Revenue Management Developer Guide

Version 67.0, Summer '26

Summer '26

Last updated: June 25, 2026

CONTENTS

CHAPTER 1 Get Started with Revenue Management Developer Resources

Get a single, unified system to automate your CRM processes. Use the developer sources of Revenue Management to automate the backend work to support the end-to-end revenue solution.

Revenue Cloud is now Revenue Management. You may see references to Revenue Cloud in our application and documentation.

Revenue Management provides extensible and API-first business components of the product-to-cash processes. Learn more about the developer resources that are available for these components.

EDITIONS

Available in: Lightning Experience

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Product Catalog Management

Create and manage an entire product portfolio with components such as attributes, product classifications, simple and bundled products, and rules.

- Use standard objects and fields to manage products, rules, and catalogs.
- Use business APIs to serve catalog definitions to users or applications.
- Use metadata API types to access and manage the metadata types, such as product specification type and product specification record types.
- Use tooling API objects to retrieve and manage smaller pieces of metadata types through SOQL capabilities. Use REST or SOAP to access metadata.
- Use Product Discovery business APIs, which are composite APIs, to search products or to discover catalogs, products, and categories.

Salesforce Pricing

Create a reliable pricing solution for your users through customized price adjustment schedules. Get accurate pricing for your entire product portfolio.

- Use standard objects and fields to manage pricing processes such as product management, and the calculation and application of discounts.
- Use business APIs to get unified pricing experiences across product lines.
- Use invocable actions to invoke the pricing Connect API by providing the pricing, context, and price waterfall details.
- Use metadata API types to work with the metadata associated with Flows and Salesforce Pricing settings.

- Use tooling API objects to retrieve and manage smaller pieces of metadata types through SOQL capabilities such as pricing action parameters, pricing procedure output map, and pricing recipe details. Use REST or SOAP to access metadata.

Product Configurator

Customize the components and attributes of a product to meet the business requirement expectations.

- Use standard objects to manage product-related information.
- Use the business APIs to retrieve and update a product's configuration from a configurator or to access configurator capabilities by integrating with any front-end application.
- Use constraint modeling language on page 1078 to enforce business logic declaratively, without the need for extensive code in a general-purpose programming language.

Transaction Management

Manage subscription lifecycles from quotes and orders to contracts, assets, amendments, and renewals. Get insights into customer assets and see a consolidated list of all assets that belong to an account.

- Use standard objects and fields to manage transactions and details of a customer asset. Use the QuoteSaveEvent platform event to notify subscribers after saving of a quote is processed.
- Use business APIs to place, clone, or supplement a sales transaction. You can also initiate amendment, renewal, or cancellation of assets by using APIs.
- Use invocable actions to create and activate an order from a quote, or to initiate amendment, renewal, or cancellation of assets through invocable actions.
- Use metadata API types to work with the metadata associated with Flows.
- Use built-in Apex classes and interfaces grouped by namespace.

Usage Management

Ensure transparent, accurate, and efficient management of usage data and estimated usage amount.

- Use standard objects and fields to set up and manage consumption of usage-based products.
- Use metadata API types to work with the metadata associated with Usage Management.
- Use business APIs to get details of a usage-based product that's associated with an asset, an order item, or a quote line item.
- Use invocable actions to invoke usage summaries, process consumption overages, and refresh usage entitlements.

Rate Management

Quote and price products based on predefined rates for future use of the product or service.

- Use standard objects and fields to manage rates and discounts for a product's resource consumption.
- Use metadata API types to work with the metadata associated with Rate Management settings.
- Use business APIs to get details of a rate plan and persisted rating waterfall.

- Use invocable action to invoke the rating service to rate the usage records.

Dynamic Revenue Orchestrator

Get visibility into a product's fulfillment journey. Also, get a view of the entire fulfillment design processes.

- Use standard objects to manage details of a product's fulfillment.
- Use invocable actions to submit an order or a sales transaction to Dynamic Revenue Orchestrator for fulfillment.
- Use metadata API types to work with the metadata associated with Flows.
- Use callout step types to make HTTP calls to an external system.

Billing

Get an integrated and extensible subscription and usage-based billing solution. Automate processes such as payment processing, invoice generation, and usage-based billing.

- Use standard objects to manage billing and tax configurations, credit memos, and invoices.
- Use platform events types to know more about standard platform events.
- Use invocable actions to manage credit application, billing schedules, and invoices.
- Use business APIs to manage credit application and to handle billing scenarios.
- Use built-in Apex classes to access the same capabilities that are available in the Billing Business APIs.
- Use metadata API types to work with the metadata associated with Billing settings and Flows.

See the RevenueManagementSettings on page 4 metadata type to set up Revenue Management through configuration settings.

CHAPTER 2 RevenueManagementSettings

Represents the configuration settings to set up Revenue Management.

Parent Type and Manifest Access

This type extends the Metadata metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See Settings for more details.

File Suffix and Directory Location

`RevenueManagementSettings` values are stored in the `revenuemanagement.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there's only one settings file for each settings component.

Version

RevenueManagementSettings is available in API version 60.0 and later.

Special Access Rules

This metadata settings type is available with Revenue Management.

Fields

Field Name	Description
`enableAdvCreateOrdersFromQuote`	**Field Type** boolean **Description** Indicates whether to enable users to choose a method for generating multiple orders from a single quote (`true`) or not (`false`). This setting updates the functionality of the Create Order capability on quotes. Available in API version 65.0 and later.

Field Name	Description
`enableAdvancedDetailLinePricing`	**Field Type** boolean **Description** Indicates whether to enable advanced pricing for quote and order detail line items (`true`) or not (`false`). The default value is `false`. Available in API version 65.0 and later.
`enableAsIsRenewals`	**Field Type** boolean **Description** Indicates whether users can enable as-is renewals capability for existing assets (`true`) or not (`false`). The default value is `false`. Available in API version 64.0 and later.
`enableAutoAddDerivedAsset`	**Field Type** boolean **Description** Indicates whether to automatically add assets with derived pricing to a quote or an order when contributing products are added to it (`true`) or not (`false`). Available in API version 62.0 and later.
`enableCoreCPQ`	**Field Type** boolean **Description** Indicates whether to enable read and write access to Revenue Management features and objects (`true`) or not (`false`). See Enable Revenue Management Features in Your Scratch Org.
`enableDeltaPricing`	**Field Type** boolean **Description** Indicates whether to reprice faster by processing only the changes (delta) made to quotes and orders (`true`) or not (`false`). The default value is `false`. Available in API version 63.0 and later.
`enableGroupRamp`	**Field Type** boolean

Field Name	Description
	Description Reserved for internal use.
`enableGroupRampPref`	**Field Type** boolean **Description** Indicates whether to create ramp deals for multiple products by creating group ramp segments (`true`) or not (`false`). The default value is `false`. Configure group ramp segments with specific start dates and end dates, and different product quantities and prices. Available in API version 65.0 and later. Before you enable this setting, ensure the `groupsEnabled` and `enableTransactionCloning` fields are set to `true`.
`enableRampDeal`	**Field Type** boolean **Description** Indicates whether to create ramp deals for individual line items by creating segments with specific start dates, end dates, quantities, and prices (`true`) or not (`false`). Available in API version 62.0 and later.
`enableRevUnifiedSetup`	**Field Type** boolean **Description** Indicates whether to enable the usage of a procedure plan for price calculation (`true`) or not (`false`).
`enableTransactionCloning`	**Field Type** boolean **Description** Indicates whether to clone quotes or orders with their line items and groups, or clone the individual line items and groups of line items. Available in API version 64.0 and later.
`enableTransactionProcessor`	**Field Type** boolean

Field Name	Description
	Description Indicates whether to enable transaction types for quotes and orders (`true`) or not (`false`). Transaction types optimize the way transactions are processed, depending on their size, complexity, and the business needs of the org. You can't turn off transaction processing after it's turned on. Available in API version 63.0 and later. To set a default transaction type, create transaction types, and select the default. After you select a default transaction type, you can't be without a default.
`groupsEnabled`	**Field Type** boolean **Description** Indicates whether users can group line items in quotes and orders (`true`) or not (`false`). Available in API version 62.0 and later.
`hidePriceRefreshNtfcn`	**Field Type** boolean **Description** Indicates whether to hide the notification that appears when quote or order prices aren't updated (`true`) or not (`false`). Hiding this notification may affect saving quotes and creating orders because you could be using outdated prices. The default value is `false`. Available in API version 65.0 and later.
`relaxUniqueCipValidation`	**Field Type** boolean **Description** Indicates whether to enable fully customizable extensions to contract item prices by ignoring record validations (`true`) or not (`false`). Available in API version 64.0 and later.
`skipOrgSttPricing`	**Field Type** boolean **Description** Indicates whether to skip the default pricing procedure and any pricing procedure set for a sales transaction with quote or order type (`true`) or not (`false`). To

Field Name	Description
	enable this field, you must enable the `enableRevUnifiedSetup` field.

Declarative Metadata Sample Definition

Here's an example of a RevenueManagementSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<RevenueManagementSettings
xmlns="http://soap.sforce.com/2006/04/metadata">
    <enableCoreCPQ>true</enableCoreCPQ>
    <enableDeltaPricing>true</enableDeltaPricing>
    <enableTransactionProcessor>true</enableTransactionProcessor>
    <enableAutoAddDerivedAsset>true</enableAutoAddDerivedAsset>
    <enableRampDeal>true</enableRampDeal>
    <enableRevUnifiedSetup>true</enableRevUnifiedSetup>
    <groupsEnabled>true</groupsEnabled>
    <enableTransactionCloning>true</enableTransactionCloning>
    <relaxUniqueCipValidation>true</relaxUniqueCipValidation>
    <skipOrgSttPricing>true</skipOrgSttPricing>
    <enableAsIsRenewals>true</enableAsIsRenewals>

<enableAdvCreateOrdersFromQuote>true</enableAdvCreateOrdersFromQuote>

<enableAdvancedDetailLinePricing>true</enableAdvancedDetailLinePricing>

    <enableGroupRampPref>true</enableGroupRampPref>
    <hidePriceRefreshNtfcn>true</hidePriceRefreshNtfcn>
</RevenueManagementSettings>
```

This example `package.xml` references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>RevenueManagement</members>
        <name>Settings</name>
    </types>
    <version>67.0</version>
</Package>
```

Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see Settings. For information about using the manifest file, see Deploying and Retrieving Metadata with the Zip File.

CHAPTER 3 Revenue Management Deployment

In this chapter ...

This section provides a clear roadmap for accurately and efficiently deploying Revenue Management objects and metadata between development, staging, sandbox, and production orgs.

Developing and maintaining complex business applications on the Salesforce Platform requires a structured approach to managing changes and deployments. This is especially true for Revenue Management, which involves a complex data model and metadata components.

The interconnected nature of Revenue Management's architecture requires a meticulous and well-defined development operations (DevOps) process. Without it, organizations face significant risks, including data corruption, deployment failures, and disruption to critical business processes.

Who This Section Is For

This section is intended for advanced users who are familiar with Salesforce development, established DevOps concepts, and Salesforce administration.

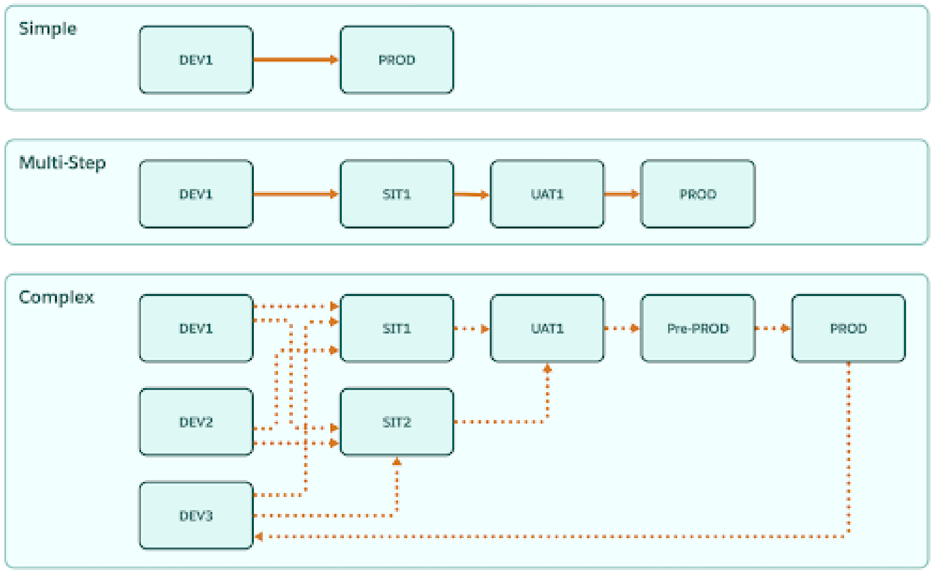
What's Not Included

- This section doesn't include information about data migration from external or legacy systems.
- There's no built-in, Revenue Management-specific deployment tool. Select the Salesforce or third-party deployment tools appropriate for your use case.
- Every Salesforce implementation is unique. This guide doesn't address how to deploy your custom objects, fields, Apex classes, metadata, Lightning Web Components (LWCs), and so on.

Deployment Workflows and Sequence

A typical dev ops cycle involves managing test orgs, sandboxes, and a production org. Your deployment workflow can be a simple deployment of all setup and data from a development org to production. Or, it can be much more complex, involving multiple staging and testing orgs before any changes are sent to production.

Here's a diagram illustrating several potential deployment plans.



Full vs. Incremental Deployment

Deployments take two primary forms: full and incremental.

A full deployment involves migrating the entire set of relevant metadata such as objects, fields, classes, triggers, and potentially a significant volume of data from a source org. This ensures that the target org is a complete, synchronized replica of the source at that point in time.

Full deployments are best suited for initial setup, major releases, or when deploying to a completely new, or non-synced environment, such as the first deployment to a sandbox or staging org.

Incremental deployments are used for ongoing DevOps activities. They focus only on the specific metadata components and associated data records that have been created, modified, or deleted since the last successful deployment.

This incremental approach is faster, reduces deployment risk by minimizing the scope of changes, and is essential for maintaining business continuity in a live production environment. Critical to this process is a version control system to track and compare differences between environments, ensuring only the necessary "delta" is packaged and deployed.

Planning for incremental deployments requires change tracking, dependency analysis, and careful sequencing of data and metadata components to ensure that all prerequisites are met in the target environment.

Deployment Sequence and Dependencies

The deployment process must navigate intricate dependencies involving both metadata and the data records themselves. For instance, before deploying the data records for an object, the necessary metadata must be in place first to ensure that the destination org is structurally prepared to receive the data.

Also, there are dependencies based on the record relationships. For example, if you're deploying a custom object with a lookup to the standard Account object, the Account records must be created first to satisfy the lookup relationship when the custom object's child records are subsequently inserted. You must also account for parent-child or master-detail relationships, requiring the parent record to be deployed before the child, to preserve referential integrity. Proper assessment and sequencing of these interdependent data and metadata components is vital to avoid validation errors and data corruption.

Sometimes, there are loops in the inter-relationships. For example, an object A depends on object B being deployed earlier, and object B depends on object A being deployed earlier. Let’s say object A goes first, then object B goes next. Because of circular dependencies, one has to redeploy object A a second time to ensure all the references are properly populated.

Here are a few deployment dependency examples.

- The Product Specification Record Type must be deployed before you can insert any Product records.
- The Attribute Based Adjustment Rule must be deployed before you can insert any Attribute Based Adjustment records.
- Decision Tables (metadata records) must be deployed before deploying Pricing Recipes (metadata records).

Note: For complete information on the required deployment sequence, see Object Deployment Sequence and Metadata Deployment Reference.

Deployment Considerations

In any deployment scenario, you must understand all dependencies and prerequisites related to your planned changes.

Here's a list of things to consider and plan for.

Key considerations include:

- What’s the sequence followed for object deployment? What dependencies exist on related objects?
- Do your objects have Draft, Active, or Inactive states?
- Does activation occur through an API or by simply setting a boolean field (active flag)?
- Are there special fields to consider, such as text fields with embedded IDs, JSON, or fields populated via triggers?
- Are there fields or objects that represent unique or sequential data that must be preserved in the target org?
- How would you handle system settings between the orgs? For example, making sure that a feature toggle is turned off in the target org so that automation doesn't start executing when you insert data from your source org.
- What's the impact of versioning on your deployment? For example, schema, app, or API versions.

Note: For detailed information about these deployment considerations, see Additional Deployment Information.

Global Unique ID Setup

The establishment of a Global Unique ID (GUID) column on all objects during day-one initialization is a recommended practice for Salesforce DevOps.

Salesforce uses its own internal ID for records, but this ID isn't portable. The same record in a testing, sandbox, or production org has different Salesforce IDs. This makes tracking a single piece of data across environments nearly impossible. By introducing your own custom, externally set GUID, you have a single, immutable, and universally consistent identifier.

Note: You can also choose your preferred method to maintain the mapping of records IDs across orgs.

Before performing any deployment work, establish your GUID across all database objects, and across all Salesforce orgs involved in your deployment plan.

Note: Add a GUID field to all objects used during your deployment. Since you can't add fields to metadata types (such as a Flow), use the API name for each metadata type as the unique identifier.

Create a GUID Field

Add a GUID field to all objects used during your deployment to ensure unique identification of records across environments.

1. From Setup, in the Quick Find box, find and select **Object Manager**.
2. Select an object.
3. Click **Fields & Relationships**.
4. Click **New**.
5. Select **Text** for the data type.
6. Enter a field label and field name.
7. Enter a length.

   We recommend 255 to avoid any errors related to ID length.
8. Select **Unique** and **External ID**.

   Important: Selecting these attributes ensures that every record gets a unique ID.
9. Click **Next**.
10. Select the appropriate profiles for field access, optionally add the field to page layouts, and then click **Save**.
11. Repeat this process for all Salesforce objects related to your deployment plan.

Note: Alternatively, you can create GUID fields by using the Metadata API. For more information, see Understanding Metadata API and the Custom Field metadata type.

GUID Design and Usage

The format and values of the Global Unique ID (GUID) are up to you. Here's some guidance on what makes a good versus poor GUID for deployment tracking.

The format and values of the GUID itself are up to you. Here's some guidance on what makes a good versus poor GUID.

A good GUID design includes these characteristics.

- Immutable
- Unique globally
- Non-translatable
- A single key
- Generated programmatically, and not manually

Poor GUID design includes these characteristics.

- Record Name field (mutable)
- Combination of mutable attributes such as Name + Version + Sequence
- Concatenated keys
- Conditional keys (Pricebook + Product OR Pricebook + Product + ISO Code)

Populate a GUID

Once you have created the GUID field on all the Salesforce objects related to your deployment plan, you're ready to populate the field with data.

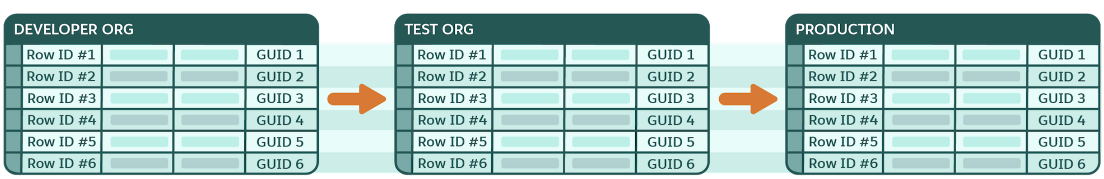
Add the GUID column to your import spreadsheets or import file definitions. Populate the field with the GUID format you've chosen. Now, you're ready to use the GUID in your deployment process.

Important: You must populate the GUID field not only at the beginning of your deployment process, but you must also populate it for any new records you generate along the way.

Usage of GUID in the Deployment Cycle

The GUID is the cornerstone of your deployment and data migration strategy. During the deployment process, leverage the GUID for accurate upserts and data mapping. When migrating data records from one org to another, your deployment method must use the GUID as the external ID field for lookup and matching. This practice ensures that updates are applied precisely to the correct record, preventing data duplication or corruption.

In the event of a deployment failure or a post-deployment data issue, administrators can use the GUID to quickly and confidently locate the problematic records in all orgs for precise auditing and troubleshooting.



Non-Extensible Objects

A few Revenue Management objects are protected, and therefore non-extensible. You can't add a GUID field to these objects. Instead, create an external reference table to store your GUID. Use this reference table to track the non-extensible object throughout your deployment process.

Managing Component States

Manage activation, versioning, and dependencies for components and objects as part of your deployment plan. A successful deployment makes sure that the system executes the intended, final, and active logic, preventing failures caused by stale or inactive component dependencies.

A component's state is its operational status, which includes the:

- Active, inactive, or draft state
- Component version

- Dependencies on other components and objects
- Component-specific attributes like rank on expression sets

Components like decision tables, expression sets, and context definitions must be deployed taking their state into account. Also, some objects use an Active checkbox to determine if their records must be used during run time operations or not.

You must also make sure that all related dependencies are moved correctly and in the proper sequence from the source org to the target org.

State Management Scenarios

Component deployments usually fall into one of these categories:

Deploy a New Component
: If the target org doesn't contain the component that you want to migrate, deploy it along with its versions from the source org to the target org.

Deploy Component Updates
: When the target org already contains the component you want to migrate, then state and version management take effect. For example, with expression sets, you must deactivate the version in the target org where you want to deploy changes. If you try to deploy to an active version, the deployment fails.

Deploy Components with Dependencies
: All related dependencies must be moved correctly and in the proper sequence from the source org to the target org. For example, expression sets reference elements such as decision matrices, decision tables, subexpressions, context definitions, field and object aliases, and explainability message templates. Migrate the dependent elements independently before you migrate the expression set version.

Helpful Links

Refer to these links for examples and component-specific information:

- Considerations for Migrating Decision Tables
- Considerations for Migrating Expression Sets
- Migration of Expression Sets with Dependencies
- Migrate Context Definitions

Note: Some Revenue Management components have unique activation requirements. For complete information about state management for these components, see Additional Deployment Information.

Post-Deployment Steps

Most deployments require that you take some actions after the deployment to the target org is complete to ensure proper functionality and data integrity.

Here are some examples of common post-deployment tasks.

- Refresh decision tables
- Sync pricing data
- Rebuild the product index
- Manually create elements that couldn't be deployed through the API
- Create or activate user accounts for testing and validation

Note: For information about the post-deployment steps necessary for each Revenue Cloud feature, see Additional Deployment Information.

Deployment Scenarios

Learn about specific deployment scenarios including new environment setup, refreshes, retiring records, deploying patches, and many more.

Product Catalog Management

Table 1: Product Definition: Full Deployment Scenarios

Scenario	Impact	Validation and Dependencies
Large Catalog Refresh Introduce 200+ new SKUs for accessories line	Metadata: See Additional Deployment Information. Data: bulk product load, product classes, selling models, price book entries, discount schedules, association to categories, catalogs	In the target org: Align baseline metadata. Validation: Run automated regression tests on bundles and pricing. Validate sample SKUs across categories.

Table 2: Product Definition: Incremental Deployment Scenarios

Scenario	Impact	Validation and Dependencies
New Product Launch Introduce a new product (simple) of type one time, subscription, and usage with standard pricing.	Metadata: product record type, updated page layouts, product catalog management, pricing, usage, and rating metadata Data: product records, product classifications, attributes, attribute picklists, price book entries, rate card entries, subscription term details	In the target org, a price book and rate card must exist, and billing rules are configured. Validation: Create a test quote with products, confirm price flows into quote or order, validate subscription billing cycle, validate rates.
Bundle Creation Launch a new product bundle that includes core products, add-ons, and attribute configurations with standard pricing.	Metadata: none Data: bundle definition, child products, option groups, option attribute configurations, bundle pricing	In the target org, attributes and picklists must be created or updated, child products must be created or updated, and a price book must exist. Validation: Configure a bundle in a quote, test configuration options, and ensure correct pricing roll up.
Update Product Classification Properties Add new attributes and update existing attribute properties to existing product classification.	Metadata: none Data: new attributes, new and updated product class attribute assignments.	In the target org, attributes and picklists must be created or updated first. Validation: Generate a quote with updated product, and validate that product attributes appear correctly.

Scenario	Impact	Validation and Dependencies
Update Product Classification Hierarchy Add a new sub-classification, configure attributes, and create a product by using the sub-class.	Metadata: none Data: new class, class relationship, and class attribute assignments	In the target org, attributes and picklists must be created or updated first. Validation: Generate a quote with a new product. Validate product attributes correctly appear.
Product Retirement Deactivate legacy products	Metadata: none Data: Set product status to Inactive. Remove the product from active price books.	Active quotes with retired products must be closed or replaced. Validation: Attempt to add a retired product to the quote and confirm it's blocked. Make sure that reporting reflects retirement.
Update Product Discovery Setup Change qualification procedure, product discovery flow, and turn on Indexed Product feature.	Metadata: See Appendix C Data: Index configuration (searchable, filterable, languages)	In target org, make sure that baseline metadata is created. Run full indexing in the target org before you enable the feature. Validation: Validate the product discovery setup changes and product indexing process status. Verify by discovering products with term-based and faceted search.

Table 3: Catalog, Categories & Related Products: Full Deployment Scenarios

Scenario	Impact	Validation and Dependencies
New Catalog Creation Introduce a new catalog for a business line. For example, Cloud Services.	Metadata: Catalog object configuration, and Salesforce Configure, Price, Quote (CPQ) page layouts Data: Create catalog records and linked products	Products must exist before adding to the catalog Validation: Validate that the catalog is visible in quotes and orders. Confirm that all linked products appear.
Large Catalog Expansion Add 500+ new SKUs across multiple categories.	Metadata: Update catalog metadata if new categories are required. Data: Bulk product-category relationships, and new catalog entries.	In the target org, make sure that baseline metadata is created. Validation: Confirm that sample SKUs appear in the correct categories. Perform a regression test of the catalog navigation.

Table 4: Catalog, Categories & Related Products: Incremental Deployment Scenarios

Scenario	Impact	Validation and Dependencies
Add New Category	Metadata: Update category hierarchy metadata	Parent catalog must exist in the target org.

Scenario	Impact	Validation and Dependencies
Add the Security Services category under the existing catalog.	Data: Create category record, and link products	Validation: Confirm that products appear under the new category in the catalog browser.
Category Reorganization Move products from the Hardware category to the Accessories category.	Metadata: Update category hierarchy and associations. Data: Update category-to-product mappings.	Validation: Validate that moved products appear only in the new category and that the old category is clean.
Product Retirement from Category Remove retired products from catalog and related category.	Metadata: Update product visibility settings. Data: Update product-category relationships.	Validation: Validate that the products aren't visible in the category browser or guided selling.
Seasonal Category Introduce a temporary Holiday Deals category.	Metadata: Configure the category (and time-based visibility if applicable). Data: Establish product-category relationships with seasonal tag.	Products must exist and be tagged for promotion. Validation: Confirm that the category is visible during the correct time period only. Verify that the correct products are included.

Table 5: Qualification Rules: Full Deployment Scenarios

Scenario	Impact	Validation and Dependencies
Large-Scale Decision Table Migration Introduce 100+ new eligibility conditions, such as new geographies and pricing models.	Metadata: Qualification Rule framework and Expression Set alignment Data: Insert decision tables in bulk.	Perform target org metadata baseline alignment and staging of decision tables for verification. Validation: Regression test eligibility across multiple conditions and customer profiles.
Composite Qualification Rule Combine multiple decision tables and expression sets into a new guided selling path.	Metadata: Create parent qualification rule, and update multiple expression sets. Data: Populate multiple decision tables with new mappings.	All child rules and data mappings must exist in the target org. Validation: Test end-to-end guided selling to confirm the composite flow works correctly.

Table 6: Qualification Rules: Incremental Deployment Scenarios

Scenario	Impact	Validation and Dependencies
New Qualification Rule with Decision Table Create a qualification rule to enforce eligibility for product bundles based on region and customer tier.	Metadata: New qualification rule metadata, and context definition setup	Product catalog and customer tiers must be available in the target org.

Scenario	Impact	Validation and Dependencies
	Data: Populate decision table entries with region and tier mappings	Validation: Create test quotes for each region and tier. Confirm that only eligible products appear.
Update Existing Decision Table Entries Add new conditions to an existing qualification rule such as adding a new country to eligibility.	Metadata: none Data: Update and add rows in decision tables.	Make sure that new values are aligned with the active product catalog. Validation: Confirm that the rule returns the correct product eligibility for the new condition.
Modify Expression Set Change logical criteria from OR to AND in the qualification logic. For example, the customer must be an enterprise and have a support contract.	Metadata: Update expression set definition Data: none	Make sure that the dependent context variable exists. Validation: Confirm both the positive and negative test cases (eligible vs. non-eligible customers).
Context Definition Expansion Add a new attribute to the context (for example, Industry) for use in qualification rules.	Metadata: Add field reference in context definition Data: None (until data is mapped into a decision table)	Ensure that the Industry field exists and is populated. Validation: Test that qualification rules can read Industry context during quote creation.
Retirement of Qualification Rule Deactivate old eligibility rule no longer needed such as a legacy discount program.	Metadata: Update rule status to inactive, and remove references from related expression set. Data: Remove or disable related decision table entries.	Make sure that the rule isn't referenced by other bundles or flows. Validation: Confirm that the retired rule no longer impacts guided selling or product selection.

Salesforce Pricing

Table 7: Pricing: Incremental Deployment Scenarios

Scenario	Impact	Validation and Dependencies
Pricing Update Update base license cost by +5% for existing products.	Metadata: None (if there are no new rules) Data: Update price book entries and adjust discount tiers.	Make sure that no dependent contracts reference the old pricing. Validation: Generate a quote with the updated product. Confirm that pricing reflects the new value. Confirm no impact to active contracts.
Promotional Discount Introduce a three-month promotional discount for enterprise customers.	Metadata: New time-based pricing rule and approval process update.	Approval workflow for discount must be active

Scenario	Impact	Validation and Dependencies
	Data: Create a discount schedule and promo product entry.	Validation: Confirm that the discount applies only during the promotion period and verify that approvals trigger correctly.

Object Deployment Reference

Get to know the object deployment sequence and associated properties.

Product Catalog Management Objects

This table provides the deployment sequence, object types, API names, lookup fields, and data translation requirements for Product Catalog Management objects in Revenue Cloud.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Note: Internal objects aren't accessible.

Object Use Type	Object Name	Object API	Deployment Sequence	Lookup Fields (Foreign Keys)

Industries Common Component Metadata

This table provides the metadata deployment reference for Industries common components in Revenue Management, including setup paths and configuration details.

Type	Label	Setup Path	Details
Setup	Context Service	Context Service > Context Service Settings	Enable
Permission Sets	Permission Sets	Setup > Users > Permission Sets	Data Pipeline User
Permission Sets	Permission Sets	Setup > Users > Permission Sets	Data Cloud Admin
Data Processing Engine (DPE) Definition	datasources -> sourceName	v{}/tooling/sobjects/BatchCalcJobDefinition	Read permission to the user who is creating the Data Processing Engine (DPE) with the data sources and fields.
Data Processing Engine (DPE) Definition	datasources -> sourceName	v{}/tooling/sobjects/BatchCalcJobDefinition	Read permission to the Analytics Integration User with the data sources and fields.
Data Processing Engine (DPE) Definition	writebacks -> targetObjectName	v{}/tooling/sobjects/BatchCalcJobDefinition	Create, update, or delete permission on the targetObjectName object based on the operationType value defined in the writebacks.
Data Processing Engine (DPE) Definition	writebacks -> writebackUser	v{}/tooling/sobjects/BatchCalcJobDefinition	Delete this value if it exists.

Salesforce Contracts Metadata

This table provides the metadata deployment reference for Salesforce Contracts in Revenue Management, including setup paths and configuration details.

Type	Label	Setup Path
Flag	Document Templates Export	Setup > Document Generation > General Settings
Setup	Context Service	Context Service > Context Service Settings > Context Definitions

Additional Deployment Information

Get to know additional deployment information for each Revenue Management feature domain, ensuring successful deployments and migrations.

Product Catalog Management Additional Information

Get to know additional deployment information for Product Catalog Management in Revenue Cloud, including active or inactive states, object information, and migration considerations.

Object-Specific Information

Object Name	Object API	Notes
Product Qualification	ProductQualification	• Considerations for Migrating Decision Tables • Considerations for Migrating Expression Sets • Migrate Context Definitions
Product Disqualification	ProductDisqualification	• Considerations for Migrating Decision Tables • Considerations for Migrating Expression Sets • Migrate Context Definitions
Product Category Qualification	ProductCategoryQualification	• Considerations for Migrating Decision Tables • Considerations for Migrating Expression Sets • Migrate Context Definitions
Product Category Disqualification	ProductCategoryDisqual	• Considerations for Migrating Decision Tables • Considerations for Migrating Expression Sets • Migrate Context Definitions

Other Information

- All product data (product, class, product attributes, attributes, picklist, catalog, categories, and so on) definitions must be active to appear in the sales channels.
  - These definitions need not be deactivated in the target to propagate updates as part of an org-to-org deployment. Exceptions are qualification rules that use decision tables, expression sets, and context definitions. The definitions in the target org must be deactivated to promote changes.
- Use the Full Index Rebuild to rebuild the entire search index, when enabling the feature for the first time, or changing the index settings. Use the Partial Index Rebuild to update recent changes to products and categories assignment. For more information about indexing products, see Manage Your Product Index.

  - If indexing is enabled in source but not enabled in the target, then while deploying the indexing flag (enable indexed product=true), the Full indexing must be run on the target org before the feature flag can be enabled.
- Migrating qualification rules records requires refreshing Qualification Rules Decision Table definitions (Product and Category Qualification and Disqualification Decision Tables).
- Migrating price book Entries requires Decision Table refresh for Product Discovery to show list price.
- Core to Near Core Sync Processes—Configure Product Catalog Management Cache in the new org to populate the product details cache, essential for large-scale implementations.
- Cross-Module Synchronization—Synchronization of catalog date to Constraint Modeling Language (CML) to support constraint rules.
- Incremental Changes and cohesive Sync (Recommended)—Depending on the deployment scenario, for example, new or changed product, new or changed price, new price book, new or changed rules, and so on.

Salesforce Pricing Additional Information

Get to know additional deployment information for Salesforce Pricing in Revenue Management, including active or inactive states, object information, and migration considerations.

Object-Specific Information

Object Name	Object API	Notes
Attribute Based Adjustment	AttributeBasedAdjustment	• Considerations for Migrating Decision Tables • Considerations for Migrating Expression Sets • Migrate Context Definitions
Price Adjustment Tier	PriceAdjustmentTier	• Considerations for Migrating Decision Tables • Considerations for Migrating Expression Sets • Migrate Context Definitions
Bundle Based Adjustment	BundleBasedAdjustment	• Considerations for Migrating Decision Tables • Considerations for Migrating Expression Sets • Migrate Context Definitions
Product Price Range	ProductPriceRange	• Considerations for Migrating Decision Tables • Considerations for Migrating Expression Sets • Migrate Context Definitions

Other Information

- You need active context definitions for pricing recipes. A pricing recipe is marked as default in an org. A System Admin can access the PricingRecipe object whereas a Pricing Admin can't access this object internally. You can't create or update fields of a PricingRecipe object.
- You must activate decision tables and pricing procedures.
- You need a refresh of the decision table for any new or modified records. For example, any modification in price book entries requires a refresh of the Price Book Entries decision table.
- You must migrate the Apex class if Apex is selected for Procedure Plan definitions. See Customize Your Procedure Plans with Apex Hooks.
- You can't delete a standard price book. A price book can be deleted after all references are removed. Instead, set the price book to Inactive status.
- If you delete a price adjustment schedule, all associated data is deleted without any warning or error messages. The adjustment method and status of a price adjustment schedule aren't considered for resolution. If you edit or delete an active price adjustment schedule, an error is thrown.
- The EffectiveFrom and EffectiveTo field values of a price adjustment tier, attribute-based adjustment, and bundle-based adjustment must be within the EffectiveFrom and EffectiveTo field values.
- Product and product selling model must be a part of the product selling model option before you create values in a price book entry.
- You can't delete an inactive or active product selling model. You can delete a draft product selling model by deleting all references. You can't change status from Active or Inactive to Draft.
- You can't edit a product price range after you've created it. Enable price tracking to edit a product price range.
- Salesforce Pricing doesn't consider the Active status of a price book when fetching the values. Also, it doesn't consider the validity date ranges of a price book.
- The pricing term and pricing term unit of a price adjustment tier aren't considered for resolution.
- The IsActive field of a price book entry and price adjustment schedule aren't considered for resolution.

Salesforce Pricing Migration Scenarios

Review these considerations to understand the Salesforce Pricing data migration process along with migration order and prerequisites.

Here are the possible migration scenarios.

- One sandbox org to another sandbox org
- Sandbox org to production org

To migrate pricing procedures, see Export and Import Procedure Plans.

To import and export pricing data, see Considerations for Importing and Exporting Pricing Data. Keep these considerations in mind for first-time migration.

First-Time Migration

- You must migrate metadata in this specific sequence to ensure a successful deployment.
  - You must migrate context definitions before any pricing procedures. If multiple pricing procedures are linked to various context definitions, include all associated definitions in the migration.

- You must deploy all decision tables (DTs) before you migrate the pricing procedures that reference them.
- Pricing recipe migration also migrates the associated default pricing procedure.

- You must manually refresh decision tables after migration within the target environment to make sure that the data is updated and active. If a decision table migration encounters missing metadata, such as a custom field or element, the deployment fails.
- You must manually update any pricing procedure constants that contain reference sandbox org IDs to the corresponding production org IDs. This step is required before migration to avoid logic failures in the production environment.
- You must manually update the price adjustment schedule IDs in the pricing procedure constants of the production org before or after migration.

Subsequent Production Migrations

- You must migrate context definitions before you migrate pricing procedures. If multiple pricing procedures are linked to various context definitions, then you must migrate all associated metadata to ensure system integrity.
- You must migrate decision tables along with any relevant metadata changes. If a decision table migration fails, the system must roll back to the previous snapshot, making sure that the existing decision tables are usable.
- You must migrate pricing procedures and expression set versions after the successful deployment of context definitions, decision tables, and pricing recipes in a sequential order.

Product Configurator Additional Information

Get to know additional deployment information for Product Configurator in Revenue Cloud, including active or inactive states, object information, and migration considerations.

Object-Specific Information

Object Name	Object API	Notes
Product Configuration Rule	ProductConfigurationRule	ProductConfigurationRule has a Binary Large Object (BLOB) for the rule content. ConfigurationRuleDefinition contains a JSON with the rules details. The BLOB references product IDs, which can't be migrated as is. You must use the npm migration utility for the migration. ProductConfigurationRule has a status field.
Product Configuration Flow	ProductConfigurationFlow	ProductConfigurationFlow has a status field. You don't require an API to set the status.
ExpressionSetConstraintObj	ExpressionSetConstraintObj	The ExpressionSet for Constraints has a status field. The ReferenceObjectId lookup field is polymorphic and references object IDs.

Other Information

- You can't update rules in active status.
- Product catalog management data must be migrated before the associations (ExpressionSetConstraintObj) are migrated and before the Business Rules Engine rules (ProductConfigurationRule) are migrated. When updating an Expression Set (Constraint Model), the target must be deactivated.
- Cross-Module Synchronization—Constraint Modeling Language (CML) and Business Rules Engine rules both reference product catalog management data. This data must be migrated before the business rules or the constraint rules.
- These components have dependencies on Industries common features.
  - Business Rules Product Configuration Rules—Business Rules Engine and Context Service
  - Constraint Builder Product Configuration Rules—Expression Set and Context Service
  - Product Configurator—Flow

In a future version of this guide, we plan to add information for moving Constraint Modeling Language (CML) code and related expression sets.

Dynamic Revenue Orchestrator Additional Information

Get to know additional deployment information for Dynamic Revenue Orchestrator (DRO) in Revenue Management, including active or inactive states, object information, and migration considerations.

RuleSet API Naming Pattern

In API version 67.0 and later, RuleSet API naming is decoupled from the parent record ID and uses a global key (UUID). This naming pattern removes the pre-commit dependency on record IDs and enables condition JSON processing during INSERT operation for records.

Existing RuleSet records that use the legacy record ID-based naming patterns keep their original API naming pattern and aren't automatically renamed. Legacy and current naming patterns can coexist in the same org. No mandatory migration is required solely to normalize RuleSet API names.

Special Fields

- These objects use a large text field to contain a JSON representation of Dynamic Revenue Orchestrator (DRO) condition data, backed up by internal Business Rules Engine (BRE) RuleSet objects.
  - FulfillmentStepDefinition
    - ExecuteOnConditionData. This is related to ExecuteOnRule field (RuleSet reference).
    - ResumeOnConditionData. This is related to ResumeOnRule field (RuleSet reference).
  - ProductFulfillmentScenario
    - ConditionData. This is related to ScenarioRule field (RuleSet reference).
  - ProductFulfillmentDecompRule
    - ConditionData. This is related to ExecuteOnRule field (RuleSet reference).
  - FulfillmentTaskAssignmentRule
    - ConditionData. This is related to Condition field (RuleSet reference).

- Condition JSON fields support full lifecycle behavior for global key-based naming pattern records. You can provide condition JSON at insert, modify it through updates, and remove it to delete associated RuleSet artifacts where applicable. Here are the details for each operation type.
  - You can create the record and provide condition JSON in the same transaction, including bulk operations.
  - When you change condition JSON, the related RuleSet reference and runtime evaluation logic are updated.
  - When you remove condition JSON, the related RuleSet artifacts are deleted where applicable, including resume on rule scenarios.

Object-Specific Information

Object Name	Object API	Notes
Product Fulfillment Decomposition Rule	ProductFulfillmentDecompRule	
Fulfillment Step Definition	FulfillmentStepDefinition	
Product Fulfillment Scenario	ProductFulfillmentScenario	
Fulfillment Task Assignment Rule	FulfillmentTaskAssignmentRule	
Fulfillment Fallout Rule	FulfillmentFalloutRule	After migration, refresh the related Decision Tables.
Orchestration Plan Context Mapping	OrchestrationPlanCtxMapping	This setup object is always active after creation. Here are some considerations. • The object must have an active context definition to create the mapping. • The context definition must remain active for the mapping to be valid. • Context nodes or referenced mappings must exist in the active context definition version.

Other Information

- Migration Prerequisites
  - When DRO is enabled in a new org, the system provides an built-in library named as DRORuleLibrary. See Dynamic Fulfillment Orchestrator Settings.
  - Context rules library is Active with `Usage Type=Dfo` and is linked with Sales Context Definition.
  - The active rule library version must point to the context definition currently configured in the DRO Admin settings. If you change the context definition in the settings, you must create a new rule library version that links to the new definition and activate it.

    When creating a version, you must clone from the latest rule library version. If you clone from an older version instead of the latest, any rule sets created in the latest version is lost in any other newly created version. This leads to evaluation errors where rules evaluate to `false` as the engine is unable to find the rule set in the active library.

    When moving to a new version, you must first deactivate the older version and then activate the cloned version.
  - Context definitions must have the necessary nodes, mappings, and context tags used in rule sets.

  - DRO rules include Product Fulfillment Decomposition Rule, Fulfillment Step Definition, Product Fulfillment Scenario, and Fulfillment Task Assignment Rule objects. To migrate DRO rules or scenarios, make sure the AttributeDefinition and AttributePicklistValue records are referenced in condition data fields by attribute code and picklist value name in the org before migration. The code value is defined in product management records.
  - The SourceAttributeIdentifier and DestinationAttributeIdentifier fields of a ProductDecompEnrichmentRule record can include attribute IDs from the source org, leading to invalid references in the target org. Refresh the identifier fields by saving the ProductDecompEnrichmentRule records again. You can also set the identifier fields to null during migration to make sure that they auto-populate correctly.
  - Before you can migrate the Product Fulfillment Decomposition Rule, Fulfillment Step Definition, Product Fulfillment Scenario, and Fulfillment Task Assignment Rule objects with their related child records, several other key records must exist in the target Salesforce org. Migrating these records first is crucial to maintain data integrity and to make sure that the relationships are correctly established in rules.

    Here are the required records in the target org as per the required migration sequence.

    - Products (Product2)—The top-level ProductFulfillmentDecompRule record is directly linked to a specific product via the ProductId field. You can't create the rule without associating it with an existing product record.

      Make sure that the Product2 records in the source and target orgs can be uniquely identified. For example, use a custom external ID field such as GlobalKey__c or any other ExternalId field, or use the standard ProductCode field.

    - Attribute Definitions (AttributeDefinition)—The ProductDecompEnrichmentRule records, which are children of the decomposition rule, use attribute definitions to specify which product attributes to use for enrichment or transformation. These rules reference AttributeDefinition records in fields, such as SourceAttributeDefinitionId and TargetAttributeDefinitionId. DRO Condition Data fields and rule sets use AttributeCode values in Condition Expressions.

      Attribute Definitions must be migrated before the enrichment rules to make sure that the lookup relationships are resolved successfully. Attribute Code values must be defined as these values are used in DRO Conditions as unique identifiers for attribute-type expressions.

    - Attribute Definition Picklist Values (AttributePicklistValue)—The ValTfrm (Value Transform) records, which are used for mapping and transforming data, often rely on picklist values defined in the AttributePicklistValue object. These records define the specific values used in the transformation logic. DRO Condition Data fields and rule sets use AttributeCode values in Condition Expressions.

      If your transformation rules involve picklist fields, you must migrate the corresponding AttributePicklistValue records first.

- DRO Rules and Scenario Migration
  - Internal rule set tables may contain attribute ID values, which are the Salesforce IDs of the relevant AttributeDefinition records of the Product or Product Classification.
  - DRO stores rule set-related data in string representation with AttributeDefinition. During migration, the JSON representation of a rule set uses Attribute Code as the natural key to resolve AttributeDefinition records and set as key in internal rule set tables. As a prerequisite, make sure that attribute code values are populated and consistent in both the source and target orgs before you migrate DRO rules.
  - Rule sets also contain attribute picklist values in condition expressions. The AttributePicklistValue records of the associated AttributeDefinition records must exist in target org before you migrate DRO rules.
  - In API version 67.0 and later, you can insert DRO rule and scenario records with condition JSON in one transaction, including bulk inserts, when prerequisites are satisfied.
  - Deleting a DRO parent record also deletes related RuleSet and rule artifacts to prevent orphan records. If condition JSON is removed from a record, related RuleSet artifacts are also removed where applicable.
- After Migration:

- Refresh the Decision Tables (DT) used by DRO Fallout Management—Migrating the Fulfillment Fallout Rules records requires a refreshed Fallout Rules DT definition.
- Refresh DTs used by DRO Jeopardy Management—Migrating the Fulfillment Step Jeopardy Rule records requires a refreshed Fulfillment Step Jeopardy Rule DT definition.
- Activate technical products in your target org as part of your deployment.

- These components have dependencies on specific features.
  - Enrichment Rule—Expression Set
  - Decomposition Rule with condition—Business Rules Engine Context Rule and Context Service
  - Callout step—Integration Definition
  - Autotask step—Flow
  - Manual Task step—Queue
  - Product Fulfillment Scenario with condition—Business Rules Engine Context Rule and Context Service

Bulk API 2.0 and Bulk API Developer Guide: Introduction to Bulk API 2.0 and Bulk API

Usage Management Additional Information

Get to know additional deployment information for Usage Management in Revenue Management, including active or inactive states, object information, and migration considerations.

