of the billing schedule is successful (`true`) or not (`false`).	Big, 62.0	62.0

Context-Aware Billing Schedule Error

Output representation of the error response related to the generation of the billing schedule.

```
    "errors": [
        {
            "errorCode": "REQUIRED_FIELD_MISSING",
            "errorMessage": "Required fields are missing: billToContact",
            "referenceId": "802xx000001nmb5"
        }
    ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Code for the resultant error.	Big, 62.0	62.0
`errorMessage`	String	Error message for the resultant error.	Big, 62.0	62.0
`referenceId`	String	Reference ID of the source item that resulted in the error.	Big, 62.0	62.0

Convert Negative Invoice Lines

Output representation of the details of the created memo along with the status of the request.

JSON example

```
{
"id": "50gxx000000g0WwAAI",
"success": true,
"errors": []
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Error Response	List of errors encountered during the processing of the API request.	Big, 62.0	62.0
`id`	String	ID of the credit memo that's created after the conversion of the negative invoice lines.	Small, 62.0	62.0
`success`	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Small, 62.0	62.0

Credit Memo Apply

Output representation of the list of applied credit memo results.

JSON example

```
  "applyCreditResults" : [ {
    "appliedToId" : "3ttxx000000003FAAQ",
    "errors" : null,
    "id" : "4sFxx00000002ppEAA",
    "success" : true
  }, {
    "appliedToId" : "3ttxx0000000001AAA",
    "errors" : null,
    "id" : "4sFxx00000002pqEAA",
    "success" : true
  } ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
appliedToId	String	ID of the invoice record that the credit is applied to.	Big, 62.0	62.0
errors	Error Response	List of errors encountered during the processing of the API request.	Big, 62.0	62.0
id	String	ID of the credit memo invoice application.	Big, 62.0	62.0
success	Boolean	Indicates whether the credit memo is successfully applied (`true`) or not (`false`).	Big, 62.0	62.0

Credit Memo Apply List

Output representation of the list of applied credit memo results.

JSON example

```
{
  "applyCreditResults" : [ {
    "appliedToId" : "3ttxx000000003FAAQ",
    "errors" : null,
    "id" : "4sFxx00000002ppEAA",
    "success" : true
  }, {
    "appliedToId" : "3ttxx0000000001AAA",
    "errors" : null,
    "id" : "4sFxx00000002pqEAA",
    "success" : true
  } ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
applyCredit Results	Credit Memo Apply[]	Output list of the applied credit memo results.	Big, 62.0	62.0

Credit Memo Post

Output representation of the request to post a credit memo.

JSON example

This example shows a sample successful response.

```
{
  "errors": [],
  "requestIdentifier": "d3a9d9ce-2a83-4a08-bcf3-df0348a0008c",
 "statusURL": "/services/data/v67.0/sobjects/AsyncOperationTracker/16PDU000000A4oz2AC",

  "success": true
}
```

This example shows a sample error response.

```
{
  "errors": [
    {
      "errorCode": "BAD_REQUEST",
      "message": "You can post up to 1 credit memo at a time."
    }
  ],
  "requestIdentifier": "9065b043-dcc3-4dcf-b5a1-55fdf5a79f7b",
  "statusURL": "",
  "success": false
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
errors		List of errors encountered during the processing of the API request.	Big, 65.0	65.0
requestIdentifier	String	Unique request identifier for the request.	Big, 65.0	65.0
statusURL	String	Status URL for tracking this operation.	Big, 65.0	65.0
success	Boolean	Indicates whether the API request was successful (true) or not (false).	Big, 65.0	65.0

Credit Memo Unapply

Output representation of the details of the credit memo invoice application record with the status of the request.

JSON example

```
{
    "errors": [],
    "id": "4sFxx00000002ppEAA",
    "success": true
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
errors	Error Response	List of errors encountered during the processing of the API request.	Big, 62.0	62.0
id	String	ID of the credit memo invoice application record.	Small, 62.0	62.0
success	Boolean	Indicates whether the credit memo is successfully unapplied (true) or not (false).	Small, 62.0	62.0

Credit Memo Line Applied

Output representation of the list of applied credit memo line results.

JSON example

```
{
"appliedCreditResponses": [
 {
  "creditMemoLineInvoiceLineId": "4sGSG0000002pMb2AI",
  "errors": null,
  "invoiceLineId": "5TVSG0000003CuH4AU",
  "success": true
 }
]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
applied CreditResponses	Credit Memo Line Applied Response[]	Output list for the applied credit memo line results.	Big, 62.0	62.0

Credit Memo Line Applied Response

Output representation of the list of applied credit memo line results.

JSON example

```
"appliedCreditResponses": [
 {
  "creditMemoLineInvoiceLineId": "4sGSG0000002pMb2AI",
```

```
    "errors": null,
    "invoiceLineId": "5TVSG0000003CuH4AU",
    "success": true
  }
]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`creditMemoLineInvoiceLineId`	String	ID of the credit memo line invoice line ID.	Big, 62.0	62.0
`errors`	Error Response	List of errors encountered during the processing of the API request.	Big, 62.0	62.0
`invoiceLineId`	String	ID of the invoice line record that the credit is applied to.	Big, 62.0	62.0
`success`	Boolean	Indicates whether the credit memo line is successfully applied (`true`) or not (`false`).	Big, 62.0	62.0

Credit Memo Line Unapplied

Output representation of the details of the credit memo line invoice line record with the status of the request.

JSON example

```
 {
 "creditMemoLineInvoiceLineId": "4sGSG0000002pOD2AY",
 "errors": [],
 "success": true
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`creditMemoLineInvoiceLineId`	String	ID of the credit memo line invoice line record.	Small, 62.0	62.0
`errors`	Error Response	List of errors encountered during the processing of the API request.	Big, 62.0	62.0
`success`	Boolean	Indicates whether the credit memo line is successfully unapplied (`true`) or not (`false`).	Small, 62.0	62.0

Document Details

Output representation of the details of the generated document.

JSON example

```
{
  "details": {
    "documentEntityId": "1BBSM00000003KT4AY",
    "documentGenerationProcessId": "0nnSM00000009jFYAQ",
    "documentTitle": "DOC-000000197",
    "existingDocumentId": "069SM000002PYQLYA4",
    "recordId": "3ttSM0000000o58YAA",
    "documentTemplateId": "0694x000000XyzABC"
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
documentEntityId	String	Identifier of the related object record that manages the relationship between the source record and the generated document. For example, InvoiceDocument for Invoice records.	Big, 66.0	66.0
documentGenerationProcessId	String	Identifier of the document generation process record that's created to track this document generation request.	Big, 66.0	66.0
documentTemplateId	String	Identifier of the document template that’s used to generate the PDF.	Big, 66.0	66.0
documentTitle	String	Document title or name of the generated document.	Big, 66.0	66.0
existingDocumentId	String	Identifier of the existing content document if a document is already generated and is available to view.	Big, 66.0	66.0
recordId	String	Identifier of the source record the document is generated for.	Big, 66.0	66.0

Invoice Batch Draft To Posted

Output representation of the batch update details of the invoices from `Draft` to `Posted` status.

JSON example

```
{
  "invoiceBatchDraftToPostedId": "4sFDU00000000652AA",
  "success": true
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
invoiceBatchDraftToPostedId	String	ID of the invoice batch draft to posted run record that's created to track the batch process of posting the draft invoices that are associated with the parent invoice batch run record.	Small, 62.0	62.0
success	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Small, 62.0	62.0

Invoice Batch Run Recovery

Output representation of the details of the invoice batch run recovery record.

JSON example

```
{
  "invoiceBatchRunRecoveryId": ["0wBxx0000004TtwGAU"]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
invoiceBatchRunRecoveryId	String	ID of the invoice batch run recovery record for the specified invoice batch run. This record represents the background recovery process.	Small, 62.0	62.0

Invoice Ingestion

Output representation of the details of the generated invoices.

JSON example

```
{
  "invoices": [
    {
      "errors": null,
      "invoiceId": "3ttxx0000000GRNAA2",
      "requestIdentifier": "16e80fbc-e7b3-4462-9439-745647fcf0a8",
      "statusURL":
"/services/data/v63.0/sobjects/AsyncOperationTracker/16Pxx0000004Gz2EAE",
      "success": true
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
invoices	Invoice Ingestion []	Result that contains the details for each generated invoice.	Big, 63.0	63.0

Invoice Ingestion Details

Output representation of the details of a generated invoice.

JSON example

```
{
  "invoices": [
    {
      "errors": null,
      "invoiceId": "3ttxx0000000GRNAA2",
      "requestIdentifier": "16e80fbc-e7b3-4462-9439-745647fcf0a8",
      "statusURL":
"/services/data/v63.0/sobjects/AsyncOperationTracker/16Pxx0000004Gz2EAE",
      "success": true
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
errors	Invoice Ingestion Output Error[]	Details of the errors if the request was unsuccessful.	Small, 63.0	63.0
invoiceId	String	ID of the Invoice record that's created in Salesforce.	Small, 63.0	63.0
request Identifier	String	Unique request identifier that can be used to poll the async request.	Small, 63.0	63.0
statusURL	String	Status URL for tracking the estimated tax callout operation.	Big, 63.0	63.0
success	Boolean	Indicates whether the API request was successful (true) or not (false).	Small, 63.0	63.0

Invoice Ingestion Output Error

Output representation of the details of an invoice generation error.

Property Name	Type	Description	Filter Group and Version	Available Version
errorCode	String	Code that indicates the type of error.	Small, 63.0	63.0

Property Name	Type	Description	Filter Group and Version	Available Version
`message`	String	Message that states the reason for error, if any.	Small, 63.0	63.0
`referenceId`	String	Reference ID that maps to the subrequest's response and can be used to reference the response in later subrequests.	Small, 63.0	63.0

Invoice Line Preview

Output representation of the invoice line preview result.

JSON example

```
"invoiceLineDetailList": [
      {
        "billingFrequency": "OneTime",
        "chargeAmount": "1990.00",
        "endDate": "2024-07-18",
        "lineAmount": "2189.00",
        "productName": "Laptop",
        "quantity": "10.0",
        "startDate": "2024-07-18",
        "taxAmount": "199.0",
        "unitPrice": "199.0"
      }
    ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`billing Frequency`	String	The frequency at which the invoice line is created for the billing transaction.	Big, 63.0	63.0
`endDate`	String	The end date of the billing for the service for invoice lines made from a time-based service.	Big, 63.0	63.0
`lineAmount`	String	The amount of the invoice line.	Big, 63.0	63.0
`productName`	String	The name of the product that was charged or ordered to create the invoice line.	Big, 63.0	63.0
`quantity`	String	The number of units of the order product that created the invoice line.	Big, 63.0	63.0
`startDate`	String	The first date of the billing for the service for invoice lines made from a time-based service.	Big, 63.0	63.0
`taxAmount`	String	The tax amount for the invoice line.	Big, 63.0	63.0

Property Name	Type	Description	Filter Group and Version	Available Version
unitPrice	String	The price for one unit of the item on the invoice line.	Big, 63.0	63.0

Invoice Preview

Output representation of the invoice preview result.

JSON example

```
"invoiceDetailList": [
  {
    "accountId": "001Z6000005aQj8",
    "currencyIsoCode": "USD",
    "dueDate": "2025-01-03",
    "invoiceDate": "2024-12-04",
    "invoiceLineDetailList": [
      {
        "billingFrequency": "OneTime",
        "chargeAmount": "1990.00",
        "endDate": "2024-07-18",
        "lineAmount": "2189.00",
        "productName": "Laptop",
        "quantity": "10.0",
        "startDate": "2024-07-18",
        "taxAmount": "199.0",
        "unitPrice": "199.0"
      }
    ],
    "totalAmount": "1990.00",
    "totalAmountWithTax": "2189.00",
    "totalTaxAmount": "199.0"
  }
]
```

Property Name	Type	Description	Filter Group and Version	Available Version
accountId	String	The account ID of the billing transaction.	Big, 63.0	63.0
currencyCode	String	The currency code for the amount fields.	Big, 63.0	63.0
dueDate	String	The date by when the customer must pay an invoice that's generated for the billing transaction.	Big, 63.0	63.0
invoiceDate	String	The date when an invoice that's generated for the billing transaction is posted.	Big, 63.0	63.0
invoiceLines	Invoice Line Preview[]	The details of the invoice lines related to the invoices that are generated for the billing transaction.	Big, 63.0	63.0

Property Name	Type	Description	Filter Group and Version	Available Version
totalAmount	String	The sum of the total amount on the invoice lines of an invoice that's generated for the billing transaction.	Big, 63.0	63.0
totalAmount WithTax	String	The sum of the total amount including tax on the invoice lines of an invoice that's generated for the billing transaction.	Big, 63.0	63.0
totalTax Amount	String	The sum of the tax amount on the invoice lines of an invoice that's generated for the billing transaction.	Big, 63.0	63.0

Invoice Preview Result

Output representation of the list of preview invoices that are generated for the billing transaction.

JSON example

```
{
  "invoiceDetailList": [
    {
      "accountId": "001Z6000005aQj8",
      "currencyIsoCode": "USD",
      "dueDate": "2025-01-03",
      "invoiceDate": "2024-12-04",
      "invoiceLineDetailList": [
        {
          "billingFrequency": "OneTime",
          "chargeAmount": "1990.00",
          "endDate": "2024-07-18",
          "lineAmount": "2189.00",
          "productName": "Laptop",
          "quantity": "10.0",
          "startDate": "2024-07-18",
          "taxAmount": "199.0",
          "unitPrice": "199.0"
        }
      ],
      "totalAmount": "1990.00",
      "totalAmountWithTax": "2189.00",
      "totalTaxAmount": "199.0"
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
invoiceDetail List	Invoice Preview[]	Details of the invoices that are generated for the billing transaction.	Big, 63.0	63.0

Invoice Recovery

Output representation of the details of the recovered invoice and billing schedules.

JSON example

```
{
  "recoveryResults": [
    {
      "billingSchedules": [
        {
          "billingScheduleId": "44bDU00000000XX",
          "billingScheduleStatus": "ReadyForInvoicing"
        }
      ],
      "invoiceErrors": [],
      "invoiceId": null,
      "success": true
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`billing Schedules`	Billing Schedule Recovery[]	Billing schedules associated with this invoice.	Big, 62.0	62.0
`invoiceErrors`	Error Response	List of errors encountered during the invoice recovery.	Big, 62.0	62.0
`invoiceId`	String	ID of the recovered invoice.	Big, 62.0	62.0
`invoiceStatus`	String	Flag that indicates the invoice status.	Big, 62.0	62.0
`success`	Boolean	Indicates whether the overall transaction was successful or not (`true`) or not (`false`).	Big, 62.0	62.0

Line Item

Output representation of the details of the line item.

JSON example

```
{
  "lineItems": [
    {
      "addresses": {
        "shipFrom": {
          "locationCode": "67890"
        },
        "shipTo": {
          "locationCode": "12345"
        },
```

```
          "soldTo": {
            "locationCode": "12345"
          }
        },
        "amountDetails": {
          "exemptAmount": 0,

      }
    ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`addresses`	Addresses	Different types of addresses that are used for the transaction of the line item.	Big, 62.0	62.0
`amountDetails`	Tax Amount Details	Details of the transaction amount and the taxes applicable for the line item.	Big, 62.0	62.0
`effectiveDate`	String	Date when the tax rules are applied on the line item.	Big, 62.0	62.0
`lineNumber`	String	Unique identifier of the line item.	Big, 62.0	62.0

Property Name	Type	Description	Filter Group and Version	Available Version
productCode	String	Product code of the line item as defined by the tax engine.	Big, 62.0	62.0
quantity	Double	Quantity of the line item.	Big, 62.0	62.0
taxCode	String	Tax code of the line item according to the tax engine.	Big, 62.0	62.0
taxes	Tax Details []	Tax details of the line item.	Big, 62.0	62.0

On-Demand Document Generation Response

Output representation of the details of the generated document along with error response.

JSON example

```
{
  "requestIdentifier": "aad8ee2d-d94d-4760-8759-a2c5d63ce6db",
  "isSuccess": true,
  "details": {
    "documentEntityId": "1BBSM00000003KT4AY",
    "documentGenerationProcessId": "0nnSM00000009jFYAQ",
    "documentTitle": "DOC-000000197",
    "existingDocumentId": "069SM000002PYQLYA4",
    "recordId": "3ttSM0000000o58YAA",
    "documentTemplateId": "0694x000000XyzABC"
  },
  "errors": []
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
details	Document Details[]	Details of the generated document.	Big, 66.0	66.0
errors	Error Response[]	Error details of any issues encountered during the enqueue operation.	Big, 66.0	66.0
isSuccess	Boolean	Status of the enqueuing PDF generation task.	Big, 66.0	66.0
requestIdentifier	String	Unique request identifier that's used to poll the asynchronous request.	Big, 66.0	66.0

Payment Line Apply

Output representation of the details of the applied payment line. The details include the ID of the payment record and date when the payment line was applied.

JSON example

```
{
  "appliedDate": "2020-08-11T08:09:01.000Z",
  "id": "1PLR000000000dDOAQ"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
appliedDate	String	Date when the payment line was applied.	Big, 64.0	64.0
id	String	ID of the payment line record.	Big, 64.0	64.0

Payment Line Unapply

Output representation of the details of the reversed payment line application. The details include the ID of the payment line record and date when the payment line application was reversed.

JSON example

```
{
  "unappliedDate": "2020-08-11T08:09:01.000Z",
  "id": "1PLR000000000dDOAQ"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
id	String	ID of the payment line record.	Big, 64.0	64.0
unappliedDate	String	Date when the payment line application was reversed.	Big, 64.0	64.0

Payment Scheduler Update

Output representation of the details of the updated payment scheduler. This representation covers the updated status value of the specified payment scheduler.

JSON example

```
{
  "status": "Active"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
status	String	Updated status value of the specified payment scheduler. Valid values are: • Active	Big, 64.0	64.0

Property Name	Type	Description	Filter Group and Version	Available Version
		• `Canceled` • `Draft` • `Inactive`		

Posted Invoice List Write-Off

Output representation of the list of invoices that are written off.

JSON example

```
{
  "result": [
    {
      "requestIdentifier": null,
      "invoiceId": "3t00000000CwAGI",
      "success": false,
      "errors": {
        "errorcode": "INVALID_API_INPUT",
        "errorMessage": "Reason is missing."
      }
    },
    {
      "requestIdentifier": 37612787,
      "invoiceId": "3t00000000CwAAI",
      "success": true,
      "errors": {
        "errorcode": null,
        "errorMessage": null
      }
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`result`	Posted Invoice Write-Off []	Details of the invoices for which the write-off process is initiated.	Big, 64.0	64.0

Posted Invoice Write-Off

Output representation of the details of a posted invoice that's written off.

JSON example

```
{
  "result": [
    {
      "requestIdentifier": null,
```

```
      "invoiceId": "3t00000000CwAGI",
      "success": false,
      "errors": {
        "errorcode": "INVALID_API_INPUT",
        "errorMessage": "Reason is missing"
      }
    },
    {
      "requestIdentifier": 37612787,
      "invoiceId": "3t00000000CwAAI",
      "success": true,
      "errors": {
        "errorcode": null,
        "errorMessage": null
      }
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Posted Invoice Write-Off Error[]	If the request fails, this property contains a list of errors.	Small, 64.0	64.0
`invoiceId`	String	ID of the invoice record that's written off.	Big, 64.0	64.0
`request Identifier`	String	If the request is successful, this property contains an asynchronous API request identifier for an invoice ID.	Big, 64.0	64.0
`success`	Boolean	Indicates whether the invoice write-off request was successful (`true`) or not (`false`).	Big, 64.0	64.0

Posted Invoice Write-Off Error

Output representation of the error response that's associated with a request to write off a posted invoice.

JSON example

```
{
  "errors": {
    "errorcode": "INVALID_API_INPUT",
    "errorMessage": "Reason is missing"
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Code that represents the error.	Small, 64.0	64.0
`errorMessage`	String	Message that describes the error.	Small, 64.0	64.0

Reference Line Error

Output representation of the details of the line level errors.

JSON example

If the API request fails, the `referenceLineErrorResults` property contains a list of errors grouped by the invoice line IDs.

```
[
  {
    "referenceLineId": "5TV9A000007x2gz",
    "errors": [
      {
        "errorCode": "INVALID_INPUT",
        "message": "Invalid invoice line id"
      }
    ]
  }
]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Error Response	List of errors with error code and error message for the specified invoice line ID.	Big, 62.0	62.0
`reference LineId`	String	ID of the invoice line specified in the API request that has an issue, causing the API request to fail.	Small, 62.0	62.0

Refund Line Applied Response

Output representation of the details of an applied refund. This representation includes the properties of a refund line, such as the date when the refund is applied against a payment and ID of the refund line record.

JSON example

```
{
  "appliedDate": "2020-08-11T08:09:01.000Z",
  "id": "0dRR000000000CsMAI"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`appliedDate`	String	Date when the refund is applied against a payment.	Big, 64.0	64.0
`id`	String	ID of the refund line record.	Big, 64.0	64.0

Revenue Async Line Level

Output representation of the result of the API request for the async line level operations.

JSON example

```
{
"success": true,
"requestIdentifier": "237e9877-e79b-12d4-a765-321741963000",
"errors":[]
}
```

If the API request fails, the `referenceLineErrorResults` property contains a list of errors grouped by the invoice line IDs.

```
[
  {
    "referenceLineId": "5TV9A000007x2gz",
    "errors": [
      {
        "errorCode": "INVALID_INPUT",
        "message": "Invalid invoice line id"
      }
    ]
  }
]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Error Response	Details of errors, if any.	Big, 62.0	62.0
`referenceLineErrorResults`	Reference Line Error[]	List of errors grouped by the invoice line IDs if the API request fails.	Big, 62.0	62.0
`referenceLineType`	String	Reference type for the reference line entity in the `referenceLineErrorResults` property.	Big, 62.0	62.0
`requestIdentifier`	String	Unique identifier of the request.	Big, 62.0	62.0
`statusURL`	String	URL to track the status of the operation.	Big, 62.0	62.0
`success`	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Big, 62.0	62.0

Revenue Async Response

Output representation of the result of the API request with the request identifier.

JSON example

```
{
  "errors": null,
  "requestIdentifier": "ae6f23bc-f056-44b7-aa4d-c7f6fc5e0cf4",
```

```
    "success": true
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Error Response	Details of errors, if any.	Big, 62.0	62.0
`request Identifier`	String	Unique identifier of the request.	Big, 62.0	62.0
`success`	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Big, 62.0	62.0

Rules Application

Output representation of the details of rules application.

JSON example

This example shows the rules application response.

```
{
  "isSuccess": true,
  "rulesApplicationSummary": {
    "fetchedPaymentsCount": 250,
    "fetchedCreditMemosCount": 250,
    "totalPaymentApplications": 250,
    "totalCreditMemoApplications": 200,
    "areAllInvoicesConsidered": true
  },
  "appliedRules": [
    "Match ID",
    "Match Balance"
  ],
  "errors": []
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`isSuccess`	Boolean	Indicates whether the rules are applied (`true`) or not (`false`).	Big, 66.0	66.0
`rulesApplication Summary`	Rules Application Summary	Summary of the application rule. This includes the number of payments and credit memos for the account, the total number of payments and credit memos that are applied to invoices, and whether all invoices for an account are considered (`true`) or not (`false`).	Big, 66.0	66.0
`appliedRules`	String[]	Rules that were applied. Valid values are:	Big, 66.0	66.0

Property Name	Type	Description	Filter Group and Version	Available Version
		• `Match ID` • `Match Balance` • `Prioritize Highest Balance Invoices` • `Prioritize Oldest Invoices`		
`errors`	Rules Application Error[]	Details of the errors if the API request was unsuccessful.	Big, 66.0	66.0

Rules Application Error

Output representation of the error details for rules application failure.

JSON example

This example shows the rules application error.

```
{
  "errors": [
    {
      "errorCode": "INVALID_ACCOUNT",
      "message": "The specified account does not exist or is not accessible."
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Code that indicates the type of error.	Big, 66.0	66.0
`message`	String	Message that states the reason for error, if any.	Big, 66.0	66.0

Rules Application Summary

Output representation of the summary of the application rule. This includes the number of payments and credit memos for the account, the total number of payments and credit memos that's applied to invoices, and whether all invoices for an account are considered (true) or not (false).

JSON example

This example shows the rules application summary.

```
{
  "rulesApplicationSummary": {
    "fetchedPaymentsCount": 5,
    "fetchedCreditMemosCount": 2,
    "totalPaymentApplications": 3,
```

```
    "totalCreditMemoApplications": 1,
    "areAllInvoicesConsidered": true
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
fetched PaymentsCount	Integer	Total number of payments related to the account.	Big, 66.0	66.0
fetchedCredit MemosCount	Integer	Total number of credit memos or credit memo lines related to the account.	Big, 66.0	66.0
totalPayment Applications	Integer	Total number of payments that are applied to the invoices or invoice lines.	Big, 66.0	66.0
totalCredit Memo Applications	Integer	Total number of credit memos that are applied to the invoice or invoice lines.	Big, 66.0	66.0
areAll Invoices Considered	Boolean	Indicates whether all invoices are considered (`true`) or not (`false`).	Big, 66.0	66.0

Send Email Error

Output representation of the error response of the API request to send emails for posted invoices.

JSON example

This example shows a sample response with an error scenario.

```
{
  "errors": [
    {
      "errorCode": "INVALID_API_INPUT",
      "errorMessage": "Specify a valid invoiceBatchRunId."
    }
  ],
  "requestIdentifier": "5IRxx0000004CKKGA2",
  "success": false
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
errorCode	String	Unique code for the error.	Big, 65.0	65.0
errorMessage	String	Descriptive message for the error.	Big, 65.0	65.0

Send Email Response

Output representation of the API request to send emails for posted invoices.

JSON example

This example shows a sample response when the request is successful.

```
{
  "errors": [],
  "requestIdentifier": "5IRLT000001SIJB4A4",
  "success": true
}
```

This example shows a sample response with an error scenario.

```
{
  "errors": [
    {
      "errorCode": "INVALID_API_INPUT",
      "errorMessage": "Specify a valid invoiceBatchRunId."
    }
  ],
  "requestIdentifier": "5IRxx0000004CKKGA2",
  "success": false
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Send Email Error[]	List of errors that occurred while trying to enqueue the request. In case of errors while sending emails, you can check the Revenue Transaction Error Logs of the InvoiceBatchRun record and associated Invoice record. An error occurs for these scenarios. • The contact email or user isn't configured. • The configured email template isn't valid. • Email is sent through a contact email, and the contact doesn't have an associated user. In this scenario, the emails are counted against the general email limits. An error is thrown if you exceed the email limits.	Big, 65.0	65.0
`requestIdentifier`	String	Unique identifier for the request, which corresponds to the invoice batch run ID.	Big, 65.0	65.0

Property Name	Type	Description	Filter Group and Version	Available Version
`success`	Boolean	Indicates whether the request to start the email sending process was successfully enqueued (`true`) or not (`false`).	Big, 65.0	65.0

Sequence Error

Output representation of the error response that's associated with a request to create or update a sequence policy, or assign sequences.