Object-Specific Information

Object Name	Object API	Notes
Rate Card	RateCard	• Considerations for Migrating Decision Tables • Considerations for Migrating Expression Sets • Migrate Context Definitions
Price Book Rate Card	PriceBookRateCard	• Considerations for Migrating Decision Tables • Considerations for Migrating Expression Sets • Migrate Context Definitions
Product Usage Resource	ProductUsageResource	Effective end date can be extended in Active state.
Rate Card Entry	RateCardEntry	• Considerations for Migrating Decision Tables

Object Name	Object API	Notes
		• Considerations for Migrating Expression Sets • Migrate Context Definitions • No updates are allowed in Active or Inactive state.
Product Usage Grant	ProductUsageGrant	The Effective End Date can be extended in Active state.
Rate Adjustment By Tier	RateAdjustmentByTier	• Considerations for Migrating Decision Tables • Considerations for Migrating Expression Sets • Migrate Context Definitions
Rate Adjustment By Attribute	RateAdjustmentByAttribute	• Considerations for Migrating Decision Tables • Considerations for Migrating Expression Sets • Migrate Context Definitions
Usage Commitment Asset Related Object	UsageCmtAssetRelatedObj	The RelatedObjectId lookup field is polymorphic.

Other Information

- For Selling (Revenue Cloud Advanced), perform these actions:
  - Confirm that Rates, Grants, and Policies for usage products are set up correctly.
  - Extend and sync the SalesTransaction context definition.
  - Confirm that the pricing procedure is active and set up correctly in Revenue Settings.
  - Refresh Decision Tables (DT) being referred in pricing procedures.
  - Set up and activate the rating discovery procedure.
  - Sync the RatingDiscovery context definition.
  - Refresh all Decision Tables (DTs) being used in the rating discovery procedure.
- For Consumption (Revenue Cloud Billing), perform these actions:
  - Clone and set up the Orchestration Flow.
  - Configure the Data Processing Engine (DPE) jobs.
  - Set up and activate the rating procedure.
  - Sync the Rate Management context definition.
  - Refresh all Decision Tables (DTs) being used in the rating procedure.
- These components have dependencies on Industries common Features:

  - Rating or Discovery Procedures: Expression Set
  - Rating, Discovery, or Selling Journey: Business Rules Engine and Context Service
  - Rating or summary creation: Batch and Data Processing Engine

- After migration, selling and consumption-related object records such as UnitOfMeasureClass, UsageResource, RateCardEntry, ProductUsageResource, ProductUsageGrant must be active before you use it.

For ProductUsageResource and ProductUsageGrant objects, review these considerations.

- You can delete records in Draft or Inactive states. You can't delete a record in Active state.
- After you activate a record, you can extend end date only.
- The applicable status transitions are Draft, Active, and Inactive.

You can edit a RateCardEntry object in Draft status only. You can't edit this object after you've activated it. The applicable status transitions are:

- Draft, Active, and Inactive
- Inactive and Active

Billing Additional Information

Get to know additional deployment information for Billing in Revenue Management, including active or inactive states, object information, and migration considerations.

Object-Specific Information

Object Name	Object API	Notes
Legal Entity	LegalEntity	This object contains a polymorphic field for address.
Billing Policy	BillingPolicy	Activate after Billing Treatment is activated.
Billing Treatment	BillingTreatment	Activate after Billing Treatment Item is activated.
Billing Treatment Item	BillingTreatmentItem	Activate first when activating Billing Policy.
Tax Policy	TaxPolicy	Activate after Tax Treatment is activated.
Tax Treatment	TaxTreament	Activate first when activating Tax Policy.
Tax Treatment	TaxTreatment	Review these considerations for the TaxTreatment object. • Create a tax treatment in Draft or Active status. • While the tax treatment is Active, you can't edit LegalEntity, TaxEngine, TaxCode, ProductCode, IsTaxable, or ShouldUseTaxTreatmentItems. • Status can move among Draft, Active, and Inactive states.

Object Name	Object API	Notes
Payment Term	PaymentTerm	Activate after Payment Term Item is activated.
Payment Term Item	PaymentTermItem	Activate first when activating Payment Term.
Payment Schedule Policy	PaymentSchedulePolicy	Activate after Payment Schedule Treatment is activated
Payment Schedule Treatment	PaymentScheduleTreatment	Activate first when activating Payment Schedule Policy.
Payment Retry Rule	PaymentRetryRule	If `RetryIntervalType` field value is specified, you must also specify values for `IntervalUnit` and `IntervalValue` fields.
Payment Retry Rule Set	PaymentRetryRuleSet	You can't delete or modify the active org-default rule set after the feature is enabled. The org can't have multiple active org-default rule sets.
Tax Treatment Item	TaxTreatmentItem	You can't delete a tax treatment item when the parent tax treatment is active.
Accounting Period	AccountingPeriod	Review these considerations for the AccountingPeriod object. • The StartDate, EndDate, and FinancialYear fields can't be edited if child records exist. • The Name field is auto-populated. • The Status field is mutable. • The TotalAssetsAmount, TotalLiabilitiesAmount, TotalEquitiesAmount, TotalRevenueAmount, and TotalExpensesAmount are derived or read-only fields. • The creation of a record can happen only in Open status. • For AccountingPeriod as a parent record and LegalEntyAccountingPeriod as a child record, the status of the parent record must be Open when the child is created. The parent record can't close if any non-closed child record exists. The parent fields, such as StartDate, EndDate, or FinancialYear, become immutable if any child record exists.

Object Name	Object API	Notes
Billing Arrangement	BillingArrangement	Review these considerations for the BillingArrangement object. • You can create a billing arrangement only in Draft status. • Before you activate it, add at least one billing arrangement line. • You can't change ShouldBillRemainderToAccount field after the billing arrangement is linked to a billing schedule group. • Status can move among Draft, Active, and Inactive states.
Billing Arrangement Line	BillingArrangementLine	Review these considerations for the BillingArrangementLine object. • You can't insert or update a line while the parent billing arrangement is in Inactive status. • You can delete a line only when the parent billing arrangement is in Draft status.
Billing Milestone Plan	BillingMilestonePlan	Review these considerations for the BillingMilestonePlan object. • Create the plan in Draft status. • Activate only after you add at least one billing milestone plan item. • Updates apply only to lines that use the latest version number. • You can't delete a line that has ShouldBillRemainder field set to `true`. • The related billing treatment must be active before you activate the plan. • At least one billing milestone plan item must exist before activation. • While the plan is active, you can't edit ReferenceItem, ExternalReference, ReferenceItemAmount, BillingTreatment, Name, or Description fields. • You can't change ReferenceItem or ExternalReference fields after the plan is linked to a billing schedule.

Object Name	Object API	Notes
		• Status can move among Draft, Active, and Inactive states. • The plan must be in Draft status before you can delete it.
Billing Milestone Plan Item	BillingMilestonePlanItem	Review these considerations for the BillingMilestonePlanItem object. • Create items while the record is in Draft status. • The parent billing milestone plan must stay in Draft status while you create, update, or delete items.
General Ledger Account	GeneralLedgerAccount	Review these considerations for the GeneralLedgerAccount object. • You can't edit LegalEntity after the account is tied to a general ledger account assignment rule. • This object doesn't use status transitions. • A general ledger account assignment rule can be active only when both a credit and a debit general ledger account are set.
General Ledger Account Assignment Rules	GeneralLedgerAcctAsgntRule	Review these considerations for the GeneralLedgerAcctAsgntRule object. • While the rule is active, you can't edit the debit account, credit account, or currency fields. • Status can move from Inactive to Active states. • The rule can be active only when both a credit and a debit general ledger account are present.
General Ledger Journal Entry Rule	GeneralLedgerJrnlEntryRule	Review these considerations for the GeneralLedgerJrnlEntryRule object. • You can't edit the journal entry rule while its general ledger account assignment rule is active. • This object doesn't use status transitions.

Object Name	Object API	Notes
		• The credit account, debit account, and assignment rule must belong to the same legal entity.
Legal Entity Accounting Period	LegalEntityAccountingPeriod	Review these considerations for the LegalEntityAccountingPeriod object. • After creation, you can't change the AccountingPeriod or LegalEntity fields. • The Name and CurrencyIsoCode fields are auto-populated. • You can change status according to the product's transition rules. For example, Open to Pending Closure, Pending Closure to Closed or Error, Closed to Pending Reopen, and related paths for Reopened and Error. • The TotalAssetsAmount, TotalLiabilitiesAmount, TotalEquitiesAmount, TotalRevenueAmount, and TotalExpensesAmount fields are derived or read-only. • The ClosureStage field is read-only. • Create a record only when the status is Open. • When `AccountingPeriod` record is the parent and `LegalEntityAccountingPeriod` is the child record, the parent record must be Open when the child record is created. The parent record can't close if any child record is still open. The StartDate, EndDate, and FinancialYear fields on the parent record can't be edited if any child record exists. • When `LegalEntity` record is the parent record, it must be active when the child record is created. It can't move to Inactive status when any child accounting period is open. • For `LegalEntityAccountingPeriod` as parent record and `GeneralLdgrAcctPrdSummary` as child record, the parent can't be

Object Name	Object API	Notes
		deleted if children exist. Children can be created or updated only when the parent is Open or Reopened. Child summary records can't be deleted.
Payment Schedule Treatment Detail	PaymentScheduleTreatmentDtl	Review these considerations for the PaymentScheduleTreatmentDtl object. • While the parent payment schedule treatment is Active, Inactive, or Canceled, you can't change the InstallmentPaymentType, Percentage, ProcessingDateReference, DateOffset, PaymentMethodSelectionType, PymtSchdDistributionMethod, or PaymentRunMatchingValue fields. • Create a detail record only when the parent payment schedule treatment is in Draft status. • Delete a detail record only when the parent payment schedule treatment is in Draft status.

Other Information

- Data pipeline must be enabled before enabling Billing.
- Order to Billing Schedule Flow must be copied from the template and activated.

Business Rules Engine and Decision Tables Additional Information

Get to know additional Revenue Management deployment information for Industries common features such as Business Rules Engine, Expression Sets, and Decision Tables.

Object-Specific Information

Object Name	Object API	Notes
Expression Set Definition	ExpressionSetDefinition	Only call the setup object via Metadata API to get child setup objects.
Expression Set Definition Version	ExpressionSetDefinitionVersion	Only call the setup object via Metadata API to get child setup objects.
Rule Library	RuleLibrary	Not supported by Metadata API.
Rule Library Version	RuleLibraryVersion	Not supported by Metadata API.

Helpful Links

- Considerations for Migrating Expression Sets
- Migration of Expression Sets with Dependencies

Deployment Considerations

- Initial Deployment—Expression Sets Decision Tables can be deployed in any state during their first deployment to a target org.
- Subsequent Updates—To update an expression set that exists in the target org, migrate a new expression set version with the updates. You must not update the existing active version.
- When deploying an active decision table, it goes through activation again in the target org and may fail if the required custom object isn't present in the target org.
- Two expression set versions of the same parent expression set can't have the same rank, regardless of the `Draft` or `Active` states. In this case:
  - Create an expression set version in the source org with the updates.
  - Activate the new version in the source org.
  - Then, migrate the new version or the entire expression set to the target org.
  - The migrated expression set version is invoked in the target org as per the specified rank.
  - Migration fails if the target org contains an expression set version with the specified rank.
- Activate and refresh of decision tables after deployment.
- Activate sub expressions after deployment.
- Dynamic rules are stored in platform objects, and not in setup objects. There's no platform support for deploying dynamic rules.

Dependencies

- Industries common features can have dependencies among themselves. For example, expression sets can have sub expressions and reference decision tables or context definitions. Decision Tables can have a dependency on a custom object, and so on.
- For a deployment to be successful, all dependent components must be migrated correctly before the expression set version itself.
- You must migrate dependencies before the expression sets that reference them. If there are nested dependencies, you must migrate the lowest-level components first. Here's a general deployment order.
  - Standard and custom objects
  - Context Definitions, Decision Tables, Decision Matrices, Object Aliases, and Explainability Message Templates
  - Sub Expression Sets
  - Parent Expression Set Version

Other Information

- Both Expression Set and Decision Matrix have versioned objects.
- Decision Tables don't have versions.

Context Service Additional Information

Get to know additional deployment information for Context Service in Revenue Cloud.

Helpful Links

- Migrate Context Definitions

Deployment Considerations

- Context tags and individual sObject mappings must be unique for every definition.
- Deployment can lead to conflict if there are multiple tags with the same name, or if there are multiple mappings to the same sObject and sObject fields.
- Standard definitions are versioned and new changes must have a higher version than the version, which is available in the org.
- You can deploy updates that introduce new custom nodes, attributes, and their corresponding mappings to existing context definitions.
- Deployments that modify (update or delete) existing custom mappings for context definitions in an activated or a deactivated state are supported.

Unsupported Deployment Scenarios

- Deploying context definitions from the current release to an older release is not supported.
- Modifying custom nodes and attributes for context definitions that are in a deactivated state aren't supported. To make changes, replicate your desired modifications manually on the target context definition. You can also delete the context definition on the target org and deploy again.
- Modifying standard nodes and attributes for context definitions that are in an activated state isn't supported. To make changes, deactivate the definition on the target org first, make your desired modifications, and then activate the context definition again.
- You can't activate or deactivate an active context definition as an action within a deployment package. Activation or deactivation must be performed as a separate, manual step outside the deployment process.
- You can't make a context mapping default or non-default as an action within a deployment. Changing the default status of context mappings must be done as a separate, manual step.

Data Processing Engine Additional Information

Get to know additional deployment information for Data Processing Engine in Revenue Cloud.

Deployment Considerations

- Data Processing Engine objects have `Draft` and `Active` states.
- The objects must be created in `Draft` state and activated later. The activation is done through API.
- Configuration can't be changed after an object is updated to `Active` state.
- Set the state of the object to `Inactive` for any modifications, and then set the state to `Active`.

Other Information

- Data Processing Engine has dependencies on these components.
  - CRM Analytics or Data Cloud
  - Bulk API

- You can deploy Data Processing Engine definitions from one organization to another. Both organizations must be on the same Salesforce release version.

Salesforce Contracts Additional Information

Get to know additional deployment information for Salesforce Contracts in Revenue Cloud, including active or inactive states, and migration considerations.

Document clauses can be in different states, such as Draft, In Approval, Active, and Archived. Keep these considerations in mind regarding the clause statuses.

- A clause is created in Draft status.
- During the import process, the clause must be in Draft status. You can update the status after you complete the import process.
- An archived clause can't be updated.
- An active clause can't be updated, but it can change to Draft status only if it's not used.
- An active clause must be moved to Draft status before you update it to Active status.

Clause Migration Considerations

Clause migration is a prerequisite for Microsoft 365 template migration. Review these considerations to understand how clause structure, versions, and relationships must exist in the target org before migrating document templates.

Clause Validations and Migration Constraints

Validation rules, data model constraints, and known migration behaviors that affect clause records during migration. Review this reference to understand sequencing, status handling, and dependency requirements that can impact migration success.

Clause Migration Considerations

Clause migration is a prerequisite for Microsoft 365 template migration. Review these considerations to understand how clause structure, versions, and relationships must exist in the target org before migrating document templates.

Clause migration prepares the target org with all required clause data so that template migration can resolve clause references correctly. Clause records don't retain source org record IDs during migration. Instead, template migration resolves references based on clause attributes and relationships that already exist in the target org.

Clause migration requires careful sequencing and coordination because clause records enforce strict validation rules around status, hierarchy, and versioning.

Microsoft 365 template migration requires all clause records, clause categories, and related clause sets to exist in the target org.

During template migration, clause references resolve in the target org by matching this combination of attributes. Make sure that the target org contains clauses with the exact attribute values referenced by the Microsoft 365 template.

- ClauseSetName
- ClauseName
- ClauseVersion
- ClauseLanguage

If a referenced clause is missing in the target org, template migration stops to prevent broken references. This alignment helps maintain template integrity and reduces the need for manual corrections after migration.

Migrate clause-related objects separately by using a data migration tool, such as Data Loader.

Migrate the three document clause objects in the required order.

- Clause Category Configuration
- Document Clause Set
- Document Clause

Important: Avoid modifying clause data in the target org after migration to prevent mismatches between source and target.

Avoid modifying clause data in the source org after exporting clause data and before Microsoft 365 template migration to prevent reference mismatches.

Clause Category Configuration

Clause Category Configuration is a setup object that you migrate by using metadata deployment tools, such as Package Manager, and Salesforce CLI. Migrate all clause categories referenced by your clause sets.

Clause Set

Clause sets must be migrated before you can migrate clauses. This needs to be either created explicitly on the target org or migrated from the source org by using data migration utilities. Resolve these clause category configuration references to IDs on the target org in your export set before you migrate.

- `CategoryReferenceId`—Replace with the mapped ID obtained from clause category migration
- `Category`—This is a 15-character ID of the clause category. Update CategoryReferenceId by removing the last three characters.

For iterative migrations, use upsert operation to update existing clause sets and insert newly created clause sets since the previous migration.

Clause

Migrate clause category configuration and clause sets before initiating clause migration. Resolve the clause set references (DocumentClauseSet) to the IDs on the target in your export set before migrating.

Important: All clauses are inserted only in Draft status, regardless of their source status. Run a subsequent migration that includes status mapping to update the clauses to the correct status. See Clause Status Mapping During Migration on page 66.

First-Time Migration

Use this approach when migrating clause data for the first time from the source org to the destination org for Microsoft 365 template migration. Clauses enforce validation rules that affect insert and update operations during migration.

- Insert main clauses before alternate clauses.
- Clauses are inserted in Draft status. Run a subsequent migration to update the clause status. See Clause Status Mapping During Migration on page 66 for details on how clause statuses are applied and updated.

Iterative Migration

Use iterative migration when clause data exists in the target org and you must migrate updates or newly created clauses from the source org. Track the timestamp of the last successful export and migrate only records that were created or updated after that timestamp. This approach avoids validation failures when attempting to update unchanged clauses, especially clauses in Archived status.

- Migrate clause records that were modified after the last export timestamp and created on or before the last export timestamp. This step migrates only updated records and preserves the correct status for existing clauses before introducing new draft versions.

- Migrate main clause records that were created after the last export timestamp. Clauses are inserted in Draft status. Run a subsequent migration to update the clause status. See Clause Status Mapping During Migration on page 66 for details on how clause statuses are applied and updated.
- Migrate alternate clause records that were created after the last export timestamp. Clauses are inserted in Draft status. Run a subsequent migration to update the status.

Clause Validations and Migration Constraints

Validation rules, data model constraints, and known migration behaviors that affect clause records during migration. Review this reference to understand sequencing, status handling, and dependency requirements that can impact migration success.

Clause Migration Validations

These validations apply during insert, update, and delete operations on clause records. Operations fail when a validation is violated.

Operation	Validation	Description
Insert	Draft-only creation	Allows only Draft clauses during initial insert operations.
Insert	Version conflict prevention	Prevents inserting a clause when a Draft version exists for the same clause.
Insert	Clause set requirement	Requires each clause to reference a valid DocumentClauseSet that exists in the target org.
Insert	Main and alternate clause hierarchy	• Requires an existing main clause before inserting alternate clauses and allows only one main clause per clause group. • Allows only one main clause per language within a clause set, and allows multiple alternate clauses for the same language.
Update	Restricted fields	Prevents updating the DocumentClauseSet, Language, IsAlternateClause, and Version fields after clause creation.
Update	Status transition rules	Allows changing an Active clause only to Draft (without modifying other fields) or to Archived.
Update	Archived clause immutability	Prevents updates to Archived clauses.
Update	Content requirement for activation	Requires clause content before changing status to Active.

Operation	Validation	Description
Delete	Status-based deletion	Allows deletion of Draft and Archived clauses only.
Delete	Main clause protection	Prevents deleting a main clause while alternate clauses still exist.

Clause Status Mapping During Migration

Clauses insert only in Draft status, regardless of their source status. Run a subsequent migration with status mapping to update the clause statuses. For example, a clause in the source org has three versions: Version 1 is Archived, Version 2 is Active, and Version 3 is Draft. When the clause is inserted, all three versions are created in Draft status in the target org. Perform a follow-up upsert migration with status mapping to align each clause version with its source org status.

Source Org Status (Pre-Migration)	Guidance
Archived	Archived clauses insert as Draft. Run a subsequent migration with status mapping to restore the Archived status. After a clause is archived, you can't change its status.
Active	Active clauses insert as Draft. Run a subsequent migration with status mapping to restore the Active status.
Draft	Draft clauses insert as Draft, so no status change is required.
In Approval	You must not migrate In Approval clauses because their workflows don't migrate. However, if In Approval clauses are migrated, they're inserted in Draft status, and the approval process must be reinitiated from the UI.

Clause Migration Constraints

These constraints describe behavioral rules, sequencing requirements, and tooling limitations that affect clause migration, especially during iterative and incremental migrations.

Category	Constraint	Description
Tooling	No automated migration	Requires that you use supported data migration tools, such as Data Loader, because no automated clause migration utility exists.
Tooling	Authentication requirements for Data Loader	Requires OAuth-based authentication. Enforcing OAuth, Proof Key for Code Exchange (PKCE), or IP restrictions requires completing additional connected app and access configuration.

Category	Constraint	Description
Data Model	Clause category limitations	Prevents adding custom fields to Clause Category Configuration because it's a setup object.
Data Model	Manual ID creation	Creation of an external ID field in the target org to store source org IDs for upsert operations on clause sets and clause records.
Data Model	Manual ID mapping	Requires manually mapping clause category IDs between source and target orgs.
Data Dependency	Clause set dependency	Requires clause sets and clause category configuration to exist in the target org before importing clauses.
Iterative Migration	Migration order dependency	Requires that you update existing clauses before you insert newly created clauses. Also, insert main clauses before alternate clauses.
Template Dependency	Missing clause references	Prevents template migration when referenced clauses, versions, or languages don't exist in the target org.
Template Dependency	Duplicate clauses	Can cause clause reference mismatches during template migration when duplicate clauses exist in the target org.
Template Dependency	Office Open XML failures	Can cause template migration to fail when Office Open XML updates fail during document import.

CHAPTER 4 Product Catalog Management

In this chapter ...

Create and manage a product catalog with components, such as attributes, product classifications, simple and bundled products, and rules.

Product Catalog Management

Manage an entire product portfolio with components such as attributes, product classifications, simple and bundled products, and rules.

EDITIONS

Available in: Lightning Experience

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions of Revenue Management

Product Catalog Management Standard Objects

The Product Catalog Management data model provides objects and fields to manage products, rules, and catalogs.

Product Catalog Management Fields on Standard Objects

Product Catalog Management adds standard and custom fields to some standard Salesforce objects. These fields are available only in orgs where Product Catalog Management is enabled. This object is available in API version 60.0 and later.

Product Catalog Management Business APIs

Use primitive APIs of Product Catalog Management that serve catalog definitions to users or applications.

Product Catalog Management Metadata API Types

Metadata API enables you to access some types and feature settings that you can customize in the user interface.

Product Catalog Management Tooling API Objects

Tooling API exposes metadata used in developer tooling that you can access through REST or SOAP. Tooling API's SOQL capabilities for many metadata types allow you to retrieve smaller pieces of metadata.

Product Catalog Management Standard Objects

The Product Catalog Management data model provides objects and fields to manage products, rules, and catalogs.

AttributeCategory

Represents a logical grouping of attributes that can be reused while defining products. Attribute Categories are used for searching and managing product attributes. For example, the "Mobile Handset Properties" category has color, storage and make model, and size attributes. This object is available in API version 60.0 and later.

AttributeCategoryAttribute

Represents a relationship between an attribute category and the attribute definition. This object is available in API version 60.0 and later.

AttrPicklistExcludedValue

Represents the excluded picklist values for a product classification attribute or a product attribute definition. This object is available in API version 61.0 and later.

ProductAttributeDefinition

Represents the relationship between a product and its attributes. This object is available in API version 60.0 and later.

ProductCategoryDisqual

Represents disqualification rules for product categories. The rules determine when the product category doesn't qualify to be displayed to users. This object is available in API version 60.0 and later.

ProductCategoryQualification

Represents qualification rules for product categories. The rules determine when the product category qualifies to be displayed to users. This object is available in API version 60.0 and later.

ProductClassification

Represents a template that holds a collection of dynamic attributes. Product classification is used to quickly define and create multiple products that are similar yet different. This object is available in API version 60.0 and later.

ProductClassificationAttr

Represents the relationship between a product classification and its attributes. This is the default configuration for products based on the product classification. This object is available in API version 60.0 and later.

ProductComponentGrpOverride

Represents override information for a Product Component Group. The cardinality of the product component group can be overridden in the context of a product bundle. This object is available in API version 60.0 and later.

ProductDisqualification

Represents disqualification rules for products. The rules determine when the product doesn't qualify to be displayed to users. The rules are based on user context. This object is available in API version 60.0 and later.

ProductQualification

Represents qualification rules for products. The rules determine when the product qualifies to be displayed to users. The rules are based on user context. This object is available in API version 60.0 and later.

ProductRampSegment

Represents the ramp period within a ramp deal where terms, volumes, and other commitments change over time. This object is available in API version 62.0 and later.

ProductRelComponentOverride

Represents the cardinality overrides for product components in a bundle. This object is available in API version 60.0 and later.

ProductSpecificationRecType

Represents the relationship between industry-specific product specifications and the product record type. This object is available in API version 60.0 and later.

ProductSpecificationType

Represents the type of product specification provided by the user to make the product terminology unique to an industry. A product specification type is associated with a product specification record type. This object is available in API version 60.0 and later.

AttributeCategory

Represents a logical grouping of attributes that can be reused while defining products. Attribute Categories are used for searching and managing product attributes. For example, the "Mobile Handset Properties" category has color, storage and make model, and size attributes. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Product Catalog Management must be enabled to access this object.

Fields

Field	Details
`Code`	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update **Description** The unique code for the attribute category. The maximum size is 80 alphanumeric characters. The code can include the following special characters: @ ! - < > * ? + = % # ( ) / \ & ‘ £ € $ ”.
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** The description of the attribute category that's used only during design time.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the attribute category was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the attribute category was last viewed.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The unique name of the attribute category. The maximum length is 80 characters (of any type).

Field	Details
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The owner of the attribute category. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AttributeCategoryFeed on page 2866
Feed tracking is available for the object.

AttributeCategoryHistory on page 2873
History is available for tracked fields of the object.

AttributeCategoryShare on page 2877
Sharing is available for the object.

AttributeCategoryAttribute

Represents a relationship between an attribute category and the attribute definition. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Product Catalog Management must be enabled to access this object.

Fields

Field	Details
AttributeCategoryId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The ID of the attribute category that the attribute is associated with. The ID is unique within the organization. This field is a relationship field. **Relationship Name** AttributeCategory **Relationship Type** Lookup **Refers To** AttributeCategory
AttributeDefinitionId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The ID of the attribute definition associated with the attribute category. The ID is unique within the organization. This field is a relationship field. **Relationship Name** AttributeDefinition **Relationship Type** Lookup **Refers To** AttributeDefinition
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the attribute category attribute was last referenced.
LastViewedDate	**Type** dateTime

Field	Details
	Properties Filter, Nillable, Sort **Description** The date the attribute category attribute was last viewed.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** A unique name for the attribute. The maximum length is 80 characters (of any type).
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The owner of the attribute category attribute. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AttributeCategoryAttributeFeed on page 2866
Feed tracking is available for the object.

AttributeCategoryAttributeHistory on page 2873
History is available for tracked fields of the object.

AttributeCategoryAttributeShare on page 2877
Sharing is available for the object.

AttrPicklistExcludedValue

Represents the excluded picklist values for a product classification attribute or a product attribute definition. This object is available in API version 61.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Product Catalog Management must be enabled to access this object.

Fields

Field	Details
`AttributeId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the product classification attribute or the product attribute definition of the picklist data type. This field is a polymorphic relationship field. **Relationship Name** Attribute **Relationship Type** Lookup **Refers To** ProductAttributeDefinition, ProductClassificationAttr
`AttributePicklistValueId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the attribute picklist value that's excluded in the product classification attribute or product attribute definition. This field is a relationship field. **Relationship Name** AttributePicklistValue **Relationship Type** Lookup **Refers To** AttributePicklistValue

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the excluded attribute picklist value was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the excluded attribute picklist value was last viewed.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the excluded attribute picklist value.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The owner of the excluded attribute picklist value. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AttrPicklistExcludedValueFeed on page 2866
Feed tracking is available for the object.

AttrPicklistExcludedValueHistory on page 2873
History is available for tracked fields of the object.

AttrPicklistExcludedValueShare on page 2877
Sharing is available for the object.

ProductAttributeDefinition

Represents the relationship between a product and its attributes. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Product Catalog Management must be enabled to access this object.

Fields

Field	Details
`AttributeCategoryId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The ID of the attribute category assigned to the parent object. This field is a relationship field. **Relationship Name** AttributeCategory **Relationship Type** Lookup **Refers To** AttributeCategory
`AttributeDefinitionId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the attribute associated with the product. This field is a relationship field.

Field	Details
	Relationship Name AttributeDefinition **Relationship Type** Lookup **Refers To** AttributeDefinition
`AttributeNameOverride`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The name to display for the attribute when shown for this object. This display name overrides the name on the attribute. For example, the attribute "Color" is overridden to display as "Laptop Color." The maximum size is 255 alphanumeric characters. The name can include these special characters: @ ! - < > * ? + = % # ( ) / \ & ' £ € $ ".
`DefaultValue`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The default value for the product attribute. The attribute value can be changed. This default overrides the default value set for a picklist for the attribute.
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** A description of the attribute definition. The maximum size is 32,000 alphanumeric characters. The description can include these special characters: @ ! - < > * ? + = % # ( ) / \ & ' £ € $ ".
`DisplayType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type to display data for the selected data type. Possible values are: • `CheckBox`—Checkbox

Field	Details
	• `ComboBox`—Combobox • `Date` • `Datetime`—Date Time • `Number` • `RadioButton`—Radio Button • `Slider`—Available in API version 61.0 and later • `Text` • `Toggle`
`HelpText`	**Type** textarea **Properties** Create, Nillable, Update **Description** The help text to display when end users are configuring this attribute. This field overrides the help text defined for the attribute itself.
`IsHidden`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates if this product attribute is hidden from end users in the run time (`true`) or not (`false`). The default value is `false`.
`IsPriceImpacting`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this attribute dictates the price of a product (`true`) or not (`false`). The default value is `false`.
`IsReadOnly`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the attribute is read-only for users in the run time (`true`) or not (`false`). The default value is `false`.

Field	Details
`IsRequired`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this attribute requires a value when assigned to a parent object (`true`) or not (`false`). The default value is `false`.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product attribute was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product attribute was last viewed.
`MaximumCharacterCount`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The maximum number of characters that can be entered for an attribute value.
`MaximumValue`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The maximum value that can be entered as an attribute value.
`MinimumCharacterCount`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The minimum number of characters that can be entered for an attribute value.
`MinimumValue`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The minimum value that can be entered as an attribute value.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the product attribute.
`OverriddenProductAttributeDefinitionId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The ID associated with the overridden product attribute definition. This field is a relationship field. **Relationship Name** OverriddenProductAttributeDefinition **Relationship Type** Lookup **Refers To** ProductAttributeDefinition
`OverrideContextId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The ID associated with the root product record in a bundle. This field is a polymorphic relationship field. **Relationship Name** OverrideContext

Field	Details
	Relationship Type Lookup **Refers To** Product2
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The owner of the product attribute definition. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User
Product2Id	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The product ID associated with the product attribute definition. This field is a relationship field. **Relationship Name** Product2 **Relationship Type** Lookup **Refers To** Product2
ProductClassificationAttributeId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the attribute assigned to the product classification. This field is a relationship field.

Field	Details
	Relationship Name ProductClassificationAttribute **Relationship Type** Lookup **Refers To** ProductClassificationAttr
`Sequence`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The display sequence of the attribute when configuring the product during run time.
`Status`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The lifecycle state of the product attribute definition. Valid values are: • `Active` • `Draft` • `Inactive` The default value is `Draft`.
`StepValue`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The increment or decrement by which a slider's value changes as the user adjusts the product attribute value. Available in API version 61.0 and later.
`ValueDescription`	**Type** textarea **Properties** Create, Nillable, Update **Description** The description of the value assigned to this attribute. This field takes on the value description from the attribute definition.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ProductAttributeDefinitionFeed on page 2866
: Feed tracking is available for the object.

ProductAttributeDefinitionHistory on page 2873
: History is available for tracked fields of the object.

ProductAttributeDefinitionShare on page 2877
: Sharing is available for the object.

ProductCategoryDisqual

Represents disqualification rules for product categories. The rules determine when the product category doesn't qualify to be displayed to users. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Product Catalog Management must be enabled to access this object.

Fields

Field	Details
`CategoryId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The product category associated with the product disqualification record. This field is a relationship field. **Relationship Name** Category **Relationship Type** Lookup **Refers To** ProductCategory
`EffectiveFromDate`	**Type** date

Field	Details
	Properties Create, Filter, Group, Sort, Update **Description** The date from which the disqualification rule for the product category comes into effect.
`EffectiveToDate`	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** The date to which the disqualification rule for the product category ceases to be in effect.
`IsDisqualified`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the product category is disqualified (`true`) or not (`false`) based on the disqualification rules. The default value is `false`.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product category disqualification record was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product category disqualification record was last viewed.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the product category disqualification record.

Field	Details
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the product category disqualification record. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User
Reason	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The reason to disqualify the product category.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ProductCategoryDisqualFeed on page 2866
: Feed tracking is available for the object.

ProductCategoryDisqualHistory on page 2873
: History is available for tracked fields of the object.

ProductCategoryDisqualShare on page 2877
: Sharing is available for the object.

ProductCategoryQualification

Represents qualification rules for product categories. The rules determine when the product category qualifies to be displayed to users. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Product Catalog Management must be enabled to access this object.

Fields

Field	Details
CategoryId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The product category associated with the category qualification record. This field is a relationship field. **Relationship Name** Category **Relationship Type** Lookup **Refers To** ProductCategory
EffectiveFromDate	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** The date from which the qualification rule for the product category comes into effect.
EffectiveToDate	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** The date to which the qualification rule for the product category ceases to be in effect.
IsQualified	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the product category is qualified (`true`) or not (`false`) based on the qualification rules. The default value is `false`.

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product category qualification record was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product category qualification record was last viewed.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the product category qualification record.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the product category qualification record. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ProductCategoryQualificationFeed on page 2866
Feed tracking is available for the object.

ProductCategoryQualificationHistory on page 2873
History is available for tracked fields of the object.

ProductCategoryQualificationShare on page 2877
Sharing is available for the object.

ProductClassification

Represents a template that holds a collection of dynamic attributes. Product classification is used to quickly define and create multiple products that are similar yet different. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Product Catalog Management must be enabled to access this object.

Fields

Field	Details
`Code`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** A unique code for the product classification. The maximum size is 80 alphanumeric characters. The code can include the following special characters: @ ! - < > * ? + = % # ( ) / \ & ‘ £ € $ ”.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product classification record was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product classification record was last viewed.

Field	Details
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the product classification. The maximum length is 80 characters (of any type).
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The owner of the product classification. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User
Status	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The lifecycle status of the product classification. Possible values are: • `Active` • `Draft` • `Inactive` The default value is `Draft`.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ProductClassificationFeed on page 2866
Feed tracking is available for the object.

ProductClassificationHistory on page 2873
History is available for tracked fields of the object.

Sharing rules are available for the object.

ProductClassificationShare on page 2877
Sharing is available for the object.

ProductClassificationAttr

Represents the relationship between a product classification and its attributes. This is the default configuration for products based on the product classification. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Product Catalog Management must be enabled to access this object.

Fields

Field	Details
`AttributeCategoryId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The ID of the attribute category assigned to the parent object. This field is a relationship field. **Relationship Name** AttributeCategory **Relationship Type** Lookup **Refers To** AttributeCategory
`AttributeDefinitionId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the attribute assigned to the parent object.

Field	Details
	This field is a relationship field. **Relationship Name** AttributeDefinition **Relationship Type** Lookup **Refers To** AttributeDefinition
`AttributeNameOverride`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The overridden attribute name to display for the attribute when shown for this object. For example, "Color" overridden to "Laptop Color."
`DefaultValue`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The default value of the attribute for a product based on the product classification. This value can be changed.
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** The description of this product classification attribute definition.
`DisplayType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type to display data for the selected data type. Valid values are: • `CheckBox`—Checkbox • `ComboBox`—Combobox • `Date`

Field	Details
	• `Datetime`—Date Time • `Number` • `RadioButton`—Radio Button • `Slider`—Available in API version 61.0 and later • `Text` • `Toggle`
`ExcludedPicklistValues`	**Type** textarea **Properties** Create, Nillable, Update **Description** The picklist values excluded from the attribute picklist. This field ensures that the product classification attribute only has valid values.
`HelpText`	**Type** textarea **Properties** Create, Nillable, Update **Description** The help text to display when end users are configuring this attribute. This field overrides the help text defined for the attribute itself.
`IsHidden`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates if this product attribute is hidden from end users in the run time (`true`) or not (`false`). The default value is `false`.
`IsPriceImpacting`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this attribute dictates the price of a product (`true`) or not (`false`). The default value is `false`.

Field	Details
`IsReadOnly`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the attribute is read-only for users in the run time (`true`) or not (`false`). The default value is `false`.
`IsRequired`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this attribute requires a value when assigned to a parent object (`true`) or not (`false`). The default value is `false`.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product classification attribute was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product classification attribute was last viewed.
`MaximumCharacterCount`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The maximum number of characters that can be entered for an attribute value.
`MaximumValue`	**Type** string

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The maximum value that can be entered as an attribute value.
MinimumCharacterCount	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The minimum number of characters that can be entered for an attribute value.
MinimumValue	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The minimum value that can be entered as an attribute value.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the product classification attribute.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the product classification attribute owner. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User

Field	Details
`ProductClassificationId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the product classification that the attribute is associated with. This field is unique within your organization. This field is a relationship field. **Relationship Name** ProductClassification **Relationship Type** Lookup **Refers To** ProductClassification
`Sequence`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The display sequence of the attribute when configuring the product during run time.
`Status`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The lifecycle status of the product classification attribute. Valid values are: • `Active` • `Draft` • `Inactive` The default value is `Draft`.
`StepValue`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The increment or decrement by which a slider's value changes as the user adjusts the product classification attribute value. Available in API version 61.0 and later.
`ValueDescription`	**Type** textarea **Properties** Create, Nillable, Update **Description** The description of the value assigned to this attribute. This field takes on the value description from the attribute definition.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ProductClassificationAttrFeed on page 2866
Feed tracking is available for the object.

ProductClassificationAttrHistory on page 2873
History is available for tracked fields of the object.

Sharing rules are available for the object.

ProductClassificationAttrShare on page 2877
Sharing is available for the object.

ProductComponentGrpOverride

Represents override information for a Product Component Group. The cardinality of the product component group can be overridden in the context of a product bundle. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Product Catalog Management must be enabled to access this object.

Fields

Field	Details
`IsExcluded`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the product component group is excluded from the product bundle in the runtime. Excluding a group automatically excludes all child components of the group. The default value is `false`.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product component override record was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product component override record was last viewed.
`MaxBundleComponents`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The maximum number of components that can be added to a group.
`MinBundleComponents`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The minimum number of components that must be added to a group.
`Name`	**Type** string

Field	Details
	Properties Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the overridden product component group.
`OverrideContextId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The root bundle product in whose context the group cardinality is overridden. This field is a polymorphic relationship field. **Relationship Name** OverrideContext **Relationship Type** Lookup **Refers To** Product2
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The owner of the product component group override record. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User
`ProductComponentGroupId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the product component group record. This field is a relationship field.

Field	Details
	Relationship Name ProductComponentGroup **Relationship Type** Lookup **Refers To** ProductComponentGroup

ProductDisqualification

Represents disqualification rules for products. The rules determine when the product doesn't qualify to be displayed to users. The rules are based on user context. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Product Catalog Management must be enabled to access this object.

Fields

Field	Details
`EffectiveFromDate`	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** The date from which the disqualification rule for the product comes into effect.
`EffectiveToDate`	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** The date to which the disqualification rule for the product ceases to be in effect.
`IsDisqualified`	**Type** boolean

Field	Details
	Properties Defaulted on create, Filter, Group, Sort **Description** Indicates whether the product is disqualified based on the disqualification rules (`true`) or not (`false`). The default value is `false`.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product disqualification record was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product disqualification record was last viewed.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the product disqualification record.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The owner of the product disqualification record. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User

Field	Details
ParentProductId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the immediate parent product in the product bundle hierarchy. This field is a relationship field. **Relationship Name** ParentProduct **Relationship Type** Lookup **Refers To** Product2
ProductId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The product for which the disqualification rule is defined. This field is a relationship field. **Relationship Name** Product **Relationship Type** Lookup **Refers To** Product2
Reason	**Type** textarea **Properties** Create, Nillable, Update **Description** The reason to disqualify the product.
RootProductId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the root product in the product bundle hierarchy.

Field	Details
	This field is a relationship field. **Relationship Name** RootProduct **Relationship Type** Lookup **Refers To** Product2

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ProductDisqualificationFeed on page 2866
Feed tracking is available for the object.

ProductDisqualificationHistory on page 2873
History is available for tracked fields of the object.

ProductDisqualificationShare on page 2877
Sharing is available for the object.

ProductQualification

Represents qualification rules for products. The rules determine when the product qualifies to be displayed to users. The rules are based on user context. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Product Catalog Management must be enabled to access this object.

Fields

Field	Details
`EffectiveFromDate`	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** The date from which the qualification rule for the product comes into effect.

Field	Details
EffectiveToDate	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** The date to which the qualification rule for the product ceases to be in effect.
IsQualified	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the product is qualified based on the qualification rules (`true`) or not (`false`). For a product to qualify, this field should be true. The default value is `false`.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product qualification record was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product qualification record was last viewed.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the product qualification record.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description The owner of the product qualification record. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User
ParentProductId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the immediate parent product in the product bundle hierarchy. This field is a relationship field. **Relationship Name** ParentProduct **Relationship Type** Lookup **Refers To** Product2
ProductId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The product for which the qualification rule is defined. This field is a relationship field. **Relationship Name** Product **Relationship Type** Lookup **Refers To** Product2
RootProductId	**Type** reference

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the root product in the product bundle hierarchy. This field is a relationship field. **Relationship Name** RootProduct **Relationship Type** Lookup **Refers To** Product2

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ProductQualificationFeed on page 2866
: Feed tracking is available for the object.

ProductQualificationHistory on page 2873
: History is available for tracked fields of the object.

ProductQualificationShare on page 2877
: Sharing is available for the object.

ProductRampSegment

Represents the ramp period within a ramp deal where terms, volumes, and other commitments change over time. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Product Catalog Management must be enabled to access this object.

Fields

Field	Details
`DurationType`	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The unit of time within which users can try the product for free. Valid values are: • `Days` • `Months`
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product ramp segment was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product ramp segment was last viewed.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the product ramp segment.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the product ramp segment. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User

Field	Details
ProductId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the product associated with the product ramp segment. This field is a relationship field. **Relationship Name** Product **Refers To** Product2
ProductSellingModelId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the product selling model associated with the product ramp segment. This field is a relationship field. **Relationship Name** ProductSellingModel **Refers To** ProductSellingModel
SegmentType	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The time duration within the ramp deal where specific terms, volumes, and commitments are applied to the subscription product. Valid values are: • `Custom` • `FreeTrial` • `Yearly` The default value is `Yearly`.
TrialDuration	**Type** int

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The duration within which users can try the product for free.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ProductRampSegmentFeed on page 2866
Feed tracking is available for the object.

ProductRampSegmentHistory on page 2873
History is available for tracked fields of the object.

ProductRampSegmentShare on page 2877
Sharing is available for the object.

ProductRelComponentOverride

Represents the cardinality overrides for product components in a bundle. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Product Catalog Management must be enabled to access this object.

Fields

Field	Details
`DoesBundlePriceIncludeChild`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the bundle price includes the associated child component's price (`true`) or not (`false`). The default value is `false`.

Field	Details
`IsComponentRequired`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the component is a required component in the product bundle. The default value is `false`.
`IsDefaultComponent`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this component is included in the product component group by default. The default value is `false`.
`IsExcluded`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the bundle excludes the component (`true`) or not (`false`). The default value is `false`.
`IsQuantityEditable`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the product component quantity can be edited (`true`) or not (`false`). The default value is `false`.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the product related component override record was last referenced.
`LastViewedDate`	**Type** dateTime

Field	Details
	Properties Filter, Nillable, Sort **Description** The date the product related component override record was last viewed.
`MaxQuantity`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The maximum quantity for the product component in the product bundle.
`MinQuantity`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The minimum quantity for the product component in the product bundle
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the product related component override. The maximum length is 255 characters (of any type).
`OverrideContextId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID associated with the root product in a bundle. This field is a polymorphic relationship field. **Relationship Name** OverrideContext **Relationship Type** Lookup **Refers To** Product2

Field	Details
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The owner ID of the product related component override record. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User
ProductRelatedComponentId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID associated with the product related component record. This field is a relationship field. **Relationship Name** ProductRelatedComponent **Relationship Type** Lookup **Refers To** ProductRelatedComponent
Quantity	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The default number of child product related components.
QuantityScaleMethod	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update

Field	Details
	Description The scaling method that determines how the child product quantity changes as the quantity of the parent product changes in the runtime cart. Possible values are: • `Constant` • `Proportional` The default value is `Proportional`.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ProductRelComponentOverrideFeed **on page 2866**
Feed tracking is available for the object.

ProductRelComponentOverrideHistory **on page 2873**
History is available for tracked fields of the object.

ProductRelComponentOverrideShare **on page 2877**
Sharing is available for the object.

ProductSpecificationRecType

Represents the relationship between industry-specific product specifications and the product record type. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Product Catalog Management must be enabled to access this object.

Fields

Field	Details
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique name of the ProductSpecificationRecType object in the API. The name:

Field	Details
	• must be 40 characters or fewer. • can contain only underscores and alphanumeric characters. • must begin with a letter. • can contain only underscores and alphanumeric characters. • can't include spaces • can't end with an underscore • can't contain 2 consecutive underscores
`IsCommercial`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the product is sold commercially (`true`) or not (`false`)
`Language`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The combined language and locale ISO code, which controls the language of the Product Specification Record Type. Possible values are: • `da`—Danish • `de`—German • `en_US`—English • `es`—Spanish • `es_MX`—Spanish (Mexico) • `fi`—Finnish • `fr`—French • `it`—Italian • `ja`—Japanese • `ko`—Korean • `nl_NL`—Dutch • `no`—Norwegian • `pt_BR`—Portuguese (Brazil) • `ru`—Russian • `sv`—Swedish • `th`—Thai

Field	Details
	• `zh_CN`—Chinese (Simplified) • `zh_TW`—Chinese (Traditional)
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Label for this Product Specification Record Type value. This display value is the internal label that doesn't get translated.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that aren't Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.
`ProductSpecificationType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The product specification type that's associated with the record type.
`RecordTypeId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update

Field	Details
	Description The ID of the record type that's associated with the product specification type. This field is a relationship field. **Relationship Name** RecordType **Relationship Type** Lookup **Refers To** RecordType

ProductSpecificationType

Represents the type of product specification provided by the user to make the product terminology unique to an industry. A product specification type is associated with a product specification record type. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Product Catalog Management must be enabled to access this object.

Fields

Field	Details
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** The description of the Product Specification Type.
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique name of the Product Specification Type object in the API. The name: • must be 40 characters or fewer. • can contain only underscores and alphanumeric characters.

Field	Details
	• must begin with a letter. • can contain only underscores and alphanumeric characters. • can't include spaces • can't end with an underscore • can't contain 2 consecutive underscores In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.
`Language`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The combined language and locale ISO code, which controls the language of the Product Specification Type. Possible values are: • `da`—Danish • `de`—German • `en_US`—English • `es`—Spanish • `es_MX`—Spanish (Mexico) • `fi`—Finnish • `fr`—French • `it`—Italian • `ja`—Japanese • `ko`—Korean • `nl_NL`—Dutch • `no`—Norwegian • `pt_BR`—Portuguese (Brazil) • `ru`—Russian • `sv`—Swedish • `th`—Thai • `zh_CN`—Chinese (Simplified) • `zh_TW`—Chinese (Traditional)
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update

Field	Details
	Description Label for this Product Specification Type value. This display value is the internal label that doesn't get translated.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix_componentName`*** The namespace prefix can have one of the following values. • In Developer Edition orgs, `NamespacePrefix` is set to the namespace prefix of the org for all objects that support it, unless an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition org of the package developer. • In orgs that aren't Developer Edition orgs, `NamespacePrefix` is set only for objects that are part of an installed managed package. All other objects have no namespace prefix.

Product Catalog Management Fields on Standard Objects

Product Catalog Management adds standard and custom fields to some standard Salesforce objects. These fields are available only in orgs where Product Catalog Management is enabled. This object is available in API version 60.0 and later.

Product Catalog Management Fields on Attribute Definition

Standard and custom fields extend the standard Attribute Definition object for use in Product Catalog Management.

Product Catalog Management Fields on Product2

Standard and custom fields extend the standard Product2 object for use in Product Catalog Management to represent information about products.

Product Catalog Management Fields on Product Catalog

Standard and custom fields extend the standard Product Catalog object for use in Product Catalog Management. This object is available in API version 60.0 and later.

Product Catalog Management Fields on Product Category

Standard and custom fields extend the standard Product Category object for use in Product Catalog Management.

Product Catalog Management Fields on Product Component Group

Standard and custom fields extend the standard Product Component Group object for use in Product Catalog Management.

Product Catalog Management Fields on Product Related Component

Standard and custom fields extend the standard Product Related Component object for use in Product Catalog Management.

Product Catalog Management Fields on Product Relationship Type

Standard and custom fields extend the standard Product Relationship Type object for use in Product Catalog Management.

Product Catalog Management Fields on Product Selling Model Option

Standard and custom fields extend the standard Product Selling Model Option object for use in Product Catalog Management. This object is available in API version 60.0 and later.

Product Catalog Management Fields on Attribute Definition

Standard and custom fields extend the standard Attribute Definition object for use in Product Catalog Management.

Fields

Field	Details
`DataType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** The data type of the attribute definition. Valid values are: • `Checkbox` • `Currency`—Available in API version 61.0 and later • `Date` • `Datetime` • `Number` • `Percent`—Available in API version 61.0 and later • `Picklist` • `Text`

Product Catalog Management Fields on Product2

Standard and custom fields extend the standard Product2 object for use in Product Catalog Management to represent information about products.

Fields

Field	Details
`Based On`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the product classification from which this product inherits. This field is a relationship field. **Relationship Name** BasedOn **Relationship Type** Lookup **Refers To** ProductClassification
`Help Text`	**Type** textarea **Properties** Create, Nillable, Update **Description** The help text that appears at runtime for the product. The maximum size is 32,000 alphanumeric characters. The help text can include these special characters: @ ! - < > * ? + = % # ( ) / \ & ' £ € $ ”.
`Availability Date`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date when the product is available.
`CanRamp`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the product's terms, volumes, and other commitments can be ramped (true) at run time or not (false) The default value is `false`.

Field	Details
`Discontinued Date`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date when the product is discontinued.
`End Of Life Date`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time after which a product isn't supported, ordered, or maintained.
`Specification Type`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The type of product specification that's being created.
`DecompositionScope`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The number of fulfillment order line items that must be generated. Available in API version 61.0 and later. Valid values are: • `Account` • `Bundle` • `Order` • `OrderLineItem`
`FulfillmentQtyCalcMethod`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Determines whether the quantity of fulfillment order line items must always be one or must be aggregated from the source line items. Available in API version 61.0 and later.

Field	Details
	Valid values are: • `Aggregate` • `AlwaysOne`
`UsageModelType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type of usage model for a product or service. Anchor is the main subscription product or service. Pack is the add-on product or service that grants additional usage resources for consumption. Available in API version 62.0 and later. Valid values are: • `Anchor` • `Pack`

Product2

Product Catalog Management Fields on Product Catalog

Standard and custom fields extend the standard Product Catalog object for use in Product Catalog Management. This object is available in API version 60.0 and later.

Fields

Field	Details
`Code`	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update **Description** A unique ID associated with the catalog. The maximum size is 80 alphanumeric characters.
`Description`	**Type** textarea **Properties** Create, Nillable, Update

Field	Details
	Description The description of the catalog that's used during design time. The maximum size is 255 alphanumeric characters.
`EffectiveEndDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date after which the product catalog is unavailable to end users.
`EffectiveStartDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date on which the product catalog is available to end users.
`CatalogType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The category of an entry in the catalog. Possible values are: • `Sales` • `ServiceProcess`—Service Process The default value is `Sales`.

SEE ALSO:

Product Catalog

Product Catalog Management Fields on Product Category

Standard and custom fields extend the standard Product Category object for use in Product Catalog Management.

Fields

Field	Details
`Code`	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update **Description** A unique ID associated with the catalog. The maximum size is 80 alphanumeric characters.
`IsNavigational`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the category or subcategory is shown in the menu as a navigational breadcrumb (`true`) or not (`false`). Available in API version 62.0 and later. The default value is `false`.

SEE ALSO:

Product Category

Product Catalog Management Fields on Product Component Group

Standard and custom fields extend the standard Product Component Group object for use in Product Catalog Management.

Fields

Field	Details
`ParentGroupId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The parent product component group in a nested group hierarchy for the same parent product. Available in API version 62.0 and later. This field is a relationship field. **Relationship Name** ParentGroup

Field	Details
	Refers To ProductComponentGroup

SEE ALSO:

Product Component Group

Product Catalog Management Fields on Product Related Component

Standard and custom fields extend the standard Product Related Component object for use in Product Catalog Management.

Fields

Field	Details
`ChildProductClassificationId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The child product classification that's associated with a product. This field is a relationship field. **Relationship Name** ChildProductClassification **Refers To** ProductClassification
`QuoteVisibility`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies the product-related component to display as a quote line item in the Transaction Line Editor and the quote document. The default value is Always. Possible values are: • Always • Transaction Line Editor Only • Quote Document Only

Field	Details
	• Never

SEE ALSO:

Product Related Component

Product Catalog Management Fields on Product Relationship Type

Standard and custom fields extend the standard Product Relationship Type object for use in Product Catalog Management.

Fields

Field	Details
AssociatedProductRoleCat	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** The role that the associated component plays in the relationship. Valid values are: • BundleComponent— The associated product is part of a bundle. • ClassificationComponent— The associated component is a product classification. Available in API version 61.0 and later

SEE ALSO:

Product Relationship Type

Product Catalog Management Fields on Product Selling Model Option

Standard and custom fields extend the standard Product Selling Model Option object for use in Product Catalog Management. This object is available in API version 60.0 and later.

Fields

Field	Details
IsDefault	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description Indicates the default product selling model for a product. Setting a product selling model as default is optional. A product can only have one default product selling model. The default value is `false`.

Product Selling Model Option

Product Catalog Management Business APIs

Use primitive APIs of Product Catalog Management that serve catalog definitions to users or applications.

This table lists the available Product Catalog Management resources.

Resource	Description
`/connect/pcm/catalogs` (POST)	Retrieve, search, filter, or sort catalog records.
`/connect/pcm/catalogs/`***`catalogId`*** (GET)	Retrieve details of catalog records based on a catalog ID.
`/connect/pcm/catalogs/`***`catalogId`***`/categories` (GET)	Retrieve the root-level categories of a catalog based on a catalog ID, or subcategories based on a parent category. You can also search, filter, or sort the categories.
`/connect/pcm/categories/`***`categoryId`*** (GET)	Retrieve details of individual category records based on a category ID.
`/connect/pcm/products` (POST)	Retrieve products. You can also search, filter, or sort the products.
`/connect/pcm/products/`***`productId`*** (GET)	Retrieve details of individual product records or a bundle based on a product ID.
`/revenue/product-catalog-management/product-classifications/details` (POST)	Retrieve the details for a list of product classification records.
`/revenue/product-discovery/products/recommendations` (POST)	Get a list of recommended products based on your underlying business rules.

Resource	Description
`/revenue/product-configurator/rules/actions/execute` (POST)	This API is used in Product Catalog Management to disable rules, get product recommendations, and get message rules.
`/connect/pcm/products/bulk` (POST)	Retrieve details for multiple products.
`/connect/pcm/products/variants` (POST)	Retrieve the variation product associated with one or more parent variant products.
`/connect/pcm/index/configurations` (GET, PUT)	Retrieve the saved index configurations. Additionally, you can persist the index configuration.
`/connect/pcm/relatedRecords/`***`entityName`*** (POST)	Retrieve related ProductRampSegment or ProductUsageGrant records for Product2 object.
`/connect/pcm/index/snapshots` (GET)	Retrieve the created snapshots and snapshot indexes.
`/connect/pcm/index/deploy` (POST)	Create indexes for a snapshot. Indexes improve search results and make it easier to find products at run time through search terms.
`/connect/pcm/index/setting` (GET, PATCH)	Fetch and update settings related to indexing and search.
`/connect/pcm/index/error` (GET)	Get the count and details of the errors that occurred during the indexing process.
`/connect/pcm/deep-clone` (POST)	Copy related records of an object along with the main product record.
`/connect/pcm/unit-of-measure/info` (GET)	Get details about the unit of measure for a specific set of records.
`/connect/pcm/unit-of-measure/rounded-data` (POST)	Round off and scale decimal data for a specific set of fields.

Resources

Learn more about the available Product Catalog Management API resources.

Bulk Product Details (POST)

Retrieve details for multiple products.

Catalog List (POST)

Retrieve, search, filter, or sort catalog records.

Catalog By ID (GET)

Retrieve details of catalog records based on a catalog ID.

Categories List (GET)

Retrieve the root-level categories of a catalog based on a catalog ID, or subcategories based on a parent category. You can also search, filter, or sort the categories.

Category By ID (GET)

Retrieve details of individual category records based on a category ID.

Deep Clone (POST)

Copy related records of an object along with the main product record.

Index Configuration Collection (GET, PUT)

Retrieve the saved index configurations. Additionally, you can persist the index configuration.

Index Setting (GET, PATCH)

Fetch and update settings related to indexing and search.

Product Classification Details (POST)

Retrieve the details for a list of product classification records.

Product Classification List (POST)

Retrieve a list of product classification records. You can also search, filter, or sort the product classifications.

Product Details (GET)

Retrieve details of individual product records or a bundle based on a product ID.

Product Related Records List (POST)

Retrieve related ProductRampSegment or ProductUsageGrant records for Product2 object.

Products List (POST)

Retrieve products. You can also search, filter, or sort the products.

Product Variants (POST)
Retrieve the variation product associated with one or more parent variant products.

Snapshot Collection (GET)
Retrieve the created snapshots and snapshot indexes.

Snapshot Deployment (POST)
Create indexes for a snapshot. Indexes improve search results and make it easier to find products at run time through search terms.

Snapshot Index Error (GET)
Get the count and details of the errors that occurred during the indexing process.

Unit of Measure Info (GET)
Get details about the unit of measure for a specific set of records.

Unit of Measure Rounded Data (POST)
Round off and scale decimal data for a specific set of fields.

Bulk Product Details (POST)

Retrieve details for multiple products.

JSON example

```
{
  "correlationId": "cbfabffb-093f-45b3-8c2d-88b4acbd4867",
  "productIds": [
    "01tT1000000F0afIAC",
    "01tT1000000F0afIAC"
  ],
  "uptoLevel": 1,
  "language": "french",
  "additionalFields": {
    "Product2": {
      "fields": [
        "code__c"
      ]
    },
    "ProductAttributeDefinition": {
      "fields": [
        "scope"
      ]
```

```
    }
  }
}
```

This example shows a sample request to fetch data from Enterprise Product Catalog.

```
{
  "productIds": [
    "01tLT000009vGXfYAM"
  ],
  "catalogSystems": [
    "epc"
  ],
  "additionalFields": {
    "AttributeDefinition": {
      "fields": [
        "OptOutAssetization",
        "OptOutDecompositionAction",
        "OptOutSupplementalAction"
      ]
    }
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`additional Fields`	Map<String, Additional Fields Input>	Map of object and list of additional standard or custom fields to be included in the response. The supported objects are: • Product2 • ProductAttributeDefinition—If the fields defined for the ProductAttributeDefinition object aren't available for the ProductClassificationAttr object, then the API request fails. If the Dynamic Revenue Orchestrator permission is enabled, then this property supports AttributeDefinition as key with these supported values. • `OptOutAssetization` • `OptOutDecompositionAction` • `OptOutSupplementalAction`	Optional	61.0

Name	Type	Description	Required or Optional	Available Version
`catalogSystems`	String[]	Name of the catalog system. Valid values are: • `epc`—Enterprise Product Catalog • `pcm`—Product Catalog Management Although this property accepts a list, you can pass only one value. If you don't specify a value, the default behavior is to fetch data from the `pcm` catalog.	Optional	66.0
`correlationId`	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	61.0
`language`	String	Custom language that you can specify to get translated data for the fields of an object that's enabled for translation. See Translate Product and Product Category Data.	Optional	64.0
`productIds`	String[]	List of product IDs that details must be returned for. If any product ID is blank, invalid, or not found, then the request is processed with valid and available product IDs.	Required	61.0
`uptoLevel`	Integer	Hierarchy level to follow to return the product details. For a bundle, this property determines the number of levels of child components to be returned. You can specify up to a hierarchy level of 1. If unspecified, the default level is the full bundle hierarchy.	Optional	61.0

Response body for POST

Products Output

Catalog List (POST)

Retrieve, search, filter, or sort catalog records.

Resource

```
/connect/pcm/catalogs
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/pcm/catalogs
```

Available version

60.0

Requires Chatter

No

HTTP methods

POST

Note: The POST method is used to retrieve the catalog records instead of the GET method as a request payload is sent to filter the records.

Request body for POST

JSON example

This example shows how to retrieve catalogs that contain `apple` in the catalog name.

```
{
"pageSize": 100,
"offset": 0,
"language": "french",
"filter": {
"criteria": [
{
"property": "name",
"operator": "contains",
"value": "apple"
}
]
}
}
```

This example shows how to retrieve catalogs with `ServiceProcess` as the catalog type.

```
{
"pageSize": 100,
"offset": 0,
"sort": {
  "orders": [
   {
   "property": "name",
   "direction": "desc"
   }
  ]
 },
"filter": {
"criteria": [
{
"property": "catalogType",
"operator": "eq",
"value": "ServiceProcess"
}
]
```

```
}
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
correlationId	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	60.0
filter	Filter	Criteria to filter the records. Filters are applicable to the fields of the ProductCatalog object. The supported operators are: • `eq` • `in` • `contains` The supported properties are `name` and `catalogType`.	Optional	60.0
language	String	Custom language that you can specify to get translated data for the fields of an object that's enabled for translation. See Translate Product and Product Category Data.	Optional	64.0
offset	Integer	Number of records to skip. The default value is 0.	Optional	60.0
pageSize	Integer	Number of records per page. Valid values are from 1 through 100. If unspecified, defaults to 100.	Optional	60.0
sort	Sort	Sort order of the catalog records. The supported operators are: • `asc` • `desc`	Optional	60.0

Response body for POST

Catalogs Output

Catalog By ID (GET)

Retrieve details of catalog records based on a catalog ID.

Resource

```
/connect/pcm/catalogs/catalogId
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/pcm/catalogs/0ZST100000000kUOAQ
```

```

`correlationId`	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	60.0
`fields`	String[]	For internal use only.	Optional	60.0
`language`	String	Custom language that you can specify to get translated data for the fields of an object that's enabled for translation. See Translate Product and Product Category Data.	Optional	64.0

Response body for GET
Categories Output

Deep Clone (POST)

Copy related records of an object along with the main product record.

Resource

```
/connect/pcm/deep-clone
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/pcm/deep-clone
```

Available version
63.0

HTTP methods
POST

Request body for POST

JSON example

```
{
  "mainRecordId": "01tSG0000028kcSYAQ",
  "mainObjectApiName": "Product2",
  "mainRecordFieldValues": {
    "Name": "New Cloud Storage"
```

```
    }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
mainObjectApiName	String	API name of the object. The supported object is Product2.	Required	63.0
mainRecordFieldValues	Map<String, String>	Mapping of the API name of the field to its value. The values passed through this map are set for the created record. You can pass the Name field only through this map.	Optional	63.0
mainRecordId	String	ID of the record.	Required	63.0

Response body for POST

Deep Clone Response

Index Configuration Collection (GET, PUT)

Retrieve the saved index configurations. Additionally, you can persist the index configuration.

Resource

```
/connect/pcm/index/configurations
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/pcm/index/configurations
```

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/pcm/index/configurations?includeMetadata=false&fieldTypes=Standard,Custom

    }
```

```
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`correlationId`	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	62.0
`index Configurations`	Index Configuration Input[]	List of index configurations.	Required	62.0

Response body for PUT

Index Configurations Update

Index Setting (GET, PATCH)

Fetch and update settings related to indexing and search.

Resource

```
/connect/pcm/index/setting
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/pcm/index/setting
```

Available version

63.0

HTTP methods

GET, PATCH

Response body for GET

Index Setting Results

Request body for PATCH

JSON example

```
{
    "setting" : {
        "supportedLanguages" : ["en_US","ja","es","nl_NL"],
        "defaultLanguage" : "en_US",
        "productsGrouping": "GROUPING_VARIATION"
    }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`setting`	Setting Input[]	Object containing the setting-related details.	Required	63.0

Request parameters for PATCH

Parameter Name	Type	Description	Required or Optional	Available Version
`settingId`	String	ID of the setting to update the details for.	Required	63.0

Response body for PATCH

Index Setting Update

Product Classification Details (POST)

Retrieve the details for a list of product classification records.

This API fetches metadata, attributes, and attribute categories associated with product classifications across supported catalog systems.

Resource

```
/revenue/product-catalog-management/product-classifications/details
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/revenue/product-catalog-management/product-classifications/details
```

Available version

66.0

HTTP methods

POST

Request body for POST

JSON example

```
{
  "productClassificationIds": [
    "01txx0000006iFMAAY",
    "01txx0000006iGxAAY"
  ],
  "catalogSystems": [
    "epc"
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`catalogSystems`	String[]	Name of the catalog system. Valid value is: • `epc`—Enterprise Product Catalog	Optional	66.0
`productClassificationIds`	String[]	List of product classification IDs for which you want to retrieve product details. In the `epc` catalog system, these values are the `Product2` record IDs.	Required	66.0

Response body for POST

Product Classification Details Collection on page 214

Product Classification List (POST)

Retrieve a list of product classification records. You can also search, filter, or sort the product classifications.

This API retrieves a paginated list of product classification records from the Product Catalog Management (PCM) or Enterprise Product Catalog (EPC) catalog system. You can search for product classifications by name, apply filters, and sort the results.

Resource

```
/revenue/product-catalog-management/product-classifications/list
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/revenue/product-catalog-management/product-classifications/list
```

Available version

67.0

HTTP methods

POST

Note: POST methods typically create an item, but for this resource POST is used to retrieve information.

Request body for POST

JSON example

```
{
  "catalogSystem": "pcm",
  "searchTerm": "Mobile",
  "filter": {
    "criteria": [
      {
        "property": "name",
        "operator": "contains",
        "value": "Mobile"
      }
```

```
    ]
  },
  "sort": {
    "orders": [
      {
        "property": "name",
        "direction": "asc"
      }
    ]
  },
  "pageSize": 25,
  "offset": 0
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`catalogSystem`	String	Name of the catalog system. Valid values are: • `pcm`—Product Catalog Management • `epc`—Enterprise Product Catalog If unspecified, the default catalog system is `pcm`.	Optional	67.0
`filter`	Criteria Input	Criteria to filter the product classification records. The supported property is `name`. The supported operators are: • `eq` • `in` • `contains` If multiple criteria are specified, they're combined by using the `and` operator. Each criterion supports only the `property`, `operator`, and `value` fields.	Optional	67.0
`offset`	Integer	Number of records to skip. The default value is 0.	Optional	67.0
`pageSize`	Integer	Specifies the number of records per page. Valid values are 5, 10, 25, 50, and 100. If unspecified, the default value is 100.	Optional	67.0
`searchTerm`	String	String used to search for product classifications with the product classification name containing the search term.	Optional	67.0

Name	Type	Description	Required or Optional	Available Version
`sort`	Order Input	Sort order for the product classifications. If unspecified, the default sort order is by name in ascending order.	Optional	67.0

Response body for POST

Product Classification List Collection on page 216

Product Details (GET)

Retrieve details of individual product records or a bundle based on a product ID.

Resource

```
/connect/pcm/products/productId
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/pcm/products/01tT1000000F0afIAC
```

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/pcm/products/01tT1000000F0afIAC?language=spanish
```

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/pcm/products/01tT1000000F0afIAC/catalogSystems=epc
```

HTTP methods

GET

Note: You must invoke this API request by using GET method only. If the request is invoked by using POST method, the request is considered as a Products List API request.

Request parameters for GET

Parameter Name	Type	Description	Required or Optional	Available Version
`catalogSystems`	String[]	Name of the catalog system. Valid values are: • `epc`—Enterprise Product Catalog • `pcm`—Product Catalog Management Although this parameter accepts a list, you can pass only one value. If you don't specify a value, the default behavior is to fetch data from the `pcm` catalog.	Optional	66.0

Parameter Name	Type	Description	Required or Optional	Available Version
`correlationId`	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	60.0
`fields`	String[]	For internal use only.	Optional	60.0
`language`	String	Custom language that you can specify to get translated data for the fields of an object that's enabled for translation. See Translate Product and Product Category Data.	Optional	64.0

Response body for GET

Products

Product Related Records List (POST)

Retrieve related ProductRampSegment or ProductUsageGrant records for Product2 object.

Resource

```
/connect/pcm/relatedRecords/entityName
```

The supported entity or object is Product2.

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/pcm/relatedRecords/product2
```

Available version

62.0

HTTP methods

POST

Note: POST methods typically create an item, but for this resource POST is used to retrieve information.

Request body for POST

JSON example

```
{
  "recordIds": [
    "01txx0000006i44AAA",
    "01txx0000006i5gAAA"
  ],
  "relatedObjectNodes": [
    {
      "relatedObjectAPIName": "ProductRampSegment",
      "pageSize": 20,
      "offSet": 0
```

```
    },
    {
      "relatedObjectAPIName": "ProductUsageGrant",
      "pageSize": 10,
      "offSet": 0,
      "filter": {
        "criteria": [
          {
            "property": "status",
            "operator": "eq",
            "value": "active"
          },
          {
            "property": "effectivestartdate",
            "operator": "lte",
            "value": "2024-06-25"
          },
          {
            "criteriaType": "CustomWhereCondition",
            "value": "(effectiveenddate = null OR effectiveenddate >= 2024-06-25)"
          }
        ]
      }
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`correlationId`	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	62.0
`recordIds`	String[]	List of record IDs to return the relatedObjects records for. The maximum number of record IDs supported is 20.	Required	62.0
`relatedObjectNodes`	Related Object Node Input[]	List of nodes for the related objects. The maximum number of related object nodes supported is two.	Required	62.0

Response body for POST

Related Records List

Products List (POST)

Retrieve products. You can also search, filter, or sort the products.

Resource

```
/connect/pcm/products
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/pcm/products?productClassificationId=11BT10000004C9SMAU
```

Available version

POST

Note: POST methods typically create an item, but for this resource POST is used to retrieve information.

Request body for POST

JSON example

This example is a search request for products that contain `Bundle Product` in the product name.

```
{
  "catalogIds": [
    "0ZST10000004D03OAE"
  ],
  "language": "spanish",
  "filter": {
    "criteria": [
      {
        "property": "name",
        "operator": "contains",
        "value": "Bundle Product"
      }
    ]
  },
  "relatedObjectFilters": [
    {
      "objectName": "ProductSpecificationRecType",
      "criteria": [
        {
          "property": "IsCommercial",
          "operator": "eq",
          "value": false
        }
      ],
      "additionalFields": {
        "Product2": {
          "fields": [
            "code__c"
          ]
        }
      }
    }
```

```
  ]
}
```

This example is a search request for products that contain the specified search term in the product name and are part of a catalog.

```
  {
  "catalogIds": [
    "0ZSDU0000002Og54AE"
  ],
  "searchTerm": "Slack"
}
```

Query parameters

Name	Type	Description	Required or Optional	Available Version
`productClassificationId`	String	ID of the product classification template that contains a collection of dynamic attributes and can be reused to create multiple products. Products that are based on a product classification inherit all the attributes of the product classification. Specify either the product classification ID, list of category IDs, or list of catalog IDs to retrieve products.	Optional	60.0

Properties

Name	Type	Description	Required or Optional	Available Version
`additionalFields`	Map<String, Additional Fields Input>	Map of the object and the list of standard and custom fields to be queried along with the standard response. The supported object is Product2.	Optional	61.0
`catalogIds`	List<String>	List of comma-separated catalog IDs. The API returns the list of product records that are associated with the specified catalog IDs. Specify either the product classification ID, list of category IDs, or list of catalog IDs to retrieve products.	Optional	60.0
`categoryIds`	List<String>	List of comma-separated category IDs. The API returns the list of product records	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
		that are associated with the specified category IDs. If unspecified, then returns all products that are added to at least one category. Specify either the product classification ID, list of category IDs, or list of catalog IDs to retrieve products.		
`correlationId`	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	60.0
`filter`	Criteria Input	Criteria to filter the records. Filters are applicable to the fields of Product2 object. The supported operators are: • `eq` • `in` • `contains`—This value isn't applicable if the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled. • `gt`—Specifies a greater than criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `lt`—Specifies a less than criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `gte`—Specifies a greater than or equal to criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `lte`—Specifies a less than or equal to criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. If multiple criteria are specified, then the criteria are combined by using the `and` operator.	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
		The supported properties are `name`, `description`, and `isActive`. If the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled, then the supported property is `name` only.		
`language`	String	Custom language that you can specify to get translated data for the fields of an object that's enabled for translation. See Translate Product and Product Category Data.	Optional	64.0
`offset`	Integer	Number of records to skip. The default value is 0.	Optional	60.0
`pageSize`	Integer	Specifies the number of records per page. Valid values are from 1 through 200. If the value is unspecified, it defaults to 100.	Optional	60.0
`relatedObjectFilters`	Related Object Filter[]	Criteria for the related objects to filter the records. The supported operator is `eq`. The supported object is `ProductSpecificationRecType`. The supported values are `true` and `false`. The supported property is `IsCommercial`.	Optional	60.0
`searchTerm`	String	String used to get products with the product name containing the search term. See Search Considerations When Using Indexed Data.	Optional	62.0
`sort`	Sort	Sort order for the products. If the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled, then you can sort products by using name only.	Optional	60.0

Response body for POST

Products Output

Product Variants (POST)

Retrieve the variation product associated with one or more parent variant products.

A parent variant product is a non-purchasable product that groups related variations. Use this API to retrieve the mapping between parent variant product IDs and their associated variation product IDs.

Resource

```
/connect/pcm/products/variants
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/pcm/products/variants
```

Available version

67.0

Requires Chatter

No

HTTP methods

POST

Note: POST methods typically create an item, but for this resource POST is used to retrieve information.

Request body for POST

JSON example

```
{
  "correlationId": "9b6bc520-3c82-4d6c-a458-47590370681a",
  "parentVariantsIds": [
    "01tT1000000F0afIAC",
    "01tT1000000F0agIAC"
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
correlationId	String	Unique ID to track and associate related events or transactions. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	67.0
parentVariantsIds	String[]	List of product IDs for parent variant products whose variations you want to retrieve. If any product ID is blank, invalid, or not found, the API skips that ID and processes the remaining valid IDs. The skipped IDs appear in the `inValidProductIds` response property. If a product ID is valid but isn't a parent variant product, the API	Required	67.0

Name	Type	Description	Required or Optional	Available Version
		includes it in the `nonVariantParentIds` response property.		

Response body for POST

Product Variants

Snapshot Collection (GET)

Retrieve the created snapshots and snapshot indexes.

Resource

```
/connect/pcm/index/snapshots
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/pcm/index/snapshots
```

Available version

62.0

HTTP methods

GET

Query Parameter for GET

Parameter Name	Type	Description	Required or Optional	Available Version
`numberOfIndexLogs`	Integer	Number of index logs to include in the response. Specify a number from 0 through 100. The default value is 25.	Optional	63.0

Response body for GET

Snapshot Collection

Snapshot Deployment (POST)

Create indexes for a snapshot. Indexes improve search results and make it easier to find products at run time through search terms.

Resource

```
/connect/pcm/index/deploy
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/pcm/index/deploy
```

Available version

62.0

HTTP methods

POST

Request body for POST

JSON example

This example shows a sample request to build a new snapshot with immediate activation.

```
{
  "snapshot": {
    "activationType": "IMMEDIATE"
  },
  "buildType": "FULL"
}
```

This example shows a sample request to rebuild a snapshot in the `active` status.

```
{
  "snapshot": {
    "activationType": "IMMEDIATE",
    "id": "1Avxx0000005DFe1AM"
  },
  "buildType": "FULL"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`buildType`	String	Build type of the snapshot index. Valid value is: • `FULL`—Specifies a full index build. • `INCREMENTAL`—Specifies an incremental index build. Available from API version 63.0 and later.	Required	62.0
`snapshot`	Run-time Catalog Snapshot Input[]	Snapshot to deploy.	Required	62.0

Response body for POST

Snapshot Deployment

Snapshot Index Error (GET)

Get the count and details of the errors that occurred during the indexing process.

Resource

```
/connect/pcm/index/error
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/pcm/index/error
```

Available version

63.0

HTTP methods

GET

Request parameters for GET

Parameter Name	Type	Description	Required or Optional	Available Version
indexId	String	ID of the index.	Required	63.0
snapshot IndexId	String	ID of the snapshot index.	Required	63.0

Response body for GET

Snapshot Index Error

Unit of Measure Info (GET)

Get details about the unit of measure for a specific set of records.

Resource

```
/connect/pcm/unit-of-measure/info
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/pcm/unit-of-measure/info
```

Available version

63.0

HTTP methods

GET

Query parameters for GET

Parameter Name	Type	Description	Required or Optional	Available Version
correlationId	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	63.0
ids	String	IDs of the unit of measure records.	Optional	63.0

Response body for GET

Bulk Unit Of Measure Info

Unit of Measure Rounded Data (POST)

Round off and scale decimal data for a specific set of fields.

Resource

```
/connect/pcm/unit-of-measure/rounded-data
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/pcm/unit-of-measure/rounded-data
```

Available version

63.0

HTTP methods

POST

Request body for POST

      ]
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
correlationId	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	63.0
dataRowInputs	Data Row Input[]	List of row inputs for rounding the data.	Required	63.0

Response body for POST

Data Rounding

Request Bodies

Learn more about the available Product Catalog Management API request bodies.

Additional Fields Input

Input representation of the additional standard or custom fields to be included in the response.

Bulk Product Details Input

Input representation of the request to retrieve the details of multiple products.

Catalog Input

Input representation of the request to retrieve catalog records.

Criteria Input

Input representation of the filter criteria item request.

Data Rounding Input

Input representation of the details of the data rounding input.

Data Row Input

Input representation of the details of the input for a data rounding request.

Deep Clone Input

Input representation of the details of the object and associated record to be cloned.

Field Data Input

Input representation of the details of the field data input.

Filter Input

Input representation of the filter request.

Include Object Input

Input representation of the object to include in the response.

Index Configuration Collection Input

Input representation of the collection of index configurations.

Index Configuration Input

Input representation of the request to persist the index configuration.

Index Setting Input

Input representation of the index setting.

Options Input

Reserved for internal use.

Order Input

Input representation of the sort order item request.

Product Classification Details Input

Input representation of the request to fetch details of product classification records, including their attributes and attribute categories.

Product Classification List Input

Input representation of the request to retrieve a list of product classification records.

Product Input

Input representation of a product in the catalog.

Product Variants Input

Input representation of the request to retrieve the variation products associated with parent variant products.

Related Object Filters Input

Input representation of the request to filter related objects.

Related Object Node Input

Input representation of the details of a related object node.

Related Records Input

Input representation of the request to retrieve related ProductRampSegment or ProductUsageGrant records for Product2 object.

Run-time Catalog Snapshot Input

Input representation of the details of a run-time catalog snapshot for deployment.

Setting Input

Input representation of the details of the index setting.

Snapshot Deployment Input

Input representation of the request to deploy a run-time catalog snapshot.

Sort Input

Input representation of the sort request.

Additional Fields Input

Input representation of the additional standard or custom fields to be included in the response.

JSON example

```
"additionalFields": {
    "Product2": {
      "fields": [
        "code__c"
      ]
    }
```

This example shows a sample request with attribute definition field details.

```
"additionalFields":{
  "OptOutAssetization":true
  "OptOutDecompositionAction":false
  "OptOutSupplementalAction":false
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`fields`	String[]	List of additional standard or custom fields to be included in the response.	Required	61.0

Bulk Product Details Input

Input representation of the request to retrieve the details of multiple products.

JSON example

```
{
  "correlationId": "cbfabffb-093f-45b3-8c2d-88b4acbd4867",
  "productIds": [
    "01tT1000000F0afIAC",
    "01tT1000000F0afIAC"
  ],
  "uptoLevel": 1,
  "language": "french",
  "additionalFields": {
    "Product2": {
      "fields": [
        "code__c"
      ]
    },
    "ProductAttributeDefinition": {
      "fields": [
        "scope"
      ]
    }
  }
}
```

This example shows a sample request to fetch data from Enterprise Product Catalog.

```
{
  "productIds": [
    "01tLT000009vGXfYAM"
  ],
  "catalogSystems": [
    "epc"
  ],
  "additionalFields": {
    "AttributeDefinition": {
      "fields": [
        "OptOutAssetization",
        "OptOutDecompositionAction",
        "OptOutSupplementalAction"
      ]
    }
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`additional Fields`	Map<String, Additional Fields Input>	Map of object and list of additional standard or custom fields to be included in the response. The supported objects are: • Product2 • ProductAttributeDefinition—If the fields defined for the ProductAttributeDefinition object aren't available for the ProductClassificationAttr object, then the API request fails. If the Dynamic Revenue Orchestrator permission is enabled, then this property supports AttributeDefinition as key with these supported values. • `OptOutAssetization` • `OptOutDecompositionAction` • `OptOutSupplementalAction`	Optional	61.0
`catalogSystems`	String[]	Name of the catalog system. Valid values are: • `epc`—Enterprise Product Catalog • `pcm`—Product Catalog Management	Optional	66.0

Name	Type	Description	Required or Optional	Available Version
		Although this property accepts a list, you can pass only one value. If you don't specify a value, the default behavior is to fetch data from the `pcm` catalog.		
`correlationId`	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	61.0
`language`	String	Custom language that you can specify to get translated data for the fields of an object that's enabled for translation. See Translate Product and Product Category Data.	Optional	64.0
`productIds`	String[]	List of product IDs that details must be returned for. If any product ID is blank, invalid, or not found, then the request is processed with valid and available product IDs.	Required	61.0
`uptoLevel`	Integer	Hierarchy level to follow to return the product details. For a bundle, this property determines the number of levels of child components to be returned. You can specify up to a hierarchy level of 1. If unspecified, the default level is the full bundle hierarchy.	Optional	61.0

Catalog Input

Input representation of the request to retrieve catalog records.

JSON example

This example shows how to retrieve catalogs that contain `apple` in the catalog name.

```
{
"pageSize": 100,
"offset": 0,
"language": "french",
"filter": {
"criteria": [
{
"property": "name",
"operator": "contains",
```

```
"value": "apple"
}
]
}
}
```

This example shows how to retrieve catalogs with `ServiceProcess` as the catalog type.

```
{
"pageSize": 100,
"offset": 0,
"sort": {
  "orders": [
   {
   "property": "name",
   "direction": "desc"
   }
  ]
 },
"filter": {
"criteria": [
{
"property": "catalogType",
"operator": "eq",
"value": "ServiceProcess"
}
]
}
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`correlationId`	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	60.0
`filter`	Filter	Criteria to filter the records. Filters are applicable to the fields of the ProductCatalog object. The supported operators are: • `eq` • `in` • `contains` The supported properties are `name` and `catalogType`.	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
`language`	String	Custom language that you can specify to get translated data for the fields of an object that's enabled for translation. See Translate Product and Product Category Data.	Optional	64.0
`offset`	Integer	Number of records to skip. The default value is 0.	Optional	60.0
`pageSize`	Integer	Number of records per page. Valid values are from 1 through 100. If unspecified, defaults to 100.	Optional	60.0
`sort`	Sort	Sort order of the catalog records. The supported operators are: • `asc` • `desc`	Optional	60.0

Criteria Input

Input representation of the filter criteria item request.

JSON example

```
"criteria":
[{
   "attributeType": "ProductStandard",
   "property": "name",
   "operator": "eq",
   "value": "iPhone"
},
{
   "criteriaType": "CustomWhereCondition",
   "value": "(effectiveenddate = null OR effectiveenddate >= 2024-06-25)"
}
]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`attributeType`	String	Search attribute type of the facet for a faceted search. Valid values are: • `ProductStandard` • `ProductCustom` • `ProductDynamicAttribute`	Optional	63.0

Name	Type	Description	Required or Optional	Available Version
		• `ProductAttributeStandard` • `ProductAttributeCustom` This property is applicable if the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled.		
`criteriaType`	String	Type of criteria for the filter. Valid value is: • `CustomWhereCondition`	Required	60.0
`operator`	String	Operator used for the filter criteria. The supported operators are: • `eq` • `in` • `contains`—This value isn't applicable if the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled. • `gt`—Specifies a greater than criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `lt`—Specifies a less than criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `gte`—Specifies a greater than or equal to criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `lte`—Specifies a less than or equal to criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only.	Required	60.0
`property`	String	Property name to use in the filter, which must be the same as the object field.	Required	60.0
`value`	Object	Value for the filter criteria.	Required	60.0

Data Rounding Input

Input representation of the details of the data rounding input.

JSON example

```
{
  "dataRowInputs": [
    {
      "key": "PRC1",
      "fieldDataInputs": [
        {
          "fieldApiName": "MaxQuantity",
          "originalValue": 1234.5678,
          "unitOfMeasureId": "0hExx0000000001EAA"
        },
        {
          "fieldApiName": "MinQuantity",
          "originalValue": "987462848934739347.32232590183756545",
          "unitOfMeasureId": "0hExx000000001dEAA"
        }
      ]
    },
    {
      "key": "PRC2",
      "fieldDataInputs": [
        {
          "fieldApiName": "MaxQuantity",
          "originalValue": 1234.5678,
          "unitOfMeasureId": "uomId1"
        },
        {
          "fieldApiName": "MinQuantity",
          "originalValue": 987.4628,
          "unitOfMeasureId": "Kgs Id"
        }
      ]
    },
    {
      "key": "PRC3",
      "fieldDataInputs": [
        {
          "fieldApiName": "MaxQuantity",
          "originalValue": 0.437584,
          "unitOfMeasureId": "uomId2"
        },
        {
          "fieldApiName": "MinQuantity",
          "originalValue": 7364.58923,
          "unitOfMeasureId": "uomId2"
        }
      ]
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`correlationId`	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	63.0
`dataRowInputs`	Data Row Input[]	List of row inputs for rounding the data.	Required	63.0

Data Row Input

Input representation of the details of the input for a data rounding request.

JSON example

```
JSON example
{
  "dataRowInputs": [
    {
      "key": "PRC1",
      "fieldDataInputs": [
        {
          "fieldApiName": "MaxQuantity",
          "originalValue": 1234.5678,
          "unitOfMeasureId": "0hExx0000000001EAA"
        },
        {
          "fieldApiName": "MinQuantity",
          "originalValue": "987462848934739347.32232590183756545",
          "unitOfMeasureId": "0hExx000000001dEAA"
        }
      ]
    },
    {
      "key": "PRC2",
      "fieldDataInputs": [
        {
          "fieldApiName": "MaxQuantity",
          "originalValue": 1234.5678,
          "unitOfMeasureId": "uomId1"
        },
        {
          "fieldApiName": "MinQuantity",
          "originalValue": 987.4628,
          "unitOfMeasureId": "Kgs Id"
        }
      ]
    },
    {
      "key": "PRC3",
```

```
      "fieldDataInputs": [
        {
          "fieldApiName": "MaxQuantity",
          "originalValue": 0.437584,
          "unitOfMeasureId": "uomId2"
        },
        {
          "fieldApiName": "MinQuantity",
          "originalValue": 7364.58923,
          "unitOfMeasureId": "uomId2"
        }
      ]
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`fieldDataInputs`	Field Data Input[]	List of field-level data inputs.	Required	63.0
`key`	String	Key that identifies a unique data row.	Required	63.0

Deep Clone Input

Input representation of the details of the object and associated record to be cloned.

JSON example

```
{
  "mainRecordId": "01tSG0000028kcSYAQ",
  "mainObjectApiName": "Product2",
  "mainRecordFieldValues": {
    "Name": "New Cloud Storage"
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`mainObjectApiName`	String	API name of the object. The supported object is Product2.	Required	63.0
`mainRecordFieldValues`	Map<String, String>	Mapping of the API name of the field to its value. The values passed through this map are set for the created record. You can pass the Name field only through this map.	Optional	63.0
`mainRecordId`	String	ID of the record.	Required	63.0

Field Data Input

Input representation of the details of the field data input.

JSON example

```
"fieldDataInputs": [
  {
    "fieldApiName": "MaxQuantity",
    "originalValue": 0.437584,
    "unitOfMeasureId": "uomId2"
  },
  {
    "fieldApiName": "MinQuantity",
    "originalValue": 7364.58923,
    "unitOfMeasureId": "uomId2"
  }
]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`fieldApiName`	String	Unique API name of the field.	Required	63.0
`originalValue`	String	Original value of the fields.	Required	63.0
`unitOfMeasureId`	String	ID of the unit of measure record that's associated to the field.	Required	63.0

Filter Input

Input representation of the filter request.

JSON example

```
"filter":
{
"criteria": [ {
"property": "name",
"operator": "eq",
"value": "iPhone"
},
{
"criteriaType": "CustomWhereCondition",
"value": "(effectiveenddate = null OR effectiveenddate >= 2024-06-25)"
}
]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`criteria`	Criteria[]	Details of the filter criteria.	Required if the `filter` property is specified.	60.0

Include Object Input

Input representation of the object to include in the response.

JSON example

```
"includeObjects":
[{
"objectName": "ProductCategory"
}]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`objectName`	String	Name of the object to include in the response. The supported object is `ProductCategory`.	Required if the `options` property is specified.	60.0

Index Configuration Collection Input

Input representation of the collection of index configurations.

JSON example

```
{
  "correlationId": "8545b5aa-f3e6-429a-8f21-9cc4ce50b1d7",
  "indexConfigurations": [
    {
      "attributeDefinitionId": "0tjT1000000002bIAA",
      "name": "Color",
      "type": "ProductDynamicAttribute",
      "isSearchable": true
    },
    {
      "attributeFieldId": "00Nxx000001FwnABII",
      "name": "Message__c",
      "type": "Custom",
      "isSearchable": true
    },
    {
      "name": "Code",
      "type": "Standard",
```

```
      "isSearchable": true
    },
    {
      "facetDisplayRank": 1,
      "isFacetable": false,
      "isSearchable": true,
      "name": "Family",
      "type": "Standard"
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`correlationId`	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	62.0
`index Configurations`	Index Configuration Input[]	List of index configurations.	Required	62.0

Index Configuration Input

Input representation of the request to persist the index configuration.

JSON example

```
  "indexConfigurations": [
    {
      "attributeDefinitionId": "0tjT1000000002bIAA",
      "name": "Color",
      "type": "ProductDynamicAttribute",
      "isSearchable": true
    },
    {
      "attributeFieldId": "00Nxx000001FwnABII",
      "name": "Message__c",
      "type": "Custom",
      "isSearchable": true
    },
    {
      "name": "Code",
      "type": "Standard",
      "isSearchable": true
    },
    {
      "facetDisplayRank": 1,
      "isFacetable": false,
      "isSearchable": true,
```

```
      "name": "Family",
      "type": "Standard"
    }
  ]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`attribute DefinitionId`	String	ID of the attribute definition.	Required if the `attribute FieldId`property isn't specified.	62.0
`attribute FieldId`	String	ID of the attribute field.	Required if the `attribute DefinitionId`property isn't specified.	62.0
`facet DisplayRank`	Integer	Sort order for displaying the facets at run time.	Optional	63.0
`isFacetable`	Boolean	Indicates whether the field is facetable (`true`) or not (`false`).	Optional	63.0
`isSearchable`	Boolean	Indicates whether the index-configured field is searchable (`true`) or not (`false`).	Optional	62.0
`name`	String	Name of the index-configured field.	Required	62.0
`type`	String	Type of the index-configured field.	Required	62.0

Index Setting Input

Input representation of the index setting.

JSON example

```
{
    "setting" : {
        "supportedLanguages" : ["en_US","ja","es","nl_NL"],
        "defaultLanguage" : "en_US",
        "productsGrouping": "GROUPING_VARIATION"
   }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`setting`	Setting Input[]	Object containing the setting-related details.	Required	63.0

Options Input

Reserved for internal use.

Order Input

Input representation of the sort order item request.

JSON example

```
"sort":{
"orders":
[{
   "property": "name",
   "direction": "asc"
}]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`direction`	String	Direction to sort the list items, such as in ascending order or descending order.	Required	60.0
`property`	String	Property to use for the sorting of the list items.	Required	60.0

Product Classification Details Input

Input representation of the request to fetch details of product classification records, including their attributes and attribute categories.

JSON example

```
{
  "productClassificationIds": [
    "01txx0000006iFMAAY",
    "01txx0000006iGxAAY"
  ],
  "catalogSystems": [
    "epc"
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`catalogSystems`	String[]	Name of the catalog system. Valid value is: • `epc`—Enterprise Product Catalog	Optional	66.0
`product ClassificationIds`	String[]	List of product classification IDs for which you want to retrieve product details. In the	Required	66.0

Name	Type	Description	Required or Optional	Available Version
		epc catalog system, these values are the Product2 record IDs.		

Product Classification List Input

Input representation of the request to retrieve a list of product classification records.