JSON example

This example shows a sample error response.

```
{
  "error": {
    "errorCode": "INVALID_INPUT",
    "message": "Specify a valid selectionLogic."
  },
  "isSuccess": false,
  "sequencePolicyId": null
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Code for the resultant error.	Big, 65.0	65.0
`message`	String	Error message for the resultant error.	Big, 65.0	65.0

Sequence Gap Reconciliation Error

Output representation of the errors encountered during the processing of the API request.

JSON example

This example shows a sample error response.

```
{
  "jobId": "",
  "sequencePolicyIds": [
    "1vdxx0000000abc",
    "1vdxx0000000def"
  ],
  "targetObjects": [
    "Invoice"
  ],
  "status": "NotSubmitted",
  "submittedAt": "",
  "error": {
    "errorCode": "INVALID_INPUT",
    "message": "Specify a value for either sequencePolicyIds or targetObjects."
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
errorCode	String	Code for the resultant error.	Big, 65.0	65.0
errorMessage	String	Error message for the resultant error.	Big, 65.0	65.0

Sequence Gap Reconciliation

Output representation of the details of the sequence gap reconciliation.

JSON example

This example shows a sample successful response.

```
{
  "jobId": "0B1xx0000006P12",
  "sequencePolicyIds": [
    "1vdxx0000000uyr",
    "1vdxx0000000lrf"
  ],
  "targetObjects": [
    "Invoice"
  ],
  "status": "Submitted",
  "submittedAt": "2025-06-05T09:12:28Z",
  "error": {}
}
```

This example shows a sample error response for an invalid input.

```
{
  "jobId": "",
  "sequencePolicyIds": [
    "1vdxx0000000abc",
    "1vdxx0000000def"
  ],
  "targetObjects": [
    "Invoice"
  ],
  "status": "NotSubmitted",
  "submittedAt": "",
  "error": {
    "errorCode": "INVALID_INPUT",
    "message": "Missing required field in the request."
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
error	Sequence Gap Reconciliation Error[]	List of errors encountered during the processing of the API request.	Big, 65.0	65.0

Property Name	Type	Description	Filter Group and Version	Available Version
`jobId`	String	Unique identifier assigned to the sequence gap reconciliation asynchronous process.	Big, 65.0	65.0
`sequence PolicyIds`	String[]	List of IDs of the sequence policies.	Big, 65.0	65.0
`status`	String	Status of the sequence gap reconciliation API request. Valid values are: • `Submitted` • `NotSubmitted`	Big, 65.0	65.0
`submittedAt`	String	Date and time when the reconciliation request was submitted to the async job.	Big, 65.0	65.0
`targetObjects`	String[]	List of objects to which the policies are applied.	Big, 65.0	65.0

Sequence Policy

Output representation that shows the status of the assigned sequence pattern values.

JSON example

This example shows a sample successful response.

```
{
  "error": null,
  "isSuccess": true,
  "sequencePolicyId": "1Vdxx0000000GRNAA2"
}
```

This example shows a sample error response.

```
{
  "error": {
    "errorCode": "INVALID_INPUT",
    "message": "Specify a valid selectionLogic."
  },
  "isSuccess": false,
  "sequencePolicyId": null
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`error`	Sequence Error[]	Details of any error that encountered during the processing of the API request.	Big, 65.0	65.0
`isSuccess`	Boolean	Indicates whether the sequence policy is generated (`true`) or not (`false`).	Big, 65.0	65.0

Property Name	Type	Description	Filter Group and Version	Available Version
sequencePolicyId	String	ID of the sequence policy.	Big, 65.0	65.0

Sequences Assignment

Output representation with the status of the assigned sequence pattern values.

JSON example

This example shows a sample successful response.

```
{
  "errors": null,
  "sequencesAssignment": [
    {
      "errors": null,
      "isSuccess": true,
      "sequencePatternValue": "INV-1234-2025-04-12-001",
      "targetObjectId": "3ttxx000000085dAAA"
    }
  ],
  "status": "Success"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
errors	Sequence Error[]	Error encountered during the processing of the API request.	Big, 65.0	65.0
sequencesAssignment	Sequences Assignment Result[]	Details of the sequence pattern values assignment.	Big, 65.0	65.0
status	String	Status of the sequence policy assignment. Valid values are: • PartialSuccess • Success • Failed	Big, 65.0	65.0

Sequences Assignment Result

Output representation of the details of the assigned sequence values to target objects.

JSON example

This example shows a sample successful response.

```
{
  "errors": null,
  "sequencesAssignment": [
    {
```

```
      "errors": null,
      "isSuccess": true,
      "sequencePatternValue": "INV-1234-2025-04-12-001",
      "targetObjectId": "3ttxx000000085dAAA"
    }
  ],
  "status": "Success"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Sequence Error[]	Error encountered during the processing of the API request.	Big, 65.0	65.0
`isSuccess`	Boolean	Indicates whether the sequence pattern value is assigned (`true`) or not (`false`).	Big, 65.0	65.0
`sequencePatternValue`	String	Sequence pattern value assigned to the target object.	Big, 65.0	65.0
`sequencePolicyId`	String	ID of the sequence policy assigned to the target object.	Big, 65.0	65.0
`targetObjectId`	String	Record to which the sequence pattern value is assigned.	Big, 65.0	65.0

Statement of Account

Output representation of the details of the generated account statement with async tracking details.

JSON example

This example shows a sample successful response.

```
{
  "requestIdentifier": "a0Bxx000000001ZEAQ",
  "statusURL":
"/services/data/v60.0/commerce/billing/document-generation-process/a0Bxx000000001ZEAQ/status",

  "success": true,
  "accountId": "001xx000003DGb2AAG",
  "templateId": "0TRxx000000001XGAQ",
  "errors": null
}
```

This example shows a sample error response.

```
{
  "success": false,
  "errors": [
    {
      "code": "ACCOUNT_NOT_FOUND",
      "message": "Account with ID 001XX000004DKy5YAG not found",
      "field": "accountId"
```

```
        }
    ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`accountId`	String	Primary account ID the statement is generated for.	Big, 66.0	66.0
`errors`	Error Response[]	List of errors encountered during the processing of the API request.	Big, 66.0	66.0
`requestIdentifier`	String	Unique identifier for the request.	Big, 66.0	66.0
`statusURL`	String	Status URL to track the operation.	Big, 66.0	66.0
`success`	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Big, 66.0	66.0
`templateId`	String	Document template ID that's used to generate the PDF.	Big, 66.0	66.0

Suspend Resume Billing

Output representation of the list of accounts and billing schedule groups, which are suspended or resumed for billing operations.

JSON example

```
{
    "result":{
        {
            "referenceId": "001DU000001o2UwYAI",
            "success": true,
            "errorcode": null,
            "errorMessage":null
        },
        {
            "referenceId": "001DU000001o2UuYAI",
            "success": false,
            "errorcode": "INVALID_API_INPUT",
            "errorMessage":"Billing is already suspended for 9Wsxx000000006TCAQ."
        }
    }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`result`	Suspend Resume Billing Object[]	Details of the accounts or billing schedule groups that the suspend or resume billing request is initiated for.	Big, 63.0	63.0

Suspend Resume Billing Object

Output representation of the details of accounts and billing schedule groups, which are suspended or resumed for billing operations, along with the status of the API request.

JSON example

```
{
    "result":{
        {
        "referenceId": "1",
        "isSuccess": true,
        "errorcode": null,
        "errorMessage":null
        }
    }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Code indicating the type of error.	Big, 63.0	63.0
`errorMessage`	String	Message stating the reason for the error, if any.	Big, 63.0	63.0
`isSuccess`	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Big, 63.0	63.0
`referenceId`	String	ID of the account or billing schedule group that the suspend or resume billing request is initiated for.	Big, 63.0	63.0

Tax Amount Details

Output representation of the details of the tax amount.

JSON example

```
{
    "exemptAmount": 0.0,
    "taxAmount": 12.5,
    "totalAmount": 100.0,
    "totalAmountWithTax": 112.5
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`exemptAmount`	Double	Amount exempted from taxation.	Big, 62.0	62.0
`taxAmount`	Double	Tax amount applicable to the transaction.	Big, 62.0	62.0
`totalAmount`	Double	Total amount without tax.	Big, 62.0	62.0

Property Name	Type	Description	Filter Group and Version	Available Version
totalAmount WithTax	Double	Total amount with tax. The totalAmountWithTax property value is the sum of the taxAmount and totalAmount property values.	Big, 62.0	62.0

Tax Calculation

Output representation of the details of the calculated tax.

JSON example

```
{
    "referenceEntityId": "001xx000003HYEhAAO",
    "status": "Committed",
    "taxEngineLogs": [
        {

    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
adapterError	Error Response	Details of the adapter error.	Big, 62.0	62.0
addresses	Addresses	Addresses that are used for calculating tax.	Big, 62.0	62.0
amountDetails	Tax Amount Details	Details of the transaction amount and taxes.	Big, 62.0	62.0
currencyIsoCode	String	Currency ISO code that's used for tax calculation.	Big, 62.0	62.0

Property Name	Type	Description	Filter Group and Version	Available Version
description	String	Description of the transaction status.	Big, 62.0	62.0
documentCode	String	Unique identifier for the tax document. If the documentCode property isn't specified, the tax engine auto-generates it.	Big, 62.0	62.0
effectiveDate	String	Date when the tax rules are applied.	Big, 62.0	62.0
lineItems	Line Item []	Line items that the taxes are calculated for.	Big, 62.0	62.0
reference DocumentCode	String	Reference document code. For subsequent transactions such as a credit tax, the referenceDocumentCode property value refers to the original document code.	Big, 62.0	62.0
reference EntityId	String	ID of the related quote, invoice, or other transaction documents.	Big, 62.0	62.0
status	String	Commit status of the tax transaction. Valid values are: • Committed—Committed transaction, which is marked for tax reporting. • Uncommitted— Uncommitted transaction, which isn't marked for tax reporting.	Big, 62.0	62.0
taxEngineLogs	Tax Engine Log []	Records that the tax engine generates while calculating taxes for the transaction.	Big, 62.0	62.0
tax TransactionId	String	Unique ID for the tax transaction.	Big, 62.0	62.0
transactionDate	String	Date of the transaction that appears on the invoice, order, and other transaction documents.	Big, 62.0	62.0
taxTransaction Type	String	Tax transaction type. Valid values are: • Debit—Increases tax liability for the user, requiring the user to pay tax on the transaction. • Credit—Decreases tax liability for the user, resulting in a tax refund for the user. • Void—Specifies that the tax engine has voided the document that's mentioned as the referenceDocumentCode property value.	Big, 62.0	62.0

Property Name	Type	Description	Filter Group and Version	Available Version
taxType	String	Type of calculated tax. Valid values are: • Actual—Exact tax amount that's calculated based on the actual sales. • Estimated— Estimated tax amount, which is adjusted later to match the actual tax calculations.	Big, 62.0	62.0

Tax Details

Output representation of the tax details for each line item.

JSON example

```
{
  "taxes": [
    {
      "exemptAmount": 0,
      "exemptReason": "NoExemption",
      "imposition": {
        "type": "General"
      },
      "jurisdiction": {
        "country": "US",
        "id": "63000",
        "level": "CIT",
        "name": "SEATTLE",
        "region": "WA",
        "stateAssignedNo": "1726"
      },
      "rate": 12.5,
      "tax": 12.5,
      "taxId": "11000378132466",
      "taxableAmount": 100
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
exemptAmount	Double	Amount exempted from taxation for the line item.	Big, 62.0	62.0
exemptReason	String	Reason for the tax exemption.	Big, 62.0	62.0
imposition	Tax Imposition	Tax imposition details applicable to the line item.	Big, 62.0	62.0
jurisdiction	Tax Jurisdiction	Details of the tax jurisdiction.	Big, 62.0	62.0

Property Name	Type	Description	Filter Group and Version	Available Version
`rate`	Double	Tax rate applied to the taxable amount to calculate the tax.	Big, 62.0	62.0
`tax`	Double	Actual amount of tax that's applicable to the line item.	Big, 62.0	62.0
`taxId`	String	Unique identifier such as a code or a number that's assigned to a specific tax. This value helps users identify which type of tax is applied.	Big, 62.0	62.0
`taxableAmount`	Double	Total amount of the line item that's eligible for taxation.	Big, 62.0	62.0

Tax Engine Log

Output representation of the logs that the tax engine generates.

JSON example

```
{
  "taxEngineLogs": [
    {
      "createdDate": "2022-03-09T10:55:38.000Z",
      "id": "3l1xx00000000PpAAI",
      "resultCode": "Success"
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`createdDate`	String	Date when the tax engine creates the log.	Big, 62.0	62.0
`id`	String	ID of the tax engine log record.	Big, 62.0	62.0
`resultCode`	String	Result code associated with the created log.	Big, 62.0	62.0

Tax Imposition

Output representation of the details of the imposed tax.

JSON example

```
{
  "type": "Parish",
  "name": "Burbank"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
name	String	Name of the tax imposition.	Big, 62.0	62.0
type	String	Type of the tax imposition.	Big, 62.0	62.0

Tax Jurisdiction

Output representation of the details of the tax jurisdiction for the tax line.

JSON example

```
{
    "country": "US",
    "id": "63000",
    "level": "CIT",
    "name": "SEATTLE",
    "region": "WA",
    "stateAssignedNo": "1726"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
country	String	Country of the tax jurisdiction.	Big, 62.0	62.0
id	String	ID of the tax jurisdiction.	Big, 62.0	62.0
level	String	Level of the tax jurisdiction, for example, State and Federal.	Big, 62.0	62.0
name	String	Name of the tax jurisdiction authority.	Big, 62.0	62.0
region	String	Parent region of the tax jurisdiction.	Big, 62.0	62.0
stateAssignedNo	String	Number of the assigned state.	Big, 62.0	62.0

Void Posted Credit Memo

Output representation of the request to void a posted credit memo.

JSON example

This example shows a sample success response.

```
{
  "errors": null,
  "statusURL": "/services/data/v67.0/sobjects/AsyncOperationTracker/16Pxx0000004LdkEAE",

  "debitMemoId": "4Dmxx00000000XtAAK",
  "success": true
}
```

This example shows a sample error response.

```
{
  "errors": [
    {
      "errorCode": "INVALID_STATUS",
      "message": "CreditMemo 50gxx00000000XtAAI is not in the Posted status."
    }
  ],
  "debitMemoId": "",
  "success": false
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
debitMemoId	String	ID of the created debit memo.	Big, 66.0	66.0
errors	Error Response[]	List of errors specific to this API request that were encountered during voiding the credit memo.	Big, 66.0	66.0
isSuccess	Boolean	Indicates whether the API request was successful (true) or not (false).	Big, 66.0	66.0
statusURL	String	Status URL for tracking this operation.	Big, 66.0	66.0

Billing Apex Reference

Billing provides the ConnectApi namespace (also called Connect in Apex) that contains classes for accessing the same capabilities that are available in the Billing Business APIs. Additionally, you can use other built-in Apex classes and interfaces grouped by namespace.

This table lists the available Billing Apex methods with the associated Connect REST API.

Apex Method	Connect REST API
convertNegativeInvoiceLines(ConvertNegativeInvoiceLinesInput, invoiceId)	Negative Invoice Lines to Credit Conversion (POST)
generateInvoices(inputRequest)	Invoices By Using Billing Schedules (POST)
recoverBillingSchedules(inputRequest)	Billing Schedule Recovery List (POST)
creditInvoice(CreditInvoiceInput, invoiceId)	Credit Memo Create and Apply (POST)
applyCreditMemos(CreditMemoApplyInput, creditMemoId)	Credit Memo Apply List(POST)
unapplyCreditMemos(CreditMemoUnapplyInput, creditMemoInvApplicationId)	Credit Memo Unapply (POST)

Apex Method	Connect REST API
applyCreditMemoLines(CreditMemoLineApplyInput, creditMemoLineId)	Credit Memo Line Apply (POST)
unapplyCreditMemoLines(CreditMemoLineUnapplyInput, creditMemoLineInvoiceLineId)	Credit Memo Line Unapply (POST)
triggerInvoiceBatchDraftToPosted(invoiceBatchRunId)	Invoices Batch Draft to Posted Status (POST)
postDraftInvoices(inputRequest)	Invoice Draft to Posted Status (POST)
createCreditMemos(CreditMemoInputRequest)	Credit Memo Create and Apply (POST)
voidPostedInvoice(invoiceId)	Posted Invoice Voidance (POST)
calculateTax(calculateTax)	Tax Calculation (POST)
applyPaymentLine(PaymentLineApplyInput, paymentId)	Payment Line Apply (POST)
unapplyPaymentLine(PaymentLineUnapplyInput, paymentId, paymentLineId)	Payment Line Unapply (POST)
applyRefundLine(RefundLineApplyInput, refundId)	Refund Line Apply (POST)
reconcileSequences(sequenceGapReconciliationInputRepresentation)	Sequence Gap Reconciliation (POST)
sequenceAssignment(sequencesAssignmentInputRepresentation)	Sequence Assignment (POST)
voidPostedCreditMemo(VoidPostedCreditMemoInput, creditMemoId)	Void Posted Credit Memo (POST)

For more information about Apex classes that are available for Commerce Payments, see CommercePayments Namespace.

ConnectApi Namespace
The `ConnectApi` namespace (also called Connect in Apex) provides classes to manage credit applications and billing scenarios.

InvoiceWriteOff Namespace
Create credit memos with the total charge amount on the invoice as the write-off amount and close the invoice.

IssueCreditMemo Namespace
Issue credit memos from disputed invoices. Use this namespace to create and apply credit memos against invoices or invoice lines based on dispute adjustments.

RulesAppln Namespace
Apply payments and credits to posted invoices by adhering to the specified rules.

TaxEngineAdapter Interface
Retrieves and evaluates the details from a tax engine to define tax details.

`ConnectApi` Namespace

The `ConnectApi` namespace (also called Connect in Apex) provides classes to manage credit applications and billing scenarios.

These classes are available in the `ConnectApi` namespace.

BatchInvoiceApplication Class

Update a batch of invoices from Draft to Posted status for a credit memo application. by using the BatchInvoiceApplication class.

Billing Class

Manage billing scenarios by using the Billing class. You can convert negative invoice lines, create and apply a credit memo to an invoice, generate invoices, and recover billing schedules.

CreditMemoApply Class

Manage credit memo applications by using the CreditMemoApply class.

CreditMemoLineApply Class

Manage credit memo line applications by using the CreditMemoLineApply class.

HarmonizeBilling Class

Update the status of the invoice from Draft to Posted by using the HarmonizeBilling class.

PaymentsBilling Class

Use the PaymentsBilling class to allocate the balance of a payment to reduce the balance of an invoice. Additionally, revert the application of a payment line from an invoice.

SequencingWithoutAura Class

Manage invoice sequencing processes by using the SequencingWithoutAura class.

ConnectApi Input Classes

Billing includes these Apex input classes.

ConnectApi Output Classes

Billing includes these Apex output classes.

ConnectApi Enums

Enums specific to the `ConnectApi` namespace.

BatchInvoiceApplication Class

Update a batch of invoices from Draft to Posted status for a credit memo application. by using the BatchInvoiceApplication class.

Namespace

ConnectApi

BatchInvoiceApplication Methods

These methods are for `BatchInvoiceApplication`. All methods are static.

triggerInvoiceBatchDraftToPosted(invoiceBatchRunId)

Update a batch of invoices from Draft to Posted status for a credit memo application.

`triggerInvoiceBatchDraftToPosted(invoiceBatchRunId)`

Update a batch of invoices from Draft to Posted status for a credit memo application.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.InvoiceBatchDraftToPostedResult
triggerInvoiceBatchDraftToPosted(String invoiceBatchRunId)
```

Parameters

`invoiceBatchRunId`

Type: String

ID of the invoice batch run record that creates the draft invoices.

Return Value

Type: `ConnectApi.InvoiceBatchDraftToPostedResult` on page 2805

Usage

You need the Billing Operations User permission set to use this method.

This method posts the draft invoices and changes the status of the invoices from `Draft` to `Posted`.

Billing Class

Manage billing scenarios by using the Billing class. You can convert negative invoice lines, create and apply a credit memo to an invoice, generate invoices, and recover billing schedules.

Namespace

ConnectApi

Billing Methods

These methods are for `Billing`. All methods are static.

convertNegativeInvoiceLines(ConvertNegativeInvoiceLinesInput, invoiceId)

Convert a list of invoice lines with a negative amount into a posted credit memo. This conversion is applicable for a single invoice at a time.

createCreditMemos(CreditMemoInputRequest)
: Create a credit memo without applying it to an invoice. You can credit the invoice at a later date.

creditInvoice(CreditInvoiceInput, invoiceId)
: Create a credit memo and apply it to an invoice. The credit memo can fully or partially credit the invoice.

generateInvoices(inputRequest)
: Create an invoice from a billing schedule.

recoverBillingSchedules(inputRequest)
: Recover the latest generated invoice associated with the billing schedules in the Error or Processing status.

voidPostedCreditMemo(VoidPostedCreditMemoInput, creditMemoId)
: Invoke the Void Posted Credit Memo API by providing a credit memo ID.

voidPostedInvoice(invoiceId)
: Void a posted invoice to rebill the customer, if necessary.

convertNegativeInvoiceLines(ConvertNegativeInvoiceLinesInput, invoiceId)

Convert a list of invoice lines with a negative amount into a posted credit memo. This conversion is applicable for a single invoice at a time.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.ConvertNegativeInvoiceLinesResult
convertNegativeInvoiceLines(ConnectApi.ConvertNegativeInvoiceLinesInputRequest
ConvertNegativeInvoiceLinesInput, String invoiceId)
```

```
ConnectApi.Billing, convertNegativeInvoiceLines,
[ConnectApi.ConvertNegativeInvoiceLinesInputRequest, String],
ConnectApi.ConvertNegativeInvoiceLinesResult
```

Parameters

ConvertNegativeInvoiceLinesInput
: Type: ConnectApi.ConvertNegativeInvoiceLinesInputRequest on page 2791

  Input parameters to convert a negative invoice line to a credit.

invoiceId
: Type: String

  ID of the invoice whose negative invoice lines must be converted.

Return Value

Type: ConnectApi.ConvertNegativeInvoiceLinesResult on page 2805

Usage

You need the Credit Memo Operations User permission set to use this method.

Keep these considerations in mind when you use this method.

- All invoice lines must be related to the same invoice.
- The invoice line must have a negative amount.
- The invoice line must not be a previously converted credit memo.
- The invoice must have the `Posted` status.
- The invoice must not have any active settlements such as credit applications.

`createCreditMemos(CreditMemoInputRequest)`

Create a credit memo without applying it to an invoice. You can credit the invoice at a later date.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.RevenueAsyncRepresentation
createCreditMemos(ConnectApi.StandaloneCreditMemoInputRequest CreditMemoInputRequest)
```

Parameters

`CreditMemoInputRequest`
Type: `ConnectApi.StandaloneCreditMemoInputRequest` on page 2800

Input representation of the details required to create a standalone credit memo.

Return Value

Type: `ConnectApi.RevenueAsyncRepresentation` on page 2807

Usage

You need the Credit Memo Operations User permission set to use this method.

Specify the credit memo header information, charge parameters, adjustment parameters, and tax parameters. A credit memo requires at least one credit memo line. The credit memo line can be a charge or an adjustment.

Specify the credit memo lines that you want as lists of charges and adjustments. Each credit memo line must be related to a product.

`creditInvoice(CreditInvoiceInput, invoiceId)`

Create a credit memo and apply it to an invoice. The credit memo can fully or partially credit the invoice.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.RevenueAsyncLineLevelOutputResponse
creditInvoice(ConnectApi.CreditInvoiceInputRequest CreditInvoiceInput, String invoiceId)
```

```
ConnectApi.Billing, creditInvoice, [ConnectApi.CreditInvoiceInputRequest, String],
ConnectApi.RevenueAsyncLineLevelOutputResponse
```

Parameters

`CreditInvoiceInput`

Type: `ConnectApi.CreditInvoiceInputRequest` on page 2792

Input representation of the details of the request to create a credit memo.

`invoiceId`

Type: String

ID of the invoice to be credited partially or fully. The status of the invoice must be `Posted`.

Return Value

Type: `ConnectApi.RevenueAsyncLineLevelOutputResponse` on page 2807

Usage

Use this method to adjust an outstanding invoice balance or rectify errors in an invoice. Pass a list of invoice lines to credit. Keep these considerations in mind when you use this API.

- The request must contain at least one invoice line. Each invoice line must have the invoice line's ID, the amount to credit, and any optional tax details. The invoice lines must be a part of the invoice passed in the resource.
- The amount to credit must not exceed the charge or adjustment amount of an individual invoice line.
- The request body's credit amount inclusive of taxes must not exceed the target invoice line's amount inclusive of taxes, except for taxes calculated through an external tax service.
- The request body's total credit amount inclusive of taxes calculated through an external tax service must not exceed the outstanding invoice balance, which is also inclusive of taxes.

This method creates and posts a credit memo. The credit memo has one credit memo line for each invoice line passed in the API request. The invoice's balance is then reduced by a value equal to the credit memo's balance. This API modifies the balance of a posted invoice or invoice line based on the specified credit application level for your org. See Apply Credits to Posted Invoices or Invoice Lines.

`generateInvoices(inputRequest)`

Create an invoice from a billing schedule.

API Version

62.0

Requires Chatter

No

Signature

`public static ConnectApi.RevenueAsyncRepresentation generateInvoices(ConnectApi.InvoiceInputRepresentation inputRequest)`

```
ConnectApi.Billing, generateInvoices, [ConnectApi.InvoiceInputRepresentation],
ConnectApi.RevenueAsyncRepresentation
```

Parameters

inputRequest

Type: ConnectApi.InvoiceInputRepresentation on page 2797

Input representation of the details of the billing schedule.

Return Value

Type: ConnectApi.RevenueAsyncRepresentation on page 2807

Usage

You need the Generate Invoices From Billing Schedule API permission set to use this method.

This method creates one billing period item for each unbilled period between the billing schedule's next billing date and the invoice's target date. Additionally, one invoice line is created for each billing period item. This method creates up to six billing periods per request.

`recoverBillingSchedules(inputRequest)`

Recover the latest generated invoice associated with the billing schedules in the Error or Processing status.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.BillingScheduleRecoveryResults
recoverBillingSchedules(ConnectApi.BillingScheduleRecoveryInputRequest inputRequest)
```

```
ConnectApi.Billing, recoverBillingSchedules,
[ConnectApi.BillingScheduleRecoveryInputRequest], ConnectApi.BillingScheduleRecoveryResults
```

Parameters

inputRequest

Type: ConnectApi.BillingScheduleRecoveryInputRequest on page 2791

Input representation of the details of the billing schedules to recover the associated invoice.

Return Value

Type: ConnectApi.BillingScheduleRecoveryResults on page 2804

Usage

You need the Manage Errors Using Invoice Error Recovery API permission set to use this method.

Billing schedules include critical details such as the amount to be billed, next billing date, and status. An invoice can be associated with one or more billing schedules. When an invoice is generated or posted, the billing schedules are updated to reflect the accurate state of the invoice. The billing schedules associated with an invoice are marked in the `Error` status if any of the invoicing processes have errors. Use this method to recover the invoice associated with the billing schedules in the `Error` or `Processing` status.

voidPostedCreditMemo(VoidPostedCreditMemoInput, creditMemoId)

Invoke the Void Posted Credit Memo API by providing a credit memo ID.

API Version

66.0

Requires Chatter

No

Signature

```
public static ConnectApi.VoidPostedCreditMemoOutputRepresentation
voidPostedCreditMemo(ConnectApi.VoidPostedCreditMemoInputRepresentation
VoidPostedCreditMemoInput, String creditMemoId)
```

```
ConnectApi.Billing, voidPostedCreditMemo,
[ConnectApi.VoidPostedCreditMemoInputRepresentation, String],
ConnectApi.VoidPostedCreditMemoOutputRepresentation
```

Parameters

VoidPostedCreditMemoInput

Type: `ConnectApi.VoidPostedCreditMemoInputRepresentation`

Input representation of the details of a credit memo to be voided.

creditMemoId

Type: String

Required. ID of the credit memo record in posted status to be voided.

Return Value

Type: `ConnectApi.VoidPostedCreditMemoOutputRepresentation`

voidPostedInvoice(invoiceId)

Void a posted invoice to rebill the customer, if necessary.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.RevenueAsyncRepresentation voidPostedInvoice(String invoiceId)
```

Parameters

invoiceId

Type: String

ID of the posted invoice to be voided.

Return Value

Type: `ConnectApi.RevenueAsyncRepresentation` on page 2807

Usage

You need the Void a Posted Invoice API permission set to use this method.

This method changes the invoice status from `Posted` to `Void In Progress`. The invoice remains in the `Void In Progress` status until the credit is applied and financial fields are recalculated on the invoice's related billing period items and billing schedule. The invoice status changes to `Voided` after all recalculations are completed.

Keep these considerations in mind when you use this method.

- The balance and total amount on the invoice must be equal. If these amounts aren't equal due to payments or credits, the API request fails.

- You can't call other APIs on an invoice with the `Void In Progress` status. You also can't update the invoice fields.
- You can void only the most recently posted invoice on a billing schedule.
- To void an invoice that has payments or credits, use the Credit Memo Unapply (POST) API.

Credit Memos

The void process creates a credit memo, which contains one credit memo line for each invoice line, including tax lines. For example, if the invoice line has a balance of US$20, the related credit memo line has a balance of $20. The credit memo's balance is then allocated to the invoice header's balance, reducing it to zero. A credit memo invoice application is created to record the details of the void process.

Negative Invoice Lines

If an invoice has negative invoice lines that aren't converted to a credit memo, you can use this endpoint to void the posted invoice.

CreditMemoApply Class

Manage credit memo applications by using the CreditMemoApply class.

Namespace

ConnectApi

CreditMemoApply Methods

These methods are for `CreditMemoApply`. All methods are static.

applyCreditMemos(CreditMemoApplyInput, creditMemoId)
Adjust or correct already issued invoices by applying an existing credit memo to an invoice.

unapplyCreditMemos(CreditMemoUnapplyInput, creditMemoInvApplicationId)
Unapply a credit memo from an invoice and return the invoice and the credit memo to their pre-application states.

`applyCreditMemos(CreditMemoApplyInput, creditMemoId)`

Adjust or correct already issued invoices by applying an existing credit memo to an invoice.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.ApplyCreditResults
applyCreditMemos(ConnectApi.CreditMemoApplyInputRequest CreditMemoApplyInput, String
creditMemoId)
```

Parameters

CreditMemoApplyInput

Type: ConnectApi.CreditMemoApplyInputRequest on page 2795

Input representation of the request to apply a credit memo to an invoice.

creditMemoId

Type: String

ID of the credit memo record.

Return Value

Type: ConnectApi.ApplyCreditResults on page 2803

Usage

Specify the credit memo ID and the amounts to be applied, with the total of all applied amounts not exceeding the credit memo's balance.

The credit amount for each invoice can't surpass the original charge or adjustment amount, and the overall credit amount must not exceed the invoice's outstanding balance. The exceptions include any taxes calculated by an external service.

For example, your organization sold 10 tablets at US$500 each, totaling $5000, to a vendor who later reported that 6 tablets were defective. Using this method, your accounts receivable team creates a $3000 credit memo and applies this credit to the original invoice.

unapplyCreditMemos(CreditMemoUnapplyInput, creditMemoInvApplicationId)

Unapply a credit memo from an invoice and return the invoice and the credit memo to their pre-application states.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.UnapplyCreditResult
unapplyCreditMemos(ConnectApi.CreditMemoUnapplyInputRequest CreditMemoUnapplyInput,
String creditMemoInvApplicationId)
```

Parameters

CreditMemoUnapplyInput

Type: ConnectApi.CreditMemoUnapplyInputRequest on page 2796

Input representation of the request to unapply a credit memo from an invoice.

creditMemoInvApplicationId

Type: String

ID of the credit memo invoice application.

Return Value

Type: ConnectApi.UnapplyCreditResult on page 2809

Usage

Use this method if an error occurred when a credit is issued. For example, if an incorrect credit memo is applied to an invoice, or if a credit memo is created for an incorrect amount, use this method to unapply the credit memo.

CreditMemoLineApply Class

Manage credit memo line applications by using the CreditMemoLineApply class.

Namespace

ConnectApi

CreditMemoLineApply Methods

These methods are for `CreditMemoLineApply`. All methods are static.

applyCreditMemoLines(CreditMemoLineApplyInput, creditMemoLineId)
: Adjust or correct already issued invoices by applying an existing credit memo line to an invoice line.

unapplyCreditMemoLines(CreditMemoLineUnapplyInput, creditMemoLineInvoiceLineId)
: Unapply a credit memo line from an invoice line and return the invoice line and the credit memo line to their pre-application states.

`applyCreditMemoLines(CreditMemoLineApplyInput, creditMemoLineId)`

Adjust or correct already issued invoices by applying an existing credit memo line to an invoice line.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.CreditMemoLineAppliedResponse
applyCreditMemoLines(ConnectApi.CreditMemoLineApplyInput CreditMemoLineApplyInput,
String creditMemoLineId)
```

Parameters

`CreditMemoLineApplyInput`
: Type: ConnectApi.CreditMemoLineApplyInput on page 2795

: Input representation of the details of the request to apply a credit memo line to an invoice line.

creditMemoLineId

Type: String

ID of the credit memo line record.

Return Value

Type: ConnectApi.CreditMemoLineAppliedResponse on page 2804

Usage

You need the Credit Memo Operations User permission set to use this method.

unapplyCreditMemoLines(CreditMemoLineUnapplyInput, creditMemoLineInvoiceLineId)

Unapply a credit memo line from an invoice line and return the invoice line and the credit memo line to their pre-application states.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.CreditMemoLineUnappliedResponse
unapplyCreditMemoLines(ConnectApi.CreditMemoLineUnapplyInput CreditMemoLineUnapplyInput,
String creditMemoLineInvoiceLineId)
```

Parameters

CreditMemoLineUnapplyInput

Type: ConnectApi.CreditMemoLineUnapplyInput on page 2796

Input representation of the details of the request to unapply a credit memo line from an invoice line.

creditMemoLineInvoiceLineId

Type: String

ID of the credit memo line invoice line record.

Return Value

Type: ConnectApi.CreditMemoLineUnappliedResponse on page 2804

Usage

You need the Credit Memo Operations User permission set to use this method.

HarmonizeBilling Class

Update the status of the invoice from Draft to Posted by using the HarmonizeBilling class.

Namespace

ConnectApi

HarmonizeBilling Methods

These methods are for `HarmonizeBilling`. All methods are static.

`postDraftInvoices(inputRequest)`

Update the status of the invoice from Draft to Posted.

API Version

62.0

Requires Chatter

No

Signature

```
public static ConnectApi.RevenueAsyncRepresentation
postDraftInvoices(ConnectApi.InvoiceDraftToPostedInputRequest inputRequest)
```

Parameters

inputRequest
Type: `ConnectApi.InvoiceDraftToPostedInputRequest` on page 2796

Input representation of the details of the draft invoice that's posted.

Return Value

Type: `ConnectApi.RevenueAsyncRepresentation` on page 2807

Usage

You need the Billing Operations User permission set to use this method.

This method calls an external tax engine to calculate taxes for the draft invoice, posts the invoice, and updates the related billing schedules and billing periods.

PaymentsBilling Class

Use the PaymentsBilling class to allocate the balance of a payment to reduce the balance of an invoice. Additionally, revert the application of a payment line from an invoice.

Namespace

ConnectApi

PaymentsBilling Methods

These methods are for `PaymentsBilling`. All methods are static.

`applyPaymentLine(PaymentLineApplyInput, paymentId)`

Allocate the balance of a payment to reduce the balance of an invoice. The response includes an ID of the payment line invoice that represents the payment balance allocated against the invoice.

API Version

64.0

Requires Chatter

No

Signature

```
public static ConnectApi.PaymentLineApplyResponse
applyPaymentLine(ConnectApi.PaymentLineApplyRequest PaymentLineApplyInput, String
paymentId)
```

Parameters

PaymentLineApplyInput
Type: `ConnectApi.PaymentLineApplyRequest` on page 2797

Input representation of the payment line details.

paymentId

Type: String

ID of the payment record.

Return Value

Type: `ConnectApi.PaymentLineApplyResponse` on page 2806

Usage

Use the Commerce Payments APIs to send your payment and refund details to external payment gateways for processing against a customer's bank. See Commerce Payments resources to check the APIs for payment gateways, payment captures, and payment authorizations.

applyRefundLine(RefundLineApplyInput, refundId)

Make a refund transaction against a payment.

API Version

64.0

Requires Chatter

No

Signature

```
public static ConnectApi.RefundLineApplyResponse
applyRefundLine(ConnectApi.RefundLineApplyRequest RefundLineApplyInput, String refundId)
```

Parameters

RefundLineApplyInput

Type: `ConnectApi.RefundLineApplyRequest` on page 2798

Input representation of the details of a transaction refund request. This representation outlines the properties of a refund, including the refund amount and ID of the payment or credit memo record that the refund is applied to.

refundId

Type: String

ID of the refund record.

Return Value

Type: `ConnectApi.RefundLineApplyResponse` on page 2806

`unapplyPaymentLine(PaymentLineUnapplyInput, paymentId, paymentLineId)`

Revert the application of a payment line from an invoice, and return the payment and invoices to their pre-application state. Use this method if you need to correct an input during the payment application process.

API Version

64.0

Requires Chatter

No

Signature

```
public static ConnectApi.PaymentLineUnapplyResponse
unapplyPaymentLine(ConnectApi.PaymentLineUnapplyRequest PaymentLineUnapplyInput, String
paymentId, String paymentLineId)
```

Parameters

`PaymentLineUnapplyInput`
: Type: `ConnectApi.PaymentLineUnapplyRequest` on page 2798

  Input representation of the payment line details.

`paymentId`
: Type: String

  ID of the payment record.

`paymentLineId`
: Type: String

  ID of the payment line record.

Return Value

Type: `ConnectApi.PaymentLineUnapplyResponse` on page 2806

Usage

Use the Commerce Payments APIs to send your payment and refund details to external payment gateways for processing against a customer's bank. See Commerce Payments resources to check the APIs for payment gateways, payment captures, and payment authorizations.

`unapplyPaymentLine(PaymentLineUnapplyInput, paymentLineId)`

Revert the application of a payment line from an invoice, and return the payment and invoices to their pre-application state. Use this method if you need to correct an input during the payment application process.

API Version

64.0

Requires Chatter

No

Signature

```
public static ConnectApi.PaymentLineUnapplyResponse
unapplyPaymentLine(ConnectApi.PaymentLineUnapplyRequest PaymentLineUnapplyInput, String
paymentLineId)
```

Parameters

PaymentLineUnapplyInput
: Type: `ConnectApi.PaymentLineUnapplyRequest` on page 2798

  Input representation of the payment line details.

paymentLineId
: Type: String

  ID of the payment line record.

Return Value

Type: `ConnectApi.PaymentLineUnapplyResponse` on page 2806

Usage

Use the Commerce Payments APIs to send your payment and refund details to external payment gateways for processing against a customer's bank. See Commerce Payments resources to check the APIs for payment gateways, payment captures, and payment authorizations.

SequencingWithoutAura Class

Manage invoice sequencing processes by using the SequencingWithoutAura class.

Namespace

ConnectApi

SequencingWithoutAura Methods

These methods are for `SequencingWithoutAura`. All methods are static.

reconcileSequences(sequenceGapReconciliationInputRepresentation)
: Restore a missing sequence value identified by using this API in gapless-enabled sequences. This sequence value can be used later in the subsequent sequence policy numbering, ensuring there are no gaps.

sequenceAssignment(sequencesAssignmentInputRepresentation)
: Assign sequence pattern values to objects based on the configured sequence policy.

`reconcileSequences(sequenceGapReconciliationInputRepresentation)`

Restore a missing sequence value identified by using this API in gapless-enabled sequences. This sequence value can be used later in the subsequent sequence policy numbering, ensuring there are no gaps.

API Version

65.0

Requires Chatter

No

Signature

```
public static ConnectApi.sequenceGapReconciliationOutputRepresentation
reconcileSequences(ConnectApi.sequenceGapReconciliationInputRepresentation
sequenceGapReconciliationInputRepresentation)
```

Parameters

`sequenceGapReconciliationInputRepresentation`

Type: `ConnectApi.SequenceGapReconciliationInputRepresentation` on page 2798

The details of the input used to identify and reconcile gaps in sequence values based on the sequence policy or target object.

Return Value

Type: `ConnectApi.SequenceGapReconciliationOutputRepresentation` on page 2808

Usage

You need the Billing Admin permission set to use this method.

`sequenceAssignment(sequencesAssignmentInputRepresentation)`

Assign sequence pattern values to objects based on the configured sequence policy.

API Version

65.0

Requires Chatter

No

Signature

```
public static ConnectApi.SequencesAssignmentOutputRepresentation
sequenceAssignment(ConnectApi.SequencesAssignmentInputRepresentation
sequencesAssignmentInputRepresentation)
```

Parameters

sequencesAssignmentInputRepresentation

Type: `ConnectApi.SequencesAssignmentInputRepresentation` on page 2799

The details of the target objects to which the sequence pattern values are assigned.

Return Value

Type: `ConnectApi.SequencesAssignmentOutputRepresentation` on page 2808

Usage

You need the Billing Admin permission set to use this method.

ConnectApi Input Classes

Billing includes these Apex input classes.

ConnectApi.ApplicationsRequest
Connect API representation of an application item input request for credit memo apply api

ConnectApi.BillingAddressRequest
Input representation of the details of an address.

ConnectApi.BillingScheduleRecoveryInputRepresentation
Input representation of the details of the billing schedules to recover the associated invoice.

ConnectApi.ConvertNegativeInvoiceLinesInputRequest
Input representation of the request details to convert a negative invoice line into a credit.

ConnectApi.CreditDetailsApplyInput
Input representation of the request to specify one or more applications to apply a credit memo line for, with each application representing an invoice line.

ConnectApi.CreditInvoiceInputRequest
Input representation of the details of the request to create a credit memo.

ConnectApi.CreditInvoiceInvoiceLine
Input representation of the details of the invoice lines to be credited.

ConnectApi.CreditInvoiceInvoiceLineTax
Input representation of the details of the tax lines to be created manually for the invoice line.

ConnectApi.CreditMemoAddressesInputRequest
Input representation of the details of the billing and shipping addresses.

ConnectApi.CreditMemoApplyInputRequest
Input representation of the request to apply a credit memo to an invoice.

ConnectApi.CreditMemoLineApplyInput
Input representation of the details of the request to apply a credit memo line to an invoice line.

ConnectApi.CreditMemoLineUnapplyInput
Input representation of the details of the request to unapply a credit memo line from an invoice line.

ConnectApi.CreditMemoUnapplyInputRequest

Input representation of the request to unapply a credit memo from an invoice.

ConnectApi.InvoiceDraftToPostedInputRequest

Input representation of the details of the draft invoice that's posted.

ConnectApi.InvoiceInputRepresentation

Input representation of the details of the billing schedule.

ConnectApi.PaymentLineApplyRequest

Input representation of the payment line details. This representation covers details on allocation of a payment to a specific invoice line. It also provides additional context through optional fields, such as associated account and effective date.

ConnectApi.PaymentLineUnapplyRequest

Input representation of the payment line details. This representation covers fields that you can specify to revert a payment line application.

ConnectApi.RefundLineApplyRequest

Input representation of the details of a transaction refund request. This representation outlines the properties of a refund, including the refund amount and ID of the payment or credit memo record that the refund is applied to.

ConnectApi.SequenceGapReconciliationInputRepresentation

The details of the input used to identify and reconcile gaps in sequence values based on the sequence policy or target object.

ConnectApi.SequencesAssignmentInputRepresentation

The details of the target objects to which the sequence pattern values are assigned.

ConnectApi.StandaloneCreditMemoChargeInputRequest

Input representation of the details of the charge lines of a credit memo.

ConnectApi.StandaloneCreditMemoInputRequest

Input representation of the details required to create a standalone credit memo.

ConnectApi.StandaloneCreditMemoTaxInputRequest

Connect API representation of Tax input request

ConnectApi.VoidPostedCreditMemoInputRepresentation

Input representation of the details of a credit memo to be voided.

ConnectApi.ApplicationsRequest

Connect API representation of an application item input request for credit memo apply api

Property	Type	Description	Required or Optional	Available Version
`amount`	Double	Credit amount to be applied to the invoice.	Required	62.0
`appliedToId`	String	ID of the invoice record to apply the credit for.	Required	62.0
`description`	String	Explanation or reason for applying the credit memo.	Optional	62.0
`effectiveDate`	String	Effective date for the credit memo.	Optional	62.0

ConnectApi.BillingAddressRequest

Input representation of the details of an address.

Property	Type	Description	Required or Optional	Available Version
city	String	Address city.	Optional	62.0
country	String	Address country.	Optional	62.0
latitude	Double	Latitude for the address.	Optional	62.0
locationCode	String	Location code for the address.	Optional	62.0
longitude	Double	Longitude for the address.	Optional	62.0
postalCode	String	Postal code for the address.	Optional	62.0
state	String	Address state.	Optional	62.0
street	String	Address street.	Optional	62.0

ConnectApi.BillingScheduleRecoveryInputRepresentation

Input representation of the details of the billing schedules to recover the associated invoice.

Property	Type	Description	Required or Optional	Available Version
billing ScheduleIds	List<String>	IDs of the billing schedules to recover the invoice for. You can recover one billing schedule per API request.	Required	62.0

ConnectApi.ConvertNegativeInvoiceLinesInputRequest

Input representation of the request details to convert a negative invoice line into a credit.

Property	Type	Description	Required or Optional	Available Version
description	String	Description stamped on the credit memo that's created after the negative invoice line conversion.	Optional	62.0
effectiveDate	String	Date stamped on the credit memo that's created after the negative invoice line conversion.	Required	62.0

Property	Type	Description	Required or Optional	Available Version
`invoiceId`	String	ID of the invoice whose negative invoice lines must be converted into a posted credit memo.	Required	62.0
`invoiceLines`	List<String>	Complete list of the negative invoice lines along with the associated invoice line taxes. The specified negative invoice lines are converted into a posted credit memo.	Required	62.0

ConnectApi.CreditDetailsApplyInput

Input representation of the request to specify one or more applications to apply a credit memo line for, with each application representing an invoice line.

Property	Type	Description	Required or Optional	Available Version
`appliedAmount`	Double	Credit amount to be applied to the invoice line.	Required	62.0
`description`	String	Explanation or reason for applying the credit memo line.	Optional	62.0
`effectiveDate`	String	Effective date for the credit memo line.	Optional	62.0
`invoiceLineId`	String	ID of the invoice line record to apply the credit for.	Required	62.0

ConnectApi.CreditInvoiceInputRequest

Input representation of the details of the request to create a credit memo.

Property	Type	Description	Required or Optional	Available Version
`description`	String	Description for the credit memo to be created.	Optional	62.0
`effectiveDate`	String	Date when the credit memo takes effect.	Optional	62.0
`invoiceLines`	List<ConnectApi.CreditInvoiceLine>	List of the invoice lines to be credited. The invoice line IDs must be related to the invoice ID specified in the API request. If invoice lines aren't specified, the API request results in an error.	Required	62.0

Property	Type	Description	Required or Optional	Available Version
`taxEffectiveDate`	String	Date when the tax takes effect to recalculate the taxes.	Optional	62.0
`taxStrategy`	ConnectApi.TaxStrategyEnum	Tax strategy to be applied across invoice lines. You can override the tax strategy at the individual invoice line level or at the tax line level. Valid values are: • `Ignore`—Specifies that the creation of tax lines must be ignored. • `ManualOverride`—Specifies that the provided tax values must be considered for taxes. • `CopyFromInvoiceLine`—Specifies that tax values must be copied from the invoice line. • `Calculate`—Specifies that tax must be calculated by using the API.	Required	62.0
`type`	ConnectApi.CreditMemoTypeEnum	Type of credit memo to be created. Valid values are `Posted` and `Draft`. Specify `Draft` as a value in your request to create draft credit memos.	Optional	62.0

ConnectApi.CreditInvoiceInvoiceLine

Input representation of the details of the invoice lines to be credited.

Property	Type	Description	Required or Optional	Available Version
`addresses`	ConnectApi.CreditMemoAddressInputRequest	Addresses to be created manually for this invoice line and the overridden tax lines. These addresses are only applicable if this invoice line is using the `ManualOverride` tax strategy.	Optional	62.0
`amountToCredit`	Double	Amount to be credited from this invoice line.	Required	62.0
`invoiceLineId`	String	ID of the invoice line record to be credited. The invoice line ID must be related to the invoice ID specified in the API request.	Required	62.0

Property	Type	Description	Required or Optional	Available Version
`isTaxOnlyCredit`	Boolean	Indicates whether the applicable tax amount is credited for the charge or adjustment amount (`true`), or the applicable tax amount is credited along with the charge or adjustment amount (`false`). The default value is `false`.	Optional	62.0
`taxEffectiveDate`	String	Date when the tax takes effect and the invoice line is credited.	Optional	62.0
`taxStrategy`	ConnectApi.TaxStrategyEnum	Tax strategy for crediting the invoice line. This tax strategy takes precedence over the `taxStrategy` property value specified in the Credit Invoice Input. Valid values are: • `Ignore`—Specifies that the creation of tax lines must be ignored. • `ManualOverride`—Specifies that the provided tax values must be considered for taxes. • `CopyFromInvoiceLine`—Specifies that tax values must be copied from the invoice line. • `Calculate`—Specifies that tax must be calculated by using the API.	Optional	62.0
`taxes`	List<ConnectApi.CreditInvoiceInvoiceLineTax>	List of tax lines to be created manually for this invoice line.	Required if the `taxStrategy` property value is `ManualOverride`.	62.0

ConnectApi.CreditInvoiceInvoiceLineTax

Input representation of the details of the tax lines to be created manually for the invoice line.

Property	Type	Description	Required or Optional	Available Version
`taxAmount`	Double	Amount of tax to be applied related to this invoice line.	Required	62.0
`taxCode`	String	Tax code to be applied related to this invoice line to create the tax line.	Optional	62.0

Property	Type	Description	Required or Optional	Available Version
taxName	String	Name of tax to be applied related to this invoice line.	Optional	62.0
taxRate	Double	Tax rate used to create the tax line.	Optional	62.0

ConnectApi.CreditMemoAddressesInputRequest

Input representation of the details of the billing and shipping addresses.

Property	Type	Description	Required or Optional	Available Version
billingAddress	ConnectApi.BillingAddressRequest	Billing address for charge or adjustment line.	Optional	62.0
shippingAddress	ConnectApi.BillingAddressRequest	Shipping address for charge or adjustment line.	Optional	62.0

ConnectApi.CreditMemoApplyInputRequest

Input representation of the request to apply a credit memo to an invoice.

Property	Type	Description	Required or Optional	Available Version
applications	List<ConnectApi.ApplicationsRequest>	List of one or more applications to apply the credit memo for. Each application represents an invoice that's credited by using the balance of the specified credit memo.	Required	62.0
creditMemoId	String	ID of the credit memo record.	Required	62.0

ConnectApi.CreditMemoLineApplyInput

Input representation of the details of the request to apply a credit memo line to an invoice line.

Property	Type	Description	Required or Optional	Available Version
applyCreditDetails	List<ConnectApi.CreditDetailsApplyInput>	List of one or more applications to apply the credit memo line for. Each application represents an invoice line that's credited by using the balance of the specified credit memo line.	Required	62.0

Property	Type	Description	Required or Optional	Available Version
creditMemoLineId	String	ID of the credit memo line record.	Required	62.0

ConnectApi.CreditMemoLineUnapplyInput

Input representation of the details of the request to unapply a credit memo line from an invoice line.

Property	Type	Description	Required or Optional	Available Version
creditMemoLineInvoiceLineId	String	ID of the credit memo line invoice line record.	Required	62.0
description	String	Explanation or reason for unapplying the credit memo line.	Optional	62.0
effectiveDate	String	Effective date for the credit memo line.	Optional	62.0

ConnectApi.CreditMemoUnapplyInputRequest

Input representation of the request to unapply a credit memo from an invoice.

Property	Type	Description	Required or Optional	Available Version
creditMemoInvApplicationId	String	ID of the credit memo invoice application.	Required	62.0
description	String	Explanation or reason for unapplying the credit memo.	Optional	62.0
effectiveDate	String	Effective date for the credit memo.	Optional	62.0

ConnectApi.InvoiceDraftToPostedInputRequest

Input representation of the details of the draft invoice that's posted.

Property	Type	Description	Required or Optional	Available Version
correlationId	String	Splunk correlation ID to track the messages that are related to the request and are logged in Splunk by the different services involved in the request. If the ID isn't specified, the service creates a random Universally Unique Identifier (UUID).	Optional	62.0
invoiceIds	List<String>	IDs of the invoice records in Draft status to be posted. You can post one draft invoice per API request.	Required	62.0

ConnectApi.InvoiceInputRepresentation

Input representation of the details of the billing schedule.

Property	Type	Description	Required or Optional	Available Version
action	ConnectApi.InvoiceAction	Type of invoice to be created. Valid values are: • Draft • Posted	Required	62.0
billing ScheduleIds	List<String>	List of billing schedule IDs that's used to create the invoices. You can specify a maximum of 200 billing schedules.	Required	62.0
correlationId	String	Property that's tagged against the published InvoiceProcessedEvent event, if specified.	Optional	62.0
invoiceDate	String	Stamping date of the invoice in ISO 8601 format.	Required	62.0
targetDate	String	Date in ISO 8601 format used to decide the billing periods that are included to create invoices.	Required	62.0

ConnectApi.PaymentLineApplyRequest

Input representation of the payment line details. This representation covers details on allocation of a payment to a specific invoice line. It also provides additional context through optional fields, such as associated account and effective date.