JSON example

```
{
  "catalogSystem": "pcm",
  "searchTerm": "Mobile",
  "filter": {
    "criteria": [
      {
        "property": "name",
        "operator": "contains",
        "value": "Mobile"
      }
    ]
  },
  "sort": {
    "orders": [
      {
        "property": "name",
        "direction": "asc"
      }
    ]
  },
  "pageSize": 25,
  "offset": 0
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
catalogSystem	String	Name of the catalog system. Valid values are: • pcm—Product Catalog Management • epc—Enterprise Product Catalog If unspecified, the default catalog system is pcm.	Optional	67.0
filter	Criteria Input	Criteria to filter the product classification records. The supported property is name. The supported operators are: • eq	Optional	67.0

Name	Type	Description	Required or Optional	Available Version
		• `in` • `contains` If multiple criteria are specified, they're combined by using the `and` operator. Each criterion supports only the `property`, `operator`, and `value` fields.		
`offset`	Integer	Number of records to skip. The default value is 0.	Optional	67.0
`pageSize`	Integer	Specifies the number of records per page. Valid values are 5, 10, 25, 50, and 100. If unspecified, the default value is 100.	Optional	67.0
`searchTerm`	String	String used to search for product classifications with the product classification name containing the search term.	Optional	67.0
`sort`	Order Input	Sort order for the product classifications. If unspecified, the default sort order is by name in ascending order.	Optional	67.0

Product Input

Input representation of a product in the catalog.

JSON example

This example is a search request for products that contain `Bundle Product` in the product name.

```
{
  "catalogIds": [
    "0ZST10000004D03OAE"
  ],
  "language": "spanish",
  "filter": {
    "criteria": [
      {
        "property": "name",
        "operator": "contains",
        "value": "Bundle Product"
      }
    ]
  },
  "relatedObjectFilters": [
    {
      "objectName": "ProductSpecificationRecType",
```

```
      "criteria": [
        {
          "property": "IsCommercial",
          "operator": "eq",
          "value": false
        }
      ],
      "additionalFields": {
        "Product2": {
          "fields": [
            "code__c"
          ]
        }
      }
    }
  ]
}
```

This example is a search request for products that contain the specified search term in the product name and are part of a catalog.

```
  {
  "catalogIds": [
    "0ZSDU00000020g54AE"
  ],
  "searchTerm": "Slack"
}
```

Query parameters

Name	Type	Description	Required or Optional	Available Version
`productClassificationId`	String	ID of the product classification template that contains a collection of dynamic attributes and can be reused to create multiple products. Products that are based on a product classification inherit all the attributes of the product classification. Specify either the product classification ID, list of category IDs, or list of catalog IDs to retrieve products.	Optional	60.0

Properties

Name	Type	Description	Required or Optional	Available Version
`additionalFields`	Map<String, Additional Fields Input>	Map of the object and the list of standard and custom fields to be queried along with the standard response. The supported object is Product2.	Optional	61.0

Name	Type	Description	Required or Optional	Available Version
`catalogIds`	List<String>	List of comma-separated catalog IDs. The API returns the list of product records that are associated with the specified catalog IDs. Specify either the product classification ID, list of category IDs, or list of catalog IDs to retrieve products.	Optional	60.0
`categoryIds`	List<String>	List of comma-separated category IDs. The API returns the list of product records that are associated with the specified category IDs. If unspecified, then returns all products that are added to at least one category. Specify either the product classification ID, list of category IDs, or list of catalog IDs to retrieve products.	Optional	60.0
`correlationId`	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	60.0
`filter`	Criteria Input	Criteria to filter the records. Filters are applicable to the fields of Product2 object. The supported operators are: • `eq` • `in` • `contains`—This value isn't applicable if the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled. • `gt`—Specifies a greater than criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `lt`—Specifies a less than criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `gte`—Specifies a greater than or equal to criteria. Available from API	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
		version 63.0 and later for Number, Date, and Datetime data types only. • `lte`—Specifies a less than or equal to criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. If multiple criteria are specified, then the criteria are combined by using the `and` operator. The supported properties are `name`, `description`, and `isActive`. If the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled, then the supported property is `name` only.		
`language`	String	Custom language that you can specify to get translated data for the fields of an object that's enabled for translation. See Translate Product and Product Category Data.	Optional	64.0
`offset`	Integer	Number of records to skip. The default value is 0.	Optional	60.0
`pageSize`	Integer	Specifies the number of records per page. Valid values are from 1 through 200. If the value is unspecified, it defaults to 100.	Optional	60.0
`relatedObjectFilters`	Related Object Filter[]	Criteria for the related objects to filter the records. The supported operator is `eq`. The supported object is `ProductSpecificationRecType`. The supported values are `true` and `false`. The supported property is `IsCommercial`.	Optional	60.0
`searchTerm`	String	String used to get products with the product name containing the search term. See Search Considerations When Using Indexed Data.	Optional	62.0
`sort`	Sort	Sort order for the products. If the **Use Indexed Data For Product Listing and Search** toggle from the	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
		Product Discovery Settings page from Setup is enabled, then you can sort products by using name only.		

Product Variants Input

Input representation of the request to retrieve the variation products associated with parent variant products.

JSON example

```
{
  "correlationId": "9b6bc520-3c82-4d6c-a458-47590370681a",
  "parentVariantsIds": [
    "01tT1000000F0afIAC",
    "01tT1000000F0agIAC"
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`correlationId`	String	Unique ID to track and associate related events or transactions. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	67.0
`parent VariantsIds`	String[]	List of product IDs for parent variant products whose variations you want to retrieve. If any product ID is blank, invalid, or not found, the API skips that ID and processes the remaining valid IDs. The skipped IDs appear in the `inValidProductIds` response property. If a product ID is valid but isn't a parent variant product, the API includes it in the `nonVariantParentIds` response property.	Required	67.0

Related Object Filters Input

Input representation of the request to filter related objects.

JSON example

```
"relatedObjectFilters":
[{
   "criteria": [
    {
    "property": "IsCommercial",
    "operator": "eq",
    "value": true
    }
  ],
   "objectName": "ProductSpecificationRecType"
 }]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`criteria`	Criteria[]	Criteria to filter the related objects.	Required if the `relatedObjectFilters` property is specified.	60.0
`objectName`	String	API name of the object that's related to the main object.	Required if the `relatedObjectFilters` property is specified.	60.0

Related Object Node Input

Input representation of the details of a related object node.

JSON example

```
 "relatedObjectNodes": [
    {
      "relatedObjectAPIName": "ProductRampSegment",
      "pageSize": 20,
      "offSet": 0
    },
    {
      "relatedObjectAPIName": "ProductUsageGrant",
      "pageSize": 10,
      "offSet": 0,
      "filter": {
        "criteria": [
          {
            "property": "status",
            "operator": "eq",
            "value": "active"
          },
          {
            "property": "effectivestartdate",
            "operator": "lte",
            "value": "2024-06-25"
```

```
        },
        {
          "criteriaType": "CustomWhereCondition",
          "value": "(effectiveenddate = null OR effectiveenddate >= 2024-06-25)"
        }
      ]
    }
  }
]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`filter`	Criteria[]	Criteria to filter records. The supported properties are: • `StartDate` • `EndDate` • `Status` The supported operators are: • `eq` • `gte` • `lte` The supported related object is ProductUsageGrant. If multiple criteria are specified, then the resultant criteria are combined by using the `and` operator.	Optional	62.0
`offSet`	Integer	Number of records to skip. The default value is 0.	Optional	62.0
`pageSize`	Integer	Number of records per page. Valid values are from 1 through 100. If unspecified, the default value is 100.	Optional	62.0
`relatedObject APIName`	String	API name of the related object to return the records for. The supported related objects are ProductRampSegment and ProductUsageGrant.	Required	62.0

Related Records Input

Input representation of the request to retrieve related ProductRampSegment or ProductUsageGrant records for Product2 object.

JSON example

```
{
  "recordIds": [
    "01txx0000006i44AAA",
    "01txx0000006i5gAAA"
  ],
  "relatedObjectNodes": [
    {
      "relatedObjectAPIName": "ProductRampSegment",
      "pageSize": 20,
      "offSet": 0
    },
    {
      "relatedObjectAPIName": "ProductUsageGrant",
      "pageSize": 10,
      "offSet": 0,
      "filter": {
        "criteria": [
          {
            "property": "status",
            "operator": "eq",
            "value": "active"
          },
          {
            "property": "effectivestartdate",
            "operator": "lte",
            "value": "2024-06-25"
          },
          {
            "criteriaType": "CustomWhereCondition",
            "value": "(effectiveenddate = null OR effectiveenddate >= 2024-06-25)"
          }
        ]
      }
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`correlationId`	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	62.0
`recordIds`	String[]	List of record IDs to return the relatedObjects records for. The maximum number of record IDs supported is 20.	Required	62.0

Name	Type	Description	Required or Optional	Available Version
`relatedObjectNodes`	Related Object Node Input[]	List of nodes for the related objects. The maximum number of related object nodes supported is two.	Required	62.0

Run-time Catalog Snapshot Input

Input representation of the details of a run-time catalog snapshot for deployment.

JSON example

```
"snapshot": {
  "activationType": "IMMEDIATE",
  "activationDate": "2024-05-06T05:12:59.000Z",
  "id": "1Avxx0000005DFe1AM"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`activationDate`	String	Activation date of the snapshot.	Optional	62.0
`activationType`	String	Activation type of the snapshot. Valid value is: • `IMMEDIATE`—Snapshot is activated immediately after a successful build.	Required	62.0
`id`	String	ID of the snapshot.	Required	62.0

Setting Input

Input representation of the details of the index setting.

JSON example

```
  "setting" : {
      "supportedLanguages" : ["en_US","ja","es","nl_NL"],
      "defaultLanguage" : "en_US"
 }
```

Properties

Name	Type	Description	Required or Optional	Available Version
`defaultLanguage`	String	Default language for the API.	Required	63.0
`supportedLanguages`	String[]	List of supported language locales for indexing.	Required	63.0

Snapshot Deployment Input

Input representation of the request to deploy a run-time catalog snapshot.

JSON example

This example shows a sample request to build a new snapshot with immediate activation.

```
{
  "snapshot": {
    "activationType": "IMMEDIATE"
  },
  "buildType": "FULL"
}
```

This example shows a sample request to rebuild a snapshot in the `active` status.

```
{
  "snapshot": {
    "activationType": "IMMEDIATE",
    "id": "1Avxx0000005DFe1AM"
  },
  "buildType": "FULL"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`buildType`	String	Build type of the snapshot index. Valid value is: • `FULL`—Specifies a full index build. • `INCREMENTAL`—Specifies an incremental index build. Available from API version 63.0 and later.	Required	62.0
`snapshot`	Run-time Catalog Snapshot Input[]	Snapshot to deploy.	Required	62.0

Sort Input

Input representation of the sort request.

JSON example

```
"sort":
{
"orders":
[{
"property": "name",
"direction": "asc"
}]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`orders`	Order[]	Details of the sort order.	Required if the `sort` property is specified.	60.0

Response Bodies

Learn more about the available Product Catalog Management API response bodies.

Attribute Category
Output representation of the attribute category.

Attribute Definition
Output representation of the attribute definition.

Attribute Picklist
Output representation of the attribute picklist.

Attribute Picklist Value
Output representation of the attribute picklist value.

Bulk Unit Of Measure Info
Output representation of the details of the unit of measure records along with error details.

Data Rounding
Output representation of the data rounding response.

Data Row
Output representation of the details of a data row.

Catalog Output
Output representation of the catalog definition.

Catalogs Output
Output representation of the retrieved catalog result.

Categories Output
Output representation of the retrieved categories result.

Category Output
Output representation of the category definition.

Deep Clone Error
Output representation of the error details related to the deep clone request.

Deep Clone Record Response
Output representation of the details of the cloned related records.

Deep Clone Response
Output representation of the details of the cloned record.

Error Output

Output representation of the error details.

Facet Value

Output representation of the facet values found in the search result.

Field Data

Output representation of the field data.

Fields Info

Output representation of the metadata fields in an object.

Index Configuration Collection

Output representation of the collection of index configuration details.

Index Configuration Field

Output representation of the details of the index-configured field.

Index Configurations Update

Output representation of the updated index configuration.

Index Error

Output representation of the error details related to an index.

Index Setting

Output representation of the retrieved index settings.

Index Setting Update

Output representation of the details of the updated index setting.

Invalid Related Object Node

Output representation of the invalid related object node with details of errors.

Metadata

Output representation of the metadata details for objects.

Object Info

Output representation of the object details along with its fields.

Product Catalog Management Error

Output representation that contains error details, including error codes and messages.

Product Classification

Output representation of the product classification details.

Product Classification Details

Output representation that contains the details of a single product classification, including its attributes and categories.

Product Classification Details Collection

Output representation that contains a collection of product classification details along with any processing errors.

Product Classification List Collection

Output representation that contains a collection of product classification records along with any processing errors.

Product Component Group

Output representation of the product component group.

Product

Output representation of the product definition.

Product Related Component

Output representation of the product-related component.

Product Selling Model

Output representation of the definition of the product selling model.

Product Selling Model Option

Output representation of the definition of the product selling model option.

Product Specification Type

Output representation of the product specification type.

Products

Output representation of the list of retrieved products.

Product Variants

Output representation of the variation products associated with the specified parent variant products.

Related Object Records

Output representation of the related records for a specified record ID and related object API name.

Related Records

Output representation of the list of relatedObject records for a specified record ID.

Related Records List

Output representation of the list of related records.

Search Facet

Output representation of the details of the faceted search.

Setting

Output representation of the setting that's used in indexing.

Setting Metadata

Output representation of the metadata associated with a setting.

Snapshot

Output representation of the list of active snapshots.

Snapshot Collection

Output representation of the retrieved snapshot collection.

Snapshot Deployment

Output representation of the snapshot deployment.

Snapshot Index

Output representation of the snapshot index of a run-time catalog.

Snapshot Index Error

Output representation of the error details related to a snapshot index.

Snapshot Index Info

Output representation of the details of a snapshot index.

Snapshot Index Log

Output representation of a snapshot index log.

Status

Output representation of the status of the request.

Unit of Measure Error

Output representation of the details of errors encountered during the processing of the Unit of Measure API request.

Unit of Measure Info

Output representation of the details of a unit of measure record.

Unit of Measure Status

Output representation of the status of the Unit of Measure API request.

Attribute Category

Output representation of the attribute category.

JSON example

```
"attributeCategory": [
        {
          "attributes": [
            {
              "additionalFields": {
                "scope": "Order"
              },
              "attributeNameOverride": "AD Text",
              "code": "AD02",
              "dataType": "Text",
              "defaultValue": "AD Text DV",
              "description": "AD Text Desc",

              "isRequired": true,
              "label": "AD Text Label",
              "maximumCharacterCount": "20",
              "maximumValue": "100",
              "minimumCharacterCount": "1",
              "minimumValue": "50",
              "name": "AD Text",
              "sequence": 1,
              "status": "Active",
              "valueDescription": "AD Text VD"
            }
          ],
          "code": "AC001",
          "id": "0v3T1000000000BIAQ",
          "name": "build and make"
    }
]
```

Property Name	Type	Description	Filter Group and Version	Available Version
attributes	Attribute Definition[]	List of categorized attributes associated with the product.	Small, 60.0	60.0
code	String	Code of the attribute category.	Small, 60.0	60.0
id	String	ID associated with the attribute category.	Small, 60.0	60.0
name	String	Name of the attribute category. If data translation is set up and specified in the org, the translated description is available.	Small, 60.0	60.0

Attribute Definition

Output representation of the attribute definition.

JSON example

```
"attributes": [
     {
      "additionalFields": {
      "scope": "Order"
       },
      "attributeNameOverride": "AD Text",
      "code": "AD02",
      "dataType": "Text",
      "defaultValue": "AD Text DV",
      "description": "AD Text Desc",
      "displayType": "Text",
      "helpText": "AD Text DHT",
      "id": "0tjT1000000002bIAA",
      "isHidden": false,
      "isPriceImpacting": true,
      "isReadOnly": true,
      "isRequired": true,
      "label": "AD Text Label",
      "maximumCharacterCount": 20,
      "maximumValue": "100",
      "minimumCharacterCount": 1,
      "minimumValue": "50",
      "name": "AD Text",
      "sequence": 1,
      "status": "Active",
      "valueDescription": "AD Text VD"
     }
   ],
    "code": "AC001",
    "id": "0v3T1000000000BIAQ",
    "name": "build and make"
}]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`additional Fields`	Map<String, Additional Fields Input>	Key-value pair of additional standard or custom fields to include in the response.	Small, 61.0	61.0
`attributeName Override`	String	Name to display for the attribute, which overrides the name on the attribute. For example, the Color attribute is overridden to display as Laptop Color.	Small, 60.0	60.0
`code`	String	Unique code of the attribute definition.	Small, 60.0	60.0
`dataType`	String	Data type of the attribute definition value.	Small, 60.0	60.0
`defaultValue`	String	Default value of the attribute.	Small, 60.0	60.0
`description`	String	Description of the attribute.	Small, 60.0	60.0
`displayType`	String	Display types of the attribute. Valid values are: • `Radio Button` • `Checkbox` • `Toggle` • `Input Date` • `DateTime` • `Currency Symbol` • `Currency Code` • `Currency Name` • `Percentage` • `Text` • `Combobox` • `Radio Button` • `MultiSelect` • `MultiSelectCheckboxes`	Small, 60.0	60.0
`helpText`	String	Help text that appears at run time for the attribute. If data translation is set up and specified in the org, the translated description is available.	Small, 60.0	60.0
`id`	String	ID of the attribute definition.	Small, 60.0	60.0
`is Configurable`	Boolean	Reserved for future use.	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
`isHidden`	Boolean	Indicates whether to hide the attribute from the users in the order capture interface (`true`) or not (`false`).	Small, 60.0	60.0
`isPrice Impacting`	Boolean	Indicates whether the attribute impacts the product price (`true`) or not (`false`).	Small, 60.0	60.0
`isReadOnly`	Boolean	Indicates whether the product attribute is read-only for the end users in the order capture page (`true`) or not (`false`).	Small, 60.0	60.0
`isRequired`	Boolean	Indicates whether a value for the attribute is required for the assigned parent object (`true`) or not (`false`).	Small, 60.0	60.0
`isValue Cloneable`	Boolean	Reserved for future use.	Small, 60.0	60.0
`label`	String	Label of the attribute. If data translation is set up and specified in the org, the translated description is available.	Small, 60.0	60.0
`maximum Character Count`	Integer	Maximum number of alphanumeric characters that can be entered for attributes of type number and text in run time.	Small, 60.0	60.0
`maximumValue`	String	Maximum value that can be entered for attributes of type number, currency, and percent in run time.	Small, 60.0	60.0
`minimum Character Count`	Integer	Minimum number of alphanumeric characters that can be entered for attributes of type number and text in run time. The minimum character count must be less than or equal to the maximum character count.	Small, 60.0	60.0
`minimumValue`	String	Minimum value that can be entered for attributes of type number, currency, and percent in run time. The minimum value must be less than or equal to the maximum value.	Small, 60.0	60.0
`name`	String	Name of the attribute.	Small, 60.0	60.0
`picklist`	Attribute Picklist	ID of the attribute picklist that provides the valid values for the attribute.	Small, 60.0	60.0
`sequence`	Integer	Order in which the attribute values appear in the attribute definition when the product is configured at run time.	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
`status`	String	Lifecycle state of the attribute picklist. Valid values are: • `Active` • `Draft` • `Inactive`	Small, 60.0	60.0
`stepValue`	String	Reserved for future use.	Small, 60.0	60.0
`valueDecoder`	String	Reserved for future use.	Small, 60.0	60.0
`value Description`	String	Description of the value assigned to the attribute.	Small, 60.0	60.0

Attribute Picklist

Output representation of the attribute picklist.

JSON example

```
"picklist": {
     "dataType": "Text",
     "description": "Fabric Module options",
     "id": "0v51Q000000TNDkQAO",
     "name": "Fabric Module options",
     "values": [
      {
        "abbreviation": "IFM1"
        "code": "PV0051",
        "displayValue": "25G Intelligent Fabric Module with 8x 25G SFP28 ports",
        "id": "0v61Q0000008OMYQA2",
        "name": "25G Intelligent Fabric Module with 8x 25G SFP28 ports",
        "sequence": "1",
        "value": "25G Intelligent Fabric Module with 8x 25G SFP28 ports",
        "status" : "Active"
      },
      {
        "abbreviation": "IFM2"
        "code": "PV0052",
        "displayValue": "100G Intelligent Fabric Module with 8x 100G QSFP28 ports",
        "id": "0v61Q0000008OMZQA2",
        "name": "100G Intelligent Fabric Module with 8x 100G QSFP28 ports",
        "sequence": "2",
        "value": "100G Intelligent Fabric Module with 8x 100G QSFP28 ports",
        "status" : "Active"
      }
     ]
  }
```

Property Name	Type	Description	Filter Group and Version	Available Version
`dataType`	String	Data type of the values in the picklist. Valid values are: • `Boolean` • `Date` • `Datetime` • `Number` • `Text` • `Currency` • `Percent`	Small, 60.0	60.0
`description`	String	Description of the picklist, such as the picklist purpose or the associated product.	Small, 60.0	60.0
`id`	String	ID associated with the attribute picklist record.	Small, 60.0	60.0
`name`	String	Name of the picklist value.	Small, 60.0	60.0
`values`	Attribute Picklist Value[]	List of values associated with the picklist.	Small, 60.0	60.0

Attribute Picklist Value

Output representation of the attribute picklist value.

JSON example

```
"values": [
      {
        "abbreviation": "IFM1"
        "code": "PV0051",
        "displayValue": "25G Intelligent Fabric Module with 8x 25G SFP28 ports",
        "id": "0v61Q0000008OMYQA2",
        "name": "25G Intelligent Fabric Module with 8x 25G SFP28 ports",
        "sequence": "1",
        "value": "25G Intelligent Fabric Module with 8x 25G SFP28 ports",
        "status" : "Active"
      }
     ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`abbreviation`	String	Name of the picklist value that appears at run time.	Small, 60.0	60.0
`code`	String	Unique code of the picklist value within the picklist.	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
`displayValue`	String	Picklist value that appears at run time in the order capture page. If data translation is set up and specified in the org, the translated description is available.	Small, 60.0	60.0
`id`	String	ID associated with the attribute picklist value.	Small, 60.0	60.0
`name`	String	Name of the picklist value.	Small, 60.0	60.0
`sequence`	String	Order in which the picklist value appears in the picklist.	Small, 60.0	60.0
`status`	String	Status of the attribute picklist value.	Small, 62.0	62.0
`value`	String	Value of the picklist item. Value must be unique within the picklist.	Small, 60.0	60.0

Bulk Unit Of Measure Info

Output representation of the details of the unit of measure records along with error details.

JSON example

```
{
  "correlationId": "928ea35f-8a2f-4932-9f7e-ec6cdbcabdbe",
  "errorCodeToErrorMap": {
    "UNIT_OF_MEASURE_INFO_INVALID_UOM_IDS": {
      "errorCode": "UOM_INFO_API_003",
      "messageDetail": "Invalid uomId is passed. Please specify a valid uomId.",
      "messageTitle": "Invalid uomId is passed.",
      "recordIds": [
        "sample"
      ],
      "source": "Unit_Of_Measure_Info_Api"
    }
  },
  "status": {
    "errors": [],
    "httpStatusCode": "200",
    "message": " Successfully fetched UnitOfMeasure Info. "
  },
  "uomIdToUnitOfMeasureInfo": {
    "0hEU200000003M5MAI": {
      "id": "0hEU200000003M5MAI",
      "name": "Pounds",
      "roundingMethod": "Nearest",
      "scale": 1,
      "unitCode": "Pounds"
    },
    "0hEU200000003KTMAY": {
      "id": "0hEU200000003KTMAY",
```

```
        "name": "Grams",
        "roundingMethod": "Down",
        "scale": 5,
        "unitCode": "Grams"
      }
    }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
correlationId	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Small, 63.0	63.0
errorCode ToErrorMap	Map<String, Unit Of Measure Error>	Error codes mapped to their details.	Small, 63.0	63.0
status	Unit Of Measure Status[]	Status of the API request.	Small, 63.0	63.0
uomIdToUnit OfMeasureInfo	Map<String, Unit Of Measure Info>	Unit of measure record IDs mapped to their details.	Small, 63.0	63.0

Data Rounding

Output representation of the data rounding response.

JSON example

```
{
  "keyToUomDataRowOutput": {
    "PRC1": {
      "key": "PRC1",
      "fieldApiNameToFieldDataOutput": {
        "MaxQuantity": {
          "fieldApiName": "MaxQuantity",
          "originalValue": 1234.5678,
          "isRoundingApplicable": true,
          "roundedValue": 1234.56,
          "unitOfMeasureId": "uomId1",
          "errorCodeToErrorMap" : []
        },
        "MinQuantity": {

          "unitOfMeasureId": "uomId2"
        }
      },
      "errorCodeToErrorMap": []
    }
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`correlationId`	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Small, 63.0	63.0

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCodeToErrorMap`	Map<String, Unit Of Measure Error>	Error codes mapped to their details.	Small, 63.0	63.0
`keyToDataRowOutput`	Map<String, Data Row>	Data row key mapped to the associated data row.	Small, 63.0	63.0
`status`	Unit Of Measure Status[]	Status of the API request.	Small, 63.0	63.0

Data Row

Output representation of the details of a data row.

JSON example

```
{
  "keyToUomDataRowOutput": {
    "PRC1": {
      "key": "PRC1",
      "fieldApiNameToFieldDataOutput": {

          "isRoundingApplicable": true,
          "roundedValue": 1234.56,
          "unitOfMeasureId": "uomId1"
        },
        "MinQuantity": {
          "fieldApiName": "MinQuantity",
          "originalValue": 987.4628,
```

```
          "isRoundingApplicable": true,
          "errorCodeToErrorMap": {
            "message": "arithrmetic operation"
          },
          "unitOfMeasureId": "uomId1"
        }
      },
      "errorCodeToErrorMap": []
    },
    "PRC3": {
      "key": "PRC3",
      "fieldApiNameToFieldDataOutput": {
        "MaxQuantity": {
          "fieldApiName": "MaxQuantity",
          "originalValue": 1234.5678,
          "isRoundingApplicable": false,
          "unitOfMeasureId": "uomId2"
        },
        "MinQuantity": {
          "fieldApiName": "MinQuantity",
          "originalValue": 987.4628,
          "isRoundingApplicable": false,
          "unitOfMeasureId": "uomId2"
        }
      },
      "errorCodeToErrorMap": []
    }
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCodeToErrorMap`	Map<String, Unit Of Measure Error>	Map of error codes to their details.	Small, 63.0	63.0
`fieldApiNameToFieldDataOutput`	Map<String, Field Data>	Map of field API name to associated field data.	Small, 63.0	63.0
`key`	String	Unique key of the data row.	Small, 63.0	63.0

Catalog Output

Output representation of the catalog definition.

JSON example

```
catalogs": [
    {
      "catalogType": "Sales",
      "code": "CAT009",
      "description": "SmartBytes B2B Catalog",
      "effectiveEndDate": "31-07-2023",
```

```
        "effectiveStartDate": "24-07-2023",
        "id": "0ZS1Q000000XbZAWA0",
        "name": "SmartBytes B2B Catalog",
        "numberOfCategories": 8
    }
]
```

Property Name	Type	Description	Filter Group and Version	Available Version
catalogType	String	The category of an entry in the catalog, which is customizable. For example, catalog types, such as sellable products, services, parts, technical services, or technical resources.	Small, 60.0	60.0
code	String	Unique ID associated with the catalog.	Small, 60.0	60.0
description	String	Description of the catalog. If data translation is set up and specified in the org, the translated description is available.	Small, 60.0	60.0
effective EndDate	String	Date and time from when the catalog isn't available to the end users.	Small, 60.0	60.0
effective StartDate	String	Date and time from when the catalog is available to the end users.	Small, 60.0	60.0
id	String	ID of the catalog.	Small, 60.0	60.0
name	String	Name of the catalog. If data translation is set up and specified in the org, the translated description is available.	Small, 60.0	60.0
numberOf Categories	Integer	Number of categories in the catalog.	Small, 60.0	60.0

Catalogs Output

Output representation of the retrieved catalog result.

JSON example

```
{
  "catalogs": [
    {
      "catalogType": "Sales",
      "code": "CAT009",
      "id": "0ZS1Q000000XbZAWA0",
      "name": "SmartBytes B2B Catalog",
      "numberOfCategories": 8
    }
  ],
  "correlationId": "0b7b6a30-895c-407a-91b3-e67482d339a3",
```

```
  "count": 1,
  "status": {
    "code": "200",
    "errors": [],
    "message": "Successfully fetched the catalog records."
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`catalogs`	Catalog Output[]	List of the catalogs.	Small, 60.0	60.0
`correlationId`	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Small, 60.0	60.0
`count`	Integer	Total number of the catalog records retrieved after the query execution, wherein the `pageSize` property determines the number of records returned in every page.	Small, 60.0	60.0
`status`	Status	Status of the request.	Small, 60.0	60.0

Categories Output

Output representation of the retrieved categories result.

JSON example

```
{
  "categories": [
    {
      "catalogId": "0ZS1Q000000XbZAWA0",
      "code": "B2B Category",
      "description": "Products Category",
      "hasSubCategories": true,
      "id": "0ZG1Q000000XbVGWA0",
      "name": "Unified Computing",
      "numberOfProducts": 2,
      "parentCategoryId": "0ZGT100000000ql0AA",
      "sortOrder": 2,
      "subCategories": [],
      "isNavigational: false
    }
  ],
  "correlationId": "30230973-0a09-405e-b148-f085bb6dd66e",
  "status": {
    "code": "200",
    "errors": [],
    "message": "Successfully fetched the category records."
```

```
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`categories`	Category Output[]	List of the retrieved categories.	Small, 60.0	60.0
`correlationId`	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Small, 60.0	60.0
`status`	Status	Status of the request.	Small, 60.0	60.0

Category Output

Output representation of the category definition.

JSON example

```
"categories": [
    {
      "catalogId": "0ZS1Q000000XbZAWA0",
      "code": "B2B Category",
      "description": "Products Category",
      "hasSubCategories": true,
      "id": "0ZG1Q000000XbVGWA0",
      "name": "Unified Computing",
      "numberOfProducts": 2,
      "parentCategoryId": "0ZGT100000000ql0AA",
      "sortOrder": 2,
      "subCategories": [],
      "isNavigational: false
    }
  ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`catalogId`	String	ID of the catalog that the category is associated with.	Small, 60.0	60.0
`code`	String	Unique code of the product category.	Small, 60.0	60.0
`description`	String	Description of the category. If data translation is set up and specified in the org, the translated description is available.	Small, 60.0	60.0
`hasSub Categories`	Boolean	Indicates whether the subcategories are available (true) or not (false).	Small, 60.0	60.0
`id`	String	ID of the category.	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
isNavigational	Boolean	Indicates whether the category node is navigational (`true`) or not (`false`).	Small, 62.0	62.0
name	String	Name of the category. If data translation is set up and specified in the org, the translated name is available.	Small, 60.0	60.0
numberOf Products	Integer	Number of products associated with the category.	Small, 60.0	60.0
parent CategoryId	String	ID of the parent category.	Small, 60.0	60.0
sortOrder	Integer	Display order of the product category relative to the siblings with the same parent category.	Small, 60.0	60.0
subCategories	Category Output[]	List of subcategories, if available. This property is returned with the Categories List (GET) API response.	Small, 60.0	60.0

Deep Clone Error

Output representation of the error details related to the deep clone request.

Property Name	Type	Description	Filter Group and Version	Available Version
errorCode	String	Code of the error message related to the deep clone request.	Small, 63.0	63.0
errorMessage	String	Details of the error message related to the deep clone request.	Small, 63.0	63.0

Deep Clone Record Response

Output representation of the details of the cloned related records.

JSON example

```
"createdRecordList": [
  {
    "createdRecordId": "01tSG0000030Yb3YAE",
    "entityApiName": "Product2",
    "entityLabel": "Product"
  },
  {
    "createdRecordId": "0iOSG0000002rMn2AI",
    "entityApiName": "ProductSellingModelOption",
    "entityLabel": "Product Selling Model Option"
```

```
    },
    {
      "createdRecordId": "0v7SG0000001ktdYAA",
      "entityApiName": "ProductAttributeDefinition",
      "entityLabel": "Product Attribute Definition"
    }
  ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`createdRecordId`	String	ID of the created related record.	Small, 63.0	63.0
`entityApiName`	String	API name of the created object.	Small, 63.0	63.0
`entityLabel`	String	Label of the created object.	Small, 63.0	63.0

Deep Clone Response

Output representation of the details of the cloned record.

JSON example

```
{
  "createdRecordList": [
    {
      "createdRecordId": "01tSG0000030Yb3YAE",
      "entityApiName": "Product2",
      "entityLabel": "Product"
    },
    {
      "createdRecordId": "0iOSG0000002rMn2AI",
      "entityApiName": "ProductSellingModelOption",
      "entityLabel": "Product Selling Model Option"
    },
    {
      "createdRecordId": "0v7SG0000001ktdYAA",
      "entityApiName": "ProductAttributeDefinition",
      "entityLabel": "Product Attribute Definition"
    }
  ],
  "createdRootRecordId": "01tSG0000030Yb3YAE",
  "errorList": [],
  "isSuccessful": true
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`createdRecordList`	Deep Clone Record Response[]	List of cloned related records of the main record.	Small, 63.0	63.0

Property Name	Type	Description	Filter Group and Version	Available Version
`createdRootRecordId`	String	ID of the created root record.	Small, 63.0	63.0
`errorList`	Deep Clone Error[]	Details of errors, if any.	Small, 63.0	63.0
`errorMessage`	String	Error message if the API request fails.	Small, 63.0	63.0
`isSuccessful`	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Small, 63.0	63.0

Error Output

Output representation of the error details.

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Code of the error message.	Small, 60.0	60.0
`messageDetail`	String	Details of the error message.	Small, 60.0	60.0
`messageTitle`	String	Title of the error message.	Small, 60.0	60.0
`nodeProductId`	String	ID of the product node.	Small, 61.0	61.0
`recordId`	String	ID of the record.	Small, 60.0	60.0
`recordName`	String	Name of the record.	Small, 60.0	60.0
`relatedObjectNodes`	Invalid Related Object Node[]	List of related object nodes with errors.	Small, 62.0	62.0
`source`	String	Name of the API that's the source of the error.	Small, 60.0	60.0

Facet Value

Output representation of the facet values found in the search result.

JSON example

```
"values": [
  {
    "displayName": "Simple",
    "nameOrId": "Simple",
    "productCount": 9
  }
]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`displayName`	String	Display name of the facet value.	Small, 63.0	63.0
`nameOrId`	String	Facet value name or ID. Reserved for internal use.	Small, 63.0	63.0
`productCount`		Number of products in the search result that match the facet value.	Small, 63.0	63.0

Field Data

Output representation of the field data.

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCodeToErrorMap`	Map<String, Unit Of Measure Error>	Error codes mapped to their details.	Small, 63.0	63.0
`fieldApiName`	String	Unique API Name of the field.	Small, 63.0	63.0
`isRoundingApplicable`	Boolean	Indicates whether data rounding is applicable to the decimal (`true`) or not (`false`).	Small, 63.0	63.0
`originalValue`	String	Original value of the field.	Small, 63.0	63.0
`roundedValue`	String	Rounded field value that corresponds to the original value, if data rounding is applicable.	Small, 63.0	63.0
`unitOfMeasureId`	String	ID of the unit of measure record that's associated to the field.	Small, 63.0	63.0

Fields Info

Output representation of the metadata fields in an object.

JSON example

```
        "fields": [
          {
            "dataType": "text",
            "isFacetableConfigurable": true,
            "isSearchableConfigurable": false,
            "label": "Product Name",
            "name": "Name",
            "type": "Standard"
          },
          {
            "dataType": "multilinetext",
            "isFacetableConfigurable": false,
            "isSearchableConfigurable": true,
```

```
            "label": "Product Description",
            "name": "Description",
            "type": "Standard"
          }
        ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
customFieldId	String	ID of the custom field.	Small, 62.0	62.0
dataType	String	Type of data.	Small, 62.0	62.0
is Configurable	Boolean	Reserved for internal use.	Small, 62.0	62.0
isFacetable Configurable	Boolean	Indicates whether the field is facetable (`true`) or not (`false`).	Small, 63.0	Small, 63.0
isSearchable Configurable	Boolean	Indicates whether the field is searchable (`true`) or not (`false`).	Small, 63.0	Small, 63.0
label	String	Label of the object field.	Small, 62.0	62.0
name	String	Name of the object field.	Small, 62.0	62.0
type	String	Type of the object field.	Small, 62.0	62.0

Index Configuration Collection

Output representation of the collection of index configuration details.

JSON example

```
{
  "correlationId": "ad960cb6-392d-4d11-bac3-3824baedf67e",
  "errors": [],
  "indexConfigurations": [
    {
      "isSearchable": true,
      "name": "Name",
      "type": "Standard"
    }
  ],
  "metadata": {
    "objectInfos": [
      {
        "fields": [
          {
            "dataType": "text",
            "isFacetableConfigurable": true,
            "isSearchableConfigurable": false,
            "label": "Product Name",
            "name": "Name",
            "type": "Standard"
```

```
          },
          {
            "dataType": "multilinetext",
            "isFacetableConfigurable": false,
            "isSearchableConfigurable": true,
            "label": "Product Description",
            "name": "Description",
            "type": "Standard"
          }
        ],
        "name": "Product2"
      },
      {
        "fields": [
          {
            "dataType": "stringplusclob",
            "label": "Description",
            "name": "Description",
            "type": "ProductAttributeDefinitionStandard"
          },
          {
            "dataType": "text",
            "label": "Name",
            "name": "Name",
            "type": "ProductAttributeDefinitionStandard"
          },
        ],
        "name": "ProductAttributeDefinition"
      }
    ]
  },
  "statusCode": "200"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`correlationId`	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Small, 62.0	62.0
`errors`	Error Output[]	List of errors, if any.	Small, 62.0	62.0
`index Configurations`	Index Configuration Field[]	Details of the index-configured fields.	Small, 62.0	62.0
`metadata`	Metadata[]	Details of the metadata for objects.	Small, 62.0	62.0
`statusCode`	String	Code that indicates the status of the request.	Small, 62.0	62.0

Index Configuration Field

Output representation of the details of the index-configured field.

JSON example

```
"indexConfigurations": [
  {
    "attributeDefinitionId": "0tjT1000000002bIAA",
    "name": "Color",
    "type": "ProductDynamicAttribute",
    "isSearchable": true
  },
  {
    "attributeFieldId": "00Nxx000001FwnABII",
    "name": "Message__c",
    "type": "Custom",
    "isSearchable": true
  },
  {
    "name": "Code",
    "type": "Standard",
    "isSearchable": true
  },
  {
    "facetDisplayRank": 1,
    "isFacetable": false,
    "isSearchable": true,
    "name": "Family",
    "type": "Standard"
  }
]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`attributeDefinitionId`	String	ID of the attribute definition.	Small, 62.0	62.0
`attributeFieldId`	String	ID of the attribute field.	Small, 62.0	62.0
`facetDisplayRank`	Integer	Sort order for displaying the facets at run time.	Small, 63.0	63.0
`isFacetable`	Boolean	Indicates whether the field is facetable (`true`) or not (`false`).	Small, 63.0	63.0
`isSearchable`	Boolean	Indicates whether the index-configured field is searchable (`true`) or not (`false`).	Small, 62.0	62.0
`name`	String	Name of the index-configured field.	Small, 62.0	62.0
`type`	String	Type of the index-configured field.	Small, 62.0	62.0

Index Configurations Update

Output representation of the updated index configuration.

JSON example

```
{
  "correlationId": "8545b5aa-f3e6-429a-8f21-9cc4ce50b1d7",
  "errors": [],
  "indexConfigurations": [
    {
      "attributeDefinitionId": "0tjT1000000002bIAA",
      "name": "Color",
      "type": "ProductDynamicAttribute",
      "isSearchable": true
    },
    {
      "attributeFieldId": "00Nxx000001FwnABII",
      "name": "Message__c",
      "type": "Custom",
      "isSearchable": true
    },
    {
      "name": "Code",
      "type": "Standard",
      "isSearchable": true
    },
    {
      "facetDisplayRank": 1,
      "isFacetable": false,
      "isSearchable": true,
      "name": "Family",
      "type": "Standard"
    }
  ],
  "statusCode": "200"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`correlationId`	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Small, 62.0	62.0
`errors`	Error Output[]	List of errors, if any.	Small, 62.0	62.0
`index Configurations`	Index Configuration Field[]	Details of the index-configured fields.	Small, 62.0	62.0
`statusCode`	String	Code that indicates the status of the request.	Small, 62.0	62.0

Index Error

Output representation of the error details related to an index.

JSON example

```
  "indexErrorDetails": {
    "errorFileId": "069xx0000004C92AAE",
    "indexCreatedDate": "2024-10-03T05:24:18.000Z",
    "indexErrorsCount": 1,
    "indexLastUpdatedDate": "2024-10-03T05:27:00.000Z",
    "itemLevelErrorsCount": 1
  }
```

Property Name	Type	Description	Filter Group and Version	Available Version
errorFileId	String	ID of the exported error file that contains the index errors.	Small, 63.0	63.0
indexCreated Date	String	Date on which the index was created.	Small, 63.0	63.0
index ErrorsCount	Integer	Number of index-level errors.	Small, 63.0	63.0
indexLast UpdatedDate	String	Date on which the index was last updated.	Small, 63.0	63.0
itemLevel ErrorsCount	Integer	Number of item-level errors.	Small, 63.0	63.0

Index Setting

Output representation of the retrieved index settings.

JSON example

```
{
  "errors": [],
  "metadata": {
    "activeLanguages": ["en_US","ja","es","nl_NL"]
  },
  "setting": {
    "defaultLanguage": "en_US",
    "id": "1JySG0000000GUb0AM",
    "supportedLanguages": ["en_US","ja","es","nl_NL"]
  },
  "statusCode": "200"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
errors	Error Output[]	List of errors, if any.	Small, 63.0	63.0

Property Name	Type	Description	Filter Group and Version	Available Version
`metadata`	Setting Metadata[]	Metadata associated with the setting.	Small, 63.0	63.0
`setting`	Setting[]	Setting that's used in indexing and maintained for an org.	Small, 63.0	63.0
`statusCode`	String	Code that indicates the status of the request.	Small, 63.0	63.0

Index Setting Update

Output representation of the details of the updated index setting.

JSON example

```
{
   "setting" : {
        "supportedLanguages" : ["en_US","ja","es","nl_NL"],
        "id": "1JySG0000000GUb0AM",
        "defaultLanguage" : "en_US"
   },
   "errors" : [],
   "statusCode" : "200"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Error Output[]	List of errors, if any.	Small, 63.0	63.0
`setting`	Setting[]	Setting that's used in indexing and maintained for an org.	Small, 63.0	63.0
`statusCode`	String	Code that indicates the status of the API request.	Small, 63.0	63.0

Invalid Related Object Node

Output representation of the invalid related object node with details of errors.

JSON example

```
To add
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errorMessages`	String[]	List of error messages.	Small, 62.0	62.0
`relatedObject APIName`	String	API name of the related object.	Small, 62.0	62.0

Metadata

Output representation of the metadata details for objects.

JSON example

```
"metadata": {
  "objectInfos": [
    {
      "fields": [
        {
          "dataType": "text",
          "isFacetableConfigurable": true,
          "isSearchableConfigurable": false,
          "label": "Product Name",
          "name": "Name",
          "type": "Standard"
        },
        {

    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`objectInfos`	Object Info[]	Metadata details for objects.	Small, 62.0	62.0

Object Info

Output representation of the object details along with its fields.

JSON example

```
"objectInfos": [
  {
    "fields": [
      {
        "dataType": "text",
        "isFacetableConfigurable": true,
        "isSearchableConfigurable": false,
        "label": "Product Name",
        "name": "Name",
        "type": "Standard"
      },
      {
        "dataType": "multilinetext",
        "isFacetableConfigurable": false,
        "isSearchableConfigurable": true,
        "label": "Product Description",
        "name": "Description",
        "type": "Standard"
      }
    ],
    "name": "Product2"
  },
  {
    "fields": [
      {
        "dataType": "stringplusclob",
        "label": "Description",
        "name": "Description",
        "type": "ProductAttributeDefinitionStandard"
      },
      {
        "dataType": "text",
        "label": "Name",
        "name": "Name",
        "type": "ProductAttributeDefinitionStandard"
      },
    ],
    "name": "ProductAttributeDefinition"
  }
]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`fields`	Fields Info[]	Fields of the object.	Small, 62.0	62.0
`name`	String	Name of the object.	Small, 62.0	62.0

Product Catalog Management Error

Output representation that contains error details, including error codes and messages.

JSON example

```
{
  "errorCode": "INSUFFICIENT_ACCESS",
  "message": "Insufficient access rights on cross-reference ID"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Error code that identifies the type of error.	Small, 66.0	66.0
`message`	String	Message that explains the reason for the error.	Small, 66.0	66.0

Product Classification

Output representation of the product classification details.

JSON example

```
{
  "productClassification": {
    "id": "11BT10000004C9SMAU",
    "name": "class",
    "code": "code",
    "parentProductClassificationId": "11BDU0000004JXq2AM",
    "status": "Active"
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`code`	String	Code of the product classification record.	Small, 61.0	61.0
`id`	String	ID of the product classification record.	Small, 60.0	60.0
`name`	String	Name of the product classification record. If data translation is set up and specified in the org, the translated description is available.	Small, 61.0	61.0
`parentProductClassificationId`	String	ID of the parent product classification.	Small, 65.0	65.0
`status`	String	Status of the product classification record.	Small, 61.0	61.0

Product Classification Details

Output representation that contains the details of a single product classification, including its attributes and categories.