Property	Type	Description	Required or Optional	Available Version
amount	Double	Amount that's applied. The amount must be less than the invoice line and payment balance.	Required	64.0
appliedToId	String	ID of the invoice line that this payment is applied to. Specify the IDs for these records. • Invoice • Invoice Line	Required	64.0
associated AccountId	String	ID of the associated account.	Optional	64.0
comments	String	Comments that you can add to the payment line application.	Optional	64.0

Property	Type	Description	Required or Optional	Available Version
`effectiveDate`	Datetime	Date from which the payment line application takes effect.	Optional	64.0

ConnectApi.PaymentLineUnapplyRequest

Input representation of the payment line details. This representation covers fields that you can specify to revert a payment line application.

Property	Type	Description	Required or Optional	Available Version
`comments`	String	Comments that you can add when you revert a payment line application.	Optional	64.0
`effectiveDate`	Datetime	Date from when the reversal of the payment line application is in effect.	Optional	64.0

ConnectApi.RefundLineApplyRequest

Input representation of the details of a transaction refund request. This representation outlines the properties of a refund, including the refund amount and ID of the payment or credit memo record that the refund is applied to.

Property	Type	Description	Required or Optional	Available Version
`amount`	Double	Amount to refund.	Required	64.0
`appliedToId`	String	ID of a payment or credit memo record. The refund is applied to this object.	Required	64.0
`comments`	String	Additional details of the refund request.	Optional	64.0
`effectiveDate`	Datetime	Date from when the refund is in effect.	Optional	64.0

ConnectApi.SequenceGapReconciliationInputRepresentation

The details of the input used to identify and reconcile gaps in sequence values based on the sequence policy or target object.

Property	Type	Description	Required or Optional	Available Version
`sequencePolicyIds`	List<`String`>	List of IDs of the sequence policies.	Required if the `targetObjects` property isn't	65.0

Property	Type	Description	Required or Optional	Available Version
			specified. You must not specify both properties.	
targetObjects	List<String>	List of objects to which the policies are applied.	Required if the sequencePolicyIds property isn't specified. You must not specify both properties.	65.0

ConnectApi.SequencesAssignmentInputRepresentation

The details of the target objects to which the sequence pattern values are assigned.

Property	Type	Description	Required or Optional	Available Version
sequencePolicyId	String	ID of the sequence policy.	Optional	65.0
shouldPublishPlatformEvent	Boolean	Indicates whether to publish a platform event when a sequence is assigned to a target record (true) or not (false).	Optional	65.0
targetObjectIds	List<String>	List of records to which the sequence pattern values are assigned.	Required	65.0

ConnectApi.StandaloneCreditMemoChargeInputRequest

Input representation of the details of the charge lines of a credit memo.

Property	Type	Description	Required or Optional	Available Version
addresses	Credit Memo Addresses Input	Details of the billing and shipping addresses.	Optional	62.0
chargeAmount	Double	Charge amount for the credit memo.	Required	62.0
description	String	Description of the created credit memo charge line.	Optional	62.0
endDate	String	End date of the credit memo charge line.	Optional	62.0
isTaxOnlyCredit	Boolean	Indicates whether the credit is for tax only (true) or not (false).	Optional	62.0
productId	String	ID of the product record that the credit memo is issued on.	Optional	62.0

Property	Type	Description	Required or Optional	Available Version
productName	String	Name of the product that the credit memo is issued on.	Optional	62.0
startDate	String	Start date of the credit memo charge line.	Optional	62.0
taxEffectiveDate	String	Date from when the tax is applicable.	Optional	62.0
taxes	List<ConnectApi.StandaloneCreditMemoTaxInputRequest>	List of credit memo tax lines.	Optional	62.0
taxStrategy	ConnectApi.StandaloneTaxStrategyEnum	Tax strategy to be applied to this credit memo charge line, child treatment lines, and tax lines. You can override the tax strategy at the individual credit memo lines or tax lines level. Valid values are: • Ignore—Specifies that the creation of tax lines must be ignored. • Manual Override—Specifies that the provided tax values must be considered for taxes. • Calculate—Specifies that tax must be calculated by using the API.	Optional	62.0
treatmentId	String	ID of the tax treatment record that's used to calculate tax.	Optional	62.0

ConnectApi.StandaloneCreditMemoInputRequest

Input representation of the details required to create a standalone credit memo.

Property	Type	Description	Required or Optional	Available Version
billToContactId	String	Contact related to the credit memo.	Optional	62.0
billingAccountId	String	ID of the account that the credit is issued to.	Required	62.0
charges	List<ConnectApi.StandaloneCreditMemoChargeInputRequest>	Charge lines of the credit memo. Requires at least one charge line.	Required	62.0
currencyIsoCode	String	ISO code currency of the new credit that's issued.	Optional	62.0
description	String	Description for the new credit that's issued.	Optional	62.0
effectiveDate	String	Effective date of the credit memo. If the value isn't specified, then it's null.	Optional	62.0

Property	Type	Description	Required or Optional	Available Version
externalReference	String	ID of the external reference for the credit memo.	Optional	62.0
externalReferenceDataSource	String	Source of the external reference for the credit memo.	Optional	62.0
taxEffectiveDate	String	Effective date of the credit memo tax. If the value isn't specified, then it's null.	Optional	62.0
taxStrategy	ConnectApi.StandaloneTaxStrategyEnum	Specifies how tax lines must be created for the standalone credit memos. Valid values are: • Ignore—Specifies that the creation of tax lines must be ignored. • Manual Override—Specifies that the provided tax values must be considered for taxes. • Calculate—Specifies that tax must be calculated by using the API.	Required	62.0
type	ConnectApi.CreditMemoTypeEnum	Type of credit memo to be created. Valid values are Posted and Draft. Specify Draft as a value in your request to create draft credit memos.	Optional	62.0

ConnectApi.StandaloneCreditMemoTaxInputRequest

Connect API representation of Tax input request

Property	Type	Description	Required or Optional	Available Version
taxAmount	Double	Amount of tax to be applied.	Required	62.0
taxCode	String	Tax code to be used to create the tax line.	Optional	62.0
taxName	String	Name of tax to be applied.	Optional	62.0
taxRate	Double	Tax rate to be used to create the tax line.	Optional	62.0

ConnectApi.VoidPostedCreditMemoInputRepresentation

Input representation of the details of a credit memo to be voided.

Property	Type	Description	Required or Optional	Available Version
`creditMemoId`	String	ID of the posted credit memo to be voided.	Required	66.0

ConnectApi Output Classes

Billing includes these Apex output classes.

ConnectApi.AppliedCreditResponse
Output representation of the list of applied credit memo line results.

ConnectApi.ApplyCreditResults
Output representation of the list of applied credit memo results.

ConnectApi.ApplyCreditResult
Connect API representation of credit memo apply output result

ConnectApi.BillingScheduleRecoveryResult
Output representation of the details of the recovered billing schedules.

ConnectApi.BillingScheduleRecoveryResults
Output representation of the recovered details of the billing schedules and associated invoice.

ConnectApi.CreditMemoLineAppliedResponse
Output representation of the list of applied credit memo line results.

ConnectApi.CreditMemoLineUnappliedResponse
Output representation of the details of the credit memo line invoice line record with the status of the request.

ConnectApi.ConvertNegativeInvoiceLinesResult
Output representation of the details of the credit memo along with the status of the request.

ConnectApi.InvoiceBatchDraftToPostedResult
Output representation of the batch update details of the invoices from `Draft` to `Posted` status.

ConnectApi.InvoiceRecoveryResult
Output representation of the details of the recovered invoice and billing schedules.

ConnectApi.PaymentLineApplyResponse
Output representation of the details of the applied payment line. The details include the ID of the payment record and date when the payment line was applied.

ConnectApi.PaymentLineUnapplyResponse
Output representation of the details of the reversed payment line application. The details include the ID of the payment line record and date when the payment line application was reversed.

ConnectApi.ReferenceLineError
Output representation of the details of the line level errors.

ConnectApi.RefundLineApplyResponse
Output representation of the details of an applied refund. This representation includes the properties of a refund line, such as the date when the refund is applied against a payment and ID of the refund line record.

ConnectApi.RevenueAsyncLineLevelOutputResponse

Output representation of the result of the API request for the async line level operations.

ConnectApi.RevenueAsyncRepresentation

Output representation of the result of the API request with the request identifier.

ConnectApi.SequenceErrorOutputRepresentation

Output representation of the error response that's associated with a request to create or update a sequence policy, or assign sequences.

ConnectApi.SequenceGapReconciliationOutputRepresentation

Output representation of the details of the sequence gap reconciliation.

ConnectApi.SequenceGapReconciliationErrorOutputRepresentation

List of errors encountered during the processing of the API request.

ConnectApi.SequencesAssignmentOutputRepresentation

Output representation showing the status of the assigned sequence pattern values.

ConnectApi.SequencesAssignmentResultOutputRepresentation

Output representation of the details of the assigned sequence values to target objects.

ConnectApi.UnapplyCreditResult

Output representation of the details of the credit memo invoice application record with the status of the request.

ConnectApi.VoidPostedCreditMemoOutputRepresentation

Output representation of the request to void a posted credit memo.

ConnectApi.AppliedCreditResponse

Output representation of the list of applied credit memo line results.

Property Name	Type	Description	Available Version
creditMemoLineInvoiceLineId	String	ID of the credit memo line invoice line ID.	62.0
errors	List<ConnectApi.ErrorResponse>	List of errors encountered during the processing of the API request.	62.0
invoiceLineId	String	ID of the invoice line record that the credit is applied to.	62.0
success	Boolean	Indicates whether the credit memo line is successfully applied (`true`) or not (`false`).	62.0

ConnectApi.ApplyCreditResults

Output representation of the list of applied credit memo results.

Property Name	Type	Description	Available Version
applyCreditResults	List<ConnectApi.ApplyCreditResult>	Output list of the applied credit memo results.	62.0

ConnectApi.ApplyCreditResult

Connect API representation of credit memo apply output result

Property Name	Type	Description	Available Version
appliedToId	String	ID of the invoice record that the credit is applied to.	62.0
errors	List<ConnectApi.ErrorResponse>	List of errors encountered during the processing of the API request.	62.0
id	String	ID of the credit memo invoice application.	62.0
success	Boolean	Indicates whether the credit memo is successfully applied (true) or not (false).	62.0

ConnectApi.BillingScheduleRecoveryResult

Output representation of the details of the recovered billing schedules.

Property Name	Type	Description	Available Version
billing ScheduleId	String	ID of the billing schedule.	62.0
billingSchedule Status	String	Flag that indicates the billing schedule status.	62.0

ConnectApi.BillingScheduleRecoveryResults

Output representation of the recovered details of the billing schedules and associated invoice.

Property Name	Type	Description	Available Version
recoveryResults	List<ConnectApi.InvoiceRecoveryResult>	Details of the recovered invoice and billing schedules.	62.0

ConnectApi.CreditMemoLineAppliedResponse

Output representation of the list of applied credit memo line results.

Property Name	Type	Description	Available Version
appliedCreditResponses	List<ConnectApi.AppliedCreditResponse>	Output list for the applied credit memo line results.	62.0

ConnectApi.CreditMemoLineUnappliedResponse

Output representation of the details of the credit memo line invoice line record with the status of the request.

Property Name	Type	Description	Available Version
creditMemoLineInvoiceLineId	String	ID of the credit memo line invoice line record.	62.0
errors	List<ConnectApi.ErrorResponse>	List of errors encountered during the processing of the API request.	62.0

Property Name	Type	Description	Available Version
`success`	Boolean	Indicates whether the credit memo line is successfully unapplied (`true`) or not (`false`).	62.0

ConnectApi.ConvertNegativeInvoiceLinesResult

Output representation of the details of the credit memo along with the status of the request.

Property Name	Type	Description	Available Version
`errors`	List<ConnectApi.ErrorResponse>	List of errors encountered during the processing of the API request.	62.0
`id`	String	ID of the credit memo that's created after the conversion of the negative invoice lines.	62.0
`success`	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	62.0

ConnectApi.InvoiceBatchDraftToPostedResult

Output representation of the batch update details of the invoices from `Draft` to `Posted` status.

Property Name	Type	Description	Available Version
`invoiceBatchDraftToPostedId`	String	ID of the invoice batch draft to posted run record that's created to track the batch process of posting the draft invoices that are associated with the parent invoice batch run record.	62.0
`success`	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	62.0

ConnectApi.InvoiceRecoveryResult

Output representation of the details of the recovered invoice and billing schedules.

Property Name	Type	Description	Available Version
`billingSchedules`	List<ConnectApi.BillingScheduleRecoveryResult>	Billing schedules associated with this invoice.	62.0
`invoiceErrors`	List<ConnectApi.ErrorResponse>	List of errors encountered during the invoice recovery.	62.0
`invoiceId`	String	ID of the recovered invoice.	62.0
`invoiceStatus`	String	Flag that indicates the invoice status.	62.0

Property Name	Type	Description	Available Version
`success`	Boolean	Indicates whether the overall transaction was successful or not (`true`) or not (`false`).	62.0

ConnectApi.PaymentLineApplyResponse

Output representation of the details of the applied payment line. The details include the ID of the payment record and date when the payment line was applied.

Property Name	Type	Description	Available Version
`appliedDate`	Datetime	Date when the payment line was applied.	64.0
`id`	String	ID of the payment line record.	64.0

ConnectApi.PaymentLineUnapplyResponse

Output representation of the details of the reversed payment line application. The details include the ID of the payment line record and date when the payment line application was reversed.

Property Name	Type	Description	Available Version
`id`	String	ID of the payment line record.	64.0
`unappliedDate`	Datetime	Date when the payment line application was reversed.	64.0

ConnectApi.ReferenceLineError

Output representation of the details of the line level errors.

Property Name	Type	Description	Available Version
`errors`	List<ConnectApi.ErrorResponse>	List of errors with error code and error message for the specified invoice line ID.	62.0
`referenceLineId`	String	ID of the invoice line specified in the API request that has an issue, causing the API request to fail.	62.0

ConnectApi.RefundLineApplyResponse

Output representation of the details of an applied refund. This representation includes the properties of a refund line, such as the date when the refund is applied against a payment and ID of the refund line record.

Property Name	Type	Description	Available Version
appliedDate	Datetime	Date when the refund is applied against a payment.	64.0
id	String	ID of the refund line record.	64.0

ConnectApi.RevenueAsyncLineLevelOutputResponse

Output representation of the result of the API request for the async line level operations.

Property Name	Type	Description	Available Version
errors	List<ConnectApi.ErrorResponse>	Details of errors, if any.	62.0
referenceLineErrorResults	List<ConnectApi.ReferenceLineError>	List of errors grouped by the invoice line IDs if the API request fails.	62.0
referenceLineType	String	Reference type for the reference line entity in the referenceLineErrorResults property.	62.0
requestIdentifier	String	Unique identifier of the request.	62.0
statusURL	String	URL to track the status of the operation.	62.0
success	Boolean	Indicates whether the API request is successful (true) or not (false).	62.0

ConnectApi.RevenueAsyncRepresentation

Output representation of the result of the API request with the request identifier.

Property Name	Type	Description	Available Version
errors	List<ConnectApi.ErrorResponse>	Details of errors, if any.	62.0
request Identifier	String	Unique identifier of the request.	62.0
success	Boolean	Indicates whether the API request is successful (true) or not (false).	62.0

ConnectApi.SequenceErrorOutputRepresentation

Output representation of the error response that's associated with a request to create or update a sequence policy, or assign sequences.

Property Name	Type	Description	Available Version
`errorCode`	String	Code for the resultant error.	65.0
`message`	String	Error message for the resultant error.	65.0

ConnectApi.SequenceGapReconciliationOutputRepresentation

Output representation of the details of the sequence gap reconciliation.

Property Name	Type	Description	Available Version
`error`	ConnectApi.SequenceGapReconciliationErrorOutputRepresentation	List of errors encountered during the processing of the API request.	65.0
`jobId`	String	Unique identifier assigned to sequence gap reconciliation asynchronous process.	65.0
`sequencePolicyIds`	List<String>	List of IDs of the sequence policies.	65.0
`status`	`StatusEnum`	The status of sequence reconciliation API request. Valid values are: • `Submitted` • `NotSubmitted`	65.0
`submittedAt`	String	Date and time when the reconciliation request was submitted to the async job.	65.0
`targetObjects`	List<String>	List of objects to which the policies are applied.	65.0

ConnectApi.SequenceGapReconciliationErrorOutputRepresentation

List of errors encountered during the processing of the API request.

Property Name	Type	Description	Available Version
`errorCode`	String	Code for the resultant error.	65.0
`errorMessage`	String	Error message for the resultant error.	65.0

ConnectApi.SequencesAssignmentOutputRepresentation

Output representation showing the status of the assigned sequence pattern values.

Property Name	Type	Description	Available Version
`errors`	List<ConnectApi.SequenceErrorOutputRepresentation>	Error encountered during the processing of the API request.	65.0
`sequencesAssignment`	List<ConnectApi.SequencesAssignmentResultOutputRepresentation>	Details of the sequence pattern values assignment.	65.0

Property Name	Type	Description	Available Version
`status`	SequenceResponseStatusEnum	Status of the sequence policy assignment. Valid values are: • `PartialSuccess` • `Success` • `Failed`	65.0

ConnectApi.SequencesAssignmentResultOutputRepresentation

Output representation of the details of the assigned sequence values to target objects.

Property Name	Type	Description	Available Version
`errors`	List<ConnectApi.SequenceErrorOutputRepresentation>	Error encountered during the processing of the API request.	65.0
`isSuccess`	Boolean	Indicates whether the sequence pattern value was assigned (`true`) or not (`false`).	65.0
`sequencePatternValue`	String	Sequence pattern value assigned to the target object.	65.0
`sequencePolicyId`	String	ID of the sequence policy assigned to the target object.	65.0
`targetObjectId`	String	Record to which the sequence pattern value is assigned.	65.0

ConnectApi.UnapplyCreditResult

Output representation of the details of the credit memo invoice application record with the status of the request.

Property Name	Type	Description	Available Version
`errors`	List<ConnectApiErrorResponse>	List of errors encountered during the processing of the API request.	62.0
`id`	String	ID of the credit memo invoice application record.	62.0
`success`	Boolean	Indicates whether the credit memo is successfully unapplied (`true`) or not (`false`).	62.0

ConnectApi.VoidPostedCreditMemoOutputRepresentation

Output representation of the request to void a posted credit memo.

Property Name	Type	Description	Available Version
`debitMemoId`	String	ID of the created debit memo.	66.0

Property Name	Type	Description	Available Version
errors	List<ConnectApi.ErrorResponse>	List of errors specific to this API request that were encountered during voiding the credit memo.	66.0
isSuccess	Boolean	Indicates whether the API request was successful (true) or not (false).	66.0
statusURL	String	Status URL for tracking this operation.	66.0

ConnectApi Enums

Enums specific to the ConnectApi namespace.

ConnectApi enums inherit all properties and methods of Apex enums.

Enums are not versioned. Enum values are returned in all API versions.

Enum	Description
ConnectApi.InvoiceAction	Type of invoice to be created. Valid values are: • Draft • Posted
ConnectApi.TaxStrategyEnum	Tax strategy to be applied across invoice lines. You can override the tax strategy at the individual invoice line level or at the tax line level. Valid values are: • Ignore—Specifies that the creation of tax lines must be ignored. • ManualOverride—Specifies that the provided tax values must be considered for taxes. • CopyFromInvoiceLine—Specifies that tax values must be copied from the invoice line. • Calculate—Specifies that tax must be calculated by using the API.
ConnectApi.CreditMemoTypeEnum	Type of credit memo to be created. Valid values are Posted and Draft. Specify Draft as a value in your request to create draft credit memos.
ConnectApi.StandaloneTaxStrategyEnum	Specifies how tax lines must be created for the standalone credit memos. Valid values are: • Ignore—Specifies that the creation of tax lines must be ignored. • Manual Override—Specifies that the provided tax values must be considered for taxes. • Calculate—Specifies that tax must be calculated by using the API.
ConnectApi.SequenceResponseStatusEnum	Status of the sequence policy assignment. Valid values are: • PartialSuccess • Success • Failed

Enum	Description
`ConnectApi.StatusEnum`	The status of sequence reconciliation API request. Valid values are: • `Submitted` • `NotSubmitted`

InvoiceWriteOff Namespace

Create credit memos with the total charge amount on the invoice as the write-off amount and close the invoice.

The `InvoiceWriteOff` namespace includes these classes.

Usage

You need the Billing Operations User or Credit Memo Operations User permission set to access this namespace.

WriteOffInvoiceInput Class

Contains invoice details that are used for the request to write off an invoice.

Namespace

InvoiceWriteOff on page 2811

WriteOffInvoiceInput Constructors

Learn more about the constructors available with the WriteOffInvoiceInput class.

The `WriteOffInvoiceInput` class includes these constructors.

WriteOffInvoiceInput(invoiceId, reasonCode, reason)
Initializes the WriteOffInvoiceInput class that stores the invoice details and reason for writing off invoices.

WriteOffInvoiceInput()
Initializes the WriteOffInvoiceInput class.

`WriteOffInvoiceInput(invoiceId, reasonCode, reason)`

Initializes the WriteOffInvoiceInput class that stores the invoice details and reason for writing off invoices.

Signature

`public WriteOffInvoiceInput(String invoiceId, String reasonCode, String reason)`

Parameters

`invoiceId`
Type: String

ID of the invoice record that you want to write off.

`reasonCode`
Type: String

Code that categorizes the write-off reason. For example, if the reason for the invoice write-off is a disputed amount, the reason code can be Disputed Amount (DA).

`reason`
Type: String

Reason for writing off invoices.

`WriteOffInvoiceInput()`

Initializes the WriteOffInvoiceInput class.

Signature

`public WriteOffInvoiceInput()`

WriteOffInvoiceInput Properties

Learn more about the properties available with the WriteOffInvoiceInput class.

The `WriteOffInvoiceInput` class includes these properties.

invoiceId
Sets the ID of the invoice record that must be written off.

reason
Sets the reason for writing off invoices.

reasonCode
Sets the code that categorizes the write-off reason.

`invoiceId`

Sets the ID of the invoice record that must be written off.

Signature

`public String invoiceId {get; set;}`

Property Value

Type: String

`reason`

Sets the reason for writing off invoices.

Signature

`public String reason {get; set;}`

Property Value

Type: String

`reasonCode`

Sets the code that categorizes the write-off reason.

Signature

`public String reasonCode {get; set;}`

Property Value

Type: String

WriteOffInvoiceInputList Class

Contains invoice details to write off a list of posted invoices.

Namespace

InvoiceWriteOff on page 2811

WriteOffInvoiceInputList Constructors
Learn more about the constructors available with the WriteOffInvoiceInputList class.

WriteOffInvoiceInputList Properties
Learn more about the properties available with the WriteOffInvoiceInputList class.

WriteOffInvoiceInputList Constructors

Learn more about the constructors available with the WriteOffInvoiceInputList class.

The `WriteOffInvoiceInputList` class includes these constructors.

WriteOffInvoiceInputList(writeOffInvoiceInputList)
Initializes the WriteOffInvoiceInputList class that stores the details of invoices that you want to write off.

WriteOffInvoiceInputList()
Initializes the WriteOffInvoiceInputList class.

WriteOffInvoiceInputList(writeOffInvoiceInputList)

Initializes the WriteOffInvoiceInputList class that stores the details of invoices that you want to write off.

Signature

```
public WriteOffInvoiceInputList(List<InvoiceWriteOff.WriteOffInvoiceInput>
writeOffInvoiceInputList)
```

Parameters

writeOffInvoiceInputList
Type: List<InvoiceWriteOff.WriteOffInvoiceInput on page 2811 >

Input representation of the request to write off a list of posted invoices.

WriteOffInvoiceInputList()

Initializes the WriteOffInvoiceInputList class.

Signature

```
public WriteOffInvoiceInputList()
```

WriteOffInvoiceInputList Properties

Learn more about the properties available with the WriteOffInvoiceInputList class.

The `WriteOffInvoiceInputList` class includes these properties.

writeOffInvoiceInputList
Input representation of the request to write off a list of posted invoices.

writeOffInvoiceInputList

Input representation of the request to write off a list of posted invoices.

Signature

```
public List<InvoiceWriteOff.WriteOffInvoiceInput> writeOffInvoiceInputList {get; set;}
```

Property Value

Type: List<nvoiceWriteOff.WriteOffInvoiceInput on page 2811>

WriteOffInvoiceResponse Class

Contains properties to store the response details to the request to write off a posted invoice.

Namespace

InvoiceWriteOff on page 2811

WriteOffInvoiceResponse Constructors
Learn more about the constructors available with the WriteOffInvoiceResponse class.

WriteOffInvoiceResponse Properties
Learn more about the properties available with the WriteOffInvoiceResponse class.

WriteOffInvoiceResponse Constructors

Learn more about the constructors available with the WriteOffInvoiceResponse class.

The `WriteOffInvoiceResponse` class includes these constructors.

WriteOffInvoiceResponse(errors, invoiceId, requestIdentifier, success)
Initializes the WriteOffInvoiceResponse class that stores the response details to the request to write off a posted invoice.

`WriteOffInvoiceResponse(errors, invoiceId, requestIdentifier, success)`

Initializes the WriteOffInvoiceResponse class that stores the response details to the request to write off a posted invoice.

Signature

```
public WriteOffInvoiceResponse(InvoiceWriteOff.WriteOffInvoiceResponseError errors,
String invoiceId, String requestIdentifier, Boolean success)
```

Parameters

errors
Type: InvoiceWriteOff.WriteOffInvoiceResponseError on page 2817

If the request fails, this property contains a list of errors.

invoiceId
Type: String

ID of the invoice record that's written off.

requestIdentifier
Type: String

If the request is successful, this property contains an asynchronous API request identifier for an invoice ID.

success

Type: Boolean

Indicates whether the invoice write-off request was successful (`true`) or not (`false`).

WriteOffInvoiceResponse Properties

Learn more about the properties available with the WriteOffInvoiceResponse class.

The `WriteOffInvoiceResponse` class includes these properties.

errors

Get the list of errors if the request to write off posted invoices fails.

invoiceId

Get the ID of the invoice record that's written off.

requestIdentifier

Get the identifier of the asynchronous API request for an invoice ID if the request is successful.

success

Get the request status of the invoice write-off request.

errors

Get the list of errors if the request to write off posted invoices fails.

Signature

```
public InvoiceWriteOff.WriteOffInvoiceResponseError errors {get; set;}
```

Property Value

Type: InvoiceWriteOff.WriteOffInvoiceResponseError on page 2817

invoiceId

Get the ID of the invoice record that's written off.

Signature

```
public String invoiceId {get; set;}
```

Property Value

Type: String

requestIdentifier

Get the identifier of the asynchronous API request for an invoice ID if the request is successful.

Signature

```
public String requestIdentifier {get; set;}
```

Property Value

Type: String

success

Get the request status of the invoice write-off request.

Signature

```
public Boolean success {get; set;}
```

Property Value

Type: Boolean

WriteOffInvoiceResponseError Class

Contains properties to store the error response that's associated with a request to write off a posted invoice.

Namespace

InvoiceWriteOff on page 2811

WriteOffInvoiceResponseError Constructors
Learn more about the constructors available with the WriteOffInvoiceResponseError class.

WriteOffInvoiceResponseError Properties
Learn more about the properties available with the WriteOffInvoiceResponseError class.

WriteOffInvoiceResponseError Constructors

Learn more about the constructors available with the WriteOffInvoiceResponseError class.

The `WriteOffInvoiceResponseError` class includes these constructors.

WriteOffInvoiceResponseError(errorCode, errorMessage)
Initializes the WriteOffInvoiceResponseError class that stores the error response that's associated with a request to write off a posted invoice.

WriteOffInvoiceResponseError(errorCode, errorMessage)

Initializes the WriteOffInvoiceResponseError class that stores the error response that's associated with a request to write off a posted invoice.

Signature

```
public WriteOffInvoiceResponseError(String errorCode, String errorMessage)
```

Parameters

errorCode
Type: String

Code that represents the error.

errorMessage
Type: String

Message that describes the error.

WriteOffInvoiceResponseError Properties

Learn more about the properties available with the WriteOffInvoiceResponseError class.

The `WriteOffInvoiceResponseError` class includes these properties.

errorCode
Get the error code details.

errorMessage
Get the error message details.

errorCode

Get the error code details.

Signature

```
public String errorCode {get; set;}
```

Property Value

Type: String

errorMessage

Get the error message details.

Signature

```
public String errorMessage {get; set;}
```

Property Value

Type: String

WriteOffInvoiceResponseList Class

Contains properties to store the response details of the list of invoices that are written off.

Namespace

InvoiceWriteOff on page 2811

WriteOffInvoiceResponseList Constructors

Learn more about the constructors available with the WriteOffInvoiceResponseList class.

WriteOffInvoiceResponseList Properties

Learn more about the properties available with the WriteOffInvoiceResponseList class.

WriteOffInvoiceResponseList Constructors

Learn more about the constructors available with the WriteOffInvoiceResponseList class.

The `WriteOffInvoiceResponseList` class includes these constructors.

WriteOffInvoiceResponseList(writeOffInvoiceResponseList)

Initializes the WriteOffInvoiceResponseList class that stores the response details of the list of invoices that are written off.

WriteOffInvoiceResponseList()

Initializes the WriteOffInvoiceResponseList class.

`WriteOffInvoiceResponseList(writeOffInvoiceResponseList)`

Initializes the WriteOffInvoiceResponseList class that stores the response details of the list of invoices that are written off.

Signature

```
public WriteOffInvoiceResponseList(List<InvoiceWriteOff.WriteOffInvoiceResponse>
writeOffInvoiceResponseList)
```

Parameters

`writeOffInvoiceResponseList`

Type: List<InvoiceWriteOff.WriteOffInvoiceResponse on page 2815>

Details of the invoices for which the write-off process is initiated.

`WriteOffInvoiceResponseList()`

Initializes the WriteOffInvoiceResponseList class.

Signature

```
public WriteOffInvoiceResponseList()
```

WriteOffInvoiceResponseList Properties

Learn more about the properties available with the WriteOffInvoiceResponseList class.

The `WriteOffInvoiceResponseList` class includes these properties.

writeOffInvoiceResponseList

Get the details of the invoices for which the write-off posted invoice process is initiated.

Signature

```
public List<InvoiceWriteOff.WriteOffInvoiceResponse> writeOffInvoiceResponseList {get;
set;}
```

Property Value

Type: List<InvoiceWriteOff.WriteOffInvoiceResponse on page 2815>

IssueCreditMemo Namespace

Issue credit memos from disputed invoices. Use this namespace to create and apply credit memos against invoices or invoice lines based on dispute adjustments.

You can access this namespace if Dispute Management is enabled in Billing.

The `IssueCreditMemo` namespace includes these classes.

CreditLineRequestInputRepresentations Class

Represents a single line-level credit request. Specifies the invoice line to credit, the amount to apply, and an optional description.

Namespace

IssueCreditMemo on page 2820

CreditLineRequestInputRepresentations Constructors

The `CreditLineRequestInputRepresentations` class includes these constructors.

[CreditLineRequestInputRepresentations(invoiceLineId, creditLineAmount, description)](#)
Creates a credit line request for the specified invoice line, amount, and description.

[CreditLineRequestInputRepresentations()](#)
Creates an empty credit line request.

`CreditLineRequestInputRepresentations(invoiceLineId, creditLineAmount, description)`

Creates a credit line request for the specified invoice line, amount, and description.

Signature

`public CreditLineRequestInputRepresentations(String invoiceLineId, Double creditLineAmount, String description)`

Parameters

`invoiceLineId`
Type: String

The ID of the invoice line to which the credit applies.

`creditLineAmount`
Type: Double

The monetary amount to credit for this invoice line.

`description`
Type: String

Optional description or reason for the credit line.

`CreditLineRequestInputRepresentations()`

Creates an empty credit line request.

Signature

`public CreditLineRequestInputRepresentations()`

CreditLineRequestInputRepresentations Properties

The `CreditLineRequestInputRepresentations` class includes these properties.

[creditLineAmount](#)
The monetary amount to credit for this invoice line.

[description](#)
Optional description or reason for the credit line.

invoiceLineId
The ID of the invoice line to which the credit applies.

creditLineAmount

The monetary amount to credit for this invoice line.

Signature

```
public Double creditLineAmount {get; set;}
```

Property Value

Type: Double

description

Optional description or reason for the credit line.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

invoiceLineId

The ID of the invoice line to which the credit applies.

Signature

```
public String invoiceLineId {get; set;}
```

Property Value

Type: String

CreditRequestInputRepresentations Class

Represents a credit request for an invoice. Contains invoice and dispute identifiers, total credit amount, category, and line-level credit details for issuing a credit memo.

Namespace

IssueCreditMemo on page 2820

CreditRequestInputRepresentations Constructors
CreditRequestInputRepresentations Properties

CreditRequestInputRepresentations Constructors

The `CreditRequestInputRepresentations` class includes these constructors.

CreditRequestInputRepresentations(invoiceId, creditAmount, description, disputeId, category, creditLineRequestInputRepresentations)
Creates a credit request with the given invoice, amount, description, dispute, category, and line-level credit details.

CreditRequestInputRepresentations(invoiceId, creditAmount, description, creditLineRequestInputRepresentations)
Creates a credit request with the given invoice, amount, description, and line-level credit details.

CreditRequestInputRepresentations()
Creates an empty credit request.

`CreditRequestInputRepresentations(invoiceId, creditAmount, description, disputeId, category, creditLineRequestInputRepresentations)`

Creates a credit request with the given invoice, amount, description, dispute, category, and line-level credit details.

Signature

```
public CreditRequestInputRepresentations(String invoiceId, Double creditAmount, String
description, String disputeId, String category,
List<IssueCreditMemo.CreditLineRequestInputRepresentations>
creditLineRequestInputRepresentations)
```

Parameters

invoiceId
Type: String

ID of the invoice to credit.

creditAmount
Type: Double

Total credit amount to apply to the invoice.

description
Type: String

Optional description for the credit request.

disputeId
Type: String

ID of the billing dispute associated with this credit request.

category
Type: String

Category of the credit memo.

creditLineRequestInputRepresentations
Type: List<IssueCreditMemo.CreditLineRequestInputRepresentations on page 2820 >

List of line-level credit requests for this invoice.

`CreditRequestInputRepresentations(invoiceId, creditAmount, description, creditLineRequestInputRepresentations)`

Creates a credit request with the given invoice, amount, description, and line-level credit details.

Signature

`public CreditRequestInputRepresentations(String invoiceId, Double creditAmount, String description, List<IssueCreditMemo.CreditLineRequestInputRepresentations> creditLineRequestInputRepresentations)`

Parameters

`invoiceId`
Type: String

ID of the invoice to credit.

`creditAmount`
Type: Double

Total credit amount to apply to the invoice.

`description`
Type: String

Optional description for the credit request.

`creditLineRequestInputRepresentations`
Type: List<IssueCreditMemo.CreditLineRequestInputRepresentations on page 2820 >

List of line-level credit requests for this invoice.

`CreditRequestInputRepresentations()`

Creates an empty credit request.

Signature

`public CreditRequestInputRepresentations()`

CreditRequestInputRepresentations Properties

The `CreditRequestInputRepresentations` class includes these properties.

category
The credit memo category.

creditAmount
The total credit amount to apply to the invoice.

creditLineRequestInputRepresentations
List of line-level credit requests for this invoice.

description
Optional description for the credit request.

disputeId
The ID of the billing dispute associated with this credit request.

invoiceId
The ID of the invoice to credit.

category

The credit memo category.

Signature

```
public String category {get; set;}
```

Property Value

Type: String

creditAmount

The total credit amount to apply to the invoice.

Signature

```
public Double creditAmount {get; set;}
```

Property Value

Type: Double

creditLineRequestInputRepresentations

List of line-level credit requests for this invoice.

Signature

```
public List<IssueCreditMemo.CreditLineRequestInputRepresentations>
creditLineRequestInputRepresentations {get; set;}
```

Property Value

Type: List<IssueCreditMemo.CreditLineRequestInputRepresentations on page 2820 >

description

Optional description for the credit request.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

disputeId

The ID of the billing dispute associated with this credit request.

Signature

```
public String disputeId {get; set;}
```

Property Value

Type: String

invoiceId

The ID of the invoice to credit.

Signature

```
public String invoiceId {get; set;}
```

Property Value

Type: String

CreditResponseOutputRepresentations Class

Represents the result of a credit memo operation. Indicates success or failure and any additional information or message.

Namespace

IssueCreditMemo on page 2820

Usage

Example

- CreditResponseOutputRepresentations Constructors
- CreditResponseOutputRepresentations Properties

CreditResponseOutputRepresentations Constructors

The `CreditResponseOutputRepresentations` class includes these constructors.

[CreditResponseOutputRepresentations(success, additionalInformation)](#)
Creates a response with the given success flag and additional information.

`CreditResponseOutputRepresentations(success, additionalInformation)`

Creates a response with the given success flag and additional information.

Signature

`public CreditResponseOutputRepresentations(Boolean success, String additionalInformation)`

Parameters

`success`
Type: Boolean

Indicates whether the credit memo is issued successfully (`true`) or not (`false`).

`additionalInformation`
Type: String

Additional information or message, such as error details or confirmation.

CreditResponseOutputRepresentations Properties

The `CreditResponseOutputRepresentations` class includes these properties.

[additionalInformation](#)
Additional information or message, such as error details or confirmation.

[success](#)
Indicates whether the credit memo is issued successfully (true) or not (false).

`additionalInformation`

Additional information or message, such as error details or confirmation.

Signature

`public String additionalInformation {get; set;}`

Property Value

Type: String

`success`

Indicates whether the credit memo is issued successfully (true) or not (false).

Signature

`public Boolean success {get; set;}`

Property Value

Type: Boolean

RulesAppln Namespace

Apply payments and credits to posted invoices by adhering to the specified rules.

The `RulesAppln` namespace includes these classes.

RulesApplicationErrorResponse Class

Contains properties to store error details that occurred during the rules application.

RulesApplicationResponse Class

Contains properties to store the response details for the rules application request.

RulesApplicationSummaryResponse Class

Contains properties to store the summary details of the rules application, including payment and credit memo counts and application statistics.

RulesApplicationErrorResponse Class

Contains properties to store error details that occurred during the rules application.

Namespace

RulesAppln on page 2828

RulesApplicationErrorResponse Constructors

Learn more about the constructors available with the RulesApplicationErrorResponse class.

RulesApplicationErrorResponse Properties

Learn more about the properties available with the RulesApplicationErrorResponse class.

RulesApplicationErrorResponse Constructors

Learn more about the constructors available with the RulesApplicationErrorResponse class.

The `RulesApplicationErrorResponse` class includes these constructors.

RulesApplicationErrorResponse(errorCode, message)

Initializes the RulesApplicationErrorResponse class that stores error details that occurred during the rules application.

RulesApplicationErrorResponse()

Initializes an empty instance of the RulesApplicationErrorResponse class.

`RulesApplicationErrorResponse(errorCode, message)`

Initializes the RulesApplicationErrorResponse class that stores error details that occurred during the rules application.

Signature

`public RulesApplicationErrorResponse(String errorCode, String message)`

```
RulesAppln.RulesApplicationErrorResponse, newinstance, [String, String],
RulesAppln.RulesApplicationErrorResponse
```

Parameters

errorCode
Type: String

Error code that identifies the type of error that occurred during the rules application.

message
Type: String

Error message that describes the error that occurred during the rules application.

RulesApplicationErrorResponse()

Initializes an empty instance of the RulesApplicationErrorResponse class.

Signature

`public RulesApplicationErrorResponse()`

```
RulesAppln.RulesApplicationErrorResponse, newinstance, [],
RulesAppln.RulesApplicationErrorResponse
```

RulesApplicationErrorResponse Properties

Learn more about the properties available with the RulesApplicationErrorResponse class.

The `RulesApplicationErrorResponse` class includes these properties.

errorCode
Get the error code that identifies the type of error that occurred during the rules application.

message
Get the error message that describes the error that occurred during the rules application.

errorCode

Get the error code that identifies the type of error that occurred during the rules application.

Signature

`public String errorCode {get; set;}`

```
RulesAppln.RulesApplicationErrorResponse, errorCode
```

Property Value

Type: String

message

Get the error message that describes the error that occurred during the rules application.

Signature

```
public String message {get; set;}
```

```
RulesAppln.RulesApplicationErrorResponse, message
```

Property Value

Type: String

RulesApplicationResponse Class

Contains properties to store the response details for the rules application request.

Namespace

RulesAppln on page 2828

RulesApplicationResponse Constructors

Learn more about the constructors available with the RulesApplicationResponse class.

The `RulesApplicationResponse` class includes these constructors.

RulesApplicationResponse(isSuccess, appliedRules, rulesApplicationSummary, errors)

Initializes the RulesApplicationResponse class that stores the response details for the rules application request.

Signature

`public RulesApplicationResponse(Boolean isSuccess, List<String> appliedRules, RulesAppln.RulesApplicationSummaryResponse rulesApplicationSummary, List<RulesAppln.RulesApplicationErrorResponse> errors)`

```
RulesAppln.RulesApplicationResponse, newinstance, [Boolean, List<String>,
RulesAppln.RulesApplicationSummaryResponse, List<RulesAppln.RulesApplicationErrorResponse>],
 RulesAppln.RulesApplicationResponse
```

Parameters

isSuccess
Type: Boolean

Indicates whether the rules are applied (`true`) or not (`false`).

appliedRules
Type: List<String>

Comma-delimited list of applied rules.

rulesApplicationSummary
Type: RulesAppln.RulesApplicationSummaryResponse on page 2833

Details of the rules application that includes these details.

- Payment and credit memo count for the account
- Payment and credit memo count that's applied to invoices or invoice lines
- Details of rules

errors
Type: List<RulesAppln.RulesApplicationErrorResponse on page 2828 >

List of error responses that occurred during the rules application.

RulesApplicationResponse()

Initializes an empty instance of the RulesApplicationResponse class.

Signature

`public RulesApplicationResponse()`

```
RulesAppln.RulesApplicationResponse, newinstance, [], RulesAppln.RulesApplicationResponse
```

RulesApplicationResponse Properties

Learn more about the properties available with the RulesApplicationResponse class.

The `RulesApplicationResponse` class includes these properties.

appliedRules
Get the comma-delimited list of rules that were applied.

[errors](#)

Get the list of error responses that occurred during the rules application.

[isSuccess](#)

Get the boolean value that indicates whether the rules were applied (true) or not (false).

[rulesApplicationSummary](#)

Get the details of the rules application that includes payment and credit memo count for the account, payment and credit memo count that's applied to invoices or invoice lines, and whether the exact amount rule is applied.

appliedRules

Get the comma-delimited list of rules that were applied.

Signature

`public List<String> appliedRules {get; set;}`

```
RulesAppln.RulesApplicationResponse, appliedRules
```

Property Value

Type: List<String>

errors

Get the list of error responses that occurred during the rules application.

Signature

`public List<RulesAppln.RulesApplicationErrorResponse> errors {get; set;}`

```
RulesAppln.RulesApplicationResponse, errors
```

Property Value

Type: List<RulesAppln.RulesApplicationErrorResponse on page 2828 >

isSuccess

Get the boolean value that indicates whether the rules were applied (true) or not (false).

Signature

`public Boolean isSuccess {get; set;}`

```
RulesAppln.RulesApplicationResponse, isSuccess
```

Property Value

Type: Boolean

`rulesApplicationSummary`

Get the details of the rules application that includes payment and credit memo count for the account, payment and credit memo count that's applied to invoices or invoice lines, and whether the exact amount rule is applied.

Signature

```
public RulesAppln.RulesApplicationSummaryResponse rulesApplicationSummary {get; set;}
```

```
RulesAppln.RulesApplicationResponse, rulesApplicationSummary
```

Property Value

Type: RulesAppln.RulesApplicationSummaryResponse on page 2833

RulesApplicationSummaryResponse Class

Contains properties to store the summary details of the rules application, including payment and credit memo counts and application statistics.

Namespace

RulesAppln on page 2828

RulesApplicationSummaryResponse Constructors

Learn more about the constructors available with the RulesApplicationSummaryResponse class.

The `RulesApplicationSummaryResponse` class includes these constructors.

`RulesApplicationSummaryResponse(fetchedPaymentsCount, fetchedCreditMemosCount, totalPaymentApplications, totalCreditMemoApplications, areAllInvoicesConsidered)`

Initializes the RulesApplicationSummaryResponse class that stores the summary details of the rules application.

Signature

`public RulesApplicationSummaryResponse(Integer fetchedPaymentsCount, Integer fetchedCreditMemosCount, Integer totalPaymentApplications, Integer totalCreditMemoApplications, Boolean areAllInvoicesConsidered)`

```
RulesAppln.RulesApplicationSummaryResponse, newinstance, [Integer, Integer, Integer,
Integer, Boolean], RulesAppln.RulesApplicationSummaryResponse
```

Parameters

fetchedPaymentsCount
    Type: Integer

    Number of payment records retrieved for an account.

fetchedCreditMemosCount
    Type: Integer

    Number of credit memo or credit memo line records retrieved for an account.

totalPaymentApplications
    Type: Integer

    Number of payments that are applied to invoices and invoice lines.

totalCreditMemoApplications
    Type: Integer

    Number of credit memos that are applied to the invoice or invoice lines.

areAllInvoicesConsidered
    Type: Boolean

    Indicates whether all invoices are considered (`true`) or not (`false`).

RulesApplicationSummaryResponse()

Initializes an empty instance of the RulesApplicationSummaryResponse class.

Signature

`public RulesApplicationSummaryResponse()`

```
RulesAppln.RulesApplicationSummaryResponse, newinstance, [],
RulesAppln.RulesApplicationSummaryResponse
```

RulesApplicationSummaryResponse Properties

Learn more about the properties available with the RulesApplicationSummaryResponse class.

The `RulesApplicationSummaryResponse` class includes these properties.

areAllInvoicesConsidered
    Indicates whether all invoices are considered (true) or not (false).

fetchedCreditMemosCount
    Get the number of credit memo or credit memo line records retrieved for an account.

fetchedPaymentsCount

Get the number of payment records retrieved for an account.

totalCreditMemoApplications

Get the number of credit memos that are applied to the invoice or invoice lines.

totalPaymentApplications

Get the number of payments that are applied to invoices and invoice lines.

areAllInvoicesConsidered

Indicates whether all invoices are considered (true) or not (false).

Signature

`public Boolean areAllInvoicesConsidered {get; set;}`

```
RulesAppln.RulesApplicationSummaryResponse, areAllInvoicesConsidered
```

Property Value

Type: Boolean

fetchedCreditMemosCount

Get the number of credit memo or credit memo line records retrieved for an account.

Signature

`public Integer fetchedCreditMemosCount {get; set;}`

```
RulesAppln.RulesApplicationSummaryResponse, fetchedCreditMemosCount
```

Property Value

Type: Integer

fetchedPaymentsCount

Get the number of payment records retrieved for an account.

Signature

`public Integer fetchedPaymentsCount {get; set;}`

```
RulesAppln.RulesApplicationSummaryResponse, fetchedPaymentsCount
```

Property Value

Type: Integer

`totalCreditMemoApplications`

Get the number of credit memos that are applied to the invoice or invoice lines.

Signature

`public Integer totalCreditMemoApplications {get; set;}`

```
RulesAppln.RulesApplicationSummaryResponse, totalCreditMemoApplications
```

Property Value

Type: Integer

`totalPaymentApplications`

Get the number of payments that are applied to invoices and invoice lines.

Signature

`public Integer totalPaymentApplications {get; set;}`

```
RulesAppln.RulesApplicationSummaryResponse, totalPaymentApplications
```

Property Value

Type: Integer

TaxEngineAdapter Interface

Retrieves and evaluates the details from a tax engine to define tax details.

You can extend the TaxEngineAdapter interface to define a custom tax adapter based on your requirements. Use the custom tax adapter with Billing services to implement standard tax.

Create a custom object and associated fields to store tax details, such as tax rate for a country. For example, create a custom object named CountryTaxRate with Country_Code and Tax_Rate fields. Create records to define the details for these fields.

TaxEngineAdapter Methods
Learn more about the available methods with the `TaxEngineAdapter` class.

TaxEngineAdapter Example Implementation
Refer to the example implementation of the `TaxEngineAdapter` interface to accept information from a tax engine and evaluate the information to define tax details.

Tax Mappings for Invoices and Credits

You can extend and customize the existing tax interface by using custom metadata types and tax mappings. These customizations help you with unique business requirements such as the inclusion of specific data for accurate calculations and audits.

Salesforce Help: Tax Calculation for Invoices

Billing Business APIs: Tax Calculation (POST)

Billing Standard Objects: TaxEngineProvider, TaxEngine, TaxPolicy, and TaxTreatment

Tax Engine Reference Gateway Adapter

TaxEngineAdapter Methods

Learn more about the available methods with the `TaxEngineAdapter` class.

The `TaxEngineAdapter` class includes these methods.

processRequest(requestType)

The `processRequest` method takes an instance of `TaxEngineContext` class and returns a response with the calculated tax details through the `TaxDetailsResponse` class or an error response through the `ErrorResponse` class.

`processRequest(requestType)`

The `processRequest` method takes an instance of `TaxEngineContext` class and returns a response with the calculated tax details through the `TaxDetailsResponse` class or an error response through the `ErrorResponse` class.

Signature

```
global commercetax.TaxEngineResponse processRequest(commercetax.TaxEngineContext var1)
```

Parameters

`var1`

Type: TaxEngineContext

Wrapper class that stores information about the type of a tax calculation request.

Return Value

Type: TaxEngineResponse

Generic interface representing a response from a tax engine.

TaxEngineAdapter Example Implementation

Refer to the example implementation of the `TaxEngineAdapter` interface to accept information from a tax engine and evaluate the information to define tax details.

Namespace

See commercetax namespace to view the list of available classes.

Usage

The `TaxEngineAdapter` interface accepts information from the tax engine through the `TaxEngineContext` class. The interface evaluates the information to define tax in the response with details, such as tax amount and addresses. The response is used to update and create entities in the Salesforce org.

Considerations

From Winter '26, the available state and country values from orgs that are configured with State and Country/Territory Picklists are also supported.

Example: Use these steps to build a sample tax adapter implementation. Each tax adapter implementation varies based on your implementation requirements. Customize this example to suit your business requirements.

See Tax Engine Reference Gateway Adapter for reference implementations of a tax engine adapter.