JSON example

```
{
  "id": "dummyId",
  "name": "Dummy Product Classification",
  "code": "DUMMY_CODE",
  "attributeCategories": [{
          "attributes": [
            {
              "attributeNameOverride": "Dummy_Attribute__c",
              "code": "ATTR_CODE_1",
              "dataType": "String",
              "defaultValue": "default",
              "description": "A dummy attribute for demonstration.",
              "developerName": "Dummy_Attribute",
              "displayType": "Text",
              "helpText": "Help text for dummy attribute",
              "id": "attrId1",
              "isConfigurable": true,
              "isHidden": false,
              "isPriceImpacting": false,
              "isReadOnly": false,
              "isRequired": false,
              "isValueCloneable": true,
              "label": "Dummy Attribute Label",
              "maximumCharacterCount": 100,
              "maximumValue": "100",
              "minimumCharacterCount": 1,
              "minimumValue": "1",
              "name": "Dummy Attribute",
              "sequence": 1,
              "status": "Active",
              "stepValue": "1"
            }
          ],
          "code": "GENERAL",
          "id": "catId1",
          "name": "General"
        }],
  "attributes": [{
          "attributeNameOverride": "Dummy_Attribute__c",

          "id": "attrId1",
          "isConfigurable": true,
          "isHidden": false,
          "isPriceImpacting": false,
```

```
            "isReadOnly": false,
            "isRequired": false,
            "isValueCloneable": true,
            "label": "Dummy Attribute Label",
            "maximumCharacterCount": 100,
            "maximumValue": "100",
            "minimumCharacterCount": 1,
            "minimumValue": "1",
            "name": "Dummy Attribute",
            "sequence": 1,
            "status": "Active",
            "stepValue": "1"
          }]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
attributeCategories	Product Classification Attribute Category[]	List of attribute categories applicable to the product classification.	Small, 66.0	66.0
attributes	Product Classification Attribute Definition[]	List of uncategorized attributes applicable to the product classification.	Small, 66.0	66.0
code	String	Code of the product classification.	Small, 66.0	66.0
id	String	ID of the product classification.	Small, 66.0	66.0
name	String	Name of the product classification.	Small, 66.0	66.0

Product Classification Details Collection

Output representation that contains a collection of product classification details along with any processing errors.

JSON example

```
{
  "success": false,
  "errors": [
    {
      "errorCode": "INSUFFICIENT_ACCESS",
      "message": "Insufficient access rights on cross-reference ID"
    }
  ],
  "productClassifications": [
    {
      "id": "dummyId",
      "name": "Dummy Product Classification",
      "code": "DUMMY_CODE",
      "attributeCategories": [
        {
          "attributes": [
```

```
          {
            "attributeNameOverride": "Dummy_Attribute__c",
            "code": "ATTR_CODE_1",
            "dataType": "String",
            "defaultValue": "default",
            "description": "A dummy attribute for demonstration.",
            "developerName": "Dummy_Attribute",
            "displayType": "Text",
            "helpText": "Help text for dummy attribute",

        "id": "attrId1",
        "isConfigurable": true,
        "isHidden": false,
        "isPriceImpacting": false,
        "isReadOnly": false,
        "isRequired": false,
        "isValueCloneable": true,
        "label": "Dummy Attribute Label",
        "maximumCharacterCount": 100,
        "maximumValue": "100",
        "minimumCharacterCount": 1,
        "minimumValue": "1",
```

```
            "name": "Dummy Attribute",
            "sequence": 1,
            "status": "Active",
            "stepValue": "1"
          }
        ]
      }
    ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Product Catalog Management Error[]	List of errors encountered during the processing of the API request.	Small, 66.0	66.0
`productClassifications`	Product Classification Details on page 213[]	List of product classification detail records that match the requested product classification IDs.	Small, 66.0	66.0
`success`	Boolean	Indicates whether the API request is successful (`true`) or has failed (`false`).	Small, 66.0	66.0

Product Classification List Collection

Output representation that contains a collection of product classification records along with any processing errors.

JSON example

```
{
  "success": true,
  "errors": [],
  "productClassifications": [
    {
      "id": "11BT10000004C9SMAU",
      "name": "Mobile Devices",
      "code": "MOB_DEV",
      "parentProductClassificationId": "11BDU0000004JXq2AM",
      "status": "Active"
    },
    {
      "id": "11BT10000004C9TMAU",
      "name": "Mobile Accessories",
      "code": "MOB_ACC",
      "status": "Active"
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
errors	Product Catalog Management Error[]	List of errors encountered during the processing of the API request.	Small, 67.0	67.0
productClassifications	Product Classification[]	List of product classification records that match the request query.	Small, 67.0	67.0
success	Boolean	Indicates whether the API request is successful (true) or has failed (false).	Small, 67.0	67.0

Product Component Group

Output representation of the product component group.

JSON example

```
"productComponentGroups":[
  {
    "childGroups":[
     {
      "childGroups":[],
    "    components":[
          {
            "additionalFields":{},
            "attributeCategory":[],
            "attributes":[],
            "catalogs":[],
            "categories":[],
            "childProducts":[],
            "id":"01txx0000006i2aAAA",
            "isActive":true,

          ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`code`	String	Unique code of the product component group, which is used only during design time.	Small, 60.0	60.0
`components`	Product[]	List of the product details.	Small, 60.0	60.0
`childGroups`	Product Component Group[]	List of child product components groups.	Small, 62.0	62.0
`description`	String	Description of the product component group.	Small, 60.0	60.0
`id`	String	ID of the record.	Small, 60.0	60.0
`isExcluded`	Boolean	Indicates whether the product component group is excluded from the product bundle for selection in the run time (`true`) or not (`false`).	Small, 60.0	60.0
`maxBundleComponents`	Integer	Maximum number of product components that can be added to a group.	Small, 60.0	60.0
`minBundleComponents`	Integer	Minimum number of product components that can be added to a group.	Small, 60.0	60.0
`name`	String	Name of the record. If data translation is set up and specified in the org, the translated description is available.	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
parentProductId	String	ID associated with the parent product record.	Small, 60.0	60.0
parentGroupId	String	ID of the parent group record.	Small, 62.0	62.0
sequence	Integer	Order in which the groups are listed in the bundle.	Small, 60.0	60.0

Product

Output representation of the product definition.

JSON example

This example shows a sample of the Product List (POST) API response.

```
{
  "products": [

`attributes`	Attribute Definition[]	List of uncategorized attributes related to the product.	Small, 60.0	60.0
`availability Date`	String	Date when the part is used in the product or is made available for sale.	Small, 60.0	60.0
`catalogs`	Catalog[]	List of the associated catalogs returned with the Product List API (POST) response. The Product By ID API (GET) returns an empty catalog list in the response. Returns the `name` and `id` values only.	Small, 61.0	61.0
`categories`	Category[]	List of the associated categories returned with the Product List API (POST) response. The Product By ID API (GET) returns an empty category list in the response. Returns the `name` and `id` values only.	Small, 60.0	60.0
`childProducts`	Product[]	Hierarchy of the child products.	Small, 60.0	60.0
`configure DuringSale`	String	Determines whether to allow or prevent configuration when a bundle is sold.	Small, 60.0	60.0
`description`	String	Description of the product. If data translation is set up and specified in the org, the translated description is available.	Small, 60.0	60.0
`discontinued Date`	String	Date from when the part can't be used in the product or sold.	Small, 60.0	60.0
`displayUrl`	String	Display image URL of the product.	Small, 60.0	60.0
`endOfLifeDate`	String	Date after which a product isn't supported, ordered, or maintained.	Small, 60.0	60.0
`id`	String	ID of the product.	Small, 60.0	60.0
`isActive`	Boolean	Indicates if the product is active (`true`) or not (`false`).	Small, 60.0	60.0
`isAssetizable`	Boolean	Indicates if the product instance remains a customer asset after it's purchased (`true`) or not (`false`).	Small, 60.0	60.0
`isSoldOnly WithOther Prods`	Boolean	Indicates whether the product can't be sold separately (`true`) or not (`false`).	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
name	String	Name of the product. If data translation is set up and specified in the org, the translated name is available.	Small, 60.0	60.0
nodeType	String	Type of the node, such as a product or bundled product.	Small, 60.0	60.0
productClassification	Product Classification	Details of the product classification that the product is based on.	Small, 60.0	60.0
productCode	String	Universal product code that's used to track the part that's used in the product.	Small, 60.0	60.0
productComponentGroups	Product Component Group[]	Logical grouping of the component products in a bundle and the group cardinality for ordering the product components.	Small, 60.0	60.0
productRelatedComponent	Product Related Component	Details of the related components of a product.	Small, 60.0	60.0
productSellingModelOptions	Product Selling Model Option[]	Details of the product selling model options.	Small, 60.0	60.0
productSpecificationType	Product Specification Type	Details of the product specification type.	Small, 60.0	60.0
quantityScaleMethod	String	Method to scale the quantity of the child product in relation to the quantity of the parent.	Small, 60.0	60.0

Product Related Component

Output representation of the product-related component.

JSON example

```
"productRelatedComponent": {
      "childProductId": "01tT1000000F0YyIAK",
      "childSellingModelId": "0jPT10000004CAfMAM",
      "doesBundlePriceIncludeChild": true,
      "id": "0dST100000000rgMAA",
      "isComponentRequired": false,
      "isDefaultComponent": false,
      "isExcluded": false,
      "isQuantityEditable": true,
      "maxQuantity": 3,
      "minQuantity": 1,
```

```
        "parentProductId": "01tT1000000F0afIAC",
        "parentSellingModelId": "0jPT10000004CAfMAM",
        "productClassificationId": "11BRO00000000222AA",
        "productRelationshipTypeId": "0yoT1000000002WIAQ",
        "quantity": 1,
        "quantityScaleMethod": "Proportional",
        "quoteVisibility": "Quote Document Only",
        "sequence": 1
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`childProductId`	String	Lookup to the child product in the bundle.	Small, 60.0	60.0
`childSellingModelId`	String	ID of the child product selling model record.	Small, 60.0	60.0
`doesBundlePriceIncludeChild`	Boolean	Indicates whether the price of the bundle includes the child product (`true`) or not (`false`).	Small, 60.0	60.0
`id`	String	ID of the record.	Small, 60.0	60.0
`isComponentRequired`	Boolean	Indicates whether the component is required in the bundle (`true`) or not (`false`).	Small, 60.0	60.0
`isDefaultComponent`	Boolean	Indicates whether to select the component in the bundle group by default (`true`) or not (`false`).	Small, 60.0	60.0
`isExcluded`	Boolean	Indicates whether the component is excluded in the bundle group (`true`) or not (`false`).	Small, 60.0	60.0
`isQuantityEditable`	Boolean	Indicates whether to allow changes to the quantity of the component in the bundle (`true`) or not (`false`).	Small, 60.0	60.0
`maxQuantity`	Double	Maximum quantity of the product in the opportunity, quote, or order line item.	Small, 60.0	60.0
`minQuantity`	Double	Minimum quantity of the product in the opportunity, quote, or order line item.	Small, 60.0	60.0
`parentProductId`	String	Lookup to the parent product.	Small, 60.0	60.0
`parentSellingModelId`	String	ID of the product selling model record.	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
`productClassificationId`	String	ID of the product classification record.	Small, 60.0	60.0
`productInstanceReuse`	String	Reserved for future use.	Small, 62.0	62.0
`productRelationshipTypeId`	String	ID of the product relationship type record.	Small, 60.0	60.0
`quantity`	Double	Quantity of the child products.	Small, 60.0	60.0
`quantityScaleMethod`	String	Method to scale the quantity of the child product in relation to the quantity of the parent. Valid values are: • `Constant` • `Proportional`	Small, 60.0	60.0
`quoteVisibility`	String	Specifies whether a quote line item must be shown on the transaction line editor or quote document. Valid values are: • `Always` • `Transaction Line Editor Only`—Specifies whether to show a quote line item on quote editor only. • `Quote Document Only`—Specifies whether to show a quote line item on quote proposal only. • `Never` The API returns this property only if the CoreCPQ permission set is available.	Small, 64.0	64.0
`sequence`	Integer	Order in which the child products are displayed.	Small, 60.0	60.0

Product Selling Model

Output representation of the definition of the product selling model.

JSON example

```
"productSellingModel":
{
  "id": "0jPT10000004CAfMAM",
  "name": "OneTimePSM",
```

```
  "pricingTerm": 1,
  "pricingTermUnit": "Months",
  "sellingModelType": "TermDefined",
  "status": "Active"
}
}]
```

Property Name	Type	Description	Filter Group and Version	Available Version
id	String	ID of the record.	Small, 60.0	60.0
name	String	Name of the record.	Small, 60.0	60.0
pricingTerm	Integer	Duration of the selling model.	Small, 60.0	60.0
pricingTermUnit	String	Units of the pricing term.	Small, 60.0	60.0
sellingModelType	String	Different models of selling the product. Valid values are: • OneTime • TermDefined • Evergreen	Small, 60.0	60.0
status	String	Status of the selling model. For example, whether the selling model is active and can be used in transactions.	Small, 60.0	60.0

Product Selling Model Option

Output representation of the definition of the product selling model option.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

JSON example

```
"productSellingModelOptions": [
   {
    "id": "0iOT10000004CMrMAM",
    "isDefault": false,
    "productId": "01tT1000000F0YyIAK",
    "productSellingModel": {
    "id": "0jPT10000004CAfMAM",
    "name": "OneTimePSM",
    "pricingTerm": 1,
    "pricingTermUnit": "Months",
    "sellingModelType": "TermDefined",
    "status": "Active"
  }
}]
```

Property Name	Type	Description	Filter Group and Version	Available Version
id	String	ID of the record.	Small, 60.0	60.0
isDefault	Boolean	Indicates whether this model option is the default product selling model option (true) or not (false).	Small, 60.0	60.0
productId	String	ID of the product.	Small, 60.0	60.0
product SellingModel	Product Selling Model	Master-detail field to the product selling model.	Small, 60.0	60.0

Product Specification Type

Output representation of the product specification type.

JSON example

```
"productSpecificationType":
{
"name": "NonCommercialSpecType",
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
name	String	Name of the product specification type.	Small, 60.0	60.0

Products

Output representation of the list of retrieved products.

JSON example

```
{
  "correlationId": "9b6bc520-3c82-4d6c-a458-47590370681a",

Property Name	Type	Description	Filter Group and Version	Available Version
correlationId	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Small, 60.0	60.0
count	Integer	Total count of the products matching the request query.	Small, 60.0	60.0
facets	Search Facet	Details of the faceted search. This property is applicable if the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled.	Small, 63.0	63.0
products	Product[]	List of products matching the request query.	Small, 60.0	60.0
status	Status	Status of the request.	Small, 60.0	60.0

Product Variants

Output representation of the variation products associated with the specified parent variant products.

JSON example

```
{
  "correlationId": "9b6bc520-3c82-4d6c-a458-47590370681a",
  "count": 2,
  "details": {
    "01tT1000000F0afIAC": [
      "01tT1000000F0ahIAC",
      "01tT1000000F0aiIAC"
    ],
    "01tT1000000F0agIAC": [
      "01tT1000000F0ajIAC"
    ]
  },
  "inValidProductIds": [],
  "nonVariantParentIds": [],
  "status": {
    "code": "200",
    "errors": [],
    "message": "Successfully fetched the product variants."
```

```
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
correlationId	String	Unique ID to track and associate related events or transactions.	Small, 67.0	67.0
count	Integer	Number of parent variant products in the response that have at least one associated variation.	Small, 67.0	67.0
details	Map<String, String[]>	Specifies a map where each key is a parent variant product ID and the value is a list of its associated variation product IDs. Only parent variants that have at least one variation are included in this map.	Small, 67.0	67.0
inValid ProductIds	String[]	List of product IDs from the request that are blank, invalid, or not found in the org. The API excludes these IDs from processing but doesn't fail the request.	Small, 67.0	67.0
nonVariant ParentIds	String[]	List of product IDs from the request that are valid products but don't have the VariationParent product class. For example, simple products or bundle products passed in the request appear in this list.	Small, 67.0	67.0
status	Status	Status of the request.	Small, 67.0	67.0

Related Object Records

Output representation of the related records for a specified record ID and related object API name.

JSON example

```
      "relatedObjectRecords": [
        {
          "count": 2,
          "records": [
            {

            "Id": "1BXxx0000004CFUGA2"
          }
        ],
        "relatedObjectAPIName": "ProductUsageGrant"
      }
    ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`count`	Integer	Total count of the related records that are returned.	Small, 62.0	62.0
`records`	Map<String, Object>	List of related object records.	Small, 62.0	62.0
`relatedObjectAPIName`	String	API name of the related object to return the records for.	Small, 62.0	62.0

Related Records

Output representation of the list of relatedObject records for a specified record ID.

JSON example

```
"relatedRecords": [
  {
    "recordId": "01txx0000006i44AAA",
    "relatedObjectRecords": [
      {
        "count": 2,

    "message": ""
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
correlationId	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Small, 62.0	62.0
related Records	Related Records[]	List of related records.	Small, 62.0	62.0
status	Status[]	Status of the API request.	Small, 62.0	62.0

Search Facet

Output representation of the details of the faceted search.

JSON example

```
  "facets":[
    {
      "attributeType": "ProductStandard",
      "displayName": "Product Type",
      "displayRank": 1,
      "displayType": "MultiSelect",
      "nameOrId": "Type",
      "values": [
        {
          "displayName": "Simple",
          "nameOrId": "Simple",
          "productCount": 9
```

```
        }
      ]
    },
    {
      "attributeType": "ProductStandard",
      "displayName": "Active",
      "displayRank": 2,
      "displayType": "MultiSelect",
      "nameOrId": "IsActive",
      "values": [
        {
          "displayName": "true",
          "nameOrId": "true",
          "productCount": 47
        }
      ]
    }
  ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
attributeType	String	Search attribute type of the facet.	Small, 63.0	63.0
displayName	String	Display name of the facet.	Small, 63.0	63.0
displayRank	Integer	Display rank of the facet.	Small, 63.0	63.0
displayType	String	Display type of the face.	Small, 63.0	63.0
nameOrId	String	Facet name or ID. Reserved for internal use.	Small, 63.0	63.0
values	Facet Value[]	Values of the facet found in the search result. Sorted by display name in alphabetical order.	Small, 63.0	63.0

Setting

Output representation of the setting that's used in indexing.

JSON example

```
"setting": {
  "defaultLanguage": "en_US",
  "id": "1JySG0000000GUb0AM",
  "supportedLanguages": ["en_US","ja","es","nl_NL"]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
default Language	String	Default language for the API.	Small, 63.0	63.0

Property Name	Type	Description	Filter Group and Version	Available Version
id	String	ID of the setting.	Small, 63.0	63.0
supported Languages	String[]	List of supported language locales for indexing.	Small, 63.0	63.0

Setting Metadata

Output representation of the metadata associated with a setting.

JSON example

```
"metadata": {
  "activeLanguages": [
    "en_US"
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
active Languages	String[]	List of active languages in an org.	Small, 63.0	63.0

Snapshot

Output representation of the list of active snapshots.

JSON example

```
"snapshots": [
  {
    "activationDate": "2024-11-06T06:58:02.000Z",
    "activationStatus": "ACTIVE",
    "activationType": "IMMEDIATE",
    "id": "1Avxx0000004C92CAE",
    "snapshotIndexes": [
      {
        "createdDate": "2024-11-06T06:56:49.000Z",

          }
        ],
        "indexType": "PRODUCT",
        "lastBuildStatus": "IN_PROGRESS",
        "venueId": "1D6xx0000004C92CAE"
      }
    ]
  }
]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`activation Date`	String	Activation date of the snapshot.	Small, 62.0	62.0

Property Name	Type	Description	Filter Group and Version	Available Version
activation Status	String	Activation status of the snapshot. Valid values are: • NONE • ACTIVE—Snapshot is in active status. • EXPIRED—Snapshot is in expired status.	Small, 62.0	62.0
activation Type	String	Activation type of the snapshot. Valid values are: • IMMEDIATE—Snapshot is activated immediately after a successful build.	Small, 62.0	62.0
id	String	ID of the snapshot.	Small, 61.0	61.0
snapshot Indexes	Snapshot Index[]	List of indexes created in the snapshot.	Small, 62.0	62.0

Snapshot Collection

Output representation of the retrieved snapshot collection.

JSON example

```
{
  "errors": [],
  "snapshots": [
    {
      "activationDate": "2024-11-06T06:58:02.000Z",

            ],
            "indexType": "PRODUCT",
            "lastBuildStatus": "IN_PROGRESS",
            "venueId": "1D6xx0000004C92CAE"
          }
        ]
      }
    ],
    "statusCode": "200"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Error Output[]	List of errors, if any.	Small, 62.0	62.0
`snapshots`	Snapshot[]	List of active snapshots.	Small, 62.0	62.0
`statusCode`	String	Code indicating the status of the request.	Small, 62.0	62.0

Snapshot Deployment

Output representation of the snapshot deployment.

JSON example

This example shows a sample response to the request to build a new snapshot with immediate activation.

```
{
  "errors": [],
  "snapshot": {
    "activationStatus": "NONE",
    "activationType": "IMMEDIATE",
    "id": "1Avxx0000004CFU",
    "snapshotIndexes": [
      {
        "createdDate": "2024-07-24T21:10:48.000Z",
        "id": "1D6xx0000004CFU",
        "indexBuildType": "FULL",
        "indexType": "PRODUCT",
        "lastBuildStatus": "IN_PROGRESS"
      }
    ]
  },
  "statusCode": "200"
}
```

This example shows a sample response of the request to rebuild a snapshot in the `active` status.

```
{
  "errors": [],
  "snapshot": {
    "activationStatus": "NONE",
    "activationType": "IMMEDIATE",
    "id": "1Avxx0000004CH6",
    "snapshotIndexes": [
      {
        "createdDate": "2024-07-24T21:13:05.000Z",
        "id": "1D6xx0000004CH6",
        "indexBuildType": "FULL",
        "indexType": "PRODUCT",
        "lastBuildStatus": "IN_PROGRESS"
      }
    ]
  },
  "statusCode": "200"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Error Output[]	List of errors, if any.	Small, 62.0	62.0
`snapshot`	Snapshot[]	Run-time catalog snapshot associated with the created index.	Small, 62.0	62.0
`statusCode`	String	Code indicating the status of the request.	Small, 62.0	62.0

Snapshot Index

Output representation of the snapshot index of a run-time catalog.

JSON example

```
"snapshotIndexes": [
  {
    "createdDate": "2024-11-06T06:56:49.000Z",
    "id": "1D6xx0000004C92CAE",
    "indexBuildType": "FULL",
    "indexInfos": [
      {
        "buildType": "FULL",
        "id": "0axxx00000000T3AAI",
        "isIncrementable": true,
        "usageType": "LIVE"
      }
    ],
    "indexLogs": [
      {
        "catalogSnapshotTime": "2024-11-06T16:14:30.000Z",
        "completionTime": "2024-11-06T16:16:02.000Z",
        "createdById": "005xx000001X7x7AAC",
        "indexBuildStatus": "COMPLETED",
        "indexBuildType": "FULL",
        "indexId": "0axxx00000000T3AAI",
        "numberOfChanges": 7
      },
      {
        "catalogSnapshotTime": "2024-11-06T15:03:32.000Z",
        "completionTime": "2024-11-06T15:05:02.000Z",
        "createdById": "005xx000001X7x7AAC",
        "indexBuildStatus": "COMPLETED_WITH_ERRORS",
        "indexBuildType": "INCREMENTAL",
        "indexId": "0axxx00000000RRAAY",
        "message": "Warning: Product errors found.",
        "numberOfChanges": 3
      },
      {
        "catalogSnapshotTime": "2024-11-06T12:35:34.000Z",
        "completionTime": "2024-11-06T12:35:34.000Z",
        "createdById": "005xx000001X7x7AAC",
        "indexBuildStatus": "COMPLETED",
        "indexBuildType": "INCREMENTAL",
        "indexId": "0axxx00000000RRAAY",
        "message": "There are no changes for the partial update.",
        "numberOfChanges": 0
      },
      {
        "catalogSnapshotTime": "2024-11-06T12:07:32.000Z",
        "completionTime": "2024-11-06T12:09:02.000Z",
        "createdById": "005xx000001X7x7AAC",
        "indexBuildStatus": "COMPLETED_WITH_ERRORS",
        "indexBuildType": "FULL",
        "message": "Warning: Product errors found.",
```

```
                "numberOfChanges": 1
              }
            ],
            "indexType": "PRODUCT",
            "lastBuildStatus": "IN_PROGRESS",
            "venueId": "1D6xx0000004C92CAE"
          }
        ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
completedDate	String	Completed date of the snapshot index.	Small, 62.0	62.0
createdDate	String	Created date of the snapshot index.	Small, 62.0	62.0
id	String	ID of the snapshot index.	Small, 62.0	62.0
indexBuild Type	String	Build type of the snapshot index. Valid value is: • FULL—Specifies a full index build. • INCREMENTAL—Specifies an incremental index build. Available in API version 63.0 and later.	Small, 62.0	62.0
indexInfos	Index Info	Index information records associated with the snapshot index.	Small, 63.0	63.0
indexLogs	Index Logs[]	Index logs associated with the snapshot index.	Small, 63.0	63.0
indexType	String	Index type of the snapshot index. Valid value is: • PRODUCT—Snapshot index is of product type.	Small, 62.0	62.0
lastBuild Status	String	Last build status of the snapshot index. Valid values are: • IN_PROGRESS—Snapshot index build is in progress. • FAILED—Snapshot index build failed. • COMPLETED—Snapshot index build completed successfully.	Small, 62.0	62.0
numberOf Records	Integer	Number of indexed records.	Small, 62.0	62.0
venueId	String	Venue ID of the snapshot index.	Small, 63.0	63.0

Snapshot Index Error

Output representation of the error details related to a snapshot index.

JSON example

```
{
  "errors": [],
  "indexErrorDetails": {
    "errorFileId": "069xx0000004C92AAE",
    "indexCreatedDate": "2024-10-03T05:24:18.000Z",
    "indexErrorsCount": 1,
    "indexLastUpdatedDate": "2024-10-03T05:27:00.000Z",
    "itemLevelErrorsCount": 1
  },
  "statusCode": "200"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Error Output[]	List of errors encountered during the processing of the API request.	Small, 63.0	63.0
`indexErrorDetails`	Index Error[]	Count and details of errors that occurred during indexing.	Small, 63.0	63.0
`statusCode`	String	Code that indicates the status of the API request.	Small, 63.0	63.0

Snapshot Index Info

Output representation of the details of a snapshot index.

JSON example

```
 "indexInfos": [
            {
              "buildType": "FULL",
              "id": "0axxx00000000T3AAI",
              "isIncrementable": true,
              "usageType": "LIVE"
            }
          ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`buildType`	String	Build type of the index. Valid values are: • `FULL`—Specifies a full index build. • `INCREMENTAL`—Specifies an incremental index build. Available in API version 63.0 and later.	Small, 63.0	63.0

Property Name	Type	Description	Filter Group and Version	Available Version
`id`	String	ID of the index information record.	Small, 63.0	63.0
`isIncrementable`	Boolean	Indicates whether a partial build is enabled (`true`) or disabled (`false`).	Small, 63.0	63.0
`usageType`	String	Usage type of the index. Valid values are: • `LIVE`—Index usage type is live. • `OUT_OF_USE`—Index usage type is out of use.	Small, 63.0	63.0

Snapshot Index Log

Output representation of a snapshot index log.

JSON example

```
          "indexLogs": [
            {
              "catalogSnapshotTime": "2024-11-06T16:14:30.000Z",
              "completionTime": "2024-11-06T16:16:02.000Z",
              "createdById": "005xx000001X7x7AAC",
              "indexBuildStatus": "COMPLETED",
              "indexBuildType": "FULL",
              "indexId": "0axxx00000000T3AAI",
              "numberOfChanges": 7
            },
            {
              "catalogSnapshotTime": "2024-11-06T15:03:32.000Z",
              "completionTime": "2024-11-06T15:05:02.000Z",
              "createdById": "005xx000001X7x7AAC",
              "indexBuildStatus": "COMPLETED_WITH_ERRORS",
              "indexBuildType": "INCREMENTAL",
              "indexId": "0axxx00000000RRAAY",
              "message": "Warning: Product errors found.",
              "numberOfChanges": 3
            },
            {
              "catalogSnapshotTime": "2024-11-06T12:35:34.000Z",
              "completionTime": "2024-11-06T12:35:34.000Z",
              "createdById": "005xx000001X7x7AAC",
              "indexBuildStatus": "COMPLETED",
              "indexBuildType": "INCREMENTAL",
              "indexId": "0axxx00000000RRAAY",
              "message": "There are no changes for the partial update.",
              "numberOfChanges": 0
            },
            {
              "catalogSnapshotTime": "2024-11-06T12:07:32.000Z",
              "completionTime": "2024-11-06T12:09:02.000Z",
              "createdById": "005xx000001X7x7AAC",
```

```
            "indexBuildStatus": "COMPLETED_WITH_ERRORS",
            "indexBuildType": "FULL",
            "message": "Warning: Product errors found.",
            "numberOfChanges": 1
          }
        ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`catalog SnapshotTime`	String	Catalog snapshot time of the index.	Small, 63.0	63.0
`completion Time`	String	Completion time of the index.	Small, 63.0	63.0
`createdById`	String	ID of the user that initiated the index build.	Small, 63.0	63.0
`indexBuild Status`	String	Status of the index build.	Small, 63.0	63.0
`indexBuild Type`	String	Type of the index build. Valid values are: • `FULL`—Specifies a full index build. • `INCREMENTAL`—Specifies an incremental index build. Available in API version 63.0 and later.	Small, 63.0	63.0
`indexId`	String	ID of the index.	Small, 63.0	63.0
`message`	String	Message for the index status.	Small, 63.0	63.0
`numberOf Changes`	Integer	Number of new or changed products included in the index.	Small, 63.0	63.0

Status

Output representation of the status of the request.

JSON example

```
"status": {
    "code": "200",
    "errors": [],
    "message": "Successfully fetched the catalog records."
  }
```

Property Name	Type	Description	Filter Group and Version	Available Version
`code`	String	Code of the error message.	Small, 60.0	60.0
`errors`	Error[]	Details of the error.	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
`message`	String	Error message.	Small, 60.0	60.0

Unit of Measure Error

Output representation of the details of errors encountered during the processing of the Unit of Measure API request.

JSON example

```
"errorCodeToErrorMap": {
  "UNIT_OF_MEASURE_INFO_INVALID_UOM_IDS": {
    "errorCode": "UOM_INFO_API_003",
    "messageDetail": "Invalid uomId is passed. Please specify a valid uomId.",
    "messageTitle": "Invalid uomId is passed.",
    "recordIds": [
      "sample"
    ],
    "source": "Unit_Of_Measure_Info_Api"
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Localized error code.	Small, 63.0	63.0
`messageDetail`	String	Localized details of the error message.	Small, 63.0	63.0
`messageTitle`	String	Localized title of the error message.	Small, 63.0	63.0
`recordIds`	String[]	List of erroneous record IDs.	Small, 63.0	63.0
`source`	String	Localized source of the error.	Small, 63.0	63.0

Unit of Measure Info

Output representation of the details of a unit of measure record.

JSON example

```
"uomIdToUnitOfMeasureInfo": {
  "0hEU200000003M5MAI": {
    "id": "0hEU200000003M5MAI",
    "name": "Pounds",
    "roundingMethod": "Nearest",
    "scale": 1,
    "unitCode": "Pounds"
  },
  "0hEU200000003KTMAY": {
    "id": "0hEU200000003KTMAY",
    "name": "Grams",
    "roundingMethod": "Down",
    "scale": 5,
```

```
      "unitCode": "Grams"
    }
  }
```

Property Name	Type	Description	Filter Group and Version	Available Version
`id`	String	ID of the unit of measure record.	Small, 63.0	63.0
`name`	String	Name of the unit of measure record.	Small, 63.0	63.0
`roundingMethod`	String	Data rounding method of the unit of measure record.	Small, 63.0	63.0
`scale`	Integer	Scale of the unit of measure record.	Small, 63.0	63.0
`unitCode`	String	Code of the unit of measure record.	Small, 63.0	63.0

Unit of Measure Status

Output representation of the status of the Unit of Measure API request.

JSON example

```
  "status": {
    "errors": [],
    "httpStatusCode": "200",
    "message": " Successfully fetched UnitOfMeasure Info. "
  }
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Unit Of Measure Error[]	Errors encountered during the processing of the API request.	Small, 63.0	63.0
`httpStatusCode`	String	HTTP status code of the API request.	Small, 63.0	63.0
`message`	String	Localized response message.	Small, 63.0	63.0

Product Catalog Management Metadata API Types

Metadata API enables you to access some types and feature settings that you can customize in the user interface.

ProductCatalogManagementSettings
Represents the settings for Product Catalog Management.

ProductSpecificationType
Represents the specification types in your org that define products with unique terminology specific to the industry.

ProductSpecificationRecType

Represents the association of a product specification type with record types defined on the Product object. The product specification record type also determines if the product specification is sold commercially or not.

SEE ALSO:

Metadata API Developer Guide: Understanding Metadata API

ProductCatalogManagementSettings

Represents the settings for Product Catalog Management.

Parent Type and Manifest Access

This type extends the Metadata metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See Settings for more details.

File Suffix and Directory Location

`ProductCatalogManagementSettings` values are stored in the `ProductCatalogManagementSettings.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there is only one settings file for each settings component.

Version

ProductCatalogManagementSettings components are available in API version 64.0 and later.

Special Access Rules

These settings are available when Product Catalog Management is enabled.

Fields

Field Name	Description
`productDeepCloneContextDefOrgValue`	**Field Type** string **Description** Name of the context definition that you want to use to deep clone the product.
`productDeepCloneExpressionSetOrgValue`	**Field Type** string **Description** Expression set that contains the rules that you want to apply to deep clone the product.

Declarative Metadata Sample Definition

The following is an example of a ProductCatalogManagementSettings component.

```
<ProductCatalogManagementSettings xmlns="http://soap.sforce.com/2006/04/metadata">
<productDeepCloneContextDefOrgValue>ProductDeepCloneContextDefinition</productDeepCloneContextDefOrgValue>
<productDeepCloneExpressionSetOrgValue>ProductDeepCloneExpressionSet</productDeepCloneExpressionSetOrgValue>
</ProductCatalogManagementSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>ProductCatalogManagement</members>
        <name>Settings</name>
    </types>
    <version>67.0</version>
</Package>
```

Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see Settings. For information about using the manifest file, see Deploying and Retrieving Metadata with the Zip File.

ProductSpecificationType

Represents the specification types in your org that define products with unique terminology specific to the industry.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Parent Type

This type extends the Metadata metadata type and inherits its `fullName` field.

File Suffix and Directory Location

ProductSpecificationType components have the suffix `.productSpecificationType` and are stored in the `productSpecificationTypes` folder.

Version

ProductSpecificationType components are available in API version 60.0 and later.

Special Access Rules

Ensure Product Catalog Management is enabled to access this metadata type.

Fields

Field Name	Description
description	**Field Type** string **Description** Required. Description of the product specification type.
masterLabel	**Field Type** string **Description** Required. A user-friendly name for the product specification record type, which is defined when the metadata component is created.

Declarative Metadata Sample Definition

The following is an example of a ProductSpecificationType component.

```
<ProductSpecificationType xmlns="http://soap.sforce.com/2006/04/metadata">
    <masterLabel>sample</masterLabel>
    <description>Sample Description</description>
</ProductSpecificationType>
```

The following is an example package.xml that references the previous definition.

```
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>*</members>
        <name>ProductSpecificationType</name>
    </types>
    <version>67.0</version>
</Package>
```

Wildcard Support in the Manifest File

This metadata type supports the wildcard character * (asterisk) in the package.xml manifest file. For information about using the manifest file, see Deploying and Retrieving Metadata with the Zip File.

ProductSpecificationRecType

Represents the association of a product specification type with record types defined on the Product object. The product specification record type also determines if the product specification is sold commercially or not.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Parent Type

This type extends the Metadata metadata type and inherits its `fullName` field.

File Suffix and Directory Location

ProductSpecificationRecType components have the suffix `.productSpecificationRecType` and are stored in the `productSpecificationRecTypes` folder.

Version

ProductSpecificationRecType components are available in API version 60.0 and later.

Special Access Rules

Ensure Product Catalog Management is enabled to access this metadata type.

Fields

Field Name	Description
`isCommercial`	**Field Type** boolean **Description** Required. Indicates whether the product is sold commercially (`true`) or not (`false`). The default value is `true`.
`masterLabel`	**Field Type** string **Description** Required. A user-friendly name for the product specification record type, which is defined when the metadata component is created.
`productSpecificationType`	**Field Type** string **Description** Required. Product specification type that's associated with the record type. This field is unique within your organization.

Field Name	Description
recordType	**Field Type** string **Description** Required. Custom record type of Product2 object.

Declarative Metadata Sample Definition

The following is an example of a ProductSpecificationRecType component.

```
<ProductSpecificationRecType xmlns="http://soap.sforce.com/2006/04/metadata">
    <masterLabel>sample</masterLabel>
   <recordType>Product2.Offer</recordType>
   <productSpecificationType>Placeholder</productSpecificationType>
   <isCommercial>true</isCommercial>
</ProductSpecificationRecType>
```

The following is an example `package.xml` that references the previous definition.

```
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>*</members>
        <name>ProductSpecificationRecType</name>
    </types>
    <types>
        <members>*</members>
        <name>ProductSpecificationType</name>
    </types>
    <types>
        <members>Product2.Offer</members>
        <name>RecordType</name>
    </types>
    <version>67.0</version>
</Package>
```

Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see Deploying and Retrieving Metadata with the Zip File.

Product Catalog Management Tooling API Objects

Tooling API exposes metadata used in developer tooling that you can access through REST or SOAP. Tooling API's SOQL capabilities for many metadata types allow you to retrieve smaller pieces of metadata.

ProductSpecificationType

Represents the specification types in your org that define products with unique terminology specific to the industry. This object is available in API version 60.0 and later.

ProductSpecificationRecType

Represents the association of a product specification type with record types defined on the Product object. The product specification record type also determines if the product specification is sold commercially or not. This object is available in API version 60.0 and later.

SEE ALSO:

Tooling API Developer Guide: Introducing Tooling API

ProductSpecificationType

Represents the specification types in your org that define products with unique terminology specific to the industry. This object is available in API version 60.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported SOAP API Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Supported REST API Methods

`DELETE, GET, HEAD, PATCH, POST, Query`

Special Access Rules

Ensure Product Catalog Management is enabled to access this object.

Fields

Field	Details
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** Description of the product specification type.
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update

Field	Details
	Description The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is **Record Type Name**.
`Language`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Language of the product specification type instance. Possible values are: • `da`—Danish • `de`—German • `en_US`—English • `es`—Spanish • `es_MX`—Spanish (Mexico) • `fi`—Finnish • `fr`—French • `it`—Italian • `ja`—Japanese • `ko`—Korean • `nl_NL`—Dutch • `no`—Norwegian • `pt_BR`—Portuguese (Brazil) • `ru`—Russian • `sv`—Swedish • `th`—Thai • `zh_CN`—Chinese (Simplified) • `zh_TW`—Chinese (Traditional)
`ManageableState`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort

Field	Details
	Description **Type** ManageableState enumerated list **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Indicates the manageable state of the specified component that is contained in a package: • `beta` • `deleted` • `deprecated` • `deprecatedEditable` • `installed` • `installedEditable` • `released` • `unmanaged`
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Label assigned to the ProductSpecificationType object.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values: • In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. • In organizations that are not Developer Edition organizations, `NamespacePrefix` is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.

ProductSpecificationRecType

Represents the association of a product specification type with record types defined on the Product object. The product specification record type also determines if the product specification is sold commercially or not. This object is available in API version 60.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported SOAP API Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Supported REST API Methods

`DELETE, GET, HEAD, PATCH, POST, Query`

Special Access Rules

Ensure Product Catalog Management is enabled to access this object.

Fields

Field	Details
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is **Record Type Name**.
`IsCommercial`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the product is sold commercially (`true`) or not (`false`). The default value is `true`.
`Language`	**Type** picklist

Field	Details
	Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Language of the product specification record type instance. Possible values are: • `da`—Danish • `de`—German • `en_US`—English • `es`—Spanish • `es_MX`—Spanish (Mexico) • `fi`—Finnish • `fr`—French • `it`—Italian • `ja`—Japanese • `ko`—Korean • `nl_NL`—Dutch • `no`—Norwegian • `pt_BR`—Portuguese (Brazil) • `ru`—Russian • `sv`—Swedish • `th`—Thai • `zh_CN`—Chinese (Simplified) • `zh_TW`—Chinese (Traditional)
`ManageableState`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** **Type** ManageableState enumerated list **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Indicates the manageable state of the specified component that is contained in a package: • `beta` • `deleted` • `deprecated` • `deprecatedEditable`

Field	Details
	• `installed` • `installedEditable` • `released` • `unmanaged`
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Label assigned to the ProductSpecificationRecType object.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the ***`namespacePrefix__componentName`*** notation. The namespace prefix can have one of the following values: • In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. • In organizations that are not Developer Edition organizations, `NamespacePrefix` is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.
`ProductSpecificationType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Required. Product specification type that's associated with the record type. This field is unique within your organization. The picklist values that are available to you depend on your industry solution and permission sets.

Field	Details
RecordType	**Type** sObject **Properties** Nillable **Description** Custom record type of Product2 object.
RecordTypeId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Required. ID of the product record type associated with the product specification type. This field is unique within your organization. This field is a relationship field. **Relationship Name** RecordType **Relationship Type** Lookup **Refers To** RecordType

Product Discovery

Product Discovery provides a hierarchical catalog browsing experience to identify suitable products with text-based and faceted search.

EDITIONS

Available in: Lightning Experience

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions of Revenue Management

Product Discovery Business APIs

Use the Product Discovery Business APIs, which are composite APIs, to search products or to discover catalogs, products, and categories during the product browsing experience.

Product Discovery Standard Invocable Actions

Use the standard invocable actions available with Product Discovery to find and retrieve product, category, and catalog details. Additionally, execute a qualification procedure, and search products with guided selection.

Product Discovery Apex Reference

Use built-in Apex classes and interfaces grouped by namespace.

Product Discovery Metadata API Types
Metadata API enables you to access some types and feature settings that you can customize in the user interface.

SEE ALSO:

Salesforce Help: Configure Product Discovery Settings

Salesforce Help: Invoke Qualification Procedures During Product Discovery

Product Discovery Business APIs

Use the Product Discovery Business APIs, which are composite APIs, to search products or to discover catalogs, products, and categories during the product browsing experience.

This table lists the available Product Discovery resources.

Resource	Description
`/connect/cpq/catalogs/`***`catalogId`*** (POST)	Get catalog details for a specified catalog ID. This API is a composite API for Product Discovery.
`/connect/cpq/catalogs` (POST)	Get a paginated list of catalogs. This API is a composite API for Product Discovery.
`/connect/cpq/categories` (POST)	Get a list of categories and subcategories of a specified catalog. This API is a composite API for Product Discovery.
`/connect/cpq/categories/`***`categoryId`*** (POST)	Get details of a category for a specified category ID. This API is a composite API for Product Discovery.
`/connect/cpq/qualification` (POST)	Run the qualification procedure on a list of product IDs. This API is a composite API for Product Discovery.
`/connect/cpq/products/search` (POST)	Retrieves a list of products based on a search query or search term. This API is a composite API for Product Discovery.
`/connect/cpq/products/`***`productId`*** (POST)	Get product details, such as attributes, hierarchy, or cardinality, for a specified product ID. This API is a

Resource	Description
	composite API for Product Discovery.
`/connect/cpq/products` (POST)	Get a list of products for a specified catalog, category, or subcategory. This API is a composite API for Product Discovery.
`/connect/cpq/products/bulk` (POST)	Retrieve details for multiple products. This API is a composite API for Product Discovery.
`/connect/cpq/products/guided-selection` (POST)	Retrieve a list of products based on the response identifier or search terms of a guided selection. Guided selection captures user requirements to show suitable products.
`/revenue/product-discovery/products/recommendations` (POST)	Get a list of recommended products based on your underlying business rules.

Catalog Details (POST)
Get catalog details for a specified catalog ID. This API is a composite API for Product Discovery.

Catalog List (POST)
Get a paginated list of catalogs. This API is a composite API for Product Discovery.

Categories List (POST)
Get a list of categories and subcategories of a specified catalog. This API is a composite API for Product Discovery.

Category Details (POST)
Get details of a category for a specified category ID. This API is a composite API for Product Discovery.

[Bulk Product Details (POST)](#)
Retrieve details for multiple products. This API is a composite API for Product Discovery.

[Global Search (POST)](#)
Retrieves a list of products based on a search query or search term. This API is a composite API for Product Discovery.

[Guided Selection (POST)](#)
Retrieve a list of products based on the response identifier or search terms of a guided selection. Guided selection captures user requirements to show suitable products.

[Product Details (POST)](#)
Get product details, such as attributes, hierarchy, or cardinality, for a specified product ID. This API is a composite API for Product Discovery.

[Product Recommendations (POST)](#)
Get a list of recommended products based on your underlying business rules.

[Products List (POST)](#)
Get a list of products for a specified catalog, category, or subcategory. This API is a composite API for Product Discovery.

[Qualification (POST)](#)
Run the qualification procedure on a list of product IDs. This API is a composite API for Product Discovery.

Catalog Details (POST)

Get catalog details for a specified catalog ID. This API is a composite API for Product Discovery.

Resource

```
/connect/cpq/catalogs/catalogId

    "contactId": "003xx00000000D7AAI"
  },
  "usePromotions": true
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`additional ContextData`	Context Data Input	Additional nodes that are added to the custom or default context definition. The maximum number of supported nodes is 10.	Optional	60.0
`catalogId`	String	ID of the catalog. If the catalog ID is specified, then the API returns the list of offers from the catalog with the pricing details related to the catalog.	Optional	60.0
`context Definition`	String	API name of the custom context definition that's sent for context creation. If this property isn't specified, then the default context definition is used.	Optional	60.0
`context Mapping`	String	Default context mapping of the context definition. If a context mapping is specified, then the API checks whether the mapping belongs to the specified context definition to process the details for hydration.	Optional	60.0
`customFields`	String[]	List of category fields to retrieve in the response.	Optional	60.0
`correlation Id`	String	Unique identifier value that's attached to the requests and messages, and accepts references to a particular transaction or event chain.	Optional	60.0
`enable Qualification`	Boolean	Indicates whether to enable qualification rules for the categories (`true`) or not (`false`). The default value is `true`. The **Qualification Procedure** toggle from the Product Discovery Settings page from Setup overrides this property. For example, if the **Qualification Procedure** toggle is disabled, then setting the `enableQualification` property to `true` has no effect and the `qualificationContext` property in the API response isn't returned.	Optional	60.0
`filter`	Filter Input	Filters records based on supported criteria. The supported property is `name`.	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
		The supported operators are: • `eq` • `in` • `contains` • `gt`—Specifies a greater than criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `lt`—Specifies a less than criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `gte`—Specifies a greater than or equal to criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `lte`—Specifies a less than or equal to criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. If multiple criteria are specified, then the resultant criteria are combined by using the `and` operator.		
`qualificationProcedure`	String	API name of the custom qualification procedure that's used for the qualification process. If this property isn't specified, then the default qualification procedure is executed.	Optional	60.0
`userContext`	User Context Input	User context details. For example, account ID or contact ID.	Optional	60.0
`usePromotions`	Boolean	Indicates whether to fetch eligible promotions from Global Promotion Management (GPM) for the requested category and its products (`true`) or not (`false`). If Promotion feature is enabled in the org and this property isn't specified, then the default value is `true`. If the Promotion feature isn't enabled, the default value is `false`.	Optional	66.0

Response body for POST

CPQ Base Details

Bulk Product Details (POST)

Retrieve details for multiple products. This API is a composite API for Product Discovery.