- Get the tax rates from the created custom object. See TaxEngineAdapter Interface on page 2836.
- The custom adapter class implements the `TaxEngineAdapter` interface. The `processRequest` method takes an instance of `TaxEngineContext` class and returns a response with the calculated tax details through the `TaxDetailsResponse` class or an error response through the `ErrorResponse` class.

```
global virtual class StandardTaxAdapter implements commercetax.TaxEngineAdapter {
    global commercetax.TaxEngineResponse processRequest(commercetax.TaxEngineContext
 taxEngineContext) {
        commercetax.RequestType requestType = taxEngineContext.getRequestType();

        // Map of tax field name to the value of the corresponding entity field
(EntityFieldName) at header level

- Select `StandardTaxAdapter` as the provider when you create a tax engine record in your org.

Tax Mappings for Invoices and Credits

You can extend and customize the existing tax interface by using custom metadata types and tax mappings. These customizations help you with unique business requirements such as the inclusion of specific data for accurate calculations and audits.

Here are some prerequisites before you work with the tax mappings for invoices and credits.

- See custom metadata types to specify all your tax mapping definitions.
- See details on extension of your tax contract with custom fields.
- Tax callout extensions are supported for the Invoice, Invoice Line, Invoice Line Tax, Credit Memo, Credit Memo Line, and Credit Memo Line Tax objects.

Request Mappings for Header Attributes

This table defines the request mappings between the header attributes of a tax callout and fields of applicable objects.

Header Attributes	Invoice Mapping	Negative Invoice Mapping	Credit Mapping
currencyIsoCode	Invoice.CurrencyISOCode	Invoice.CurrencyISOCode	CreditMemo.CurrencyISOCode
isCommit	If status is `DRAFT` then this value is `False`. If status is `POSTED`, then this value is `True`.	If status is `DRAFT` then this value is `False`. If status is POSTED, then this value is `True`.	This value is `True` until Summer '25. From Winter '26, if status is `DRAFT`, then this value is `False`. If status is `POSTED`, then this value is `True`.

Billing Metadata API Types

Metadata API enables you to access some types and feature settings that you can customize in the user interface.

BillingSettings
Represents the settings for Salesforce Billing.

Flow for Billing
Represents the metadata associated with a flow. With Flow, you can create an application that navigates users through a series of screens to query and update records in the database. You can also execute logic and provide branching capability based on user input to build dynamic applications.

PaymentsSharingSettings
Represents the settings to enable account-based sharing to view details related to Revenue Cloud Billing on the objects for Payments and Refunds.

SEE ALSO:

Metadata API Developer Guide: Understanding Metadata API

BillingSettings

Represents the settings for Salesforce Billing.

Parent Type and Manifest Access

This type extends the Metadata metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the “Settings” name. See Settings for more details.

File Suffix and Directory Location

The `BillingSettings` values are stored in the `BillingSettings.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there’s only one settings file for each settings component.

Version

BillingSettings components are available in API version 62.0 and later.

Special Access Rules

These settings are available when Billing is enabled.

Fields

Field Name	Description
acctRecGlAccount	**Field Type** string **Description** General ledger account to record the credit amount for unrealized or realized losses and the debit amount for unrealized or realized gains in transaction journals. Available in API version 64.0 and later.
billingContextDefinition	**Field Type** string **Description** Name of the context definition that the Create Billing Schedules for Orders API uses to understand your order data. Available in API version 64.0 and later.
billingContextSourceMapping	**Field Type** string **Description** Name of the context mapping that links Order fields to billing transaction context nodes. Available in API version 64.0 and later.
billingIntraCtxtSrcMapping	**Field Type** string **Description** Name of the custom context mapping that maps your custom or standard Order fields to billing transaction context nodes. Available in API version 64.0 and later.
defaultAPClosureDPEDefnName	**Field Type** string **Description** Org-wide default value to specify the Data Processing Engine (DPE) definition to close legal entity accounting periods. Available in API version 64.0 and later.
defaultApplyCreditMemoFlow	**Field Type** string

Field Name	Description
	Description Default flow that's used to apply the credit memo to invoices. Available in API version 64.0 and later.
`defaultBillingTreatment`	**Field Type** string **Description** Org-wide default value to specify the name of the billing treatment. Available in API version 64.0 and later.
`defaultEmailTemplate`	**Field Type** string **Description** Default email template to send the generated invoice PDFs. Available in API version 64.0 and later.
`defaultInvPreviewTemplate`	**Field Type** string **Description** Default template to generate PDFs of invoice previews. Available in API version 64.0 and later.
`defaultInvoiceDocTemplate`	**Field Type** string **Description** Default template to generate PDFs of invoices. Available in API version 64.0 and later.
`defaultLegalEntity`	**Field Type** string **Description** Org-wide default value to specify the name of the legal entity. Available in API version 64.0 and later.
`defaultTaxTreatment`	**Field Type** string **Description** Org-wide default value to specify the name of the tax treatment. Available in API version 64.0 and later.
`enableBillingDisputeManagement`	**Field Type** boolean

Field Name	Description
	Description Indicates whether to enable Dispute Management (`true`) or not (`false`). The default value is `false`. Available in API version 66.0 and later.
`enableBillingSetup`	**Field Type** boolean **Description** Indicates whether to enable Billing setting (`true`) or not (`false`). The default value is `false`.
`enableCreditMemoSequenceService`	**Field Type** boolean **Description** Indicates whether to mandate the application of sequence policy for credit memos (`true`) or not (`false`). The default value is `false`. Available in API version 66.0 and later with Revenue Cloud Billing.
`enableCrMemoApplicationToPostedInvoices`	**Field Type** boolean **Description** Indicates whether to enable Apply Credits to Posted Invoices setting (`true`) or not (`false`). The default value is `false`. This setting automates settlement of invoices through application of credits to posted invoices. The credit application level determines whether credits are automatically applied to invoices or invoice lines.
`enableFailedPaymentsRetry`	**Field Type** boolean **Description** Indicates whether to retry failed payment schedule items automatically based on the defined payment retry rules (`true`) or not (`false`). The default value is `false`. Available in API version 66.0 and later.
`enableForeignExchangeTrxnJrnlCreation`	**Field Type** boolean **Description** Indicates whether to create Transaction Journal records for invoices that hold balance amounts (partially settled and not fully settled posted invoices) to record foreign exchange unrealized gains or losses during the closure activity of a legal entity accounting period. The default value is `false`. Available in API version 65.0 and later with Revenue Cloud Billing.

Field Name	Description
enableInvoiceEmailDelivery	**Field Type** boolean **Description** Indicates whether to enable Configure Email Delivery Settings (`true`) or not (`false`). The default value is `false`. Available in API version 63.0 and later with Revenue Cloud Billing.
enableInvoicePdfGeneration	**Field Type** boolean **Description** Indicates whether to enable Document Generation setting (`true`) or not (`false`). The default value is `false`. Available in API version 63.0 and later with Revenue Cloud Billing.
enableInvoiceSequenceService	**Field Type** boolean **Description** Indicates whether to mandate the application of sequence policy for posted invoices (`true`) or not (`false`). The default value is `false`. If enabled, each posted invoice is assigned an invoice number. Available in API version 65.0 and later with Revenue Cloud Billing.
enableNegInvoiceLnConversionToCrMemoLn	**Field Type** boolean **Description** Indicates whether to enable Convert Negative Invoice Lines to Credit Memo Lines setting (`true`) or not (`false`). The default value is `false`.
enablePaymentSchedulesAndItemsCreation	**Field Type** boolean **Description** Indicates whether to create a default payment schedule policy and payment schedule treatment (`true`) or not (`false`). The default value is `false`. If enabled, payment schedules and payment schedule items are created during financial transactions such as posting of invoices. Available in API version 64.0 and later with Revenue Cloud Billing.
enableRefundIssuingAndBalanceSettlement	**Field Type** boolean **Description** Indicates whether to issue refunds and settle balances (`true`) or not (`false`). The default value is `false`.

Field Name	Description
	If enabled, refunds are issued and credit memos are applied to any remaining invoice balance when customers amend or cancel an order. Available in API version 67.0 and later.
`enableTransactionJournalCreation`	**Field Type** boolean **Description** Indicates whether to create Transaction Journal records based on the defined general ledger account assignment rules for the billing entities when billing transaction records are created or updated (`true`) or not (`false`). The default value is `false`. Available in API version 63.0 and later with Revenue Cloud Billing. Billing transaction records include these transaction types. • Invoice • Invoice Line • Invoice Line Tax • Credit Memo • Credit Memo Line • Credit Memo Line Tax • Payment • Refund • Payment Line Invoice • Payment Line Invoice Line • Credit Memo Inv Application • Credit Memo Line Invoice Line
`enableTransactionsApplicationToInvoices`	**Field Type** boolean **Description** Indicates whether to enable Credit Application Level setting (`true`) or not (`false`). The default value is `false`. **Revenue Cloud Advanced** This setting applies balances of credit memos to invoices or balances of credit memo lines to invoice lines. For the latter, amounts and balances on the invoices are rolled-up from the related invoice lines. **Revenue Cloud Billing** This setting applies balances of credit memos and payments to invoices or balances of credit memo lines and payments lines to invoice lines. For the latter, amounts and balances on the invoices are rolled-up from the related invoice lines.

Field Name	Description
enableTrxnAmountsStorageInCorpCurrency	**Field Type** boolean **Description** Indicates whether to allow conversion of amounts of the Invoice, Invoice Line, Credit Memo, and Credit Memo Line records to your corporate currency (`true`) or not (`false`). The default value is `false`. Available in API version 63.0 and later. Store the converted amounts in corporate currency-specific amount fields.
realisedGainGlAccount	**Field Type** string **Description** Name of the general ledger account to record realized gains in transaction journals. Available in API version 64.0 and later.
realisedLossGlAccount	**Field Type** string **Description** Name of the general ledger account to record realized losses in transaction journals. Available in API version 64.0 and later.
ruleBasedCrAndPymtAppln	**Field Type** string **Description** Automates the settlement of the posted invoices by applying payments and credits that meet the specified application rules. The rules application level determines whether payments or credits are applied first to the invoices. The ruleset displays a list of selectable rules. Available in API version 66.0 and later.
unrealisedGainGlAccount	**Field Type** string **Description** Name of the general ledger account to record unrealized gains in transaction journals. Available in API version 64.0 and later.
unrealisedLossGlAccount	**Field Type** string **Description** Name of the general ledger account to record unrealized losses in transaction journals. Available in API version 64.0 and later.

Declarative Metadata Sample Definition

The following is an example of a BillingSettings component.

```
<BillingSettings xmlns="http://soap.sforce.com/2006/04/metadata">
    <enableBillingSetup>true</enableBillingSetup>
    <enableForeignExchangeTrxnJrnlCreation>true</enableForeignExchangeTrxnJrnlCreation>
    <enableInvoicePdfGeneration>true</enableInvoicePdfGeneration>
   <enableTransactionsApplicationToInvoices>true</enableTransactionsApplicationToInvoices>

   <enableCrMemoApplicationToPostedInvoices>true</enableCrMemoApplicationToPostedInvoices>

    <enableInvoiceEmailDelivery>true</enableInvoiceEmailDelivery>
    <enableInvoiceSequenceService>true</enableInvoiceSequenceService>
    <enableTransactionJournalCreation>true</enableTransactionJournalCreation>
    <enableTrxnAmountsStorageInCorpCurrency>true</enableTrxnAmountsStorageInCorpCurrency>

    <enablePaymentSchedulesAndItemsCreation>true</enablePaymentSchedulesAndItemsCreation>
</BillingSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>Billing</members>
        <name>Settings</name>
    </types>
    <version>67.0</version>
</Package>
```

Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see Settings. For information about using the manifest file, see Deploying and Retrieving Metadata with the Zip File.

Flow for Billing

Represents the metadata associated with a flow. With Flow, you can create an application that navigates users through a series of screens to query and update records in the database. You can also execute logic and provide branching capability based on user input to build dynamic applications.

FlowActionCall

Billing exposes additional actionType values for the FlowActionCall Metadata type.

Field Name	Field Type	Description
`actionType`	InvocableActionType (enumeration of type string)	Required. The action type. Additional valid values only for Billing include:

Field Name	Field Type	Description
		• `applyCredit`—Apply a credit memo or credit memo line to an invoice or invoice line, respectively. • `unapplyCredit`—Unapply a credit memo or credit memo line from an invoice or invoice line, respectively. • `postDraftInvoice`—Update the status of an invoice from `Draft` to `Posted` for a credit memo application. • `postDraftInvoiceBatchRun`—Update the status of a batch of invoices from `Draft` to `Posted` for a credit memo application. • `createBillingSchedulesFromBillingTransaction`—Create one or more billing schedules for a specified billing transaction ID. • `recoverBillingSchedules`—Recover one or more billing schedules in the `Error` or `Processing` status. • `generateInvoiceDocuments`—Asynchronously generate PDF documents for the invoices associated with an invoice batch run record that are in the `Draft` or `Posted` status. • `createBillingSchedulesFromTrxn`—Creates billing schedules for internal or external transaction records by calling the Create Standalone Billing Schedules API. • `unapplyPayment`—Unapplies a payment that's already been applied to an invoice or invoice line by crediting the amount back to the payment and the invoice or invoice line. • `writeOffInvoices`—Write off partially paid or unpaid invoices to manage pending debts and to maintain accurate financial records. This action calls the Posted Invoice List Write-Off (POST) API. • `assignSequences`—Assigns sequence pattern values to target invoice records based on the specified sequence policy. • `postDraftCreditMemo`—Post a draft credit memo to a credit memo record for review and approval. • `generateAccountStatement`—Generates a comprehensive account statement for a specified account with transaction history and balance information. • `blngDsptIssueCreditMemo`—Issue credit memos for disputed invoices to resolve billing disputes. • `blngSvcExtendInvoiceDueDate`—Update the due date on an invoice to accommodate payment extensions or resolve billing disputes. • `blngSvcSuspendBilling`—Suspend or resume the billing of an account to handle billing disputes. • `blngSvcUpdateBillToContact`—Update the Bill to Contact detail on an invoice to ensure accurate billing communication and routing.

Field Name	Field Type	Description
		• `blngSendDunningEmail`—Run an orchestration that sends dunning process emails for collection plans to recover overdue revenue and notify customers about amounts still due. • `automateRefund`—Initiate refund orchestration for a credit memo generated from a subscription cancellation or negative amendment.

PaymentsSharingSettings

Represents the settings to enable account-based sharing to view details related to Revenue Cloud Billing on the objects for Payments and Refunds.

Use account-based sharing to view Revenue Cloud Billing details on these objects.

- Payment
- Payment Authorization
- Payment Authorization Adjustment
- Refund
- Saved Payment Method

Parent Type and Manifest Access

This type extends the Metadata metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See Settings for more details.

File Suffix and Directory Location

The `PaymentsSharingSettings` values are stored in the `PaymentsSharing.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there's only one settings file for each settings component.

Version

PaymentsSharingSettings components are available in API version 64.0 and later.

Special Access Rules

If you don't have the View All Records permission to the Payments and Refunds objects, then you can:

- View the records only when the records have a value for the `Account` field and a shared Account ID.
- Use Payment Sale API and Payment Authorization API irrespective of whether the Account ID is null or shared.
- Use Payment Capture API, Authorization Reversal API, Create Payment Refund Billing API, and Apply Refunds to Payments API only when the corresponding Authorization or Payment record has a shared Account ID.

See Commerce Payments resources.

Fields

Field Name	Description
delegatePaymentSharingToAccount	**Field Type** boolean **Description** Indicates whether sharing for these objects must be delegated to the corresponding Account record (`true`) or not (`false`). • Payment • Payment Authorization • Payment Authorization Adjustment • Refund • Saved Payment Method The default value is `false`. If this field's value is set to `true`, you get access to these objects based on the access you have for the Account object. For example, if you have Read access to the Account object, you get Read access to the objects for Payments and Refunds. For saved payment method, the sharing is delegated to merchant account instead of account if the user has Manage Saved Payment Methods user permission.

Declarative Metadata Sample Definition

The following is an example of a PaymentsSharingSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<PaymentsSharingSettings xmlns="http://soap.sforce.com/2006/04/metadata">
    <delegatePaymentSharingToAccount>true</delegatePaymentSharingToAccount>
</PaymentsSharingSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>PaymentsSharing</members>
        <name>Settings</name>
    </types>
    <version>67.0</version>
</Package>
```

Wildcard Support in the Manifest File

The wildcard character * (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see Settings. For information about using the manifest file, see Deploying and Retrieving Metadata with the Zip File.

CHAPTER 13 Revenue Management Associated Objects

In this chapter ...

This section provides a list of objects associated to standard objects of Revenue Management with their standard fields.

Some fields may not be listed for some objects. To see the system fields for each object, see System Fields in the *Object Reference for Salesforce and Lightning Platform*.

To verify the complete list of fields for an object, use a describe call from the API or inspect with an appropriate tool. For example, inspect the WSDL or use a schema viewer.

*StandardObjectName*ChangeEvent

A ChangeEvent object is available for each object that supports Change Data Capture. You can subscribe to a stream of change events using Change Data Capture to receive data tied to record changes in Salesforce. Changes include record creation, updates to an existing record, deletion of a record, and undeletion of a record. A change event isn't a Salesforce object—it doesn't support CRUD operations or queries. It's included in the object reference so you can discover which Salesforce objects support change events.

Supported Calls

`describeSObjects()`

Special Access Rules

- All objects may not be available in your org. Some objects require specific feature settings and permissions to be enabled.
- For more special access rules, if any, see the documentation for the standard object. For example, for AccountChangeEvent, see the special access rules for Account.

Change Event Support

Change events are available for all custom objects and a subset of standard objects. Change events that correspond to custom settings are partially supported. They aren't supported in Apex triggers but are supported in other types of subscribers. For more information about standard object support, see the Objects That Support Change Events section below.

Change Event Name

The name of a change event is based on the name of the corresponding object for which it captures the changes.

Standard Object Change Event Name

```
<Standard_Object_Name>ChangeEvent
```

Example: `AccountChangeEvent`

Custom Object Change Event Name

```
<Custom_Object_Name>__ChangeEvent
```

Example: `MyCustomObject__ChangeEvent`

Change Event Fields

The fields that a change event can include correspond to the fields on the associated parent Salesforce object, with a few exceptions. For example, AccountChangeEvent fields correspond to the fields on Account.

The fields that a change event doesn't include are:

- The `IsDeleted` system field.
- The `SystemModStamp` system field.
- Any field whose value isn't on the record and is derived from another record or from a formula, except roll-up summary fields, which are included. Examples are formula fields. Examples of fields with derived values include `LastActivityDate` and `PhotoUrl`.

Each change event also contains header fields. The header fields are included inside the `ChangeEventHeader` field. They contain information about the event, such as whether the change was an update or delete and the name of the object, like Account.

In addition to the event payload, the event schema ID is included in the `schema` field. Also included is the event-specific field, `replayId`, which is used for retrieving past events.

Event Message Example

This example is an event message in JSON format for a new account record creation.

```
{
  "schema": "IeRuaY6cbI_HsV8Rv1Mc5g",
  "payload": {
    "ChangeEventHeader": {
      "entityName": "Account",
      "recordIds": [
        "<record_ID>"
      ],
      "changeType": "CREATE",
      "changeOrigin": "com/salesforce/api/soap/51.0;client=SfdcInternalAPI/",
      "transactionKey": "0002343d-9d90-e395-ed20-cf416ba652ad",
      "sequenceNumber": 1,
      "commitTimestamp": 1612912679000,
      "commitNumber": 10716283339728,
      "commitUser": "<User_ID>"
    },
    "Name": "Acme",
    "Description": "Everyone is talking about the cloud. But what does it mean?",
    "OwnerId": "<Owner_ID>",
    "CreatedDate": "2021-02-09T23:17:59Z",
    "CreatedById": "<User_ID>",
    "LastModifiedDate": "2021-02-09T23:17:59Z",
    "LastModifiedById": "<User_ID>"
  },
  "event": {
    "replayId": 6
  }
}
```

API Version and Schema

When you subscribe to change events, the subscription uses the latest API version and the event messages received reflect the latest field definitions. For more information, see API Version and Event Schema in the *Change Data Capture Developer Guide*.

Usage

For more information about Change Data Capture, see Change Data Capture Developer Guide.

*StandardObjectName*Feed

*StandardObjectName*Feed is the model for all feed objects associated with standard objects. These objects represent the posts and feed-tracked changes of a standard object.

The object name is variable and uses *StandardObjectName*Feed syntax. For example, AccountFeed represents the posts and feed-tracked changes on an account record. We list the available associated feed objects at the end of this topic. For specific version information, see the documentation for the standard object.

Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

In the internal org, users can delete all feed items they created. This rule varies in Experience Cloud sites where threaded discussions and delete-blocking are enabled. Site members can delete all feed items they created, provided the feed items don't have content nested under them—like a comment, answer, or reply. Where the feed item has nested content, only feed moderators and users with the Modify All Data permission can delete threads.

To delete feed items they didn't create, users must have one of these permissions:

- Modify All Data
- Modify All Records on the parent object, like Account for AccountFeed
- Moderate Chatter

  Note: Users with the Moderate Chatter permission can delete only the feed items and comments they can see.

  Only users with this permission can delete items in unlisted groups.

For more special access rules, if any, see the documentation for the standard object. For example, for AccountFeed, see the special access rules for Account.

Fields

Field	Details
BestCommentId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the comment marked as best answer on a question post. This field is available in API version 44.0 and later.
Body	**Type** textarea

Field	Details
	Properties Nillable, Sort **Description** The body of the post. Required when `Type` is `TextPost`. Optional when `Type` is `ContentPost` or `LinkPost`.
`CommentCount`	**Type** int **Properties** Filter, Group, Sort **Description** The number of comments associated with this feed item. In a feed that supports pre-moderation, `CommentCount` isn't updated until a comment is published. For example, say that you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, comments aren't counted until approved by an admin or someone with Can Approve Feed Post and Comment or Modify All Data. Feed moderation has implications on how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through `CommentCount`, go through pagination until the end of comments is returned.
`ConnectionId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** When a PartnerNetworkConnection modifies a record that is tracked, the `CreatedBy` field contains the ID of the system administrator. The `ConnectionId` contains the ID of the PartnerNetworkConnection. Available if Salesforce to Salesforce is enabled for your organization.
`ContentData`	**Type** base64 **Properties** Nillable **Description** Available in API version 36.0 and earlier only. Required if `Type` is `ContentPost`. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets `Type` to `ContentPost`.
`ContentDescription`	**Type** textarea

Field	Details
	Properties Nillable, Sort **Description** Available in API version 36.0 and earlier only. The description of the file specified in `ContentData`.
`ContentFileName`	**Type** string **Properties** Group, Nillable, Sort **Description** Available in API version 36.0 and earlier only. This field is required if `Type` is `ContentPost`.The name of the file uploaded to the feed. Setting `ContentFileName` automatically sets `Type` to `ContentPost`.
`ContentSize`	**Type** int **Properties** Group, Nillable, Sort **Description** Available in API version 36.0 and earlier only. The size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.
`ContentType`	**Type** string **Properties** Group, Nillable, Sort **Description** Available in API version 36.0 and earlier only. The MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.
`FeedPostId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** This field was removed in API version 22.0, and is available in earlier versions for backward compatibility only. ID of the associated FeedPost. A FeedPost represents the following types of changes in a feed item: changes to tracked fields, text posts, link posts, and content posts.

Field	Details
`InsertedById`	**Type** reference **Properties** Group, Nillable, Sort **Description** ID of the user who added this item to the feed. For example, if an application migrates posts and comments from another application into a feed, the `InsertedBy` value is set to the ID of the context user.
`isRichText`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the feed item `Body` contains rich text. If you post a rich text feed comment using SOAP API, set `IsRichText` to `true` and escape HTML entities from the body. Otherwise, the post is rendered as plain text. Rich text supports the following HTML tags: • `<p>`Though the ` ` tag isn't supported, you can use `<p> </p>` to create lines. • `<a>` • `<b>` • `<code>` • `<i>` • `<u>` • `<s>` • `<ul>` • `<ol>` • `<li>` • `<img>` The `<img>` tag is accessible only through the API and must reference files in Salesforce similar to this example: `<img src="sfdc://069B0000000omjh"></img>` In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.
`LikeCount`	**Type** int **Properties** Filter, Group, Sort

Field	Details
	Description The number of likes associated with this feed item.
LinkUrl	**Type** url **Properties** Nillable, Sort **Description** The URL of a LinkPost.
NetworkScope	**Type** picklist **Properties** Group, Nillable, Restricted picklist, Sort **Description** Specifies whether this feed item is available in the default Experience Cloud site, a specific Experience Cloud site, or all sites. This field is available in API version 26.0 and later, if digital experiences is enabled for your org. NetworkScope can have the following values: • NetworkId—The ID of the Experience Cloud site in which the FeedItem is available. If left empty, the feed item is only available in the default Experience Cloud site. • AllNetworks—The feed item is available in all Experience Cloud sites. Note the following exceptions for NetworkScope: • Only feed items with a Group or User parent can set a NetworkId or a null value for NetworkScope. • For feed items with a record parent, users can set NetworkScope only to AllNetworks. • You can't filter a feed item on the NetworkScope field.
ParentId	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the record that is tracked in the feed. The detail page for the record displays the feed.
RelatedRecordId	**Type** reference **Properties** Group, Nillable, Sort

Field	Details
	Description ID of the ContentVersion record associated with a `ContentPost`. This field is null for all posts except `ContentPost`.
`Title`	**Type** string **Properties** Group, Nillable, Sort **Description** The title of the feed item. When the `Type` is `LinkPost`, the `LinkUrl` is the URL and this field is the link name.
`Type`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The type of feed item: • `ActivityEvent`—indirectly generated event when a user or the API adds a Task associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a Task or Event associated with a case record (excluding email and call logging). For a recurring Task with CaseFeed disabled, one event is generated for the series only. For a recurring Task with CaseFeed enabled, events are generated for the series and each occurrence. • `AdvancedTextPost`—created when a user posts a group announcement and, in Lightning Experience as of API version 39.0 and later, when a user shares a post. • `AnnouncementPost`—Not used. • `ApprovalPost`—generated when a user submits an approval. • `BasicTemplateFeedItem`—Not used. • `CanvasPost`—a post made by a canvas app posted on a feed. • `CollaborationGroupCreated`—generated when a user creates a public group. • `CollaborationGroupUnarchived`—Not used. • `ContentPost`—a post with an attached file. • `CreatedRecordEvent`—generated when a user creates a record from the publisher. • `DashboardComponentAlert`—generated when a dashboard metric or gauge exceeds a user-defined threshold. • `DashboardComponentSnapshot`—created when a user posts a dashboard snapshot on a feed. • `LinkPost`—a post with an attached URL. • `PollPost`—a poll posted on a feed.

Field	Details
	• `ProfileSkillPost`—generated when a skill is added to a user's Chatter profile. • `QuestionPost`—generated when a user posts a question. • `ReplyPost`—generated when Chatter Answers posts a reply. • `RypplePost`—generated when a user creates a Thanks badge in WDC. • `TextPost`—a direct text entry on a feed. • `TrackedChange`—a change or group of changes to a tracked field. • `UserStatus`—automatically generated when a user adds a post. Deprecated. The following values appear in the `Type` picklist for all feed objects but apply only to CaseFeed: • `CaseCommentPost`—generated event when a user adds a case comment for a case object • `EmailMessageEvent`—generated event when an email related to a case object is sent or received • `CallLogPost`—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event. • `ChangeStatusPost`—generated event when a user changes the status of a case • `AttachArticleEvent`—generated event when a user attaches an article to a case If you set `Type` to `ContentPost`, also specify `ContentData` and `ContentFileName`.
`Visibility`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if digitial experiences is enabled for your organization. `Visibility` can have the following values: • `AllUsers`—The feed item is available to all users who have permission to see the feed item. • `InternalUsers`—The feed item is available to internal users only. Note the following exceptions for `Visibility`: • For record posts, `Visibility` is set to `InternalUsers` for all internal users by default. • External users can set `Visibility` only to `AllUsers`. • On user and group posts, only internal users can set `Visibility` to `InternalUsers`.

Usage

A feed for an object is automatically created when a user enables feed tracking for the object. Use feeds to track changes to records. For example, `AccountFeed` tracks changes to an account record. Use feed objects to retrieve the content of feed fields, such as type of feed or feed ID.

- `NewsFeed` and `UserProfileFeed` are available in API version 18.0 through API version 26.0. In API version 27.0 and later, `NewsFeed` and `UserProfileFeed` are no longer available in SOAP API. Use Connect REST API to access `NewsFeed` and `UserProfileFeed`.

  Use the `NewsFeed` object to query and retrieve lead feed items associated with a converted lead record.

- For `NewsFeed` and `UserProfileFeed`, users who don't have the View All Data permission have the following limitations when querying records: Must specify a `LIMIT` clause and the limit must be less than or equal to 1000. Can include a `WHERE` clause that references object fields, but can't include references to fields in related objects. For example, you can filter by `CreatedDate` or `ParentId`, but not by `Parent.Name`. Can include an `ORDER BY` clause that references object fields, but can't include references to fields in related objects. For example, `ORDER BY CreatedDate` or `ParentId`, but not by `Parent.Name`. To query for the most recent feed items, `ORDER BY CreatedDate DESC, Id DESC`.

  Note the following SOQL restrictions. No SOQL limit if logged-in user has View All Data permission. If not, specify a `LIMIT` clause of 1,000 records or fewer. SOQL `ORDER BY` on fields using relationships isn't available. Use `ORDER BY` on fields on the root object in the SOQL query.

- The name *`Article Type`*__Feed is variable, where *Article Type* is the object name for the article type associated with the article. For example, `Offer__Feed` represents a feed on an article of type *Offer*.
- Field Service must be enabled in your organization for `ServiceAppointmentFeed`, `ServiceCrewFeed`, `ServiceMemberFeed`, `ServiceResourceCapacityFeed`, `ServiceResourceFeed`, `ServiceResourceSkillFeed`, `ServiceTerritoryFeed`, `ServiceTerritoryMemberFeed`, and `SkillRequirementFeed`.
- For `WorkOrderFeed`, Work Orders or Field Service must be enabled in your organization.
- On `UserFeed`, if you use the `FeedComment` object to comment on a user record, the user can delete the comment. For example, if John Smith adds a comment to the feed on Sasha Jones' user record, Sasha can delete the comment.

*`StandardObjectName`*History

*`StandardObjectName`*History is the model for all history objects associated with standard objects. These objects represent the history of changes to the values in the fields of a standard object.

The object name is variable and uses *`StandardObjectName`*History syntax. For example, AccountHistory represents the history of changes to the values of an account record's fields. We list the available associated history objects at the end of this topic. For specific version information, see the documentation for the standard object.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

You can also enable `delete()` in API version 42.0 and later. See Enable delete of Field History and Field History Archive.

Special Access Rules

For specific special access rules, if any, see the documentation for the standard object. For example, for AccountHistory, see the special access rules for Account.

Fields

Field Name	Details
*StandardObjectName*Id	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the standard object.
DataType	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Data type of the field that was changed.
Field	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Name of the field that was changed.
NewValue	**Type** anyType **Properties** Nillable, Sort **Description** New value of the field that was changed.
OldValue	**Type** anyType **Properties** Nillable, Sort **Description** Old value of the field that was changed.

*StandardObjectName*OwnerSharingRule

*StandardObjectName*OwnerSharingRule is the model for all owner sharing rule objects associated with standard objects. These objects represent a rule for sharing a standard object with users other than the owner.

The object name is variable and uses *StandardObjectName*OwnerSharingRule syntax. For example, ChannelProgramOwnerSharingRule is a rule for sharing a channel program with users other than the channel program owner. The available associated owner sharing rule objects are listed at the end of this topic. For specific version information, see the standard object documentation.

Note: To enable access to this object, contact Salesforce customer support. But we recommend that you use Metadata API to programmatically update owner sharing rules instead because it triggers automatic sharing rule recalculation. The SharingRules Metadata API type is enabled for all orgs.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

For specific special access rules, if any, see the documentation for the standard object. For example, for ChannelProgramOwnerSharingRule, see the special access rules for ChannelProgram.

Fields

Field Name	Details
AccessLevel	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Determines the level of access users have to records. Values are: • Read (read only) • Edit (read/write)
Description	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** Description of the sharing rule. Maximum length is 1,000 characters.

Field Name	Details
DeveloperName	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The unique name of the object in the API. This name can contain only underscores and alphanumeric characters and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package, and the changes are reflected in a subscriber's organization. When creating large sets of data, always specify a unique `DeveloperName` for each record. If no `DeveloperName` is specified, performance can slow while Salesforce generates one for each record.
GroupId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the source group. Records that are owned by users in the source group trigger the rule to give access.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Label of the sharing rule as it appears in the UI. Maximum length is 80 characters.
UserOrGroupId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the user or group that you're granting access to.

*StandardObjectName*Share

*StandardObjectName*Share is the model for all share objects associated with standard objects. These objects represent a sharing entry on the standard object.

The object name is variable and uses *StandardObjectName*Share syntax. For example, AccountBrandShare is a sharing entry on an account brand. For specific version information, see the standard object documentation.

You can only create, edit, and delete sharing entries for standard objects whose `RowCause` field is set to `Manual`. Sharing entries for standard objects with different `RowCause` values are created as a result of your Salesforce org's sharing configuration and are read-only. For some sharing mechanisms, such as sharing sets, sharing entries aren't stored at all.

Note: While Salesforce currently maintains read-only sharing entries for multiple sharing mechanisms, it's possible that we'll stop storing certain share records to improve performance. As a best practice, don't create customizations that rely on the availability of these sharing entries. Any changes to sharing behavior will be communicated before they occur.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

For specific special access rules, if any, see the documentation for the standard object. For example, for AccountBrandShare, see the special access rules for AccountBrand.

Fields

Field Name	Details
`AccessLevel`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The level of access allowed. Values are: • `All` (owner) • `Edit` (read/write) • `Read` (read only)
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the parent record.

Field Name	Details
RowCause	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Reason that the sharing entry exists.
UserOrGroupId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the user or group that has been given access to the object.

Event

Represents an event in the calendar. In the user interface, event and task records are collectively referred to as activities.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Note:

- An EventRelation object can't be related to a child event, and child events don't include the invitee related list.
- `query()`, `delete()`, and `update()` aren't allowed with events related to more than one contact in API versions 25.0 and earlier.
- `create()` and `update()` aren't available for read-only fields on Lightning Experience event series.
- `upsert()` and `undelete()` aren't supported for syncing changes made to events through the API using the feature Lightning Sync.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AcceptedEventInviteeIds	**Type** JunctionIdList

Field	Details
	Properties Create, Update **Description** A string array of contact or lead IDs who accepted this event. This `JunctionIdList` is linked to the `AcceptedEventRelation` child relationship. Warning: Adding a `JunctionIdList` field name to the `fieldsToNull` property deletes all related junction records. This action can't be undone.
`AccountId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Represents the ID of the related account. The `AccountId` is determined as follows. If the value of `WhatId` is any of the following objects, then Salesforce uses that object's `AccountId`. • Account • Opportunity • Contract • Custom object that's a child of Account If the value of the `WhatId` field is any other object, and the value of the `WhoId` field is a contact object, then Salesforce uses that contact's `AccountId`. If your org uses Shared Activities, Salesforce uses the `AccountId` of the primary contact. Otherwise, Salesforce sets the value of the `AccountId` field to `null`. This is a relationship field. **Relationship Name** Account **Relationship Type** Lookup **Refers To** Account
`ActivityDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Contains the event's due date if the `IsAllDayEvent` flag is set to `true`. This field is a date field with a timestamp that's always set to midnight in the Coordinated Universal Time

Field	Details
	(UTC) time zone. Don't attempt to alter the timestamp to account for time zone differences. Label is **Due Date Only**. This field is required in API versions 12.0 and earlier if the `IsAllDayEvent` flag is set to `true`. The value for this field and `StartDateTime` must match, or one of them must be `null`.
`ActivityDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Contains the event's due date if the `IsAllDayEvent` flag is set to `false`. The time portion of this field is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate. Label is **Due Date Time**. This field is required in API versions 12.0 and earlier if the `IsAllDayEvent` flag is set to `false`. The value for this field and `StartDateTime` must match, or one of them must be `null`.
`ClientGuid`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The client globally unique identifier identifies the external API client used to create the event. Label is **Client GUID**.
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only for orgs with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization.
`DeclinedEventInviteeIds`	**Type** JunctionIdLIst **Properties** Create, Update **Description** A string array of contact, lead, or user IDs who declined this event. This `JunctionIdList` is linked to the `DeclinedEventRelation` child relationship.

Field	Details
	Warning: Adding a `JunctionIdList` field name to the `fieldsToNull` property deletes all related junction records. This action can't be undone.
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** Contains a text description of the event. Limit: 32,000 characters.
`Division`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.
`DurationInMinutes`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Contains the event length, in minutes. Even though this field represents a temporal value, it's an integer type—not a Date/Time type. Required in API versions 12.0 and earlier if `IsAllDayEvent` is false. In API versions 13.0 and later, this field is optional, depending on the following: • If `IsAllDayEvent` is true, you can supply a value for either `DurationInMinutes` or `EndDateTime`. Supplying values in both fields is allowed if the values add up to the same amount of time. If both fields are `null`, the duration defaults to one day. • If `IsAllDayEvent` is false, a value must be supplied for either `DurationInMinutes` or `EndDateTime`. Supplying values in both fields is allowed if the values add up to the same amount of time. If the multiday event feature is enabled, then API versions 13.0 and later support values greater than 1440 for the `DurationInMinutes` field. API versions 12.0 and earlier can't access event objects whose `DurationInMinutes` is greater than 1440. For more information, see **Multiday Events**. Depending on your API version, errors with the `DurationInMinutes` and `EndDateTime` fields may appear in different places. • Versions 38.0 and before—Errors always appear in the `DurationInMinutes` field.

Field	Details
	• Versions 39.0 and later—If there's no value for the `DurationInMinutes` field, errors appear in the `EndDateTime` field. Otherwise, they appear in the `DurationInMinutes` field.
`EndDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** Read-only. Available in API versions 46.0 and later. This field supplies the date value that appears in the EndDateTime field. This field is a date field with a timestamp that is always set to midnight in the Coordinated Universal Time (UTC) time zone.
`EndDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Available in API versions 13.0 and later. The time portion of this field is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate. This field is optional, depending on the following: • If `IsAllDayEvent` is true, you can supply a value for either `DurationInMinutes` or `EndDateTime`. Supplying values in both fields is allowed if the values add up to the same amount of time. If both fields are `null`, the duration defaults to one day. • If `IsAllDayEvent` is false, a value must be supplied for either `DurationInMinutes` or `EndDateTime`. Supplying values in both fields is allowed if the values add up to the same amount of time. Depending on your API version, errors with the `DurationInMinutes` and `EndDateTime` fields may appear in different places. • Versions 38.0 and before—Errors always appear in the `DurationInMinutes` field. • Versions 39.0 and later—If there's no value for the `DurationInMinutes` field, errors appear in the `EndDateTime` field. Otherwise, they appear in the `DurationInMinutes` field.
`EventSubtype`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Provides standard subtypes to facilitate creating and searching for events. This field isn't updateable.

Field	Details
EventWhoIds	**Type** JunctionIdList **Properties** Create, Update **Description** A string array of contact or lead IDs used to create many-to-many relationships with a shared event. EventWhoIds is available when the shared activities setting is enabled. The first contact or lead ID in the list becomes the primary WhoId if you don't specify a primary WhoId. If you set the EventWhoIds field to null, all entries in the list are deleted and the value of WhoId is added as the first entry. Warning: Adding a JunctionIdList field name to the fieldsToNull property deletes all related junction records. This action can't be undone.
GroupEventType	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Read-only. Available in API versions 19.0 and later. The possible values are: • 0 (Non–group event)—An event with no invitees. • 1 (Group event)—An event with invitees. • 2 (Proposed event)—An event created when a user requests a meeting with a contact, lead, or person account using the Salesforce user interface. When the user confirms the meeting, the proposed event becomes a group event. You can't create, edit, or delete proposed events in the API. This value is no longer used in API version 41.0 and later. • 3 (IsRecurrence2 Series Pattern)—An event representing an event series recurrence pattern in Lightning Experience.
IsAllDayEvent	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the ActivityDate field (true) or the ActivityDateTime field (false) is used to define the date or time of the event. Label is **All-Day Event**. See also DurationInMinutes and EndDateTime.
IsArchived	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort

Field	Details
	Description Indicates whether the event has been archived.
IsChild	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the event is a child of another event (`true`) or not (`false`). For a child event, you can update `IsReminderSet` and `ReminderDateTime` only. You can query and delete a child event. If the objects related to the child event are different from those objects related to the parent event (this difference is possible if you use API version 25.0 or earlier) and one of the objects related to the child event is deleted, the objects related to the parent event are updated to ensure data integrity.
IsClientManaged	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the event is managed by an external client. If the value of this field is false, the event isn't owned or managed by an external client, and Salesforce can be used to update it. If the value is true, Salesforce can be used to change only noncritical fields on the event. Label is **Is Client Managed**.
IsGroupEvent	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the event is a group event—that is, whether it has invitees (`true`) or not (`false`).
IsPrivate	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether users other than the creator of the event can (`false`) or can't (`true`) see the event details when viewing the event user's calendar. However, users with the View All Data or Modify All Data permission can see private events in reports and searches, or when viewing other users' calendars. Private events can't be associated with opportunities, accounts, cases, campaigns, contracts, leads, or contacts. Label is **Private**.

Field	Details
IsRecurrence	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort **Description** Indicates whether a Salesforce Classic event is scheduled to repeat itself (`true`) or only occurs one time (`false`). This field is read-only when updating records, but not when creating them. If this field value is `true`, then `RecurrenceEndDateOnly`, `RecurrenceStartDateTime`, `RecurrenceType`, and any recurrence fields associated with the given recurrence type must be populated. Label is **Create recurring series of events**.
IsRecurrence2	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Read-only. This field is available in API version 44.0 and later. Indicates whether a Lightning Experience event is scheduled to repeat (`true`) or only occurs one time (`false)`. If this field value is true, then `Recurrence2PatternText` and `Recurrence2PatternVersion` must be populated. Label is **Repeat**.
IsRecurrence2Exception	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Read-only. This field is available in API version 44.0 and later. Indicates whether an individual event in a Lightning Experience event series has a recurrence pattern that’s different from the rest of the series, making it an exception.
IsRecurrence2Exclusion	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Read-only. This field is available in API version 44.0 and later. Indicates when updates to a Lightning Experience event series recurrence pattern have been made, but affect future event occurrences only. For past event occurrences, `IsRecurrence2Exclusion` is set to `true`, excluding past occurrences from the series recurrence pattern.
IsReminderSet	**Type** boolean

Field	Details
	Properties Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the activity is a reminder (`true`) or not (`false`).
`IsVisibleInSelfService`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether an event associated with an object can be viewed in the Customer Portal (`true`) or not (`false`). If your org has enabled digital experiences, events marked `IsVisibleInSelfService` are visible to any external user in the Experience Cloud site, as long as the user has access to the record the event was created on. This field is available when • Customer Portal or partner portal is enabled OR • Digital experiences is enabled and you have Customer Portal or partner portal licenses
`Location`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Contains the location of the event.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Contains the ID of the user or public calendar who owns the event. Label is **Assigned to ID**. This is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Calendar, User

Field	Details
`Recurrence2PatternStartDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Read-only. This field is available in API version 44.0 and later. Indicates the date and time when the Lightning Experience event series begins. The time portion of this field is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate.
`Recurrence2PatternText`	**Type** textarea **Properties** Create, Nillable **Description** The RRULE that describes the recurrence pattern for Lightning Experience event series. Supports a subset of the RFC 5545 standard for internet calendaring and scheduling. See the Event Series section in this topic for usage examples. This field has a maximum length of 512 characters. This field is available in API version 44.0 and later, and has the `Create` property in API version 52.0 and later.
`Recurrence2PatternTimeZone`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** This field is available in API version 44.0 and later. Indicates the time zone in which the Lightning Experience event series was created or updated. This field uses standard Java TimeZone IDs. For example, America/Los_Angeles.
`Recurrence2PatternVersion`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort, **Description** Read-only. This field is available in API version 44.0 and later. Indicates the standard specifications for Lightning Experience event series recurrence patterns. The only possible value is `1` (RFC 5545 v4 RRULE)—RFC 5545 is a standard set of specifications for internet calendaring and scheduling that `IsRecurrence2` adheres to for series recurrence patterns. RFC 5545 specifications for series recurrence patterns are called RRULES. For examples of RRULE usage, see the Lightning Experience Event Series and Recurring Events section in this topic.

Field	Details
RecurrenceActivityId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Read-only. Not required on create. Contains the ID of the main record of the Salesforce Classic recurring event. Subsequent occurrences have the same value in this field.
RecurrenceDayOfMonth	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates the day of the month on which the event repeats.
RecurrenceDayOfWeekMask	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates the day or days of the week on which the Salesforce Classic recurring event repeats. This field contains a bitmask. The values are as follows: • Sunday = 1 • Monday = 2 • Tuesday = 4 • Wednesday = 8 • Thursday = 16 • Friday = 32 • Saturday = 64 Multiple days are represented as the sum of their numerical values. For example, Tuesday and Thursday = 4 + 16 = 20.
RecurrenceEndDateOnly	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates the last date on which the event repeats. For multiday Salesforce Classic recurring events, this date is the day on which the last occurrence starts. This field is a date field with a timestamp that is always set to midnight in the Coordinated Universal Time (UTC) time zone. Don't attempt to alter the timestamp to account for time zone differences.

Field	Details
RecurrenceInstance	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates the frequency of the Salesforce Classic event's recurrence. For example, `2nd` or `3rd`.
RecurrenceInterval	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates the interval between Salesforce Classic recurring events.
RecurrenceMonthOfYear	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates the month in which the Salesforce Classic recurring event repeats.
RecurrenceStartDateTime	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Indicates the date and time when the Salesforce Classic recurring event begins. The value must precede the `RecurrenceEndDateOnly`. The time portion of this field is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate.
RecurrenceTimeZoneSidKey	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates the time zone associated with a Salesforce Classic recurring event. For example, "UTC-8:00" for Pacific Standard Time.
RecurrenceType	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates how often the Salesforce Classic event repeats. For example, daily, weekly, or every nth month (where "nth" is defined in `RecurrenceInstance`).
`ReminderDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Represents the time when the reminder is scheduled to fire, if `IsReminderSet` is set to `true`. If `IsReminderSet` is set to `false`, then the user may have deselected the reminder checkbox in the Salesforce user interface, or the reminder has already fired at the time indicated by the value.
`ShowAs`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates how this event appears when another user views the calendar: Busy, Out of Office, or Free. Label is **Show Time As**.
`StartDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Indicates the start date and time of the event. Available in versions 13.0 and later. If the Event `IsAllDayEvent` flag is set to true (indicating that it's an all-day Event), then the event start date information is contained in the `StartDateTime` field. The time portion of this field is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate. If the Event `IsAllDayEvent` flag is set to false (indicating that it isn't an all-day event), then the event start date information is contained in the `StartDateTime` field. The time portion is always transferred in the Coordinated Universal Time (UTC) time zone. You need to translate the time portion to or from a local time zone for the user or the application, as appropriate. If this field has a value, then `ActivityDate` and `ActivityDateTime` must either be `null` or match the value of this field.

Field	Details
`Subject`	**Type** combobox **Properties** Create, Filter, Nillable, Sort, Update **Description** The subject line of the event, such as Call, Email, or Meeting. Limit: 255 characters.
`Type`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Indicates the event type, such as Call, Email, or Meeting.
`UndecidedEventInviteeIds`	**Type** JunctionIdList **Properties** Create, Update **Description** A string array of contact, lead, or user IDs who are undecided about this event. This `JunctionIdList` is linked to the `UndecidedEventRelation` child relationship. Warning: Adding a `JunctionIdList` field name to the `fieldsToNull` property deletes all related junction records. This action can't be undone.
`WhatCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Available if your organization has enabled Shared Activities. Represents the count of related EventRelations pertaining to the `WhatId`. The count of the `WhatId` must be *1* or less.
`WhatId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The `WhatId` represents nonhuman objects such as accounts, opportunities, campaigns, cases, or custom objects. `WhatIds` are polymorphic. Polymorphic means a `WhatId` is equivalent to the ID of a related object. The label is `Related To ID`. This is a polymorphic relationship field.

Field	Details
	Relationship Name What **Relationship Type** Lookup **Refers To** Account, Accreditation, AssessmentIndicatorDefinition, AssessmentTask, AssessmentTaskContentDocument, AssessmentTaskDefinition, AssessmentTaskOrder, Asset, AssetRelationship, AssignedResource, Award, BoardCertification, BusinessLicense, BusinessMilestone, BusinessProfile, Campaign, CareBarrier, CareBarrierDeterminant, CareBarrierType, CareDeterminant, CareDeterminantType, CareDiagnosis, CareInterventionType, CareMetricTarget, CareObservation, CareObservationComponent, CarePgmProvHealthcareProvider, CarePreauth, CarePreauthItem, CareProgram, CareProgramCampaign, CareProgramEligibilityRule, CareProgramEnrollee, CareProgramEnrolleeProduct, CareProgramEnrollmentCard, CareProgramGoal, CareProgramProduct, CareProgramProvider, CareProgramTeamMember, CareProviderAdverseAction, CareProviderFacilitySpecialty, CareProviderSearchableField, CareRegisteredDevice, CareRequest, CareRequestDrug, CareRequestExtension, CareRequestItem, CareSpecialty, CareSpecialtyTaxonomy, CareTaxonomy, Case, CommSubscriptionConsent, ContactEncounter, ContactEncounterParticipant, ContactRequest, Contract, CoverageBenefit, CoverageBenefitItem, CreditMemo, DelegatedAccount, DocumentChecklistItem, EnrollmentEligibilityCriteria, HealthcareFacility, HealthcareFacilityNetwork, HealthcarePayerNetwork, HealthcarePractitionerFacility, HealthcareProvider, HealthcareProviderNpi, HealthcareProviderSpecialty, HealthcareProviderTaxonomy, IdentityDocument, Image, IndividualApplication, Invoice, ListEmail, Location, MemberPlan, Opportunity, Order, OtherComponentTask, PartyConsent, PersonLifeEvent, PlanBenefit, PlanBenefitItem, ProcessException, Product2, ProductItem, ProductRequest, ProductRequestLineItem, ProductTransfer, PurchaserPlan, ReceivedDocument, ResourceAbsence, ReturnOrder, ReturnOrderLineItem, ServiceAppointment, ServiceResource, Shift, Shipment, ShipmentItem, Solution, Visit, VisitedParty, VolunteerProject, WorkOrder, WorkOrderLineItem
`WhoCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Available to organizations that have Shared Activities enabled. Represents the count of related EventRelations pertaining to the `WhoId`.
`WhoId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The WhoId represents a human such as a lead or a contact. WhoIds are polymorphic. Polymorphic means a WhoId is equivalent to a contact's ID or a lead's ID. The label is `Name ID`. If Shared Activities is enabled, the value of this field is the ID of the related lead or primary contact. If you add, update, or remove the WhoId field, you might encounter problems with triggers, workflows, and data validation rules that are associated with the record. The label is `Name ID`. If the `JunctionIdList` field is used, all `WhoIds` are included in the relationship list. Beginning in API version 37.0, if the contact or lead ID in the `WhoId` field isn't in the `EventWhoIds` list, no error occurs and the ID is added to the `EventWhoIds` as the primary `WhoId`. If `WhoId` is set to null, an arbitrary ID from the existing `EventWhoIds` list is promoted to the primary position. This is a polymorphic relationship field. **Relationship Name** Who **Relationship Type** Lookup **Refers To** Contact, Lead

Usage

Use Event to manage calendar appointments.

Queries on events are denied before they time out if they involve amounts of data that are deemed too large. In such cases, the exception code `OPERATION_TOO_LARGE` is returned. If you receive `OPERATION_TOO_LARGE`, refactor your query to return or scan a smaller amount of data.

When querying for events with a specific due date, you must filter on both the `ActivityDateTimeand` and `ActivityDate` fields. For example to find all events with a due date of February 14, 2003, you need two filters:

- One filter with the `ActivityDate` field equal to the Coordinated Universal Time (UTC) time zone on February 14, 2003.
- One filter with the `ActivityDate` field greater than or equal to midnight on February 14, 2003 in the user's local time zone AND less than or equal to midnight on February 15, 2003 in the user's local time zone.

Alternatively, in API version 13.0 and later, you can find events with a specific due date by filtering on `StartDateTime`. For example, to find all events with a due date of February 14, 2003, filter with the `StartDateTime` greater than or equal to midnight on February 14, 2003 in the user's local time zone AND less than or equal to midnight on February 15, 2003 in the user's local time zone.

The `EventId` field of an EventRelation object always points to the master record. An invitee on a group event can query the EventRelation object to view the master record.

Multiday Events

- Multiday events are available in API version 13.0 and later. Also, in earlier versions SOQL queries don't return multiday events.

- Multiday events are enabled through the user interface from Setup by entering *Activity Settings* in the Quick Find box, then selecting **Activity Settings**.
- If the multiday event feature is enabled, then API versions 13.0 and later support values greater than 1440 for the DurationInMinutes field. API versions 12.0 and earlier can't access event objects whose DurationInMinutes is greater than 1440.
- Multiday events can't exceed 14 days.

Event Series and Recurring Events

In Lightning Experience, events with multiple occurrences are called event series, and are indicated when the IsRecurrence2 field is set to true. In Salesforce Classic, events with multiple occurrences are called recurring events, and are indicated when the IsRecurrence field is set to true. Both fields can't be set to true for the same event.

- Lightning Experience event series are available in API version 44.0 and later as read-only fields. Recurrence patterns, specified by the Recurrence2PatternText field, are creatable in API version 52.0 and later. Salesforce Classic recurring events are available in API version 7.0 and later. In earlier versions, SOQL queries don't return any Lightning Experience event series.
- After an event is created, you can't change the values of IsRecurrence2 or IsRecurrence from true to false or vice versa.
- You can't set fields associated with IsRecurrence2 for events where IsRecurrence is set to true, or vice versa.
- For Lightning Experience event series where IsRecurrence2 is true, if you'd like to delete a single or all remaining events, use the REST API call. For Salesforce Classic recurring events where IsRecurrence is true, all past and future events in the series are removed when you delete the recurring event series through the API. However, when you delete the recurring event series through the user interface, only future occurrences are removed.
- For Lightning Experience event series in API version 58.0 and later, when you change a future event, events in the entire series also change. When you change a past event, IsRecurrence2Exception is set to true and only that past event changes.
- When creating a Salesforce Classic recurring event series, the duration of the event must be 24 hours or less. When the Salesforce Classic recurring event series is created, you can extend the length of individual occurrences beyond 24 hours if Multiday events are enabled; see **Multiday Events**.
- For Salesforce Classic recurring events, RecurrenceStartDateTime, RecurrenceEndDateOnly, RecurrenceType, and any properties associated with the given recurrence type (see the Recurrence Field Usage for Salesforce Classic Recurring Events table) must be populated.
- When updating a Salesforce Classic recurring event series, it's not possible to update the EventRelation for the event series object and the EventRelation for the series object occurrences at the same time.
- Lightning Experience event series have no series ID, so it's not possible to locate other occurrences in the series. In Salesforce Classic recurring events, you can use RecurrenceActivityId to locate other occurrences.
- For both Lightning Experience event series and Salesforce Classic recurring events, when a series repeats every day, month, or year, you can only schedule occurrences one time per day, month, or year. The week option lets you schedule occurrences multiple days per week.

Limits for Lightning Experience event series and limits for Salesforce Classic recurring events also apply.

Lightning Experience Event Series and Recurring Events

Use the Recurrence2PatternText field to specify the recurrence pattern for Lightning Experience event series. These recurrence patterns, called reference rules or RRULES, support a subset of the RFC 5545 standards. This table includes common RRULE examples.