Resource

```

      "contactId": "003xx00000000D7AAI"
  }
}
```

This example shows a sample request with proration policy details requested through the `additionalFields` property.

```
{
  "additionalFields": {
    "ProductSellingModelOption": {
      "additionalFields": {
        "ProrationPolicy": {
          "fields": [
            "ArePartialPeriodsAllowed",
            "ProrationPolicyType"
          ]
        }
      }
```

```
      }
    },
    "productData": [
      {
        "productId": "01txx0000006ivJAAQ",
        "productSellingModelId": "0jPxx000000009hEAA"
      },
      {
        "productId": "01txx0000006ivLAAQ",
        "productSellingModelId": "0jPxx000000009iEAABB"
      }
    ],
    "correlationId": "de9a674c-1807-438c-ac78-2c96f4655325",
    "priceBookId": "01sxx0000005qxxAAA",
    "userContext": {
      "accountId": "001xx0000000001AAA",
      "contactId": "003xx00000000D7AAI"
    }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
additional ContextData	Context Data Input[]	Additional nodes to add to the custom or default context definition. This data is appended to the context input and sent for hydration and qualification. The maximum limit of supported nodes is 10.	Optional	61.0
additional Fields	Map<String, Additional Fields Input>	Additional standard or custom fields of the Product2 object to include in the response. The field values are returned in the response for each of the products. In API version 66.0 and later, you can request proration policy details in the response for each product selling model option through this property.	Optional	61.0
context Definition	String	Name of the custom context definition that's sent for the context creation. If unspecified, the default context definition is used.	Optional	61.0
context Mapping	String	Context mapping details from the context definition. If specified, the API validates if the context mapping belongs to the specified context definition and considers the mapping for hydration.	Optional	61.0

Name	Type	Description	Required or Optional	Available Version
		If unspecified, the default context mapping of the context definition is used.		
`correlationId`	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	61.0
`currencyCode`	String	Currency code to consider for pricing and filtering.	Optional	61.0
`enablePricing`	Boolean	Indicates whether to enable pricing for the products (`true`) or not (`false`). The default value is `true`. The **Pricing Procedure** toggle from the Product Discovery Settings page from Setup overrides this property. For example, if the **Pricing Procedure** toggle is disabled, then setting the `enablePricing` property to `true` has no effect and the `prices` property in the API response is returned empty.	Optional	61.0
`enableQualification`	Boolean	Indicates whether to enable qualification rules for the products (`true`) or not (`false`). The default value is `true`. The **Qualification Procedure** toggle from the Product Discovery Settings page from Setup overrides this property. For example, if the **Qualification Procedure** toggle is disabled, then setting the `enableQualification` property to `true` has no effect and the `qualificationContext` property in the API response isn't returned.	Optional	61.0
`priceBookId`	String	ID of the price book to fetch the prices from.	Optional	61.0
`pricingProcedure`	String	Name of the custom pricing procedure to send for processing. If unspecified, the default pricing procedure is executed.	Optional	61.0
`productData`	Product Data Input[]	List of maps that contain product IDs and product selling model IDs.	Required	61.0

Name	Type	Description	Required or Optional	Available Version
`qualificationProcedure`	String	Name of the custom qualification procedure to send for processing. If unspecified, the default qualification procedure is executed.	Optional	61.0
`userContext`	User Context Input[]	User context details. For example, account ID or contact ID.	Optional	61.0

  "limit": 10,
  "cursor": "MTAwMDAwMDAwNg==",
  "orderBy": [
    "name:asc",
    "id:desc"
  ],
  "userContext": {
    "accountId": "001xx0000000001AAA",
    "contactId": "003xx00000000D7AAI"
```

```
  },
  "additionalFields": {
    "Product2": {
      "fields": [
        "CustomField1__c",
        "CustomField2__c",
        "StandardField1"
      ]
    }
  }
}
```

This example shows a sample request to search products by using the `searchTerm` property.

```
{
  "searchTerm": "Laptop",
  "catalogId": "0ZSDU0000002Og64AE",
  "categoryId": "0ZGDU0000002P0A4AU",
  "correlationId": "d9d8f898-19f5-464a-ba2b-6a070783f6c4",
  "limit": 10,
  "cursor": "MTAwMDAwMDAwNw==",
  "orderBy": [
    "name:asc",
    "id:desc"
  ],
  "userContext": {
    "accountId": "001DU000001o2V0YAI"
  }
}
```

If a parent category ID is specified in the request body, then the API returns all products associated to all child categories.

This example shows a sample request to search products with eligible promotions. To fetch eligible promotions, specify a value for the `query` or `searchTerm` property, and set the `usePromotions` property to `true`.

```
{
  "query": {
    "textQuery": {
      "searchPhrase": "laptop"
    }
  },
  "catalogId": "0ZSxx0000000001GAA",
  "categoryId": "0ZGT100000000qlOAA",
  "correlationId": "9cbb9650-48c5-11ed-96d1-0afcf185843b",
  "limit": 10,
  "cursor": "MTAwMDAwMDAwNg==",
  "orderBy": [
    "name:asc",
    "id:desc"
  ],
  "userContext": {
    "accountId": "001xx0000000001AAA",
    "contactId": "003xx00000000D7AAI"
  },
  "additionalFields": {
    "Product2": {
```

```
        "fields": [
          "CustomField1__c",
          "CustomField2__c",
          "StandardField1"
        ]
      }
    },
    "usePromotions": true
}
```

This example shows a sample request to run visibility rules.

```
{
  "enableQualification": true,
  "enablePricing": true,
  "includeCatalogDetails": true,
  "searchTerm": "128GB LRDIMM",
  "catalogId": "0ZSVW000000AhdC4AS",

  "userContext": {
    "accountId": null
  },
  "priceBookId": "01sVW0000024PZlYAM",
  "currencyCode": "USD",
  "transactionId": "0Q0VW000001190f0AA",
  "filter": {
    "criteria": [
      {
        "property": "isActive",
        "operator": "eq",
        "value": true
      },
      {
        "property": "UsedFor",
        "operator": "eq",
        "value": ""
      }
    ]
  },
  "orderBy": [
    "name:asc"
  ],
  "executeConfigurationRules": true
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`additionalContextData`	Context Data Input[]	Additional nodes that are added to the custom or default context definition. The maximum number of supported nodes is 10.	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
additional Fields	Map<String, Additional Fields Input>	Additional standard or custom fields of the Product2 object to include in the response. If the requested fields are invalid or access to fields isn't available, then the API throws an error.	Optional	61.0
catalogId	String	ID of the catalog. If the catalog ID is specified, then the API returns the list of offers from the catalog with the pricing details related to the catalog.	Optional	60.0
categoryId	String	ID of the category. If the category ID isn't specified, then the API returns the matching query offers from the catalog.	Optional	60.0
context Definition	String	API name of the custom context definition that's sent for context creation. If this property isn't specified, then the default context definition is used.	Optional	60.0
context Mapping	String	Default context mapping of the context definition. If a context mapping is specified, then the API checks whether the mapping belongs to the specified context definition to process the details for hydration.	Optional	60.0
correlation Id	String	Unique identifier of the request.	Optional	60.0
currencyCode	String	Currency code that's considered for pricing and filtering request.	Optional	60.0
cursor	String	Unique ID to represent the position of each product in the dataset.	Optional	60.0
enable Pricing	Boolean	Indicates whether to enable pricing for the products (`true`) or not (`false`). The default value is `true`. The **Pricing Procedure** toggle from the Product Discovery Settings page from Setup overrides this property. For example, if the **Pricing Procedure** toggle is disabled, then setting the `enablePricing` property to `true` has no effect and the `prices` property in the API response is returned empty.	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
`enableQualification`	Boolean	Indicates whether to enable qualification rules for the products (`true`) or not (`false`). The default value is `true`. The **Qualification Procedure** toggle from the Product Discovery Settings page from Setup overrides this property. For example, if the **Qualification Procedure** toggle is disabled, then setting the `enableQualification` property to `true` has no effect and the `qualificationContext` property in the API response isn't returned.	Optional	60.0
`executeConfigurationRules`	Boolean	Indicates whether to execute configuration rules (`true`) or not (`false`).	Optional	67.0
`filter`	Filter Input	Filters records based on supported criteria. The supported property is `name`. The supported operators are: • `eq` • `in` • `contains` • `gt`—Specifies a greater than criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `lt`—Specifies a less than criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `gte`—Specifies a greater than or equal to criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `lte`—Specifies a less than or equal to criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. If multiple criteria are specified, then the resultant criteria are combined by using the `and` operator.	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
include CatalogDetails	Boolean	Indicates whether to include catalog details in the response (`true`) or not (`false`).	Optional	61.0
limit	Integer	Number of items to include in the response. The default value is 10.	Optional	60.0
offset	Integer	Reserved for internal use.	Optional	60.0
orderBy	String[]	Sort order of the results, which is either ascending or descending order. The default sort order is ascending order. The default value is `asc`.	Optional	60.0
priceBookId	String	ID of the price book to get the prices from. If this property isn't specified, then prices from the standard price book are fetched.	Optional	60.0
pricingProcedure	String	API name of the custom pricing procedure that's used for the pricing process. If this property isn't specified, then the default pricing procedure is executed.	Optional	60.0
product ClassificationId	String	ID of the product classification.	Optional	60.0
qualification Procedure	String	API name of the custom qualification procedure that's used for the product qualification process. If this property isn't specified, then the default qualification procedure is executed.	Optional	60.0
query	Map<String, Object>	Query to search the products.	Required	60.0
related ObjectFilter	Related Object Filter Input[]	Filter records based on supported criteria for related objects. The supported object is `ProductSpecificationRecType`. The supported property is `IsCommerical`. The supported operator is `eq`. The supported values are `true` and `false`.	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
`searchTerm`	String	String used to get products with the product name containing the search term. See Search Considerations When Using Indexed Data.	Optional	62.0
`transactionContextId`	String	ID of the transaction context.	Optional	66.0
`transactionId`	String	ID of the transaction.	Optional	66.0
`usePromotions`	Boolean	Indicates whether to retrieve eligible promotions from Global Promotion Management (GPM) for each product in the search results (`true`) or not (`false`). If Promotion feature is enabled in the org and this property isn't specified, then the default value is `true`. If the Promotion feature isn't enabled, the default value is `false`.	Optional	66.0
`userContext`	User Context Input	User context details. For example, account ID or contact ID.	Optional	60.0

Properties

Name	Type	Description	Required or Optional	Available Version
additionalContextData	Context Data Input[]	Additional nodes that are added to the custom or default context definition. The maximum number of supported nodes is 10.	Optional	62.0
additionalFields	Map<String, Additional Fields Input>	Additional standard or custom fields of the Product2 object to include in the response. If the requested fields are invalid or access to fields isn't available, then the API throws an error.	Optional	62.0
catalogId	String	ID of the catalog.	Required	62.0
categoryId	String	ID of the category.	Optional	62.0
contextDefinition	String	API name of the custom context definition that's sent for context creation. If this property isn't specified, then the default context definition is used.	Optional	62.0
contextMapping	String	Default context mapping of the context definition. If a context mapping is specified, then the API checks whether the mapping belongs to the specified context definition to process the details for hydration.	Optional	62.0
correlationId	String	Unique identifier value that's attached to the requests and messages, and accepts references to a particular transaction or event chain.	Optional	62.0
currencyCode	String	Currency code that's considered for pricing and filtering request. If multiple currencies are enabled for the org, then the `currencyCode` property is required.	Optional	62.0
cursor	String	Unique ID to represent the position of each product in the dataset.	Optional	62.0
enablePricing	Boolean	Indicates whether to enable pricing for the products (`true`) or not (`false`). The default value is `true`.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
enable Qualification	Boolean	Indicates whether to enable qualification rules for the products (`true`) or not (`false`). The default value is `true`.	Optional	62.0
execute ConfigurationRules	Boolean	Indicates whether to execute configuration rules (`true`) or not (`false`).	Optional	67.0
filter	Filter Input	Filters records based on supported criteria. The supported property is `name`. The supported operators are: • `eq` • `in` • `contains`—This value isn't applicable if the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled. If multiple criteria are specified, then the resultant criteria are combined by using the `and` operator.	Optional	62.0
guided Selection ResponseId	String	Response identifier of the guided selection.	Required if the `searchTerms` property isn't specified.	62.0
include Catalog Details	Boolean	Indicates whether to include catalog details in the response (`true`) or not (`false`).	Optional	62.0
limit	Integer	Number of items to include in the response. The default value is 10.	Optional	62.0
orderBy	String[]	Sort order of the results, which is either ascending (`asc`) or descending order (`desc`). The default sort order is ascending order. The default value is `asc`. If the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled, then you can sort products by using name only.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
priceBookId	String	ID of the price book to get the prices from. If this property isn't specified, then prices from the standard price book are fetched.	Required	62.0
pricing Procedure	String	API name of the custom pricing procedure that's used for the pricing process. If this property isn't specified, then the default pricing procedure is executed.	Optional	62.0
product Classification Id	String	ID of the product classification.	Optional	62.0
qualification Procedure	String	API name of the custom qualification procedure that's used for the product qualification process. If this property isn't specified, then the default qualification procedure is executed.	Optional	62.0
searchTerms	Guided Selection Search Term Input[]	Search terms of the guided selection.	Required if the guided Selection ResponseId property isn't specified.	62.0
transaction ContextId	String	ID of the transaction context.	Optional	67.0
transactionId	String	ID of the transaction.	Optional	67.0
usePromotions	Boolean	Indicates whether to fetch applicable promotions from Global Promotion Management (GPM) for the guided selection (true) or not (false). If Promotion feature is enabled in the org and this property isn't specified, then the default value is true. If the Promotion feature isn't enabled, the default value is false.	Optional	66.0
userContext	User Context Input	User context details. For example, account ID or contact ID.	Optional	62.0

If both the guidedSelectionResponseId and searchTerms properties are specified, then the searchTerms property is considered in the input request.

		• `contains`—This value isn't applicable if the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled. If you specify multiple criteria, then the resultant criteria are combined by using the `and` operator.		
`limit`	Integer	Number of recommended products to include in the response. The default value is `10`.	Optional	67.0
`priceBookId`	String	ID of the price book to get prices from. If you don't specify a price book ID, then prices from the standard price book are fetched.	Optional	67.0
`pricingProcedure`	String	API name of the custom pricing procedure that's used for the pricing process. If you don't specify this property, then the default pricing procedure is executed.	Optional	67.0
`qualificationProcedure`	String	API name of the custom qualification procedure that's used for the product qualification process. If you don't specify this property, then the default qualification procedure is executed.	Optional	67.0
`transactionContextId`	String	ID of the sales transaction context instance.	Optional	67.0
`transactionId`	String	ID of the quote or order.	Optional	67.0
`usePromotions`	Boolean	Indicates whether to fetch applicable promotions from Global Promotion Management (GPM) for the guided selection (`true`) or not (`false`). The default value is `false`.	Optional	67.0
`userContext`	User Context Input[]	User context details. For example, account ID or contact ID.	Optional	67.0

Response body for POST

Product Recommendations

Products List (POST)

Get a list of products for a specified catalog, category, or subcategory. This API is a composite API for Product Discovery.

Resource

```
/connect/cpq/products
```

Properties

Name	Type	Description	Required or Optional	Available Version
additional ContextData	Context Data Input[]	Additional nodes that are added to the custom or default context definition. The maximum number of supported nodes is 10.	Optional	60.0
additional Fields	Map<String, Additional Fields Input>	Additional standard or custom fields of the Product2 object to include in the response. If the requested fields are invalid or access to fields isn't available, then the API throws an error.	Optional	61.0
catalogId	String	ID of the catalog. If the catalog ID is specified, then the API returns the list of offers from the catalog with the pricing details related to the catalog.	Optional	60.0
categoryId	String	ID of the category. If the category ID isn't specified, then the API returns the list of offers from the catalog.	Optional	60.0
context Definition	String	API name of the custom context definition that's sent for context creation. If this property isn't specified, then the default context definition is used.	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
context Mapping	String	Default context mapping of the context definition. If a context mapping is specified, then the API checks whether the mapping belongs to the specified context definition to process the details for hydration.	Optional	60.0
correlation Id	String	Unique identifier of the request.	Optional	60.0
currencyCode	String	Currency code that's considered for pricing and filtering request. If multiple currencies are enabled for the org, then the `currencyCode` property is required.	Optional	60.0
cursor	String	Unique ID to represent the position of each product in the dataset.	Optional	60.0
enable Pricing	Boolean	Indicates whether to enable pricing for the products (`true`) or not (`false`). The default value is `true`. The **Pricing Procedure** toggle from the Product Discovery Settings page from Setup overrides this property. For example, if the **Pricing Procedure** toggle is disabled, then setting the `enablePricing` property to `true` has no effect and the `prices` property in the API response is returned empty.	Optional	60.0
enable Qualification	Boolean	Indicates whether to enable qualification rules for the products (`true`) or not (`false`). The default value is `true`. The **Qualification Procedure** toggle from the Product Discovery Settings page from Setup overrides this property. For example, if the **Qualification Procedure** toggle is disabled, then setting the `enableQualification` property to `true` has no effect and the `qualificationContext` property in the API response isn't returned.	Optional	60.0
execute ConfigurationRules	Boolean	Indicates whether to execute configuration rules (`true`) or not (`false`).	Optional	67.0

Name	Type	Description	Required or Optional	Available Version
`filter`	Filter Input	Filters records based on supported criteria. The supported property is `name`. The supported operators are: • `eq` • `in` • `contains`—This value isn't applicable if the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled. If multiple criteria are specified, then the resultant criteria are combined by using the `and` operator.	Optional	60.0
`include Catalog Details`	Boolean	Indicates whether to include catalog details in the response (`true`) or not (`false`).	Optional	61.0
`limit`	Integer	Number of items to include in the response. The default value is 10.	Optional	60.0
`offset`	Integer	Reserved for internal use.	Optional	60.0
`orderBy`	String[]	Sort order of the results, which is either ascending (`asc`) or descending order (`desc`). The default sort order is ascending order. The default value is `asc`. If the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled, then you can sort products by using name only.	Optional	60.0
`priceBookId`	String	ID of the price book to get the prices from. If this property isn't specified, then prices from the standard price book are fetched.	Required	60.0
`pricing Procedure`	String	API name of the custom pricing procedure that's used for the pricing process. If this property isn't specified, then the default pricing procedure is executed.	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
`productClassificationId`	String	ID of the product classification.	Optional	60.0
`qualificationProcedure`	String	API name of the custom qualification procedure that's used for the product qualification process. If this property isn't specified, then the default qualification procedure is executed.	Optional	60.0
`relatedObjectFilters`	Related Object Filter Input[]	Filter records based on supported criteria for related objects. The supported object is `ProductSpecificationRecType`. The supported property is `IsCommerical`. The supported operator is `eq`. The supported values are `true` and `false`.	Optional	60.0
`transactionContextId`	String	ID of the transaction context.	Optional	67.0
`transactionId`	String	ID of the transaction.	Optional	67.0
`usePromotions`	Boolean	Indicates whether to fetch applicable promotions from Global Promotion Management (GPM) for each product in the list (`true`) or not (`false`). If Promotion feature is enabled in the org and this property isn't specified, then the default value is `true`. If the Promotion feature isn't enabled, the default value is `false`.	Optional	66.0
`userContext`	User Context Input	User context details. For example, account ID or contact ID.	Optional	60.0

Response body for POST

CPQ Base List

Qualification (POST)

Run the qualification procedure on a list of product IDs. This API is a composite API for Product Discovery.

Resource

```
/connect/cpq/qualification
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/cpq/qualification
```

Available version

```
{
  "productIds": [
    "01txx0000006i7PAAQ",
    "01txx0000006i7QAAQ",
    "01txx0000006i7IAAQ"
  ],
  "userContext": {
    "accountId": "001xx000003GZHgAAO"
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
additional ContextData	Context Data Input[]	Additional nodes that are added to the custom or default context definition. The maximum number of supported nodes is 10.	Optional	60.0
catalogId	String	ID of the catalog.	Optional	60.0
categoryId	String	ID of the category.	Optional	60.0
context Definition	String	API name of the custom context definition that's sent for context creation. If this property isn't specified, the default context definition is used.	Optional	60.0
context Mapping	String	Default context mapping of the context definition. If a context mapping is specified, then the API checks whether the mapping belongs to the specified context definition to process the details for hydration.	Optional	60.0
correlation Id	String	Unique identifier of the request.	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
productIds	String[]	List of product IDs for qualification check.	Required	60.0
qualificationProcedure	String	API name of the custom qualification procedure that's sent for processing. If this property isn't specified, the default qualification procedure is executed.	Optional	60.0
userContext	User Context Input	User context details. For example, account ID or contact ID.	Optional	60.0

Response body for POST

CPQ Base List

Request Bodies

Learn more about the available Product Discovery API request bodies.

Additional Fields Input

Input representation of the additional standard or custom fields to include in the response.

Bulk Product Details Input

Input representation of the request to retrieve details of multiple products.

Catalog Details Input

Input representation of the request to get the catalog details.

Catalog List Input

Input representation of the request to get a list of catalogs.

Category Details Input

Input representation of the request to get category details.

Category List Input

Input representation of the request to get a list of categories.

Context Data Input

Input representation of the context data.

Guided Selection Input

Input representation of the guided selection details.

Guided Selection Search Term Input

Input representation of the search terms of a guided selection.

Filter Criteria Input

Input representation of the criteria to filter records based on supported properties.

Filter Input

Input representation of the request to filter records.

Product Details Input

Input representation of the request to get product details.

Product Data Input

Input representation of the product details such as the product ID and product selling model ID.

Product List Input

Input representation of the request to retrieve a list of products.

Product Recommendation Input

Input representation of the details of a request to get product recommendations.

Products Search Input

Input representation of the request to search products.

QOC Qualification

Input representation of the qualification request.

Related Object Filter Input

Input representation of the request to filter records of a related object.

User Context Input

Input representation of the details with the user context.

Additional Fields Input

Input representation of the additional standard or custom fields to include in the response.

JSON example

```
  "additionalFields" : {
    "Product2" : {
    "fields" : ["CustomField1__c","StandardField1"]
}
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`fields`	String[]	List of additional standard or custom fields to include in the response.	Optional	61.0

Bulk Product Details Input

Input representation of the request to retrieve details of multiple products.

JSON example

```
{
  "productData": [
    {
      "productId": "01txx0000006ivJAAQ",
      "productSellingModelId": "0jPxx000000009hEAA"
    },
    {
      "productId": "01txx0000006ivLAAQ",
      "productSellingModelId": "0jPxx000000009iEAABB"
```

```
    }
  ],
  "correlationId": "de9a674c-1807-438c-ac78-2c96f4655325",
  "priceBookId" : "01sxx0000005qxxAAA",
  "userContext": {
      "accountId": "001xx0000000001AAA",
      "contactId": "003xx00000000D7AAI"
  }
}
```

This example shows a sample request with proration policy details requested through the `additionalFields` property.

```
{
  "additionalFields": {
    "ProductSellingModelOption": {
      "additionalFields": {
        "ProrationPolicy": {
          "fields": [
            "ArePartialPeriodsAllowed",
            "ProrationPolicyType"
          ]
        }
      }
    }
  },
  "productData": [
    {
      "productId": "01txx0000006ivJAAQ",
      "productSellingModelId": "0jPxx000000009hEAA"
    },
    {
      "productId": "01txx0000006ivLAAQ",
      "productSellingModelId": "0jPxx000000009iEAABB"
    }
  ],
  "correlationId": "de9a674c-1807-438c-ac78-2c96f4655325",
  "priceBookId": "01sxx0000005qxxAAA",
  "userContext": {
    "accountId": "001xx0000000001AAA",
    "contactId": "003xx00000000D7AAI"
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`additional ContextData`	Context Data Input[]	Additional nodes to add to the custom or default context definition. This data is appended to the context input and sent for hydration and qualification. The maximum limit of supported nodes is 10.	Optional	61.0

Name	Type	Description	Required or Optional	Available Version
additional Fields	Map<String, Additional Fields Input>	Additional standard or custom fields of the Product2 object to include in the response. The field values are returned in the response for each of the products. In API version 66.0 and later, you can request proration policy details in the response for each product selling model option through this property.	Optional	61.0
context Definition	String	Name of the custom context definition that's sent for the context creation. If unspecified, the default context definition is used.	Optional	61.0
context Mapping	String	Context mapping details from the context definition. If specified, the API validates if the context mapping belongs to the specified context definition and considers the mapping for hydration. If unspecified, the default context mapping of the context definition is used.	Optional	61.0
correlationId	String	Unique token to track and associate related events or transactions across different components of the application. If unspecified, a Universally Unique Identifier (UUID) is generated.	Optional	61.0
currencyCode	String	Currency code to consider for pricing and filtering.	Optional	61.0
enablePricing	Boolean	Indicates whether to enable pricing for the products (`true`) or not (`false`). The default value is `true`. The **Pricing Procedure** toggle from the Product Discovery Settings page from Setup overrides this property. For example, if the **Pricing Procedure** toggle is disabled, then setting the `enablePricing` property to `true` has no effect and the `prices` property in the API response is returned empty.	Optional	61.0

Name	Type	Description	Required or Optional	Available Version
enable Qualification	Boolean	Indicates whether to enable qualification rules for the products (`true`) or not (`false`). The default value is `true`. The **Qualification Procedure** toggle from the Product Discovery Settings page from Setup overrides this property. For example, if the **Qualification Procedure** toggle is disabled, then setting the `enableQualification` property to `true` has no effect and the `qualificationContext` property in the API response isn't returned.	Optional	61.0
priceBookId	String	ID of the price book to fetch the prices from.	Optional	61.0
pricing Procedure	String	Name of the custom pricing procedure to send for processing. If unspecified, the default pricing procedure is executed.	Optional	61.0
productData	Product Data Input[]	List of maps that contain product IDs and product selling model IDs.	Required	61.0
qualification Procedure	String	Name of the custom qualification procedure to send for processing. If unspecified, the default qualification procedure is executed.	Optional	61.0
userContext	User Context Input[]	User context details. For example, account ID or contact ID.	Optional	61.0

Catalog Details Input

Input representation of the request to get the catalog details.

JSON example

```
{
  "correlationId": "9cbb9650-48c5-11ed-96d1-0afcf185843b",
  "userContext": {
     "accountId": "001xx0000000001AAA",
     "contactId": "003xx00000000D7AAI"
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
correlationId	String	Unique identifier value that's attached to the requests and messages, and accepts references to a particular transaction or event chain.	Optional	60.0
userContext	User Context Input	User context details. For example, account ID or contact ID.	Optional	60.0

Catalog List Input

Input representation of the request to get a list of catalogs.

JSON example

```
{
"correlationId": "9cbb9650-48c5-11ed-96d1-0afcf185843b",
"limit": 10,
"offset": 0,
"orderBy": [
    "name:asc",
    "id:desc"
],
"userContext": {
    "accountId": "001xx0000000001AAA",
    "contactId": "003xx00000000D7AAI"
}
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
correlationId	String	Unique identifier value that's attached to the requests and messages, and accepts references to a particular transaction or event chain.	Optional	60.0
limit	Integer	Number of items to include in the response.	Optional	60.0
offset	Integer	Offset size from which to get the catalog count.	Optional	60.0
orderBy	String[]	Sort order for the catalogs.	Optional	60.0
userContext	User Context Input	User context details. For example, account ID or contact ID.	Optional	60.0

Category Details Input

Input representation of the request to get category details.

JSON example

```
{
  "correlationId": "9cbb9650-48c5-11ed-96d1-0afcf185843b",
  "userContext": {
      "accountId": "001xx0000000001AAA",
      "contactId": "003xx00000000D7AAI"
  }
}
```

This example shows a sample request to get category details with eligible promotions.

```
{
  "correlationId": "9cbb9650-48c5-11ed-96d1-0afcf185843b",
  "userContext": {
    "accountId": "001xx0000000001AAA",
    "contactId": "003xx00000000D7AAI"
  },
  "usePromotions": true
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
additional ContextData	Context Data Input	Additional nodes that are added to the custom or default context definition. The maximum number of supported nodes is 10.	Optional	60.0
catalogId	String	ID of the catalog. If the catalog ID is specified, then the API returns the list of offers from the catalog with the pricing details related to the catalog.	Optional	60.0
context Definition	String	API name of the custom context definition that's sent for context creation. If this property isn't specified, then the default context definition is used.	Optional	60.0
context Mapping	String	Default context mapping of the context definition. If a context mapping is specified, then the API checks whether the mapping belongs to the specified context definition to process the details for hydration.	Optional	60.0
customFields	String[]	List of category fields to retrieve in the response.	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
`correlationId`	String	Unique identifier value that's attached to the requests and messages, and accepts references to a particular transaction or event chain.	Optional	60.0
`enable Qualification`	Boolean	Indicates whether to enable qualification rules for the categories (`true`) or not (`false`). The default value is `true`. The **Qualification Procedure** toggle from the Product Discovery Settings page from Setup overrides this property. For example, if the **Qualification Procedure** toggle is disabled, then setting the `enableQualification` property to `true` has no effect and the `qualificationContext` property in the API response isn't returned.	Optional	60.0
`filter`	Filter Input	Filters records based on supported criteria. The supported property is `name`. The supported operators are: • `eq` • `in` • `contains` • `gt`—Specifies a greater than criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `lt`—Specifies a less than criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `gte`—Specifies a greater than or equal to criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `lte`—Specifies a less than or equal to criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. If multiple criteria are specified, then the resultant criteria are combined by using the `and` operator.	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
`qualificationProcedure`	String	API name of the custom qualification procedure that's used for the qualification process. If this property isn't specified, then the default qualification procedure is executed.	Optional	60.0
`userContext`	User Context Input	User context details. For example, account ID or contact ID.	Optional	60.0
`usePromotions`	Boolean	Indicates whether to fetch eligible promotions from Global Promotion Management (GPM) for the requested category and its products (`true`) or not (`false`). If Promotion feature is enabled in the org and this property isn't specified, then the default value is `true`. If the Promotion feature isn't enabled, the default value is `false`.	Optional	66.0

Category List Input

Input representation of the request to get a list of categories.

JSON example

```
{
  "correlationId": "9cbb9650-48c5-11ed-96d1-0afcf185843b",
  "catalogId": "0ZSxx000000009hGAA",
  "userContext": {
      "accountId": "001xx0000000001AAA",
      "contactId": "003xx00000000D7AAI"
    }
}
```

This example shows a sample request to get a list of categories with eligible promotions.

```
{
  "correlationId": "9cbb9650-48c5-11ed-96d1-0afcf185843b",
  "catalogId": "0ZSxx000000009hGAA",
  "userContext": {
    "accountId": "001xx0000000001AAA",
    "contactId": "003xx00000000D7AAI"
  },
  "usePromotions": true
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`additionalContextData`	Context Data Input[]	Additional nodes that are added to the custom or default context definition. The maximum number of supported nodes is 10.	Optional	60.0
`catalogId`	String	ID of the catalog.	Required	60.0
`contextDefinition`	String	API name of the custom context definition that's sent for context creation. If this property isn't specified, then the default context definition is used.	Optional	60.0
`contextMapping`	String	Default context mapping of the context definition. If a context mapping is specified, then the API checks whether the mapping belongs to the specified context definition to process the details for hydration.	Optional	60.0
`correlationId`	String	Unique identifier value that's attached to the requests and messages, and accepts references to a particular transaction or event chain.	Optional	60.0
`customFields`	String[]	List of additional custom fields to include in the response.	Optional	60.0
`depth`	Integer	Specifies the levels of subcategories to retrieve beneath the parent category. This parameter only applies when `parentCategoryId` is provided.	Optional	61.0
`enableQualification`	Boolean	Indicates whether to enable qualification rules for the products (`true`) or not (`false`). The default value is `true`.	Optional	60.0
`filter`	Filter Input	Filters records based on supported criteria. The supported property is `isQualified`. The supported operators are: • `eq` • `in` • `contains`—This value isn't applicable if the **Use Indexed Data For Product Listing and Search**	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
		toggle from the Product Discovery Settings page from Setup is enabled.		
parent CategoryId	String	ID of the parent category whose subcategories you want to retrieve. If not specified, only root-level categories from the catalog are returned.	Optional	61.0
qualification Procedure	String	API name of the custom qualification procedure that's used for the product qualification process. If this property isn't specified, then the default qualification procedure is executed.	Optional	60.0
usePromotions	Boolean	Indicates whether to fetch eligible promotions from Global Promotion Management (GPM) for the requested category and its products (`true`) or not (`false`). If Promotion feature is enabled in the org and this property isn't specified, then the default value is `true`. If the Promotion feature isn't enabled, the default value is `false`.	Optional	66.0
userContext	User Context Input	User context details. For example, account ID or contact ID.	Optional	60.0

Context Data Input

Input representation of the context data.

JSON example

```
"additionalContextData":[
  {
  "nodeName": "Contract",
  "nodeData": {
    "id": "xxxxx231",
    "name": "Contract1"

  }
},
{
  "nodeName": "Lead",
  "nodeData": {
    "id": "11111131",
    "name": "Lead1"
```

```
  }
}]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`nodeData`	Map<String, Object>	Details of the node.	Optional	60.0
`nodeName`	String	Name of the node.	Optional	60.0

Guided Selection Input

Input representation of the guided selection details.

JSON example

```
{
  "correlationId": "corrId",
  "catalogId": "0ZSxx0000000001GAA",
  "priceBookId": "pricebookId",
  "limit": 10,
  "cursor": "MTAwMDAwMDAwNg==",
  "userContext": {
    "accountId": "accId"
  },
  "guidedSelectionResponseId": "ABCxx0000000001GAA",
  "searchTerms": [
    {
      "term": "IPhone",
      "tags": [
        "deviceType",
        "mobile"
      ]
    },
    {
      "term": "4GB",
      "tags": [
        "RAM"
      ]
    },
    {
      "term": "64GB",
      "tags": [
        "Storage"
      ]
    }
  ],
  "enableQualification": true,
  "enablePricing": true,
  "includeCatalogDetails": false
}
```

This example shows a sample request to fetch eligible promotions.

```
{
  "correlationId": "corrId",
  "catalogId": "0ZSxx0000000001GAA",
  "priceBookId": "pricebookId",
  "limit": 10,
  "cursor": "MTAwMDAwMDAwNg==",
  "userContext": {
    "accountId": "accId"
  },
  "guidedSelectionResponseId": "ABCxx0000000001GAA",
  "searchTerms": [
    {
      "term": "IPhone",
      "tags": [
        "deviceType",
        "mobile"
      ]
    },
    {
      "term": "4GB",
      "tags": [
        "RAM"
      ]
    },
    {
      "term": "64GB",
      "tags": [
        "Storage"
      ]
    }
  ],
  "enableQualification": true,
  "enablePricing": true,
  "includeCatalogDetails": false,
  "transactionContextId": "context123",
  "transactionId": "trans456",
  "usePromotions": true
}
```

This example shows a sample request to run visibility rules.

```
{
  "catalogId": "0ZSVW000000AhdC4AS",
  "currencyCode": "USD",
  "enablePricing": true,
  "enableQualification": true,
  "executeConfigurationRules": true,

  ],
  "priceBookId": "01sVW0000024PZlYAM",
  "transactionId": "0Q0VW000001190f0AA",
  "userContext": {
    "accountId": null
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`additional ContextData`	Context Data Input[]	Additional nodes that are added to the custom or default context definition. The maximum number of supported nodes is 10.	Optional	62.0
`additional Fields`	Map<String, Additional Fields Input>	Additional standard or custom fields of the Product2 object to include in the response. If the requested fields are invalid or access to fields isn't available, then the API throws an error.	Optional	62.0
`catalogId`	String	ID of the catalog.	Required	62.0
`categoryId`	String	ID of the category.	Optional	62.0
`context Definition`	String	API name of the custom context definition that's sent for context creation. If this property isn't specified, then the default context definition is used.	Optional	62.0
`context Mapping`	String	Default context mapping of the context definition. If a context mapping is specified, then the API checks whether the mapping belongs to the specified context definition to process the details for hydration.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
correlationId	String	Unique identifier value that's attached to the requests and messages, and accepts references to a particular transaction or event chain.	Optional	62.0
currencyCode	String	Currency code that's considered for pricing and filtering request. If multiple currencies are enabled for the org, then the currencyCode property is required.	Optional	62.0
cursor	String	Unique ID to represent the position of each product in the dataset.	Optional	62.0
enablePricing	Boolean	Indicates whether to enable pricing for the products (true) or not (false). The default value is true.	Optional	62.0
enable Qualification	Boolean	Indicates whether to enable qualification rules for the products (true) or not (false). The default value is true.	Optional	62.0
execute ConfigurationRules	Boolean	Indicates whether to execute configuration rules (true) or not (false).	Optional	67.0
filter	Filter Input	Filters records based on supported criteria. The supported property is name. The supported operators are: • eq • in • contains—This value isn't applicable if the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled. If multiple criteria are specified, then the resultant criteria are combined by using the and operator.	Optional	62.0
guided Selection ResponseId	String	Response identifier of the guided selection.	Required if the searchTerms property isn't specified.	62.0
include Catalog Details	Boolean	Indicates whether to include catalog details in the response (true) or not (false).	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
limit	Integer	Number of items to include in the response. The default value is 10.	Optional	62.0
orderBy	String[]	Sort order of the results, which is either ascending (asc) or descending order (desc). The default sort order is ascending order. The default value is asc. If the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled, then you can sort products by using name only.	Optional	62.0
priceBookId	String	ID of the price book to get the prices from. If this property isn't specified, then prices from the standard price book are fetched.	Required	62.0
pricingProcedure	String	API name of the custom pricing procedure that's used for the pricing process. If this property isn't specified, then the default pricing procedure is executed.	Optional	62.0
productClassificationId	String	ID of the product classification.	Optional	62.0
qualificationProcedure	String	API name of the custom qualification procedure that's used for the product qualification process. If this property isn't specified, then the default qualification procedure is executed.	Optional	62.0
searchTerms	Guided Selection Search Term Input[]	Search terms of the guided selection.	Required if the guidedSelectionResponseId property isn't specified.	62.0
transactionContextId	String	ID of the transaction context.	Optional	67.0
transactionId	String	ID of the transaction.	Optional	67.0
usePromotions	Boolean	Indicates whether to fetch applicable promotions from Global Promotion Management (GPM) for the guided selection (true) or not (false). If Promotion feature is enabled in the org	Optional	66.0

Name	Type	Description	Required or Optional	Available Version
		and this property isn't specified, then the default value is `true`. If the Promotion feature isn't enabled, the default value is `false`.		
`userContext`	User Context Input	User context details. For example, account ID or contact ID.	Optional	62.0

If both the `guidedSelectionResponseId` and `searchTerms` properties are specified, then the `searchTerms` property is considered in the input request.

Guided Selection Search Term Input

Input representation of the search terms of a guided selection.

JSON example

```
"searchTerms": [
  {
    "term": "IPhone",
    "tags": [
      "deviceType",
      "mobile"
    ]
  },
  {
    "term": "4GB",
    "tags": [
      "RAM"
    ]
  },
  {
    "term": "64GB",
    "tags": [
      "Storage"
    ]
  }
]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`tags`	String[]	Search term tags for the guided selection.	Optional	62.0
`term`	String	Search term for the guided selection.	Required	62.0

Filter Criteria Input

Input representation of the criteria to filter records based on supported properties.

JSON example

```
"criteria":
 [{
   "attributeType": "ProductStandard",
   "property": "name",
   "operator": "eq",
   "value": "iPhone"
 }]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`attributeType`	String	Search attribute type of the facet for a faceted search. Valid values are: • `ProductStandard` • `ProductCustom` • `ProductDynamicAttribute` • `ProductAttributeStandard` • `ProductAttributeCustom`	Optional	63.0
`operator`	String	Operator used for the filter criteria. The supported operators are: • `eq` • `in` • `contains` • `gt`—Specifies a greater than criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `lt`—Specifies a less than criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `gte`—Specifies a greater than or equal to criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `lte`—Specifies a less than or equal to criteria. Available from API version	Required	60.0

Name	Type	Description	Required or Optional	Available Version
		63.0 and later for Number, Date, and Datetime data types only.		
`property`	String	Property name to use in the filter, which must be the same as the object field. The supported property is `name`.	Required	60.0
`value`	Object	Value for the filter criteria.	Required	60.0

Filter Input

Input representation of the request to filter records.

JSON example

```
"filter":
 {"criteria":
 [ {
   "attributeType": "ProductStandard",
   "property": "name",
   "operator": "eq",
   "value": "iPhone"
 }]}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`criteria`	Filter Criteria Input[]	Filter criteria to filter the records.	Optional	60.0

Product Details Input

Input representation of the request to get product details.

JSON example

```
{
  "correlationId": "9cbb9650-48c5-11ed-96d1-0afcf185843b",
  "catalogId": "0ZSxx0000000001GAA",
  "priceBookId": "01s26000002ZT71AAG",
  "productSellingModelId": "0jP1Q000000CaVFUA0",
  "userContext": {
    "accountId": "001xx0000000001AAA",
    "contactId": "003xx00000000D7AAI"
  },
  "enablePricing": true,
  "enableQualification": true,
  "qualificationProcedure": "QualificationProcedure",
  "pricingProcedure": "Preview",
```

```
  "contextDefinition": "TestDefinition",
  "contextMapping": "TestDefinitionNode",
  "additionalFields": {
    "ProductSellingModelOption": {
      "additionalFields": {
        "ProrationPolicy": {
          "fields": [
            "ArePartialPeriodsAllowed",
            "ProrationPolicyType"
          ]
        }
      }
    },
    "Product2": {
      "fields": [
        "field1",
        "field2"
      ]
    },
    "ProductAttributeDefinition": {
      "fields": [
        "field3",
        "field4"
      ]
    }
  },
  "additionalContextData": [
    {
      "nodeName": "Contract",
      "nodeData": {
        "id": "xxxxx231",
        "name": "Contract1"
      }
    },
    {
      "nodeName": "Lead",
      "nodeData": {
        "id": "lllllll31",
        "name": "Lead1"
      }
    }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
additional ContextData	Context Data Input[]	Additional nodes that are added to the custom or default context definition. The maximum number of supported nodes is 10.	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
additionalFields	Map<String, Additional Fields Input>	Additional standard or custom fields to include in the response. The supported objects are: • Product2 • ProductAttributeDefinition—If the fields defined for the ProductAttributeDefinition object aren't available for the ProductClassificationAttr object, then the API request fails. In API version 66.0 and later, you can request proration policy details in the response for each product selling model option through this property.	Optional	61.0
catalogId	String	ID of the catalog. If the catalog ID is specified, then the API returns the list of offers from the catalog with the pricing details related to the catalog.	Optional	60.0
contextDefinition	String	API name of the custom context definition that's sent for context creation. If this property isn't specified, then the default context definition is used.	Optional	60.0
contextMapping	String	Default context mapping of the context definition. If a context mapping is specified, then the API checks whether the mapping belongs to the specified context definition to process the details for hydration.	Optional	60.0
correlationId	String	Unique identifier value that's attached to the requests and messages, and accepts references to a particular transaction or event chain.	Optional	60.0
currencyCode	String	Currency code that's considered for pricing and filtering request. If multiple currencies are enabled for the org, then the `currencyCode` property is required.	Optional	60.0
enablePricing	Boolean	Indicates whether to enable pricing for the products (`true`) or not (`false`). The default value is `true`. The **Pricing Procedure** toggle from the Product Discovery Settings page from	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
		Setup overrides this property. For example, if the **Pricing Procedure** toggle is disabled, then setting the `enablePricing` property to `true` has no effect and the `prices` property in the API response is returned empty.		
`enableQualification`	Boolean	Indicates whether to enable qualification rules for the products (`true`) or not (`false`). The default value is `true`. The **Qualification Procedure** toggle from the Product Discovery Settings page from Setup overrides this property. For example, if the **Qualification Procedure** toggle is disabled, then setting the `enableQualification` property to `true` has no effect and the `qualificationContext` property in the API response isn't returned.	Optional	60.0
`priceBookId`	String	ID of the price book to fetch the prices from. If this property isn't specified, then the prices from the standard price book are fetched.	Required	60.0
`pricingProcedure`	String	API name of the custom pricing procedure that's used for the pricing process. If this property isn't specified, then the default pricing procedure is executed.	Optional	60.0
`productSellingModelId`	String	ID of the product selling model.	Optional	60.0
`qualificationProcedure`	String	API name of the custom qualification procedure that's used for the product qualification process. If this property isn't specified, then the default qualification procedure is executed.	Optional	60.0
`userContext`	User Context Input	User context details. For example, account ID or contact ID.	Optional	60.0

Product Data Input

Input representation of the product details such as the product ID and product selling model ID.

JSON example

```
"productData": [
  {
    "productId": "01txx0000006ivJAAQ",
    "productSellingModelId": "0jPxx000000009hEAA"
  },
  {
    "productId": "01txx0000006ivLAAQ",
    "productSellingModelId": "0jPxx000000009iEAABB"
  }
]
```

Properties

Name	Type	Description	Required or Optional	Available Version
productId	String	ID of the product.	Required	61.0
product Selling ModelId	String	ID of the product selling model.	Optional	61.0

Product List Input

Input representation of the request to retrieve a list of products.

JSON example

```
{
  "correlationId": "eeaa1db2-f371-4227-a886-c77e2f66ce1d",
  "limit": 60,
  "cursor": "MTAwMDAwMDAwNg==",
  "orderBy": [
    "name:asc"
  ],
  "catalogId": "0ZSDU0000002Og74AE",
  "categoryId": "0ZGDU0000002P0H4AU",
  "priceBookId": "01sDU000000JVsVYAW",
  "productClassificationId": "11BDU0000002TCC2A2",
  "currencyCode": "USD",
  "userContext": {
    "accountId": "001DU000001o2UzYAI"
  },
  "includeCatalogDetails": true,
  "enableQualification": true,
  "enablePricing": true,
  "qualificationProcedure": "ProductQualification",
  "pricingProcedure": "pricingProcedure",
  "contextDefinition": "BrowseContextDefinitionExt",
  "contextMapping": "ProductDiscoveryMapping",
  "filter": {
    "criteria": [
```

```
      {
        "property": "name",
        "operator": "eq",
        "value": "Laptop Pro Bundle"
      }
    ]
  },
  "relatedObjectFilters": [
    {
      "objectName": "ProductSpecificationRecType",
      "criteria": [
        {
          "property": "IsCommercial",
          "operator": "eq",
          "value": true
        }
      ]
    }
  ],
  "additionalContextData": [
    {
      "nodeName": "Account",
      "nodeData": {
        "id": "001DU000001o2UzYAI",
        "name": "Cloud Kicks"
      }
    }
  ],
  "additionalFields": {
    "Product2": {
      "fields": [
        "CanRamp",
        "DecompositionScope",
        "ProductCode"
      ]
    }
  }
}
```

If a parent category ID is specified in the request body, then the API returns all products associated to all child categories.

This example shows a sample request to retrieve a product list with promotions.

```

Optional	60.0
`enable Qualification`	Boolean	Indicates whether to enable qualification rules for the products (`true`) or not (`false`). The default value is `true`. The **Qualification Procedure** toggle from the Product Discovery Settings page from Setup overrides this property. For example, if the **Qualification Procedure** toggle is disabled, then setting the	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
		`enableQualification` property to `true` has no effect and the `qualificationContext` property in the API response isn't returned.		
`executeConfigurationRules`	Boolean	Indicates whether to execute configuration rules (`true`) or not (`false`).	Optional	67.0
`filter`	Filter Input	Filters records based on supported criteria. The supported property is `name`. The supported operators are: • `eq` • `in` • `contains`—This value isn't applicable if the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled. If multiple criteria are specified, then the resultant criteria are combined by using the `and` operator.	Optional	60.0
`includeCatalogDetails`	Boolean	Indicates whether to include catalog details in the response (`true`) or not (`false`).	Optional	61.0
`limit`	Integer	Number of items to include in the response. The default value is 10.	Optional	60.0
`offset`	Integer	Reserved for internal use.	Optional	60.0
`orderBy`	String[]	Sort order of the results, which is either ascending (`asc`) or descending order (`desc`). The default sort order is ascending order. The default value is `asc`. If the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled, then you can sort products by using name only.	Optional	60.0
`priceBookId`	String	ID of the price book to get the prices from. If this property isn't specified, then prices from the standard price book are fetched.	Required	60.0

Name	Type	Description	Required or Optional	Available Version
pricing Procedure	String	API name of the custom pricing procedure that's used for the pricing process. If this property isn't specified, then the default pricing procedure is executed.	Optional	60.0
product Classification Id	String	ID of the product classification.	Optional	60.0
qualification Procedure	String	API name of the custom qualification procedure that's used for the product qualification process. If this property isn't specified, then the default qualification procedure is executed.	Optional	60.0
relatedObject Filters	Related Object Filter Input[]	Filter records based on supported criteria for related objects. The supported object is `ProductSpecificationRecType`. The supported property is `IsCommerical`. The supported operator is `eq`. The supported values are `true` and `false`.	Optional	60.0
transaction ContextId	String	ID of the transaction context.	Optional	67.0
transactionId	String	ID of the transaction.	Optional	67.0
usePromotions	Boolean	Indicates whether to fetch applicable promotions from Global Promotion Management (GPM) for each product in the list (`true`) or not (`false`). If Promotion feature is enabled in the org and this property isn't specified, then the default value is `true`. If the Promotion feature isn't enabled, the default value is `false`.	Optional	66.0
userContext	User Context Input	User context details. For example, account ID or contact ID.	Optional	60.0

Product Recommendation Input

Input representation of the details of a request to get product recommendations.

JSON example

```
{
  "currencyCode": "USD",
  "enablePricing": true,
  "enableQualification": true,
  "filter": {
    "criteria": [
      {
        "property": "isActive",
        "operator": "eq",
        "value": true
      },
      {
        "property": "isQualified",
        "operator": "eq",
        "value": true
      }
    ]
  },
  "limit": 12,
  "priceBookId": "01sSG00000DQCjhYAH",
  "transactionId": "0Q0SG0000014Ui50AE"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
additionalContextData	Context Data Input[]	Additional nodes that are added to the custom or default context definition. The maximum number of supported nodes is 10.	Optional	67.0
additionalFields	Map<String, AdditionalFieldInputRepresentation>	Additional standard or custom fields of the Product2 object to include in the response. If the requested fields are invalid or access to fields isn't available, then the API throws an error.	Optional	67.0
catalogId	String	ID of the catalog to fetch the recommended products from.	Optional	67.0
contextDefinition	String	API name of the custom context definition that's sent for context creation. If you don't specify this property, then the default context definition is used.	Optional	67.0
contextMapping	String	Default context mapping of the context definition. If you specify a context mapping, then the API checks whether the mapping belongs to the specified context	Optional	67.0

Name	Type	Description	Required or Optional	Available Version
		definition to process the details for hydration.		
`currencyCode`	String	Currency code that's considered for pricing and filtering request. If multiple currencies are enabled in the org, then the `currencyCode` property is required. If you don't specify a currency code, then the value is fetched from the account.	Optional	67.0
`cursor`	String	Unique ID to represent the position of each product in the data set.	Optional	67.0
`enablePricing`	Boolean	Indicates whether to enable pricing for products in orgs where Salesforce Pricing is enabled (`true`) or not (`false`). Set the value to `false` to skip the execution of Salesforce Pricing. In orgs where Salesforce Pricing is disabled, you can't override this value to `true`. The default value is `true`.	Optional	67.0
`enableQualification`	Boolean	Indicates whether to enable qualification rules for products in orgs where Qualification Procedure is enabled (`true`) or not (`false`). Set the value to `false` to skip the execution of Business Rules Engine qualification rules. In orgs where Qualification Procedure is disabled, you can't override this value to `true`. The default value is `true`.	Optional	67.0
`filter`	Filter Input[]	Filters records based on supported criteria. The supported property is `name`. The supported operators are: • `eq` • `in` • `contains`—This value isn't applicable if the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled.	Optional	67.0

Name	Type	Description	Required or Optional	Available Version
		If you specify multiple criteria, then the resultant criteria are combined by using the `and` operator.		
`limit`	Integer	Number of recommended products to include in the response. The default value is `10`.	Optional	67.0
`priceBookId`	String	ID of the price book to get prices from. If you don't specify a price book ID, then prices from the standard price book are fetched.	Optional	67.0
`pricingProcedure`	String	API name of the custom pricing procedure that's used for the pricing process. If you don't specify this property, then the default pricing procedure is executed.	Optional	67.0
`qualificationProcedure`	String	API name of the custom qualification procedure that's used for the product qualification process. If you don't specify this property, then the default qualification procedure is executed.	Optional	67.0
`transactionContextId`	String	ID of the sales transaction context instance.	Optional	67.0
`transactionId`	String	ID of the quote or order.	Optional	67.0
`usePromotions`	Boolean	Indicates whether to fetch applicable promotions from Global Promotion Management (GPM) for the guided selection (`true`) or not (`false`). The default value is `false`.	Optional	67.0
`userContext`	User Context Input[]	User context details. For example, account ID or contact ID.	Optional	67.0

Products Search Input

Input representation of the request to search products.

JSON example

This example shows a sample request to search products by using a query.

```
{
  "query": {
    "textQuery": {
      "searchPhrase": "firstproduct"
    }
  },
  "catalogId": "0ZSxx0000000001GAA",
```

```
  "categoryId": "0ZGT100000000qlOAA",
  "correlationId": "9cbb9650-48c5-11ed-96d1-0afcf185843b",
  "limit": 10,
  "cursor": "MTAwMDAwMDAwNg==",
  "orderBy": [
    "name:asc",
    "id:desc"
  ],
  "userContext": {
    "accountId": "001xx0000000001AAA",
    "contactId": "003xx00000000D7AAI"
  },
  "additionalFields": {
    "Product2": {
      "fields": [
        "CustomField1__c",
        "CustomField2__c",
        "StandardField1"
      ]
    }
  }
}
```

This example shows a sample request to search products by using the `searchTerm` property.

```
{
  "searchTerm": "Laptop",
  "catalogId": "0ZSDU0000002Og64AE",
  "categoryId": "0ZGDU0000002P0A4AU",
  "correlationId": "d9d8f898-19f5-464a-ba2b-6a070783f6c4",
  "limit": 10,
  "cursor": "MTAwMDAwMDAwNw==",
  "orderBy": [
    "name:asc",
    "id:desc"
  ],
  "userContext": {
    "accountId": "001DU000001o2V0YAI"
  }
}
```

If a parent category ID is specified in the request body, then the API returns all products associated to all child categories.

This example shows a sample request to search products with eligible promotions. To fetch eligible promotions, specify a value for the `query` or `searchTerm` property, and set the `usePromotions` property to `true`.

```
{
  "query": {
    "textQuery": {
      "searchPhrase": "laptop"
    }
  },
  "catalogId": "0ZSxx0000000001GAA",
  "categoryId": "0ZGT100000000qlOAA",
  "correlationId": "9cbb9650-48c5-11ed-96d1-0afcf185843b",
  "limit": 10,
```

```
  "cursor": "MTAwMDAwMDAwNg==",
  "orderBy": [
    "name:asc",
    "id:desc"
  ],
  "userContext": {
    "accountId": "001xx0000000001AAA",
    "contactId": "003xx00000000D7AAI"
  },
  "additionalFields": {
    "Product2": {
      "fields": [
        "CustomField1__c",
        "CustomField2__c",
        "StandardField1"
      ]
    }
  },
  "usePromotions": true
}
```

This example shows a sample request to run visibility rules.

```
{
  "enableQualification": true,
  "enablePricing": true,
  "includeCatalogDetails": true,
  "searchTerm": "128GB LRDIMM",
  "catalogId": "0ZSVW000000AhdC4AS",
  "limit": 12,
  "userContext": {
    "accountId": null
  },
  "priceBookId": "01sVW0000024PZlYAM",
  "currencyCode": "USD",
  "transactionId": "0Q0VW000001190f0AA",
  "filter": {
    "criteria": [
      {
        "property": "isActive",
        "operator": "eq",
        "value": true
      },
      {
        "property": "UsedFor",
        "operator": "eq",
        "value": ""
      }
    ]
  },
  "orderBy": [
    "name:asc"
  ],
  "executeConfigurationRules": true
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
additional ContextData	Context Data Input[]	Additional nodes that are added to the custom or default context definition. The maximum number of supported nodes is 10.	Optional	60.0
additional Fields	Map<String, Additional Fields Input>	Additional standard or custom fields of the Product2 object to include in the response. If the requested fields are invalid or access to fields isn't available, then the API throws an error.	Optional	61.0
catalogId	String	ID of the catalog. If the catalog ID is specified, then the API returns the list of offers from the catalog with the pricing details related to the catalog.	Optional	60.0
categoryId	String	ID of the category. If the category ID isn't specified, then the API returns the matching query offers from the catalog.	Optional	60.0
context Definition	String	API name of the custom context definition that's sent for context creation. If this property isn't specified, then the default context definition is used.	Optional	60.0
context Mapping	String	Default context mapping of the context definition. If a context mapping is specified, then the API checks whether the mapping belongs to the specified context definition to process the details for hydration.	Optional	60.0
correlationId	String	Unique identifier of the request.	Optional	60.0
currencyCode	String	Currency code that's considered for pricing and filtering request.	Optional	60.0
cursor	String	Unique ID to represent the position of each product in the dataset.	Optional	60.0
enablePricing	Boolean	Indicates whether to enable pricing for the products (`true`) or not (`false`). The default value is `true`. The **Pricing Procedure** toggle from the Product Discovery Settings page from Setup overrides this property. For example, if the **Pricing Procedure** toggle is	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
		disabled, then setting the `enablePricing` property to `true` has no effect and the `prices` property in the API response is returned empty.		
`enableQualification`	Boolean	Indicates whether to enable qualification rules for the products (`true`) or not (`false`). The default value is `true`. The **Qualification Procedure** toggle from the Product Discovery Settings page from Setup overrides this property. For example, if the **Qualification Procedure** toggle is disabled, then setting the `enableQualification` property to `true` has no effect and the `qualificationContext` property in the API response isn't returned.	Optional	60.0
`executeConfigurationRules`	Boolean	Indicates whether to execute configuration rules (`true`) or not (`false`).	Optional	67.0
`filter`	Filter Input	Filters records based on supported criteria. The supported property is `name`. The supported operators are: • `eq` • `in` • `contains` • `gt`—Specifies a greater than criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `lt`—Specifies a less than criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `gte`—Specifies a greater than or equal to criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only. • `lte`—Specifies a less than or equal to criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only.	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
		If multiple criteria are specified, then the resultant criteria are combined by using the `and` operator.		
`includeCatalogDetails`	Boolean	Indicates whether to include catalog details in the response (`true`) or not (`false`).	Optional	61.0
`limit`	Integer	Number of items to include in the response. The default value is 10.	Optional	60.0
`offset`	Integer	Reserved for internal use.	Optional	60.0
`orderBy`	String[]	Sort order of the results, which is either ascending or descending order. The default sort order is ascending order. The default value is `asc`.	Optional	60.0
`priceBookId`	String	ID of the price book to get the prices from. If this property isn't specified, then prices from the standard price book are fetched.	Optional	60.0
`pricingProcedure`	String	API name of the custom pricing procedure that's used for the pricing process. If this property isn't specified, then the default pricing procedure is executed.	Optional	60.0
`productClassificationId`	String	ID of the product classification.	Optional	60.0
`qualificationProcedure`	String	API name of the custom qualification procedure that's used for the product qualification process. If this property isn't specified, then the default qualification procedure is executed.	Optional	60.0
`query`	Map<String, Object>	Query to search the products.	Required	60.0
`relatedObjectFilter`	Related Object Filter Input[]	Filter records based on supported criteria for related objects. The supported object is `ProductSpecificationRecType`. The supported property is `IsCommerical`. The supported operator is `eq`. The supported values are `true` and `false`.	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
searchTerm	String	String used to get products with the product name containing the search term. See Search Considerations When Using Indexed Data.	Optional	62.0
transaction ContextId	String	ID of the transaction context.	Optional	66.0
transactionId	String	ID of the transaction.	Optional	66.0
usePromotions	Boolean	Indicates whether to retrieve eligible promotions from Global Promotion Management (GPM) for each product in the search results (`true`) or not (`false`). If Promotion feature is enabled in the org and this property isn't specified, then the default value is `true`. If the Promotion feature isn't enabled, the default value is `false`.	Optional	66.0
userContext	User Context Input	User context details. For example, account ID or contact ID.	Optional	60.0

QOC Qualification

Input representation of the qualification request.

JSON example

```
{
  "productIds": [
    "01txx0000006i7PAAQ",
    "01txx0000006i7QAAQ",
    "01txx0000006i7IAAQ"
  ],
  "userContext": {
    "accountId": "001xx000003GZHgAAO"
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
additional ContextData	Context Data Input[]	Additional nodes that are added to the custom or default context definition. The maximum number of supported nodes is 10.	Optional	60.0
catalogId	String	ID of the catalog.	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
categoryId	String	ID of the category.	Optional	60.0
context Definition	String	API name of the custom context definition that's sent for context creation. If this property isn't specified, the default context definition is used.	Optional	60.0
context Mapping	String	Default context mapping of the context definition. If a context mapping is specified, then the API checks whether the mapping belongs to the specified context definition to process the details for hydration.	Optional	60.0
correlationId	String	Unique identifier of the request.	Optional	60.0
productIds	String[]	List of product IDs for qualification check.	Required	60.0
qualification Procedure	String	API name of the custom qualification procedure that's sent for processing. If this property isn't specified, the default qualification procedure is executed.	Optional	60.0
userContext	User Context Input	User context details. For example, account ID or contact ID.	Optional	60.0

Related Object Filter Input

Input representation of the request to filter records of a related object.

JSON example

```
"relatedObjectFilters":
 [
    {
      "objectName": "ProductSpecificationRecType",
      "criteria":
 [{
      "property": "IsCommercial",
      "operator": "eq",
      "value": true
   }]
  }
  ]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`criteria`	Filter Criteria Input[]	Criteria to filter the related objects.	Required if the `relatedObjectFilters` property is specified.	60.0
`objectName`	String	Name of the object that's related to the main object.	Required if the `relatedObjectFilters` property is specified.	60.0

User Context Input

Input representation of the details with the user context.

JSON example

```
"userContext": {
    "accountId": "001xx0000000001AAA",
    "contactId": "003xx00000000D7AAI",
    "contextId": "e055bb18-d4e8-41c3-881e-0132b9561708"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`accountId`	String	ID of the account in a user context.	Optional	60.0
`contactId`	String	ID of the contact in a user context.	Optional	60.0
`contextId`	String	ID of the context that represents the created session.	Optional	60.0

Response Bodies

Learn more about the available Product Discovery API response bodies.

API Status
Output representation of the API status.

Catalog Details
Output representation of the details of a catalog definition.

Category Details
Output representation of the details of a category.

Bulk Product Details
Output representation of the response that contains the details of multiple products.

CPQ Base Details
Output representation of the catalog, category, or product details based on the request.

CPQ Base List
Output representation of the list of catalogs, categories, or products based on the request.

CPQ Message
Output representation of the API messages.

Facet Value
Output representation of the facet values found in the search result.

Guided Selection
Output representation of the details of a guided selection.

Guided Selection Search Term
Output representation of the search term details for a guided selection.

Pricing Model
Output representation of the details of the pricing model.

Product Classification
Output representation of the details of a product classification.

Product Configuration Rule Details
Output representation of the product configuration rule details.

Product Configuration Rules
Output representation of the details of the product configuration rules.

Product Prices
Output representation of the details of the product prices.

Product Quantity
Output representation of the details of the quantity constraints and current quantity for a product in the product discovery context.

Product Recommendation Errors
Output representation of the details of the errors encountered during the processing of the Product Recommendations API request.

Product Recommendations
Output representation of the fetched product recommendations.

Product Selling Model Option
Output representation of the product selling model option component.

Product Selling Model
Product Selling Model Component output representation

Product Specification Record Type
Output representation of the details of the product specification record type.

Product Specification Type
Output representation of the details of the product specification type.

Promotion Details
Output representation of the details of applicable promotions.

Proration Policy
Output representation of the details of the proration policy component.

[Qualification Context](#)
Output representation of the details about the product qualification.

[Recommended Products](#)
Output representation of the list of recommended products.

[Search Products Facet](#)
Output representation of the details of the faceted search.

[User Context](#)
Output representation of the user context details.

API Status

Output representation of the API status.

Property Name	Type	Description	Filter Group and Version	Available Version
`messages`	CPQ Message[]	Status messages of the API execution.	Small, 60.0	60.0
`statusCode`	String	Status code of the API execution.	Small, 60.0	60.0
`statusMessage`	String	Display label for the API status.	Small, 60.0	60.0

Catalog Details

Output representation of the details of a catalog definition.

JSON example

```
{
  "catalogs": [
    {
      "customFields": {},
      "id": "0ZSSG0000018750 4AQ",
      "name": "Hardware Catalog",
      "numberOfCategories": 4
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`catalogCode`	String	Unique ID associated with the catalog.	Small, 67.0	67.0
`catalogType`	String	Category of an entry in the catalog, which is customizable. For example, catalog types, such as sellable products, services, parts, technical services, or technical resources.	Small, 67.0	67.0
`customFields`	Map<String, Object>	Details of the custom fields associated with a catalog.	Small, 67.0	67.0

Property Name	Type	Description	Filter Group and Version	Available Version
description	String	Description of the catalog.	Small, 67.0	67.0
effectiveEndDate	String	Date and time from when the catalog isn't available to the end users.	Small, 67.0	67.0
effectiveStartDate	String	Date and time from when the catalog is available to the end users.	Small, 67.0	67.0
id	String	ID of the catalog.	Small, 67.0	67.0
name	String	Name of the catalog.	Small, 67.0	67.0
numberOfCategories	Integer	Number of categories in the catalog.	Small, 67.0	67.0
status	String	Status of the catalog.	Small, 67.0	67.0

Category Details

Output representation of the details of a category.

JSON example

```
{
  "categories": [
    {
      "catalogId": "0ZSSG00000187504AQ",
      "childCategories": [],
      "customFields": {},
      "eligiblePromotions": [],
      "id": "0ZGSG000001DJtv4AG",
      "name": "Accessories",
      "qualificationContext": {
        "isQualified": true
      }
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
catalogId	String	ID of the catalog the requested category belong to.	Small, 67.0	67.0
customFields	Map<String, Object>	Details of the custom fields associated with a catalog.	Small, 67.0	67.0
description	String	Description of the category.	Small, 67.0	67.0
eligiblePromotions	Promotion Output[]	List of eligible promotions for the product.	Small, 67.0	67.0
hasSubCategories	Boolean	Indicates whether the subcategories are available (true) or not (false).	Small, 67.0	67.0

Property Name	Type	Description	Filter Group and Version	Available Version
`id`	String	ID of the category.	Small, 67.0	67.0
`isNavigational`	Boolean	Indicates whether the category node is navigational (`true`) or not (`false`).	Small, 67.0	67.0
`name`	String	Name of the category.	Small, 67.0	67.0
`parentCategoryId`	String	ID of the parent category.	Small, 67.0	67.0
`qualificationContext`	Qualification Context Output[]	Context details of a user, which are used for qualification rules.	Small, 67.0	67.0
`sortOrder`	Integer	Display order of the product category relative to the siblings with the same parent category.	Small, 67.0	67.0

Bulk Product Details

Output representation of the response that contains the details of multiple products.

JSON example

```
{
  "apiStatus": {
    "messages": [],
    "statusCode": "FetchedDetailsSuccessfully"
  },
  "contextId": "c68c7c7e85f3ea5b0e7bcfefc0f2dba9bbd24bfe2f4240ca589af50e473e2242",

Property Name	Type	Description	Filter Group and Version	Available Version
`apiStatus`	API Status[]	Status of the API request.	Small, 61.0	61.0
`contextId`	String	ID of the context.	Small, 61.0	61.0
`correlationId`	String	Unique identifier of the request.	Small, 61.0	61.0
`result`	Any response body	Result that contains the details of products.	Small, 61.0	61.0
`userContext`	User Context[]	User context details. For example, account ID or contact ID.	Small, 61.0	61.0

CPQ Base Details

Output representation of the catalog, category, or product details based on the request.

JSON example

This example shows the sample catalog details.

```
{
  "apiStatus": {

Property Name	Type	Description	Filter Group and Version	Available Version
apiStatus	API Status	Status of the API request.	Small, 60.0	60.0
contextId	String	ID of the context.	Small, 60.0	60.0
correlationId	String	Unique ID of the request.	Small, 60.0	60.0
cursor	String	Unique ID to represent the position of each product in the dataset.	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
facets	Search Products Facet	Details of the faceted search.	Small, 63.0	63.0
limit	Integer	Number of items fetched in the response.	Small, 60.0	60.0
offSet	Integer	Offset size from which the item count is fetched.	Small, 60.0	60.0
query	Map<String, Object>	Query that was used for the search request.	Small, 60.0	60.0
result	Any response body	Result that contains the list of catalogs, categories, or products as per the requested resource.	Small, 60.0	60.0
total	Integer	Number of fetched records.	Small, 60.0	60.0
userContext	User Context	User context details. For example, account ID or contact ID.	Small, 60.0	60.0

CPQ Message

Output representation of the API messages.

Property Name	Type	Description	Filter Group and Version	Available Version
code	String	Code specifying the type of message. Valid value is `CartValidationError`.	Small, 60.0	60.0
detail	String	Required details other than the message text.	Small, 60.0	60.0
message	String	Text of the API message.	Small, 60.0	60.0
severity	String	Severity of the API message. Valid values are: • `Error` • `Info` • `Warning`	Small, 60.0	60.0

Facet Value

Output representation of the facet values found in the search result.

JSON example

```
"values": [
  {
```

```
          "displayName": "1080p Built-in Display",
          "nameOrId": "1080p Built-in Display"
        },
        {
          "displayName": "2k Built-in Display",
          "nameOrId": "2k Built-in Display"
        },
        {
          "displayName": "4k Built-in Display",
          "nameOrId": "4k Built-in Display"
        }
      ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
displayName	String	Display name of the facet value.	Small, 63.0	63.0
nameOrId	String	ID or the internal name of the facet value.	Small, 63.0	63.0

Guided Selection

Output representation of the details of a guided selection.

Property Name	Type	Description	Filter Group and Version	Available Version
apiStatus	API Status	Status of the API request.	Small, 62.0	62.0
correlationId	String	Unique ID of the request.	Small, 62.0	62.0
cursor	String	Unique ID to represent the position of each product in the dataset.	Small, 62.0	62.0
result	Any response body	Result that contains the list of products as per the requested resource.	Small, 62.0	62.0
searchTerms	Guided Selection Search Term[]	Search terms for the guided selection.	Small, 62.0	62.0

Guided Selection Search Term

Output representation of the search term details for a guided selection.

JSON example

```
{
  "searchTerms": [
    {
      "term": "IPhone",
      "tags": [
        "deviceType",
        "mobile"
      ]
    },
    {
      "term": "4GB",
      "tags": [
        "RAM"
      ]
    },
    {
      "term": "64GB",
      "tags": [
```

```
          "Storage"
        ]
      }
    ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`tags`	String[]	Search term tags for the guided selection.	Small, 62.0	62.0
`term`	String	Search term value for the guided selection.	Small, 62.0	62.0

Pricing Model

Output representation of the details of the pricing model.

JSON example

```
{
  "pricingModel": {
    "id": "0jPSG000000Avcv2AC",
    "name": "One Time",
    "pricingModelType": "OneTime"
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`frequency`	String	Details about the frequency of recurrence of the pricing model.	Small, 67.0	67.0
`id`	String	ID of the pricing model.	Small, 67.0	67.0
`name`	String	Name of the pricing model.	Small, 67.0	67.0
`occurrence`	Integer	Details about the number of occurrences of the pricing model.	Small, 67.0	67.0
`pricingModelType`	String	Type of the pricing model.	Small, 67.0	67.0
`unitOfMeasure`	String	Unit of measure for the pricing model.	Small, 67.0	67.0

Product Classification

Output representation of the details of a product classification.

JSON example

```
{
  "productClassification": {
    "id": "11BSG00000UNijx2AD"
```

```
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
code	String	Code of the product classification.	Small, 67.0	67.0
id	String	ID of the product classification.	Small, 67.0	67.0
name	String	Name of the product classification.	Small, 67.0	67.0
status	String	Status of the product classification.	Small, 67.0	67.0

Product Configuration Rule Details

Output representation of the product configuration rule details.

JSON example

```
{
  "configurationRules": [
    {
      "details": [
        {
          "message": "recommend Mouse from monitor"
        }
      ],
      "type": "recommend"
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
message	String	Message associated with the product configuration rule.	Small, 67.0	67.0

Product Configuration Rules

Output representation of the details of the product configuration rules.

JSON example

```
{
  "configurationRules": [
    {
      "details": [
        {
          "message": "recommend Mouse from monitor"
        }
      ],
      "type": "recommend"
```

```
      }
    ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`details`	Product Configuration Rule Details[]	Details of the product configuration rule.	Small, 67.0	67.0
`type`	String	Type of the product configuration rule.	Small, 67.0	67.0

Product Prices

Output representation of the details of the product prices.

JSON example

```
{
  "prices": [
    {
      "currencyIsoCode": "USD",
      "isDefault": true,
      "isDerived": false,
      "isSelected": false,
      "price": 7.99,
      "priceBookEntryId": "01uSG000004wTsEYAU",
      "priceBookId": "01sSG00000DQCjhYAH",
      "pricingModel": {
        "id": "0jPSG000000Avcv2AC",
        "name": "One Time",
        "pricingModelType": "OneTime"
      }
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`currencyIsoCode`	String	Currency ISO code of the given price.	Small, 67.0	67.0
`effectiveFrom`	String	Date from when the given price is effective.	Small, 67.0	67.0
`effectiveTo`	String	Date until when the given price is effective.	Small, 67.0	67.0
`isDefault`	Boolean	Indicates whether the given price is default (`true`) or not (`false`).	Small, 67.0	67.0
`isDerived`	Boolean	Indicates whether the given price is derived (`true`) or not (`false`).	Small, 67.0	67.0

Property Name	Type	Description	Filter Group and Version	Available Version
`isSelected`	Boolean	Indicates whether the given price is selected (`true`) or not (`false`).	Small, 67.0	67.0
`price`	Double	Price of the product.	Small, 67.0	67.0
`priceBookEntryId`	String	Price book entry ID of the given price.	Small, 67.0	67.0
`priceBookId`	String	Price book ID of the given price.	Small, 67.0	67.0
`pricingModel`	Pricing Model[]	Pricing model of the given price.	Small, 67.0	67.0

Product Quantity

Output representation of the details of the quantity constraints and current quantity for a product in the product discovery context.

Property Name	Type	Description	Filter Group and Version	Available Version
`maxQuantity`	Double	Maximum quantity allowed for a product.	Small, 67.0	67.0
`minQuantity`	Double	Minimum quantity allowed for a product.	Small, 67.0	67.0
`quantity`	Double	Default or current quantity of the product.	Small, 67.0	67.0

Product Recommendation Errors

Output representation of the details of the errors encountered during the processing of the Product Recommendations API request.

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Code that indicates the type of error.	Small, 66.0	66.0
`message`	String	Message stating the reason for error, if any.	Small, 66.0	66.0

Product Recommendations

Output representation of the fetched product recommendations.

JSON example

```
{
  "cursor": "MTAwMDAwMDAwNQ==",
  "errors": [],
  "products": [
    {
      "additionalFields": {},

`transactionContextId`	String	ID of the sales transaction context.	Small, 67.0	67.0

Product Selling Model Option

Output representation of the product selling model option component.

JSON example

```
{
  "productSellingModelOptions": [
    {
      "id": "0iOSG000000J64x2AC",
      "isDefault": true,
      "productId": "01tSG00000BiywkYAB",
      "productSellingModel": {

        "name": "One Time",
        "sellingModelType": "OneTime",
        "status": "Active"
      },
      "productSellingModelId": "0jPSG000000Avcv2AC"
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`id`	String	ID of the product selling model option.	Small, 67.0	67.0
`isDefault`	Boolean	Indicates whether this product selling model option is default (`true`) or not (`false`).	Small, 67.0	67.0
`productId`	String	ID of the product.	Small, 67.0	67.0
`productSellingModel`	Product Selling Model[]	Details of the product selling model.	Small, 67.0	67.0
`productSellingModelId`	String	ID of the product selling model.	Small, 67.0	67.0
`prorationPolicy`	Proration Policy[]	Details of the proration policy.	Small, 67.0	67.0

Product Selling Model

Product Selling Model Component output representation

JSON example

```
{
  "productSellingModel": {
    "doesAutoRenewByDefault": false,
    "id": "0jPSG000000Avcv2AC",
    "name": "One Time",
    "sellingModelType": "OneTime",
    "status": "Active"
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
doesAutoRenewByDefault	Boolean	Indicates whether the product is automatically renewed by default (true) or not (false).	Small, 67.0	67.0
id	String	ID of the product selling model.	Small, 67.0	67.0
name	String	Name of the product selling model.	Small, 67.0	67.0
pricingTerm	Integer	Pricing term of the product selling model.	Small, 67.0	67.0
pricingTermUnit	String	Pricing term unit of the product selling model.	Small, 67.0	67.0
sellingModelType	String	Selling model type associated with the product selling model.	Small, 67.0	67.0
status	String	Status of the product selling model.	Small, 67.0	67.0

Product Specification Record Type

Output representation of the details of the product specification record type.

Property Name	Type	Description	Filter Group and Version	Available Version
isCommercial	Boolean	Indicates whether this product specification record type is commercial (true) or not (false).	Small, 67.0	67.0

Product Specification Type

Output representation of the details of the product specification type.

Property Name	Type	Description	Filter Group and Version	Available Version
name	String	Name of the product specification type.	Small, 67.0	67.0
productSpecificationRecordType	Product Specification Record Type[]	Details of the product specification record type.	Small, 67.0	67.0

Promotion Details

Output representation of the details of applicable promotions.

Property Name	Type	Description	Filter Group and Version	Available Version
couponCode	String	Coupon code for the promotion.	Small, 67.0	67.0

Property Name	Type	Description	Filter Group and Version	Available Version
description	String	Description of the promotion.	Small, 67.0	67.0
displayName	String	Display name of the promotion.	Small, 67.0	67.0
endDateTime	String	End date and time of the promotion.	Small, 67.0	67.0
id	String	ID of the promotion.	Small, 67.0	67.0
isAutomatic	Boolean	Indicates whether the promotion is automatic (true) or not (false).	Small, 67.0	67.0
isCategoryPromo	Boolean	Indicates whether the promotion is a category-level promotion (true) or not (false).	Small, 67.0	67.0
isProductPromo	Boolean	Indicates whether the promotion is a product-level promotion (true) or not (false).	Small, 67.0	67.0
name	String	Name of the promotion.	Small, 67.0	67.0
priority	Integer	Priority of the promotion.	Small, 67.0	67.0
startDateTime	String	Start date and time of the promotion.	Small, 67.0	67.0
termsAndConditions	String	Terms and conditions of the promotion.	Small, 67.0	67.0

Proration Policy

Output representation of the details of the proration policy component.

Property Name	Type	Description	Filter Group and Version	Available Version
additionalFields	Map<String, Object>	Fields associated with the proration policy.	Small, 67.0	67.0
id	String	ID of the proration policy.	Small, 67.0	67.0

Qualification Context

Output representation of the details about the product qualification.

JSON example

```
{
  "qualificationContext": {
    "isQualified": true
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`isQualified`	Boolean	Indicates whether the product is qualified (`true`) or not (`false`).	Small, 67.0	67.0
`reason`	String	Specifies the reason for product qualification or disqualification.	Small, 67.0	67.0

Recommended Products

Output representation of the list of recommended products.

JSON example

```
{
  "products": [
    {
      "additionalFields": {},
      "catalogs": [
        {
          "customFields": {},
          "id": "0ZSSG000001875O4AQ",
          "name": "Hardware Catalog",
          "numberOfCategories": 4
        }
      ],
      "categories": [
        {

Property Name	Type	Description	Filter Group and Version	Available Version
additionalFields	Map<String, Object>	Additional fields of the product.	Small, 67.0	67.0
availabilityDate	String	Date when the part is used in the product or is made available for sale.	Small, 67.0	67.0
catalogs	Catalog[]	List of the associated catalogs. This property returns the name and id values only.	Small, 67.0	67.0
categories	Category[]	List of the associated categories. This property returns the name and id values only.	Small, 67.0	67.0
configurationRules	Product Configuration Rules[]	List of configuration rules of the product.	Small, 67.0	67.0
configureDuringSale	String	Specifies whether to allow or prevent configuration when a bundle is sold.	Small, 67.0	67.0
description	String	Description of the product.	Small, 67.0	67.0
discontinuedDate	String	Date from when the part can't be used in the product or sold.	Small, 67.0	67.0
displayUrl	String	Display image URL of the product.	Small, 67.0	67.0
eligiblePromotions	Promotion Details[]	List of applicable promotions of the product.	Small, 67.0	67.0
endOfLifeDate	String	Date after which a product isn't supported, ordered, or maintained.	Small, 67.0	67.0
id	String	ID of the product.	Small, 67.0	67.0
isActive	Boolean	Indicates whether the product is active (true) or not (false).	Small, 67.0	67.0
isAssetizable	Boolean	Indicates whether a product instance remains a customer asset after it's purchased (true) or not (false). The default value is true.	Small, 67.0	67.0
isComponentRequired	Boolean	Indicates whether a product component is required (true) or not (false).	Small, 67.0	67.0
isDefaultComponent	Boolean	Indicates whether a product component is a default component (true) or not (false).	Small, 67.0	67.0
isQuantityEditable	Boolean	Indicates whether the quantity of a product is editable (true) or not (false).	Small, 67.0	67.0
isSoldOnlyWithOtherProds	Boolean	Indicates whether a product can be sold only with other products (true) or not (false).	Small, 67.0	67.0

Property Name	Type	Description	Filter Group and Version	Available Version
`name`	String	Name of the product.	Small, 67.0	67.0
`nodeType`	String	Specifies whether a node is a product node or a product classification node.	Small, 67.0	67.0
`prices`	Product Prices[]	Pricing details of a product.	Small, 67.0	67.0
`productClassification`	Product Classification[]	Details of the product classification that the product is based on.	Small, 67.0	67.0
`productCode`	String	Universal product code that's used to track the part that's used in the product.	Small, 67.0	67.0
`productQuantity`	Product Quantity[]	Quantity details of a product.	Small, 67.0	67.0
`productSellingModelOptions`	Product Selling Model Option[]	Details of the product selling model options.	Small, 67.0	67.0
`productSpecificationType`	Product Specification Type[]	Details of the product specification type.	Small, 67.0	67.0
`productType`	String	Details about the product type.	Small, 67.0	67.0
`qualificationContext`	Qualification Context[]	Context details of a user, which are used for qualification rules.	Small, 67.0	67.0
`status`	String	Status of the product, such as active or inactive.	Small, 67.0	67.0

Search Products Facet

Output representation of the details of the faceted search.

JSON example

```
"facets": [
  {
    "attributeType": "ProductStandard",
    "displayName": "Product Type",
    "displayRank": 2,
    "nameOrId": "Type",
    "values": [
      {
        "displayName": "Bundle",
        "nameOrId": "Bundle"
      }
    ]
  },
  {
    "attributeType": "ProductDynamicAttribute",
    "displayName": "Display",
    "displayRank": 3,
    "nameOrId": "0tjDU0000003K5BYAU",
```

```
      "values": [
        {
          "displayName": "1080p Built-in Display",
          "nameOrId": "1080p Built-in Display"
        },
        {
          "displayName": "2k Built-in Display",
          "nameOrId": "2k Built-in Display"
        },
        {
          "displayName": "4k Built-in Display",
          "nameOrId": "4k Built-in Display"
        }
      ]
    }
  ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
attributeType	String	Search attribute type of the facet.	Small, 63.0	63.0
displayName	String	Display name of the facet.	Small, 63.0	63.0
displayRank	Integer	Display rank for the facet.	Small, 63.0	63.0
nameOrId	String	ID or the internal name of the facet.	Small, 63.0	63.0
values	Facet Value[]	Values of the facet found in the search result. Sorted by display name in alphabetical order.	Medium, 63.0	63.0

User Context

Output representation of the user context details.

Property Name	Type	Description	Filter Group and Version	Available Version
contextId	String	ID of the context.	Small, 60.0	60.0

Product Discovery Standard Invocable Actions

Use the standard invocable actions available with Product Discovery to find and retrieve product, category, and catalog details. Additionally, execute a qualification procedure, and search products with guided selection.

Find Products Action

Search for the products from a catalog, category, or subcategory by using the specified search term.

Execute Qualification Procedure Action

Execute a qualification procedure, which returns the qualification status for the specified products.

Get Catalogs Action
Get a list of catalog records.

Get Catalog Details Action
Get details of a catalog record.

Get Categories Action
Get the list of categories associated with a catalog record.

Get Category Details Action
Get details of a category record.

Get Multiple Product Details Action
Get product details for a list of products.

Get Products Action
Get products from the specified catalog, category, or subcategory, including product qualification and pricing details.

Get Product Details Action
Get details such as attributes, hierarchy, and cardinality for the specified product.

Search Product with Guided Selection Action
Use guided product selection to search for products.

Get Product Recommendations Action
Retrieve a list of recommended products for a quote or order by using the Constraint Rule Engine.

Find Products Action

Search for the products from a catalog, category, or subcategory by using the specified search term.

This action is available in API version 62.0 and later.

Special Access Rules

The Find Products action is available in Enterprise, Unlimited, and Developer Editions where Product Discovery is enabled.

You can invoke this action via Apex and Flows only.

Inputs

Input	Details
`additionalContextData`	**Type** Apex-defined **Description** An array of Apex `runtime_industries_cpq.AdditionalContextData` records that contain the additional nodes that are used along with the context definition nodes for data hydration. The maximum number of supported nodes is 10.

Input	Details
`additionalFields`	**Type** Apex-defined **Description** An Apex `runtime_industries_cpq.AdditionalFields` record that contains an array of additional standard or custom fields to include in the response. The supported objects are: • `Product2` • `ProductAttributeDefinition`—If the fields defined for the `ProductAttributeDefinition` object aren't available for the `ProductClassificationAttr` object, then the API request fails.
`catalogId`	**Type** string **Description** Catalog ID that's used to find and retrieve the products.
`categoryId`	**Type** string **Description** ID of the category or subcategory to get the products for.
`contextDefinition`	**Type** string **Description** API name of the context definition used for context creation. If you don't specify a value, the context selected on the Product Discovery Settings page from Setup is used.
`contextMapping`	**Type** string **Description** API name of the context mapping that's used for data hydration. The value of this parameter is used only if it belongs to the specified context definition.
`correlationId`	**Type** string **Description** Currency code that's used to calculate and show prices. Only the products with the currency code matching the specified currency code are fetched.

Input	Details
`currencyCode`	**Type** string **Description** Currency code that's used to calculate and show prices.
`cursor`	**Type** string **Description** A unique identifier that represents the position of the product from which the next set of results are retrieved.
`executeConfigurationRules`	**Type** boolean **Description** Indicates whether configuration rules must run (`true`) or not (`false`). Available in API version 67.0 and later.
`enablePricing`	**Type** boolean **Description** Indicates whether the pricing procedure must run (`true`) or not (`false`). The default value is `true`. To use this parameter, you must enable the Pricing Procedure setting from Setup.
`enableQualification`	**Type** boolean **Description** Indicates whether the qualification procedure must run (`true`) or not (`false`). The default value is `true`. To use this parameter, you must enable the Qualification Procedure setting from Setup.
`filter`	**Type** Apex-defined **Description** A collection of Apex `runtime_industries_cpq.FilterInputRepresentation` records where each record contains a related object and the filter criteria that's applied on the object. The `filter` parameter supports only the `name` property.

Input	Details
	The supported operators are: • `eq` • `in` • `contains` If this parameter contains multiple criteria, all the criteria are applied.
`includeCatalogDetails`	**Type** boolean **Description** Indicates whether catalog details must be included in the response (`true`) or not (`false`).
`limit`	**Type** integer **Description** Maximum number of results to be returned in the response. Enter a value from 1 through 100. The default value is 10.
`orderBy`	**Type** string **Description** Comma-separated string of key-value pairs that specify how results are sorted. Each string must contain a field name and its sort order. For example, `["name:asc",”custom_field:asc”]`.
`priceBookId`	**Type** string **Description** ID of the pricebook from which you wan to retrieve the pricing details.
`productClassificationId`	**Type** string **Description** ID of the product classification that’s used to filter products.
`pricingProcedure`	**Type** string **Description** API name of the pricing procedure to calculate product prices. If you don’t specify a value, the pricing procedure selected on the Product Discovery Settings page from Setup is used.

Input	Details
`qualificationProcedure`	**Type** string **Description** API name of the qualification procedure to evaluate product eligibility. If you don't specify a value, the qualification procedure selected on the Product Discovery Settings page from Setup is used.
`transactionContextId`	**Type** string **Description** Context ID of the quote or order. Available in API version 67.0 and later.
`transactionId`	**Type** string **Description** ID of the quote or order. Available in API version 67.0 and later.
`relatedObjectFilters`	**Type** Apex-defined **Description** A collection of Apex `runtime_industries_cpq.RelatedObjectFilterInputRepresentation` records, where each record contains a related object and the filter criteria that's applied on the object.
`searchTerm`	**Type** string **Description** Required. Search term to find and retrieve products.
`userContext`	**Type** Apex-defined **Description** An Apex `ConnectApi.UserContextInputRepresentation` record that contains the user details to evaluate product eligibility and calculate prices.

Outputs

Output	Details
`apiStatus`	**Type** Apex-defined **Description** An Apex `runtime_industries_cpq.ApiStatusRepresentation` record that contains a status code and message.
`contextId`	**Type** string **Description** ID of the context that's created by using the specified context definition.
`correlationId`	**Type** string **Description** ID to reference a series of related actions.
`cursor`	**Type** string **Description** Unique identifier that represents the position of the next product in the dataset. It's used as an input to retrieve the next set of products.
`facets`	**Type** Apex-defined **Description** Collection of Apex ProductFacetsRepresentation records that contain details of the facet that's retrieved.
`results`	**Type** Apex-defined **Description** An Apex `runtime_industries_cpq.SearchProductsRepresentation` record that contains the products that match the query.
`userContext`	**Type** Apex-defined

Output	Details
	Description An Apex `ConnectApi.UserContextRepresentation` record that includes the user details.

Example

Here's a sample input to call this invocable action from Apex code.

```
Invocable.Action action = Invocable.Action.createStandardAction('findProducts');
action.setInvocationParameter('searchTerm', 'Additional API');
action.setInvocationParameter('executeConfigurationRules', true);
action.setInvocationParameter('catalogId', '0ZSVW000000AhdB4AS');
action.setInvocationParameter('transactionId', '0Q0VW0000018J6X0AU');
List<String> orderBy = new List<String>();
orderBy.add('name:asc');
action.setInvocationParameter('orderBy', orderBy);
List<Invocable.Action.Result> results = action.invoke();

for (Invocable.Action.Result res : results) {
    if (res.isSuccess()) {
        Map<String, Object> outMap = res.getOutputParameters();
        String jsonOutput = JSON.serialize(outMap);
        System.debug(jsonOutput);
    }
}
```

Here’s a sample response for this action.

Usage of an Apex-Defined Data Type in a Flow

To use an Apex-defined input parameter in a flow, follow these guidelines.

Create an Apex Class

Create an Apex class defining the input and output parameters. In the flow, include the Apex-defined input parameters for which you want to add the details. In this example, we've created a class named ProductServiceAction that takes an object's API name and record ID as input, and returns the additional context data.

```
public class ProductServiceAction {
    // Define input parameters
    public class FlowInput{
        @InvocableVariable(required=false)
        public String objectApiName;

        @InvocableVariable(required=false)
        public String recordId;
    }

    // Define output parameters
    public class FlowOutput{
        @invocableVariable
        public runtime_industries_cpq.AdditionalContextData
additionalContextDataFinalOutput = new runtime_industries_cpq.AdditionalContextData();
    }

    // This method is invoked from a Flow
    @InvocableMethod(label='Process Input' description='Creates the Array of
ContextDataInput for additional Context Data')
    public static List<FlowOutput> processContextData(List<FlowInput> inputs){
        String apiName;
        String recId;
        FlowOutput output = new FlowOutput();

    // Capture input from the flow
        for(FlowInput input: inputs){
            apiName = input.objectApiName;
            recId = input.recordId;
            }
    // Populate the ContextDataInput list to store additional context data
        List<runtime_industries_cpq.ContextDataInput> listContextData = new
List<runtime_industries_cpq.ContextDataInput>();
        runtime_industries_cpq.ContextDataInput cd1 = new
runtime_industries_cpq.ContextDataInput();
        cd1.nodeName = apiName;
```

```
        cd1.nodeData = new Map<String, Object>();
        cd1.nodeData.put('id',recId);
        listContextData.add(cd1);

       output.additionalContextDataFinalOutput.additionalContextData = listContextData;

        List<FlowOutput> flowOutputs = new List<FlowOutput>();
        flowOutputs.add(output);

        List<runtime_industries_cpq.RelatedObjectFilter> relatedObjectFilterList = new
 List<runtime_industries_cpq.RelatedObjectFilter>();

        runtime_industries_cpq.RelatedObjectFilter relatedObjectFilter = new
runtime_industries_cpq.RelatedObjectFilter();

        relatedObjectFilter.objectName = 'ProductSpecificationRecType';
        List<runtime_industries_cpq.FilterCriteriaInputRepresentation> criteriaList =
new  List<runtime_industries_cpq.FilterCriteriaInputRepresentation>();
        runtime_industries_cpq.FilterCriteriaInputRepresentation criteria = new
runtime_industries_cpq.FilterCriteriaInputRepresentation();
        criteria.property = 'IsCommercial';
        criteria.operator = 'eq';
        criteria.value = 'true';
        criteriaList.add(criteria);
        relatedObjectFilter.criteria = criteriaList;

        relatedObjectFilterList.add(relatedObjectFilter);
        output.relatedObjectFilter.relatedObjectFilter  = relatedObjectFilterList;

  output.userContext.accountId = '001DU000001nx9BYAQ';

        return flowOutputs;

    }

}
```

Create a Flow with the Necessary Variables and Components

Create a flow that enables users to add a search term to find products. Add the ProductService action that you've created above by using Apex. When a flow is invoked from a record, the flow sends the record's objectApiName and recordId to the Apex class, which then generates the flow output. The flow passes the objectApiName and recordId of the record that the flow is invoked from to the Apex class to generate the flow output. See Example of How to Create a Flow for Product Discovery.

Configure the Action

Configure the action (for example, Find Products action) to add values for the Apex-defined input parameters. Use the output of the created Apex class as the input of the Apex-defined parameter in the Find Products action, which users can use to find products.

Execute Qualification Procedure Action

Execute a qualification procedure, which returns the qualification status for the specified products.

This action is available in API version 64.0 and later.

You can invoke this action via Apex and Flows only.

Special Access Rules

The Execute Qualification Procedure action is available in Enterprise, Unlimited, and Developer Editions where Product Discovery is enabled.

Inputs

Input	Details
`additionalContextData`	**Type** Apex-defined **Description** Collection of Apex AdditionalContextData records that contain additional context data for nodes of the custom context definition, if applicable. You can add details for up to 10 nodes. See AdditionalContextData.
`contextDefinitionName`	**Type** string **Description** Name of the custom context definition that's used to create context data for categories. If null, the default context definition is used.
`contextMappingName`	**Type** string **Description** Name of the context mapping. By default, the default context mapping associated with the context definition is used.
`correlationId`	**Type** string **Description** Unique identifier attached to requests and messages, allowing reference to a specific transaction or event chain.
`productIds`	**Type** string **Description** Required. Collection of IDs of products that are to be checked for qualification.
`qualificationProcedureName`	**Type** string

Input	Details
	Description Name of the custom qualification procedure that's executed to determine the category list. If null, the default qualification procedure is executed.
`userContextInputRepresentation`	**Type** Apex-defined **Description** An Apex UserContextInputRepresentation record that contains user details, such as account ID, geographical location, language preferences, and more.

Outputs

Output	Details
`apiStatusOutputRepresentation`	**Type** Apex-defined **Description** An Apex ApiStatusOutputRepresentation record that contains the status of the request, including the status code and message.
`contextId`	**Type** string **Description** ID of the context that's created by using the specified context definition.
`correlationId`	**Type** string **Description** Unique identifier attached to requests and messages, allowing reference to a specific transaction or event chain.
`qualificationResultRepresentations`	**Type** Apex-defined **Description** Collection of Apex QualificationResultRepresentation records that contain details about the qualified product.

Example

Here's a sample input to call this invocable action from Apex code.