Recurrence Pattern	RRULE Example
Every day for five days	RRULE:FREQ=DAILY;INTERVAL=1;COUNT=5

Recurrence Pattern	RRULE Example
Every Monday, Tuesday, Wednesday, Thursday, and Friday with no end date	`RRULE:FREQ=WEEKLY;INTERVAL=1;BYDAY=MO,TU,WE,TH,FR`
Every two weeks on Monday and Friday for 10 occurrences	`RRULE:FREQ=WEEKLY;INTERVAL=2;BYDAY=MO,FR;COUNT=10`
Monthly on the first day of the month until January 1, 2020	`RRULE:FREQ=MONTHLY;INTERVAL=1;BYMONTHDAY=1;UNTIL=20200101T100000Z`
Yearly on July 4th for three years (in this example, specify the date using StartDateTime)	`RRULE:FREQ=YEARLY;INTERVAL=1;BYMONTH=7;BYMONTHDAY=4;COUNT=3`
Daily until January 1, 2022 with no end date	`RRULE:FREQ=DAILY;UNTIL=20220101T000000Z`
Every third Friday of the month with no end date	`RRULE:FREQ=MONTHLY;BYSETPOS=3;BYDAY=FR`

The RRULE defined by `Recurrence2PatternText` supports a subset of the RFC 5545 standard for internet calendaring and scheduling. Supported RRULE parts include FREQ, BYMONTH, BYMONTHDAY, BYDAY, WKST, BYSETPOS, INTERVAL, UNTIL, and COUNT.

When the event record is saved, the RRULE might be modified to follow the required format:

- The RRULE parts are placed in the following order: FREQ, BYMONTH, BYMONTHDAY, BYDAY, WKST, BYSETPOS, INTERVAL, UNTIL, and COUNT.
- Any missing default values are inserted. For example, if the RRULE doesn't include INTERVAL, then `INTERVAL=1` is added.
- The RRULE is prefaced with `RRULE:` if that preface is missing.

RRULE Part	Supported RFC 5545 Implementation
FREQ	Required. Indicates the type of recurrence rule. Allowed values are: • `DAILY`—supported parts include FREQ, INTERVAL, UNTIL, and COUNT. • `WEEKLY`—supported parts include INTERVAL, UNTIL, COUNT, BYDAY, and WKST. BYDAY is required, but can't be preceded by a number. For example, to indicate weekly on Tuesday and Thursday until September 1, 2023, use `RRULE:FREQ=WEEKLY;UNTIL=20230901T000000Z;BYDAY=TU,TH` • `MONTHLY`—supported patterns include: – BYMONTHDAY For example, to indicate monthly on the third day of the month use: `RRULE:FREQ=MONTHLY;BYMONTHDAY=3` – BYDAY and BYSETPOS For example, to indicate the last weekday of the month, use `RRULE:FREQ=MONTHLY;BYDAY=MO,TU,WE,TH,FR;BYSETPOS=-1` – BYDAY, where the BYDAY values are specified with a numeric value For example, to indicate monthly on the first Friday for 10 occurrences, use `RRULE:FREQ=MONTHLY;COUNT=10;BYDAY=1FR` • `YEARLY`—supported patterns include: – BYMONTH, BYDAY, and BYSETPOS

RRULE Part	Supported RFC 5545 Implementation
	For example, to indicate every year on the second Friday of January, use `RRULE:FREQ=YEARLY;BYMONTH=1;BYDAY=FR;BYSETPOS=2` – BYMONTH and BYMONTHDAY For example, to indicate every year on October 31, use `RRULE:FREQ=YEARLY;BYMONTH=10;BYMONTHDAY=31` For example, to create a maintenance pattern such as twice in May, and September on 7th and 15th; and one time in June/July/August on the 1st, use two RRULEs: `RRULE: FREQ=MONTHLY; BYMONTH=5,9; BYMONTHDAY=7, 15` `RRULE:FREQ=MONTHLY; BYMONTH=6,7,8; BYMONTHDAY=1`
BYMONTH	The month. Valid values are `1` to `12`.
BYMONTHDAY	The day of the month. Valid values are `1` to `31`. If BYMONTHDAY is `31` and the month has fewer than 31 days, the event is created on the last day of the month.
BYDAY	A comma-separated list of days of the week. Valid values are `SU`, `MO`, `TU`, `WE`, `TH`, `FR`, `SA`. For RRULES with yearly or monthly frequency, BYDAY must be one of: • a single day • weekend days • weekdays • every day of the week Each BYDAY value can be preceded by an integer that indicates the nth occurrence of a specific day within the monthly or yearly RRULE. Allowed values are `–1`, `1`, `2`, `3`, and `4`. You can't use different numbers in the BYDAY values. For example, this RRULE isn't supported: `RRULE:FREQ=MONTHLY;INTERVAL=2;COUNT=10;BYDAY=1SU,-1SU` If BYDAY values are prefaced with a number, the RRULE can't include BYSETPOS.
WKST	Specifies the day on which the workweek starts. Valid values are `MO`, `TU`, `WE`, `TH`, `FR`, `SA`, and `SU`. Default value is based on the user's locale.
BYSETPOS	A comma-separated list of values that correspond to the nth occurrence within the set of recurrence instances specified by the rule. Valid values are `–1`, `1`, `2`, `3`, or `4`. Default value is `1`. For example, to indicate the last weekday of the month, use: `RRULE:FREQ=MONTHLY;BYDAY=MO,TU,WE,TH,FR;BYSETPOS=-1`
INTERVAL	The repetition interval. Valid values are: • an integer between `1` and `999` if FREQ=DAILY • an integer between `1` and `99` if FREQ=WEEKLY or FREQ=MONTHLY • `1` if FREQ=YEARLY Default value is `1`.

RRULE Part	Supported RFC 5545 Implementation
UNTIL	Specifies the datetime in UTC format when the recurrence rule stops. The supported format is yyyyMMddTHHmmssZ, for example: 20210419T083000Z. An RRULE can't contain both UNTIL and COUNT. A recurring event without either UNTIL or COUNT repeats indefinitely.
COUNT	The number of occurrences. Allowed values are 1 to 999. An RRULE can't contain both UNTIL and COUNT. A recurring event without either UNTIL or COUNT repeats indefinitely.
BYWEEKNO	Specifies a comma-separated list of values that specify weeks of the year. Valid values are: • `1 to 53` • `-53 to -1` For example, to indicate specific weeks in a year, use: `RRULE: BYWEEKNO=20, -20`. This rule part can't be used when the FREQ rule part is set to anything other than YEARLY. For example, 3 represents the third week of the year. Note: Assuming a Monday week start, week 53 can only occur when Thursday is January 1 or if it's a leap year and Wednesday is January 1.
BYYEARDAY	Specifies a comma-separated list of values that specify days of the year. Valid values are: • `1 to 366` • `-366 to -1` For example, to indicate specific days in a year, use: `RRULE:BYYEARDAY=1,100,200`; or, `RRULE:BYYEARDAY=1,-2`.

Salesforce Classic Event Series and Recurring Events

This table describes the usage of recurrence fields for Salesforce Classic recurring events. Each recurrence type must have all of its properties set. All unused properties must be set to null.

RecurrenceType Value	Properties	Example Pattern
RecursDaily	RecurrenceInterval	Every second day
RecursEveryWeekday	RecurrenceDayOfWeekMask	Every weekday - can't be Saturday or Sunday
RecursMonthly	RecurrenceDayOfMonth RecurrenceInterval	Every second month, on the third day of the month
RecursMonthlyNth	RecurrenceInterval RecurrenceInstance RecurrenceDayOfWeekMask	Every second month, on the last Friday of the month
RecursWeekly	RecurrenceInterval RecurrenceDayOfWeekMask	Every three weeks on Wednesday and Friday
RecursYearly	RecurrenceDayOfMonth RecurrenceMonthOfYear	Every March on the 26th day of the month

RecurrenceType Value	Properties	Example Pattern
RecursYearlyNth	RecurrenceDayOfWeekMask RecurrenceInstanceRecurrenceMonthOfYear	The first Saturday in every October

Attendees, Invitees, and Resources

The field `GroupEventType` indicates that event participants are included on an event. You can add a resource to an event only when the resource is available. The only attendance status that can be assigned to resources is Accepted. Events can't be saved when resources you've added aren't available.

JunctionIdList

To create an event using `JunctionIdList`, IDs are pulled from the related contacts and both the event and the `EventRelation` records are created in one API call. If the `EventRelation` fails, the event is rolled back because it's all done in a single API call.

```
public void createEventNew(Contact[] contacts) {
 String[] contactIds = new String[contacts.size()];
 for (int i = 0; i < contacts.size(); i++) {
  contactIds[i] = contacts[i].getID();
 }
 Event event = new Event();
 event.setSubject("New Event");
 event.setEventWhoIds(contactIds);
 SaveResult[] results = null;
 try {
  results = connection.create(new Event[] {
   task
  });
 } catch (ConnectionException ce) {
  ce.printStackTrace();
 }
}
```

Syncing Events with Lightning Sync

Attendee statuses (Accepted or Maybe, Declined, or No Response) sync from Microsoft® Exchange or Google to Salesforce, but not from Salesforce to Exchange or Google. Be wary of creating API flows that update attendee status in Salesforce for users set up to sync both ways. Eventually the original Exchange or Google status overrides the update made in Salesforce.

Shared Field-Level Security for Event and Task Objects

Metadata deployments for the Event object must include the field-level security for the Task object. Shared field-level security prevents each object from changing the field-level security of the associated object.

Metadata deployments that include field-level security for only one of either the Event or Task objects can cause field-level security changes to the other object that aren't reflected in the metadata.

- If field-level security is enabled for one object, then field-level security is enabled for both objects.
- If field-level security is disabled for one object, then it's disabled for both objects.

Note: A missing entry in the metadata is treated as field-level security being disabled.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

EventChangeEvent (API version 44.0)
Change events are available for the object.

EventFeed (API version 20.0)
Feed tracking is available for the object.

Task

Represents a business activity such as making a phone call or other to-do items. In the user interface, Task and Event records are collectively referred to as activities.

Note: Task fields related to calls are exclusive to Salesforce CRM Call Center. Also, `query()`, `delete()`, and `update()` aren't allowed with tasks related to more than one contact in API versions 23.0 and earlier.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Field Type
`AccountId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Represents the ID of the related Account. The `AccountId` is determined as follows. If the value of `WhatId` is any of the following objects, then Salesforce uses that object's `AccountId`. • Account • Opportunity • Contract • Custom object that is a child of Account If the value of the `WhatId`field is any other object, and the value of the `WhoId` field is a Contact object, then Salesforce uses that contact's `AccountId`. (If your organization uses Shared Activities, then Salesforce uses the `AccountId` of the primary contact.) Otherwise, Salesforce sets the value of the `AccountId` field to `null`. For information on IDs, see ID Field Type.

Field	Field Type
	This is a relationship field. **Relationship Name** Account **Relationship Type** Lookup **Refers To** Account
`ActivityDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Represents the due date of the task. This field has a timestamp that is always set to midnight in the Coordinated Universal Time (UTC) time zone. The timestamp is not relevant; do not attempt to alter it to accommodate time zone differences. Label is **Due Date**. This field can't be set or updated for a recurring task (`IsRecurrence` is `true`).
`CallDisposition`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Represents the result of a given call, for example, "we'll call back," or "call unsuccessful." Limit is 255 characters. Not subject to field-level security, available for any user in an organization with Salesforce CRM Call Center.
`CallDurationInSeconds`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Duration of the call in seconds. Not subject to field-level security, available for any user in an organization with Salesforce CRM Call Center.
`CallObject`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Field Type
	Description Name of a call center. Limit is 255 characters. Not subject to field-level security, available for any user in an organization with Salesforce CRM Call Center.
CallType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type of call being answered: Inbound, Internal, or Outbound.
CompletedDateTime	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time the task was saved with a Closed status. • For insert, if the task is saved with a Closed status the field is set. If the task is saved with an Open status the field is set to NULL. • For update, if the task is saved with a new Closed status, the field is reset. If the task is saved with a new non-closed status, the field is reset to NULL. If the task is saved with the same closed status (that is, unchanged) there is no change to the field. The status is a dynamic enum. If the Closed mapping is changed it won't cause an update of existing tasks. Only new insert/update operations are affected.
ConnectionReceivedId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the PartnerNetworkConnection that shared this record with your organization. This field is available if you enabled Salesforce to Salesforce.
ConnectionSentId	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Field Type
	Description ID of the PartnerNetworkConnection that you shared this record with. This field is available if you enabled Salesforce to Salesforce. This field is supported using API versions earlier than 15.0. In all other API versions, this field's value is null. You can use the new PartnerNetworkRecordConnection object to forward records to connections.
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** Contains a text description of the task.
`IsArchived`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the event has been archived. The default value of this field is `false`.
`IsClosed`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the task has been completed (`true`) or not (`false`). The default value of this field is `false`. Is only set indirectly via the `Status` picklist. Label is **Closed**.
`IsHighPriority`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates a high-priority task. This field is derived from the `Priority` field. The default value of this field is `false`.
`IsRecurrence`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort

Field	Field Type
	Description Indicates whether the task is scheduled to repeat itself (`true`) or only occurs once (`false`). The default value of this field is `false`. This field is read-only on update, but not on create. If this field value is `true`, then `RecurrenceStartDateOnly`, `RecurrenceEndDateOnly`, `RecurrenceType`, and any recurrence fields associated with the given recurrence type must be populated. See Recurring Tasks.
`IsReminderSet`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether a popup reminder has been set for the task (`true`) or not (`false`). The default value of this field is `false`.
`IsVisibleInSelfService`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether a task associated with an object can be viewed in the Customer Portal (`true`) or not (`false`). If your organization has digital experiences enabled, tasks marked `IsVisibleInSelfService` are visible to any external user in the Experience Cloud site, as long as the user has access to the record the task was created on.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** ID of the User or Group who owns the record. Label is **Assigned To ID**. This field accepts Groups of type Queue only. In the user interface, Group IDs correspond with the queue's list view names. To create or update tasks assigned to Group, use v48.0 or later. This is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User

Field	Field Type
Priority	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. Indicates the importance or urgency of a task, such as high or low. The default value of this field is `Normal`.
RecurrenceActivityId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Read-only. Not required on create. ID of the main record of the recurring task. Subsequent occurrences have the same value in this field.
RecurrenceDayOfMonth	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The day of the month in which the task repeats.
RecurrenceDayOfWeekMask	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The day or days of the week on which the task repeats. This field contains a bitmask. The values are as follows: • Sunday = 1 • Monday = 2 • Tuesday = 4 • Wednesday = 8 • Thursday = 16 • Friday = 32 • Saturday = 64 Multiple days are represented as the sum of their numerical values. For example, Tuesday and Thursday = 4 + 16 = 20.

Field	Field Type
RecurrenceEndDateOnly	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The last date on which the task repeats. This field has a timestamp that is always set to midnight in the Coordinated Universal Time (UTC) time zone. The timestamp is not relevant; do not attempt to alter it to accommodate time zone differences.
RecurrenceInstance	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The frequency of the recurring task. Possible values are: • First—1st • Fourth—4th • Last—last • Second—2nd • Third—3rd
RecurrenceInterval	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The interval between recurring tasks.
RecurrenceMonthOfYear	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The month of the year in which the task repeats.
RecurrenceRegeneratedType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

Field	Field Type
	Description Represents what triggers a repeating task to repeat. Add this field to a page layout together with the `RecurrenceInterval` field, which determines the number of days between the triggering date (due date or close date) and the due date of the next repeating task in the series. Label is **Repeat This Task**. This field has the following picklist values: • **None**: The task doesn't repeat. • **After due date**: The next repeating task will be due the specified number of days after the current task's due date. • **After the task is closed**: The next repeating task will be due the specified number of days after the current task is closed. • **(Task closed)**: This task, now closed, was opened as part of a repeating series. Note: When tasks in a series are set to repeat after their due date, Salesforce doesn't create recurrences that would have been due in the past. Instead, Salesforce keeps adding the interval until a repeated task has a due date in the future. For example, suppose that someone sets a task to repeat three days after it's due. But, that person doesn't complete the task (mark it Closed) until five days after it's due. Instead of creating a task that's already overdue, Salesforce gives the new task a due date of tomorrow. This due date is equivalent to 6 days after the due date; two intervals of three days each. If that person completes the repeating task (marks it Closed) before the due date, the next task is still due three days after the due date.
RecurrenceStartDateOnly	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date when the recurring task begins. Must be a date and time before `RecurrenceEndDateOnly`.
RecurrenceTimeZoneSidKey	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The time zone associated with the recurring task. For example, "UTC-8:00" for Pacific Standard Time.
RecurrenceType	**Type** picklist

Field	Field Type
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates how often the task repeats. For example, daily, weekly, or every nth month (where "nth" is defined in `RecurrenceInstance`).
`ReminderDateTime`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Represents the time when the reminder is scheduled to fire, if `IsReminderSet` is set to `true`. If `IsReminderSet` is set to `false`, then the user may have deselected the reminder checkbox in the Salesforce user interface, or the reminder has already fired at the time indicated by the value.
`Status`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Required. Indicates the status of the task. The default value of this field is `Not Started`. Each predefined `Status` field implies a value for the `IsClosed` flag. To obtain picklist values, query the TaskStatus object. Possible values are: • Completed • Deferred • In Progress • Not Started • Waiting on someone else Note: This field can't be updated for recurring tasks (`IsRecurrence` is `true`).
`Subject`	**Type** combobox **Properties** Create, Filter, Nillable, Sort, Update **Description** The subject line of the task, such as "Call" or "Send Quote." Limit: 255 characters.
`TaskSubtype`	**Type** picklist

Field	Field Type
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Provides standard subtypes to facilitate creating and searching for specific task subtypes. This field isn't updateable. `TaskSubtype` values: • `Task` • `Email` • `LinkedIn` —Available in API version 56.0 and later. • `List Email` • `Cadence` • `Call` Note: The `Cadence` subtype is an internal value used by Sales Engagement, and can't be set manually.
`TaskWhoIds`	**Type** JunctionIdList **Properties** Create, Update **Description** A string array of contact or lead IDs related to this task. This `JunctionIdList` field is linked to the `TaskWhoRelations` child relationship. `TaskWhoIds` is only available when the shared activities setting is enabled. The first contact or lead ID in the list becomes the primary `WhoId` if you don't specify a primary `WhoId`. If you set the `EventWhoIds` field to null, all entries in the list are deleted and the value of `WhoId` is added as the first entry. Warning: Adding a `JunctionIdList` field name to the `fieldsToNull` property deletes all related junction records. This action can't be undone.
`Type`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The type of task, such as Call or Meeting.
`WhatCount`	**Type** int **Properties** Filter, Group, Nillable, Sort

Field	Field Type
	Description Available to organizations that have Shared Activities enabled. Count of related TaskRelations pertaining to `WhatId`. Count of the `WhatId` must be *1* or less.
`WhatId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The `WhatId` represents nonhuman objects such as accounts, opportunities, campaigns, cases, or custom objects. `WhatId`s are polymorphic. Polymorphic means a `WhatId` is equivalent to the ID of a related object. The label is `Related To ID`. This is a polymorphic relationship field. **Relationship Name** What **Relationship Type** Lookup **Refers To** Account, Accreditation, AssessmentIndicatorDefinition, AssessmentTask, AssessmentTaskContentDocument, AssessmentTaskDefinition, AssessmentTaskOrder, Asset, AssetRelationship, AssignedResource, Award, BoardCertification, BusinessLicense, BusinessMilestone, BusinessProfile, Campaign, CareBarrier, CareBarrierDeterminant, CareBarrierType, CareDeterminant, CareDeterminantType, CareDiagnosis, CareInterventionType, CareMetricTarget, CareObservation, CareObservationComponent, CarePgmProvHealthcareProvider, CarePreauth, CarePreauthItem, CareProgram, CareProgramCampaign, CareProgramEligibilityRule, CareProgramEnrollee, CareProgramEnrolleeProduct, CareProgramEnrollmentCard, CareProgramGoal, CareProgramProduct, CareProgramProvider, CareProgramTeamMember, CareProviderAdverseAction, CareProviderFacilitySpecialty, CareProviderSearchableField, CareRegisteredDevice, CareRequest, CareRequestDrug, CareRequestExtension, CareRequestItem, CareSpecialty, CareSpecialtyTaxonomy, CareTaxonomy, Case, CommSubscriptionConsent, ContactEncounter, ContactEncounterParticipant, ContactRequest, Contract, CoverageBenefit, CoverageBenefitItem, CreditMemo, DelegatedAccount, DocumentChecklistItem, EnrollmentEligibilityCriteria, HealthcareFacility, HealthcareFacilityNetwork, HealthcarePayerNetwork, HealthcarePractitionerFacility, HealthcareProvider, HealthcareProviderNpi, HealthcareProviderSpecialty, HealthcareProviderTaxonomy, IdentityDocument, Image, IndividualApplication, Invoice, ListEmail, Location, MemberPlan, Opportunity, Order, OtherComponentTask, PartyConsent, PersonLifeEvent, PlanBenefit, PlanBenefitItem, ProcessException, Product2, ProductItem, ProductRequest, ProductRequestLineItem, ProductTransfer, PurchaserPlan, ReceivedDocument, ResourceAbsence, ReturnOrder, ReturnOrderLineItem, ServiceAppointment, ServiceResource, Shift, Shipment, ShipmentItem, Solution, Visit, VisitedParty, VolunteerProject, WorkOrder, WorkOrderLineItem

Field	Field Type
WhoCount	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Available to organizations that have Shared Activities enabled. Count of related TaskRelations pertaining to `WhoId`.
WhoId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The WhoId represents a human such as a lead or a contact. WhoIds are polymorphic. Polymorphic means a WhoId is equivalent to a contact's ID or a lead's ID. The label is `Name ID`. If Shared Activities is enabled, the value of this field is the ID of the related lead or primary contact. If you add, update, or remove the WhoId field, you might encounter problems with triggers, workflows, and data validation rules that are associated with the record. The label is `Name ID`. Beginning in API version 37.0, if the contact or lead ID in the `WhoId` field is not in the `TaskWhoIds` list, no error occurs and the ID is added to the `TaskWhoIds` as the primary `WhoId`. If `WhoId` is set to null, an arbitrary ID from the existing `TaskWhoIds` list is promoted to the primary position. This is a polymorphic relationship field. **Relationship Name** Who **Relationship Type** Lookup **Refers To** Contact, Lead

Usage

Recurring Tasks

- Recurring tasks are available in API version 16.0 and later.
- After a task is created, it can't be changed from recurring to nonrecurring or vice versa.
- When a user creates a series of recurring tasks, Salesforce creates a main record and subsequent occurrences. For the main record, `IsRecurrence` is set to `true` and other fields that define the recurrence pattern are populated. The ID of the main record of the recurring task is saved in the subsequent occurrences, in the `RecurrenceActivityId` field.

- When you delete a recurring task series through the API, all open and closed task occurrences in the series are removed. However, when you delete a recurring task series through the user interface, only open tasks occurrences (`IsClosed` is `false`) in the series are removed.
- If `IsRecurrence` is `true`, then `RecurrenceStartDateOnly`, `RecurrenceEndDateOnly`, `RecurrenceType`, and any properties associated with the given recurrence type (see the following table) must be populated.
- When you change the `RecurrenceStartDateOnly` field or the recurrence pattern, all open tasks occurrences in the series are deleted and new open task occurrences are created based on the new recurrence pattern. The following fields determine the recurrence pattern: `RecurrenceType`, `RecurrenceTimeZoneSidKey`, `RecurrenceInterval`, `RecurrenceDayOfWeekMask`, `RecurrenceDayOfMonth`, `RecurrenceInstance`, and `RecurrenceMonthOfYear`.
- When you change the value of `RecurrenceEndDateOnly` to an earlier date (for example, from January 20 to January 10), all open task occurrences in the series with the `ActivityDate` value greater than the new end date value are deleted. Other open and closed task occurrences in the series are not affected.
- When you change the value of `RecurrenceEndDateOnly` to a later date (for example, from January 10 to January 20), new task occurrences are created up to the new end date. Existing open and closed tasks in the series are not affected.

This table describes the usage of recurrence fields for Salesforce Classic recurring events. Each recurrence type must have all of its properties set. All unused properties must be set to null.

RecurrenceType Value	Properties	Example Pattern
RecursDaily	RecurrenceInterval	Every second day
RecursEveryWeekday	RecurrenceDayOfWeekMask	Every weekday - can't be Saturday or Sunday
RecursMonthly	RecurrenceDayOfMonth RecurrenceInterval	Every second month, on the third day of the month
RecursMonthlyNth	RecurrenceInterval RecurrenceInstance RecurrenceDayOfWeekMask	Every second month, on the last Friday of the month
RecursWeekly	RecurrenceInterval RecurrenceDayOfWeekMask	Every three weeks on Wednesday and Friday
RecursYearly	RecurrenceDayOfMonth RecurrenceMonthOfYear	Every March on the 26th day of the month
RecursYearlyNth	RecurrenceDayOfWeekMask RecurrenceInstanceRecurrenceMonthOfYear	The first Saturday in every October

JunctionIdList

The `JunctionIdList` field is now implemented in the Event and Task objects. With a single API call, it's easy to create many-to-many relationships between the Event or Task object with contacts, leads, or users.

To create a Task with related Contacts without `JunctionIdList`, you first have to create the task, then use the returned task ID to create the `TaskRelation` records. If the `TaskRelation` save call fails, error handling is your responsibility because the task has already been committed to the database.

```
public void createTasksOld(Contact[] contacts) {
 Task task = new Task();
 task.setSubject("New Task");
 SaveResult[] results = null;
```

```
  try {
   results = connection.create(new Task[] {
    task
   });
   if (results[0].isSuccess()) {
    TaskRelation[] relations = new TaskRelation[contacts.size()];
    for (int i = 0; i < contacts.length; i++) {
     relations[i] = new TaskRelation();
     relations[i].setTaskId(results[0].getID());
     relations[i].setRelationId(contacts[i].getID());
    }
    results = connection.create(relations);
   }
  } catch (ConnectionException ce) {
   ce.printStackTrace();
  }
}
```

To create a task using `JuncionIdList`, IDs are pulled from the related contacts and both the task and the `TaskRelation` records are created in one API call. If the `TaskRelation` fails, the task is rolled back because it's all done in a single API call.

```
public void createTaskNew(Contact[] contacts) {
  String[] contactIds = new String[contacts.size()];
  for (int i = 0; i < contacts.size(); i++) {
   contactIds[i] = contacts[i].getID();
  }
  Task task = new Task();
  task.setSubject("New Task");
  task.setTaskWhoIds(contactIds);
  SaveResult[] results = null;
  try {
   results = connection.create(new Task[] {
    task
   });
  } catch (ConnectionException ce) {
   ce.printStackTrace();
  }
}
```

Shared Field-Level Security for Event and Task Objects

Metadata deployments for the Task object should always include the field-level security for the Event object. Shared field-level security prevents each object from changing the field-level security of the associated object.

Metadata deployments that include field-level security for only one of either the Event or Task objects can cause field-level security changes to the other object that aren't reflected in the metadata.

- If field-level security is enabled for one object, then field-level security is enabled for both objects.
- If field-level security is disabled for one object, then it's disabled for both objects.

Note: A missing entry in the metadata is treated as field-level security being disabled.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

TaskChangeEvent (API version 44.0)
Change events are available for the object.

TaskFeed (API version 20.0)
Feed tracking is available for the object.