```
Invocable.Action action =
Invocable.Action.createStandardAction('executeQualificationProcedure');

ConnectApi.UserContextInputRepresentation userContext = new
ConnectApi.UserContextInputRepresentation();
userContext.accountId = '001xx000003GYiEAAW';

runtime_industries_cpq.ContextDataInput data = new
runtime_industries_cpq.ContextDataInput();
String nodeNameVal = 'Quote__c';
Map<String,Object> nodeDataVal = new Map<String,Object>();
nodeDataVal.put('id',(Object)'0Q0xx0000004CDsCAM');
nodeDataVal.put('businessObjectType',(Object)'Quote');
data.nodeName = nodeNameVal;
data.nodeData = nodeDataVal;
List<runtime_industries_cpq.ContextDataInput> contextData= new
List<runtime_industries_cpq.ContextDataInput>();
contextData.add(data);
runtime_industries_cpq.AdditionalContextData additionalContextDataOut = new
runtime_industries_cpq.AdditionalContextData();
additionalContextDataOut.additionalContextData = new
List<runtime_industries_cpq.ContextDataInput>();
additionalContextDataOut.additionalContextData.add(data);

List<String> productIds = new List<String>();
prodIds.add('01txx0000006i2ZAAQ');
prodIds.add('01txx0000006i35AAA');
action2.setInvocationParameter('productIds', productIds);
action.setInvocationParameter('correlationId', '9cbb9650-48c5-11ed-96d1-0afcf185843b');
action.setInvocationParameter('userContextInputRepresentation', userContext);
action.setInvocationParameter('qualificationProcedureName', 'CatQual02');
action.setInvocationParameter('contextDefinitionName', 'CategoryCD');
action.setInvocationParameter('contextMappingName', 'ProductDiscoveryMapping');
action.setInvocationParameter('additionalContextData', additionalContextDataOut);

List<Invocable.Action.Result> results = action.invoke();
System.debug('Execute Qualification Procedure Action + '+results);
```

Here's a sample response when you call this action.

```
[
  {
    "actionName": "executeQualificationProcedure",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": {
      "apiStatusOutputRepresentation": {
        "statusMessage": null,
        "statusCode": "FetchedDetailsSuccessfully",
        "messages": []
```

```
      },
      "qualificationResultRepresentations": [
        {
          "qualificationContext": {
            "reason": null,
            "isQualified": true
          },
          "productId": "01tSG000007uDL8YAM"
        },
        {
          "qualificationContext": {
            "reason": "Product is not qualified because one or more field(s) do not
match the qualification criteria. Fields:- ProductId - 01tSG000007uDLBYA2
Max_Number_of_Employees - 50 Min_Number_of_Employees - 50 RootProductId - ",
            "isQualified": false
          },
          "productId": "01tSG000007uDLBYA2"
        }
      ],
      "correlationId": "9cbb9650-48c5-11ed-96d1-0afcf185843b",
      "contextId": "0000000b28op21g0025174722465473 9cade16577eac4c8fb5d94a20d952fdab"
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Get Catalogs Action

Get a list of catalog records.

This action is available in API version 64.0 and later.

You can invoke this action via Apex and Flows only.

Special Access Rules

Inputs

Input	Details
`recordLimit`	**Type** integer **Description** Number of catalog records to get. The minimum is 1, the maximum is 100, and the default is 100.
`recordOffset`	**Type** integer

Input	Details
	Description Number of catalog records to skip in the request. The default is 0.
`correlationId`	**Type** string **Description** Unique identifier for tracking requests and messages, allowing reference to a specific transaction or event chain.
`orderBy`	**Type** string **Description** Sort records in ascending or descending order.

Outputs

Output	Details
`resultCatalogList`	**Type** Apex-defined **Description** List of filtered catalog records. See CatalogOutputRepresentation.
`apiStatusOutputRepresentation`	**Type** Apex-defined **Description** An Apex `runtime_industries_cpq.ApiStatusRepresentation` record that contains the status of the request, including the status code and message.
`recordLimit`	**Type** integer **Description** Number of catalog records to show per page.
`resultListCount`	**Type** integer **Description** Number of catalog records in the result.

Output	Details
correlationId	**Type** string **Description** Unique identifier for tracking requests and messages, allowing reference to a specific transaction or event chain.
recordOffset	**Type** integer **Description** Number of catalog records to skip in the request. The default is 0.

Example

POST

Here's a sample input to call this invocable action from Apex code.

```
Invocable.Action action = Invocable.Action.createStandardAction('getCatalogs');

action.setInvocationParameter('correlationId', '9cbb9650-48c5-11ed-96d1-0afcf185843b');
action.setInvocationParameter('recordLimit', 1);
action.setInvocationParameter('recordOffset', 1);
String[] sortOrder = new String[]{'Name:ASC'};
action.setInvocationParameter('orderBy', sortOrder);

List<Invocable.Action.Result> results = action.invoke();
System.debug('Catalog List Action + '+results);
```

Here's a sample response when you call this action.

```
[
  {
    "actionName": "getCatalogs",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": {
      "resultListCount": 2,
      "apiStatusOutputRepresentation": {
        "statusMessage": null,
        "statusCode": "FetchedDetailsSuccessfully",
        "messages": []
      },
      "resultCatalogList": [
        {
          "status": null,
          "numberOfCategories": 2,
          "name": "Hardware Catalog",
```

```
          "id": "0ZSZ6000000CtXYOA0",
          "effectiveStartDate": null,
          "effectiveEndDate": null,
          "description": "Hardware Catalog Desc",
          "customFields": [],
          "catalogType": "Sales",
          "catalogCode": "HC"
        }
      ],
      "correlationId": "9cbb9650-48c5-11ed-96d1-0afcf185843b",
      "recordOffset": 0,
      "recordLimit": 1
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Get Catalog Details Action

Get details of a catalog record.

This action is available in API version 64.0 and later.

You can invoke this action via Apex and Flows only.

Special Access Rules

The Get Catalog Details action is available in Enterprise, Unlimited, and Developer Editions where Product Discovery is enabled.

Inputs

Input	Details
`catalogId`	**Type** string **Description** Required. ID of the catalog record.
`correlationId`	**Type** string **Description** Unique identifier attached to requests and messages, enabling reference to a specific transaction or event chain.

Outputs

Output	Details
apiStatusOutputRepresentation	**Type** Apex-defined **Description** An Apex `runtime_industries_cpq.ApiStatusRepresentation` record that contains the status of the request, including the status code and message.
`catalogDetailsResult`	**Type** Apex-defined **Description** Details of the catalog record.
`correlationId`	**Type** string **Description** Unique identifier attached to requests and messages, allowing reference to a specific transaction or event chain.

Example

Here's a sample input to call this invocable action from Apex code.

```
Invocable.Action action = Invocable.Action.createStandardAction('getCatalogDetails');

action.setInvocationParameter('correlationId', '9cbb9650-48c5-11ed-96d1-0afcf185843b');
action.setInvocationParameter('catalogId', '0ZSZ6000000CtXYOA0');

List<Invocable.Action.Result> results = action.invoke();
System.debug('Catalog Details Action + '+results);
```

Here's a sample response when you call this action.

```
[
  {
    "actionName": "getCatalogDetails",
    "errors": null,
    "invocationId": null,
    "isSuccess": true,
    "outcome": null,
    "outputValues": {
      "apiStatusOutputRepresentation": {
        "statusMessage": null,
        "statusCode": "FetchedDetailsSuccessfully",
        "messages": []
      },
      "correlationId": "9cbb9650-48c5-11ed-96d1-0afcf185843b",
```

```
      "catalogDetailsResult": {
        "status": null,
        "numberOfCategories": 2,
        "name": "Hardware Catalog",
        "id": "0ZSZ6000000CtXYOA0",
        "effectiveStartDate": null,
        "effectiveEndDate": null,
        "description": "Hardware Catalog Desc",
        "customFields": null,
        "catalogType": "Sales",
        "catalogCode": "HC"
      }
    },
    "sortOrder": -1,
    "version": 1
  }
]
```

Get Categories Action

Get the list of categories associated with a catalog record.

This action is available in API version 64.0 and later.

You can invoke this action via Apex and Flows only.

Special Access Rules

The Get Categories action is available in Enterprise, Unlimited, and Developer Editions where Product Discovery is enabled.

Inputs

Input	Details
`additionalContextData`	**Type** Apex-defined **Description** Collection of Apex `runtime_industries_cpq.AdditionalContextData` records that contain additional context data for nodes of the custom context definition, if applicable. You can add details for up to 10 nodes.
`catalogId`	**Type** string **Description** Required. ID of the catalog record.

Input	Details
`categoryNestLevel`	**Type** integer **Description** Level of nesting within the category hierarchy to include in the request.
`contextDefinitionName`	**Type** string **Description** Name of the custom context definition that's used to create context data for categories. If null, the default context definition is used.
`correlationId`	**Type** string **Description** Unique identifier attached to requests and messages, allowing reference to a specific transaction or event chain.
`contextMappingName`	**Type** string **Description** Name of the context mapping. By default, the default context mapping associated with the context definition is used.
`enableQualificationProcedure`	**Type** boolean **Description** Indicates whether qualification rules are applied to categories (`true`) or not (`false`).
`filterInputRepresentation`	**Type** Apex-defined **Description** Collection of Apex `runtime_industries_cpq.FilterInputRepresentation` records that contain the filter criteria applied to the category records.
`parentCategoryId`	**Type** string **Description** ID of the parent category record.

Input	Details
qualificationProcedureName	**Type** string **Description** Name of the custom qualification procedure that's executed to determine the category list. If null, the default qualification procedure is executed.
userContextInputRepresentation	**Type** Apex-defined **Description** An Apex UserContextInputRepresentation record that contains user details, such as account ID, geographical location, language preferences, and more.

Outputs

Output	Details
apiStatusOutputRepresentation	**Type** Apex-defined **Description** An Apex `runtime_industries_cpq.ApiStatusRepresentation` record that contains the status of the request, including the status code and message.
correlationId	**Type** string **Description** Unique identifier attached to requests and messages, allowing reference to a specific transaction or event chain.
resultCategoryList	**Type** Apex-defined **Description** List of filtered category records. See CategoryOutputRepresentation.
resultListCount	**Type** integer **Description** Number of category records in the result.

Example

Here's a sample input to call this invocable action from Apex code.

```
Invocable.Action action = Invocable.Action.createStandardAction('getCategories');

ConnectApi.UserContextInputRepresentation userContext = new
ConnectApi.UserContextInputRepresentation();
userContext.accountId = '001xx000003GYiEAAW';

runtime_industries_cpq.ContextDataInput data = new
runtime_industries_cpq.ContextDataInput();
String nodeNameVal = 'Quote__c';
Map<String,Object> nodeDataVal = new Map<String,Object>();
nodeDataVal.put('id',(Object)'0Q0xx0000004CDsCAM');
nodeDataVal.put('businessObjectType',(Object)'Quote');
data.nodeName = nodeNameVal;
data.nodeData = nodeDataVal;
List<runtime_industries_cpq.ContextDataInput> contextData= new
List<runtime_industries_cpq.ContextDataInput>();
contextData.add(data);
runtime_industries_cpq.AdditionalContextData additionalContextDataOut = new
runtime_industries_cpq.AdditionalContextData();
additionalContextDataOut.additionalContextData = new
List<runtime_industries_cpq.ContextDataInput>();
additionalContextDataOut.additionalContextData.add(data);

action.setInvocationParameter('catalogId', '0ZSxx0000000002GAA');
action.setInvocationParameter('correlationId', '9cbb9650-48c5-11ed-96d1-0afcf185843b');
action.setInvocationParameter('userContextInputRepresentation', userContext);
action.setInvocationParameter('enableQualificationProcedure', True);
action.setInvocationParameter('qualificationProcedureName', 'CatQual02');
action.setInvocationParameter('contextDefinitionName', 'CategoryCD');
action.setInvocationParameter('contextMappingName', 'ProductDiscoveryMapping');
action.setInvocationParameter('additionalContextData', additionalContextDataOut);
//action.setInvocationParameter('categoryDepth', 4);
//action.setInvocationParameter('parentCategoryId', '0ZGxx0000000001GAA');

List<Invocable.Action.Result> results = action.invoke();
System.debug('Search Action + '+results);
```

Here's a sample response when you call this action.

Get Category Details Action

Get details of a category record.

This action is available in API version 64.0 and later.

You can invoke this action via Apex and Flows only.

Special Access Rules

The Get Category Details action is available in Enterprise, Unlimited, and Developer Editions where Product Discovery is enabled.

Inputs

Input	Details
additionalContextData	**Type** Apex-defined **Description** Collection of Apex runtime_industries_cpq.AdditionalContextData records that contain additional context data for nodes of the custom context definition, if applicable. You can add details for up to 10 nodes.
catalogId	**Type** string **Description** ID of the catalog record that's used to search for products within a category.
categoryId	**Type** string **Description** Required. ID of the category or subcategory that's used to search for products.
contextDefinitionName	**Type** string **Description** Name of the custom context definition that's used to create context data for categories. If null, the default context definition is used.

Input	Details
contextMappingName	**Type** string **Description** Name of the context mapping. By default, the default context mapping associated with the context definition is used.
correlationId	**Type** string **Description** Unique identifier attached to requests and messages, allowing reference to a specific transaction or event chain.
enableQualificationProcedure	**Type** boolean **Description** Indicates whether qualification rules are applied to categories (`true`) or not (`false`).
filterInputRepresentation	**Type** Apex-defined **Description** Collection of Apex `runtime_industries_cpq.FilterInputRepresentation` records that contain the filter criteria applied to the category records.
qualificationProcedureName	**Type** string **Description** Name of the custom qualification procedure that's executed to determine the category list. If null, the default qualification procedure is executed.
userContextInputRepresentation	**Type** Apex-defined **Description** An Apex UserContextInputRepresentation record that contains user details, such as account ID, geographical location, language preferences, and more.

Outputs

Output	Details
apiStatusOutputRepresentation	**Type** Apex-defined **Description** An Apex `runtime_industries_cpq.ApiStatusRepresentation` record that contains the status of the request, including the status code and message.
categoryDetailsRepresentations	**Type** Apex-defined **Description** Collection of Apex CategoryDetailsRepresentation records that contain details about the retrieved category.
correlationId	**Type** string **Description** Unique identifier attached to requests and messages, allowing reference to a specific transaction or event chain.

Example

Here's a sample input to call this invocable action from Apex code.

```
Invocable.Action action = Invocable.Action.createStandardAction('getCategoryDetails');

ConnectApi.UserContextInputRepresentation userContext = new
ConnectApi.UserContextInputRepresentation();
userContext.accountId = '001xx000003GYiEAAW';

runtime_industries_cpq.ContextDataInput data = new
runtime_industries_cpq.ContextDataInput();
String nodeNameVal = 'Quote__c';
Map<String,Object> nodeDataVal = new Map<String,Object>();
nodeDataVal.put('id',(Object)'0Q0xx0000004CDsCAM');
nodeDataVal.put('businessObjectType',(Object)'Quote');
data.nodeName = nodeNameVal;
data.nodeData = nodeDataVal;
List<runtime_industries_cpq.ContextDataInput> contextData= new
List<runtime_industries_cpq.ContextDataInput>();
contextData.add(data);
runtime_industries_cpq.AdditionalContextData additionalContextDataOut = new
runtime_industries_cpq.AdditionalContextData();
additionalContextDataOut.additionalContextData = new
List<runtime_industries_cpq.ContextDataInput>();
additionalContextDataOut.additionalContextData.add(data);
```

```
action.setInvocationParameter('categoryId', '0ZGxx0000000001GAA');
action.setInvocationParameter('correlationId', '9cbb9650-48c5-11ed-96d1-0afcf185843b');
action.setInvocationParameter('userContext', userContext);
action.setInvocationParameter('enableQualification', True);
action.setInvocationParameter('qualificationProcedure', 'CatQual02');
action.setInvocationParameter('contextDefinition', 'CategoryCD');
action.setInvocationParameter('contextMapping', 'ProductDiscoveryMapping');
action.setInvocationParameter('additionalContextData', additionalContextDataOut);

List<Invocable.Action.Result> results = action.invoke();
System.debug('Search Action + '+results);
```

Here's a sample response when you call this action.

Get Multiple Product Details Action

Get product details for a list of products.

This action is available in API version 64.0 and later.

You can invoke this action via Apex and Flows only.

Special Access Rules

The Get Multiple Product Details action is available in Enterprise, Unlimited, and Developer Editions where Product Discovery is enabled.

Inputs

Input	Details
`additionalContextData`	**Type** Apex-defined **Description** Collection of Apex `runtime_industries_cpq.AdditionalContextData` records that contain additional context data for nodes of the custom context definition, if applicable. You can add details for up to 10 nodes.
`additionalFields`	**Type** Apex-defined **Description** An Apex AdditionalFields record that contains the additional fields that are passed for the Product2 object.
`catalogId`	**Type** string

Input	Details
	Description ID of the catalog record.
`contextDefinitionName`	**Type** string **Description** Name of the custom context definition that’s used to create context data for categories. If null, the default context definition is used.
`contextMappingName`	**Type** string **Description** Name of the context mapping. By default, the default context mapping associated with the context definition is used.
`correlationId`	**Type** string **Description** Unique identifier attached to requests and messages, allowing reference to a specific transaction or event chain.
`currencyCode`	**Type** string **Description** Currency code that’s used to calculate and show prices.
`enablePricing`	**Type** boolean **Description** Indicates whether pricing procedure must run (`true`) or not (`false`). The default value is `true`. To use this parameter, the **Pricing Procedure** setting must be enabled.
`enableQualificationProcedure`	**Type** boolean **Description** Indicates whether the qualification procedure is applied to categories (`true`) or not (`false`).
`priceBookId`	**Type** string

Input	Details
	Description ID of the pricebook that the pricing information is retrieved from.
`pricingProcedureName`	**Type** string **Description** Name of the pricing procedure to calculate product prices. If you don't enter a value, the pricing procedure selected on the **Product Discovery Settings** page is used.
`productDataInputs`	**Type** Apex-defined **Description** Required. Collection of Apex BulkProductDetailsInputBody records that contain details about the products that are to be retrieved.
`qualificationProcedureName`	**Type** string **Description** Name of the custom qualification procedure that's executed to determine the category list. If null, the default qualification procedure is executed.
`userContextInputRepresentation`	**Type** Apex-defined **Description** An Apex UserContextInputRepresentation record that contains user details, such as account ID, geographical location, language preferences, and more.

Outputs

Output	Details
`apiStatusOutputRepresentation`	**Type** Apex-defined **Description** An Apex `runtime_industries_cpq.ApiStatusRepresentation` record that contains the status of the request, including the status code and message.
`contextId`	**Type** string

Output	Details
	Description ID of the context that's created using the specified context definition.
`correlationId`	**Type** string **Description** Unique identifier attached to requests and messages, allowing reference to a specific transaction or event chain.
`productDetailsOutputRepresentation`	**Type** Apex-defined **Description** Collection of Apex BulkProductDetailsRepresentation records that contain details of available products.
`userContext`	**Type** Apex-defined **Description** An Apex ConnectApi.UserContextRepresentation record containing user information.

Example

Here's a sample input to call this invocable action from Apex code.

```
Invocable.Action action =
Invocable.Action.createStandardAction('getMultipleProductDetails');

List<runtime_industries_cpq.BulkProductDetailsInputBody> productDataList = new
List<runtime_industries_cpq.BulkProductDetailsInputBody>();
runtime_industries_cpq.BulkProductDetailsInputBody productData = new
runtime_industries_cpq.BulkProductDetailsInputBody();
productData.productId = '01tIY000000nCxhYAE';

productDataList.add(productData);

runtime_industries_cpq.BulkProductDetailsInputBodyList productList = new
runtime_industries_cpq.BulkProductDetailsInputBodyList();
productList.productData = productDataList;

action.setInvocationParameter('productDataInputs', productList);

List<Invocable.Action.Result> results = action.invoke();
System.debug('Result === ' + results);
```

Here's a sample response when you call this action.

```

Get Products Action

Get products from the specified catalog, category, or subcategory, including product qualification and pricing details.

If a catalog, category, or subcategory isn't specified, then this action retrieves all the products from all catalogs. This action is available in API version 62.0 and later.

You can invoke this action via Apex and Flows only.

Special Access Rules

The Get Products action is available in Enterprise, Unlimited, and Developer Editions where Product Discovery is enabled.

Inputs

Input	Details
additionalContextData	**Type** Apex-defined **Description** An array of Apex `runtime_industries_cpq.AdditionalContextData` records that contain the additional nodes that are used along with the context definition nodes for data hydration. The maximum number of supported nodes is 10.
additionalFields	**Type** Apex-defined

Input	Details
	Description An Apex `runtime_industries_cpq.AdditionalFields` record that contains an array of additional standard or custom fields to include in the response. The supported objects are: • `Product2` • `ProductAttributeDefinition`—If the fields defined for the `ProductAttributeDefinition` object aren't available for the `ProductClassificationAttr` object, then the API request fails.
`catalogId`	**Type** string **Description** Catalog ID that's used to find and retrieve the products.
`categoryId`	**Type** string **Description** ID of the category or subcategory to get the products for.
`contextDefinition`	**Type** string **Description** API name of the context definition that's used for context creation. If you don't specify a value, the context selected on the Product Discovery Settings page from Setup is used.
`contextMapping`	**Type** string **Description** API name of the context mapping that's used for data hydration. The value of this parameter is used only if it belongs to the specified context definition.
`correlationId`	**Type** string **Description** Unique ID that's used to reference a series of related actions.

Input	Details
`currencyCode`	**Type** string **Description** Currency code that's used to calculate and show prices. Only the products with the currency code matching the specified currency code are fetched.
`cursor`	**Type** string **Description** Unique identifier that represents the position of the product from which the next set of results are retrieved.
`enablePricing`	**Type** boolean **Description** Indicates whether the pricing procedure must run (`true`) or not (`false`). The default value is `true`. To use this parameter, you must enable the Pricing Procedure setting from Setup.
`enableQualification`	**Type** boolean **Description** Indicates whether the qualification procedure must run (`true`) or not (`false`). The default value is `true`. To use this parameter, you must enable the Qualification Procedure setting from Setup.
`executeConfigurationRules`	**Type** boolean **Description** Indicates whether configuration rules must run (`true`) or not (`false`). Available in API version 67.0 and later.
`filter`	**Type** Apex-defined **Description** A collection of Apex `runtime_industries_cpq.FilterInputRepresentation` records where each record contains a related object and the filter criteria that's applied on the object. The `filter` parameter supports only the `name` property.

Input	Details
	The supported operators are: • `eq` • `in` • `contains` If this parameter contains multiple criteria, all the criteria are applied.
`includeCatalogDetails`	**Type** boolean **Description** Indicates whether catalog details must be included in the response (`true`) or not (`false`).
`limit`	**Type** integer **Description** Maximum number of results to be returned in the response. Specify a value from 1 through 100. The default value is 10.
`orderBy`	**Type** string **Description** Comma-separated string of key-value pairs that specify how the results are sorted. Each string must contain a field name and its sort order. For example, `["name:asc",”custom_field:asc”]`.
`priceBookId`	**Type** string **Description** ID of the pricebook that the pricing details are retrieved from.
`pricingProcedure`	**Type** string **Description** API name of the pricing procedure to calculate product prices. If you don’t specify a value, the pricing procedure selected on the Product Discovery Settings page from Setup is used.
`productClassificationId`	**Type** string **Description** ID of the product classification that’s used to filter the products.

Input	Details
`qualificationProcedure`	**Type** string **Description** API name of the qualification procedure to evaluate product eligibility. If you don't specify a value, the qualification procedure selected on the Product Discovery Settings page from Setup is used.
`transactionContextId`	**Type** string **Description** Context ID of the quote or order. Available in API version 67.0 and later.
`transactionId`	**Type** string **Description** ID of the quote or order. Available in API version 67.0 and later.
`relatedObjectFilters`	**Type** Apex-defined **Description** A collection of Apex `runtime_industries_cpq.RelatedObjectFilterInputRepresentation` records, where each record contains a related object and the filter criteria that's applied on the object.
`userContext`	**Type** Apex-defined **Description** An Apex `ConnectApi.UserContextInputRepresentation` record that contains the user details to evaluate product eligibility and calculate prices.

Outputs

Output	Details
`apiStatus`	**Type** Apex-defined

Output	Details
	Description An Apex `runtime_industries_cpq.ApiStatusRepresentation` record that contains a status code and message.
`contextId`	**Type** string **Description** ID of the context that's created by using the specified context definition.
`correlationId`	**Type** string **Description** ID to reference a series of related actions.
`cursor`	**Type** string **Description** Unique identifier that represents the position of the product from which the next set of results are retrieved.
`results`	**Type** Apex-defined **Description** An Apex `runtime_industries_cpq.ProductListRepresentation` record that contains the retrieved products.
`userContext`	**Type** Apex-defined **Description** An Apex `ConnectApi.UserContextRepresentation` record that includes the user details.

Example

Here's a sample input to call this invocable action from Apex code.

```
Invocable.Action action = Invocable.Action.createStandardAction('getProducts');
action.setInvocationParameter('executeConfigurationRules', true);
action.setInvocationParameter('catalogId', '0ZSVW000000AhdB4AS');
action.setInvocationParameter('transactionId', '0Q0VW0000018J6X0AU');
```

```
List<String> orderBy = new List<String>();
orderBy.add('name:asc');
action.setInvocationParameter('orderBy', orderBy);
List<Invocable.Action.Result> results = action.invoke();

for (Invocable.Action.Result res : results) {
    if (res.isSuccess()) {
        Map<String, Object> outMap = res.getOutputParameters();
        String jsonOutput = JSON.serialize(outMap);
        System.debug(jsonOutput);
    }
}
```

Here's a sample response for this action.

```

Usage of an Apex-Defined Data Type in a Flow

To use an Apex-defined input parameter in a Flow, follow these guidelines.

Create an Apex class

Create an Apex class defining the input and output parameters. In the flow, include the Apex-defined input parameters for which you want to add the details. In this example, we have created a class named ProductServiceAction that takes an object's API name and record ID as input, and returns the additional context data.

```
public class ProductServiceAction {
    // Define input parameters
    public class FlowInput{
        @InvocableVariable(required=false)
        public String objectApiName;

        @InvocableVariable(required=false)
        public String recordId;
    }

    // Define output parameters
    public class FlowOutput{
        @invocableVariable
        public runtime_industries_cpq.AdditionalContextData
additionalContextDataFinalOutput = new runtime_industries_cpq.AdditionalContextData();

        @invocableVariable
        public runtime_industries_cpq.RelatedObjectFilterInputRepresentation
relatedObjectFilter = new runtime_industries_cpq.RelatedObjectFilterInputRepresentation();

        @invocableVariable
        public ConnectApi.UserContextInputRepresentation userContext = new
ConnectApi.UserContextInputRepresentation();

        }

    // This method is invoked from a Flow
    @InvocableMethod(label='Process Input' description='Creates the Array of
ContextDataInput for additional Context Data')
    public static List<FlowOutput> processContextData(List<FlowInput> inputs){
        String apiName;
        String recId;
        FlowOutput output = new FlowOutput();
```

```
    // Capture input from the flow
        for(FlowInput input: inputs){
            apiName = input.objectApiName;
            recId = input.recordId;
            }
    // Populate the ContextDataInput list to store additional context data
        List<runtime_industries_cpq.ContextDataInput> listContextData = new
List<runtime_industries_cpq.ContextDataInput>();
        runtime_industries_cpq.ContextDataInput cd1 = new
runtime_industries_cpq.ContextDataInput();
        cd1.nodeName = apiName;
        cd1.nodeData = new Map<String, Object>();
        cd1.nodeData.put('id',recId);
        listContextData.add(cd1);

       output.additionalContextDataFinalOutput.additionalContextData = listContextData;

        List<FlowOutput> flowOutputs = new List<FlowOutput>();
        flowOutputs.add(output);

        List<runtime_industries_cpq.RelatedObjectFilter> relatedObjectFilterList = new
 List<runtime_industries_cpq.RelatedObjectFilter>();

        runtime_industries_cpq.RelatedObjectFilter relatedObjectFilter = new
runtime_industries_cpq.RelatedObjectFilter();

        relatedObjectFilter.objectName = 'ProductSpecificationRecType';
        List<runtime_industries_cpq.FilterCriteriaInputRepresentation> criteriaList =
new  List<runtime_industries_cpq.FilterCriteriaInputRepresentation>();
        runtime_industries_cpq.FilterCriteriaInputRepresentation criteria = new
runtime_industries_cpq.FilterCriteriaInputRepresentation();
        criteria.property = 'IsCommercial';
        criteria.operator = 'eq';
        criteria.value = 'true';
        criteriaList.add(criteria);
        relatedObjectFilter.criteria = criteriaList;

       relatedObjectFilterList.add(relatedObjectFilter);

        output.relatedObjectFilter.relatedObjectFilter  = relatedObjectFilterList;

  output.userContext.accountId = '001Hs00003r17HNIAY';

        return flowOutputs;

    }

}
```

Create a Flow with the necessary variables and components

Create a flow that enables users to add a search term to find products. Add the ProductService action that you've created above by using Apex. When a flow is invoked from a record, the flow sends the record's objectApiName and recordId to the Apex class, which then generates the flow output. The flow passes the objectApiName and recordId of the record that the flow is invoked from to the Apex class to generate the flow output. See Example of How to Create a Flow for Product Discovery.

Configure the action

Configure the action (for example, Get Products action) to add values for the Apex-defined input parameters. Use the output of the created Apex class as the input of the Apex-defined parameter in the Get Products action, which users can use to get products.

Get Product Details Action

Get details such as attributes, hierarchy, and cardinality for the specified product.

This action is available in API version 62.0 and later.

You can invoke this action via Apex and Flows only.

Special Access Rules

The Get Product Details action is available in Enterprise, Unlimited, and Developer Editions where Product Discovery is enabled.

Inputs

Input	Details
`additionalContextData`	**Type** Apex-defined **Description** An array of Apex `runtime_industries_cpq.AdditionalContextData` records that contain the additional nodes that are used along with the context definition nodes for data hydration. The maximum number of supported nodes is 10.
`additionalFields`	**Type** Apex-defined **Description** An Apex `runtime_industries_cpq.AdditionalFields` record that contains an array of additional standard or custom fields to include in the response. The supported objects are: • `Product2` • `ProductAttributeDefinition`—If the fields defined for the `ProductAttributeDefinition` object aren't available for the `ProductClassificationAttr` object, then the API request fails.
`catalogId`	**Type** string **Description** Catalog ID that's used to find and retrieve the products.

Input	Details
`contextDefinition`	**Type** string **Description** API name of the context definition for context creation. If you don't provide a value, the context selected on the Product Discovery Settings page from Setup is used.
`contextMapping`	**Type** string **Description** API name of the context mapping for data hydration. The value of this parameter is used only if it belongs to the specified context definition.
`correlationId`	**Type** string **Description** Currency code that's used to calculate and show prices. Only the products with the currency code matching the specified currency code are fetched.
`currencyCode`	**Type** string **Description** Currency code that's used to calculate and show prices.
`enablePricing`	**Type** boolean **Description** Indicates whether the pricing procedure must run (`true`) or not (`false`). The default value is `true`. To use this parameter, you must enable the Pricing Procedure setting from Setup.
`enableQualification`	**Type** boolean **Description** Indicates whether the qualification procedure must run (`true`) or not (`false`). The default value is `true`. To use this parameter, you must enable the Qualification Procedure setting from Setup.

Input	Details
`priceBookId`	**Type** string **Description** ID of the pricebook from which you want to retrieve the pricing details.
`pricingProcedure`	**Type** string **Description** API name of the pricing procedure to calculate product prices. If you don't specify a value, the pricing procedure selected on the Product Discovery Settings page from Setup is used.
`productId`	**Type** string **Description** Required. ID of the product to get the details for.
`productSellingModelId`	**Type** string **Description** ID of the product selling model.
`qualificationProcedure`	**Type** string **Description** API name of the qualification procedure to evaluate product eligibility. If you don't specify a value, the qualification procedure selected on the Product Discovery Settings page from Setup is used.
`userContext`	**Type** Apex-defined **Description** An Apex `ConnectApi.UserContextInputRepresentation` record that contains the user details to evaluate product eligibility and calculate prices.

Outputs

Output	Details
`apiStatus`	**Type** Apex-defined **Description** An Apex `runtime_industries_cpq.ApiStatusRepresentation` record that contains a status code and message.
`contextId`	**Type** string **Description** ID of the context that's created by using the specified context definition.
`correlationId`	**Type** string **Description** ID to reference a series of related actions.
`results`	**Type** Apex-defined **Description** An Apex `runtime_industries_cpq.ProductDetailsRepresentation` record that contains the product details.
`userContext`	**Type** Apex-defined **Description** An Apex `ConnectApi.UserContextRepresentation` record that contains the user details.

Example

Usage of an Apex-Defined Data Type in a Flow

To use an Apex-defined input parameter in a flow, follow these guidelines.

Create an Apex Class

Create an Apex class defining the input and output parameters. In the flow, include the Apex-defined input parameters for which you want to add the details. In this example, we have created a class named ProductServiceAction that takes an object's API name and record ID as input, and returns the additional context data.

```
public class ProductServiceAction {
    // Define input parameters
    public class FlowInput{
        @InvocableVariable(required=false)
        public String objectApiName;

        @InvocableVariable(required=false)
        public String recordId;
    }

    // Define output parameters
    public class FlowOutput{
        @invocableVariable
        public runtime_industries_cpq.AdditionalContextData
additionalContextDataFinalOutput = new runtime_industries_cpq.AdditionalContextData();

    }

    // This method is invoked from a Flow
    @InvocableMethod(label='Process Input' description='Creates the Array of
ContextDataInput for additional Context Data')
    public static List<FlowOutput> processContextData(List<FlowInput> inputs){
        String apiName;
        String recId;
        FlowOutput output = new FlowOutput();

    // Capture input from the flow
        for(FlowInput input: inputs){
            apiName = input.objectApiName;
            recId = input.recordId;
            }
    // Populate the ContextDataInput list to store additional context data
        List<runtime_industries_cpq.ContextDataInput> listContextData = new
List<runtime_industries_cpq.ContextDataInput>();
        runtime_industries_cpq.ContextDataInput cd1 = new
runtime_industries_cpq.ContextDataInput();
        cd1.nodeName = apiName;
        cd1.nodeData = new Map<String, Object>();
        cd1.nodeData.put('id',recId);
        listContextData.add(cd1);

       output.additionalContextDataFinalOutput.additionalContextData = listContextData;

        List<FlowOutput> flowOutputs = new List<FlowOutput>();
        flowOutputs.add(output);

        List<runtime_industries_cpq.RelatedObjectFilter> relatedObjectFilterList = new
 List<runtime_industries_cpq.RelatedObjectFilter>();
```

```
        runtime_industries_cpq.RelatedObjectFilter relatedObjectFilter = new
runtime_industries_cpq.RelatedObjectFilter();

        relatedObjectFilter.objectName = 'ProductSpecificationRecType';
        List<runtime_industries_cpq.FilterCriteriaInputRepresentation> criteriaList =
new  List<runtime_industries_cpq.FilterCriteriaInputRepresentation>();
        runtime_industries_cpq.FilterCriteriaInputRepresentation criteria = new
runtime_industries_cpq.FilterCriteriaInputRepresentation();
        criteria.property = 'IsCommercial';
        criteria.operator = 'eq';
        criteria.value = 'true';
        criteriaList.add(criteria);
        relatedObjectFilter.criteria = criteriaList;

        relatedObjectFilterList.add(relatedObjectFilter);
        output.relatedObjectFilter.relatedObjectFilter  = relatedObjectFilterList;

  output.userContext.accountId = '001DU000001nx9BYAQ';

        return flowOutputs;

    }

}
```

Create a Flow with the Necessary Variables and Components

Create a flow that enables users to add a search term to find products. Add the ProductService action that you've created above by using Apex. When a flow is invoked from a record, the flow sends the record's objectApiName and recordId to the Apex class, which then generates the flow output. The flow passes the objectApiName and recordId of the record that the flow is invoked from to the Apex class to generate the flow output. See Example of How to Create a Flow for Product Discovery.

Configure the action

Configure the action (for example, Get Product Details action) to add values for the Apex-defined input parameters. Use the output of the created Apex class as the input of the Apex-defined parameter in the Get Product Details action, which users can use to get the product details.

Search Product with Guided Selection Action

Use guided product selection to search for products.

This action is available in API version 64.0 and later.

You can invoke this action via Apex and Flows only.

Special Access Rules

The Search Product with Guided Selection action is available in Enterprise, Unlimited, and Developer Editions where Product Discovery is enabled.

Inputs

Input	Details
`additionalContextData`	**Type** Apex-defined **Description** Collection of Apex `runtime_industries_cpq.AdditionalContextData` records that contain the nodes used in addition to context definition nodes for data hydration. This parameter can contain up to 10 nodes.
`additionalFields`	**Type** Apex-defined **Description** An Apex `runtime_industries_cpq.AdditionalFields` record that contains the collection of additional fields to be included in the response. This parameter supports only the fields from the Product2 and ProductAttributeDefinition objects. The fields defined for the ProductAttributeDefinition object must also be available on the ProductClassificationAttr object.
`catalogId`	**Type** string **Description** ID of the catalog to find and retrieve products.
`categoryId`	**Type** string **Description** ID of the category or subcategory to find and retrieve products.
`contextDefinition`	**Type** string **Description** API name of the context definition that's used for context creation. If you don't specify a value, the context selected on the **Product Discovery Settings** page is used.
`contextMapping`	**Type** string **Description** API name of the context mapping that's used for data hydration. The value of this parameter is used only if it belongs to the specified context definition.
`correlationId`	**Type** string

Input	Details
	Description Unique ID that's used to reference a series of related actions.
`currencyCode`	**Type** string **Description** Currency code that's used to calculate and show prices. Only the products with the currency code matching the entered currency code are fetched.
`executeConfigurationRules`	**Type** boolean **Description** Indicates whether configuration rules must run (`true`) or not (`false`). Available in API version 67.0 and later.
`enablePricing`	**Type** boolean **Description** Indicates whether pricing procedure must run (`true`) or not (`false`). The default value is `true`. To use this parameter, the **Pricing Procedure** setting must be enabled.
`enableQualification`	**Type** boolean **Description** Indicates whether qualification procedure must run (`true`) or not (`false`). The default value is `true`. To use this parameter, the **Qualification Procedure** setting must be enabled.
`filterInputRepresentation`	**Type** Apex-defined **Description** An Apex `runtime_industries_cpq.FilterInputRepresentation` record that contains the filter criteria. This parameter supports only the `name` property and the `eq`, `in`, or `contains` operators. If it contains multiple criteria, all the criteria are applied.
`guidedSelectionResponseId`	**Type** string **Description** Response identifier that stores user responses specified in the guided product selection window.
`includeCatalogDetails`	**Type** boolean

Input	Details
	Description Indicates whether catalog details must be included in the response (`true`) or not (`false`).
`orderBy`	**Type** string **Description** Comma-delimited string of key-value pairs that specify how results are sorted. Each string must contain a field name and its sort order. For example, ["name:asc",”custom_field:asc”].
`priceBookId`	**Type** string **Description** ID of the pricebook that the pricing information is retrieved from.
`pricingProcedure`	**Type** string **Description** API name of the pricing procedure to calculate product prices. If you don’t specify a value, the pricing procedure selected on the **Product Discovery Settings** page is used.
`productClassificationId`	**Type** string **Description** ID of the product classification that's used to filter products.
`productCursor`	**Type** string **Description** Unique identifier that represents the position of the product from which the next set of results are retrieved.
`qualificationProcedure`	**Type** string **Description** API name of the qualification procedure to evaluate product eligibility. If you don’t specify a value, the qualification procedure selected on the **Product Discovery Settings** page is used.
`recordLimit`	**Type** integer

Input	Details
	Description Maximum number of results to be returned in the response. Specify a value from 1 through 100. Default value is 10.
`relatedObjectFilters`	**Type** Apex-defined **Description** Collection of Apex `runtime_industries_cpq.RelatedObjectFilterInputRepresentation` records, each containing a related object and the filter criteria that's applied on the object.
`searchTerms`	**Type** Apex-defined **Description** Collection of terms that are used to search products. See GuidedSelectionSearchTerm.
`transactionContextId`	**Type** string **Description** Context ID of the quote or order. Available in API version 67.0 and later.
`transactionId`	**Type** string **Description** ID of the quote or order. Available in API version 67.0 and later.
`userContext`	**Type** Apex-defined **Description** An Apex ConnectApi.UserContextInputRepresentation record containing user information to evaluate product eligibility and calculate pricing.

Outputs

Output	Details
`apiStatusOutputRepresentation`	**Type** Apex-defined

Output	Details
	Description An Apex `runtime_industries_cpq.ApiStatusRepresentation` record that contains the status of the request, including the status code and message.
`contextId`	**Type** string **Description** ID of the context that's created by using the specified context definition.
`correlationId`	**Type** string **Description** Unique identifier attached to requests and messages, allowing reference to a specific transaction or event chain.
`productCursor`	**Type** string **Description** Unique identifier that represents the position of the product from which the next set of results are retrieved.
`productListOutputRepresentations`	**Type** Apex-defined **Description** Collection of Apex ProductListOutputRepresentation records that contain details about the product shown by the Guided Product Selection.
`recordOffset`	**Type** integer **Description** Number of catalog records to skip in the request. The default is 0.
`searchTerms`	**Type** Apex-defined **Description** Collection of terms that are used to search products. See GuidedSelectionSearchTerm.
`userContext`	**Type** Apex-defined

Output	Details
	Description An Apex ConnectApi.UserContextRepresentation record containing user information.

Example

Here's a sample input to call this invocable action from Apex code.

```
Invocable.Action action =
Invocable.Action.createStandardAction('searchPrdctWithGuidedSelection');

action.setInvocationParameter('correlationId', '77f9dc6a-8ecc-44a3-8d89-4050179cc846');
//action.setInvocationParameter('catalogId', '0ZSxx000000004sGAA');
action.setInvocationParameter('guidedSelectionResponseId', '0U3xx0000004CPACA2');
//action.setInvocationParameter('priceBookId', '01sxx0000005pyfAAA');
//action.setInvocationParameter('categoryId', '0ZGxx000000004rGAA');
action.setInvocationParameter('enableQualification', true);
action.setInvocationParameter('enablePricing', true);
//action.setInvocationParameter('contextDefinition', 'PDACDCtx');
//action.setInvocationParameter('contextMapping', 'ProductDiscoveryMapping');
//action.setInvocationParameter('qualificationProcedure', 'PDQualProceWithQuote');
//action.setInvocationParameter('pricingProcedure', 'IconpricingProcedure');
action.setInvocationParameter('includeCatalogDetails', true);
action.setInvocationParameter('currencyCode', 'USD');
action.setInvocationParameter('executeConfigurationRules', true);
List<String> orderByInputs = new List<String>();
orderByInputs.add('name:asc');
orderByInputs.add('id:desc');
action.setInvocationParameter('orderBy', orderByInputs);
List<runtime_industries_cpq.GuidedSelectionSearchTerm> searchTerms = new
List<runtime_industries_cpq.GuidedSelectionSearchTerm>();
runtime_industries_cpq.GuidedSelectionSearchTerm searchTerm = new
runtime_industries_cpq.GuidedSelectionSearchTerm();
searchTerm.term = 'Laptop Basic Bundle';
List<String> tags = new List<String>();
tags.add('Laptop');
tags.add('Desktop');
searchTerm.tags = tags;
searchTerms.add(searchTerm);

runtime_industries_cpq.GuidedSelectionSearchTermList searchTermList = new
runtime_industries_cpq.GuidedSelectionSearchTermList();
searchTermList.searchTerms = searchTerms;
action.setInvocationParameter('searchTerms', searchTermList);
List<Invocable.Action.Result> results = action.invoke();
System.debug('Guided Selection result = ' + results);
```

Here's a sample response when you call this action.

Get Product Recommendations Action

Retrieve a list of recommended products for a quote or order by using the Constraint Rule Engine.

This action is available in API version 67.0 and later.

Special Access Rules

The Get Product Details action is available in Enterprise, Unlimited, and Developer Editions where Product Discovery is enabled.

You can invoke this action via Apex and Flows only.

Inputs

Input	Details
additionalContextData	**Type** Apex-defined **Description** An array of Apex `runtime_industries_cpq.AdditionalContextData` records that contain the additional nodes used along with the context definition nodes for data hydration. The maximum number of supported nodes is 10.
additionalFields	**Type** Apex-defined **Description** An Apex `runtime_industries_cpq.AdditionalFields` record that contains an array of additional standard or custom fields from the `Product2` object to include in the response.

Input	Details
`catalogId`	**Type** string **Description** ID of the catalog from which to retrieve recommended products.
`contextDefinition`	**Type** string **Description** API name of the context definition used for context creation. If you don't specify a value, the context definition selected on the Product Discovery Settings page from Setup is used.
`contextMapping`	**Type** string **Description** API name of the context mapping used for data hydration. The value of this parameter is used only if it belongs to the specified context definition. If you don't specify a value, the default context mapping of the context definition is used.
`currencyCode`	**Type** string **Description** Currency code used for pricing calculations and product filtering.
`enablePricing`	**Type** boolean **Description** Indicates whether the pricing procedure must run (`true`) or not (`false`). For orgs where pricing is enabled, you can override to `false` to skip Salesforce Pricing execution. For orgs where pricing is disabled, you can't override to `true`.
`enableQualification`	**Type** boolean **Description** Indicates whether the qualification procedure must run (`true`) or not (`false`). For orgs where qualification is enabled, you can override to `false` to skip BRE qualification rules. For orgs where qualification is disabled, you can't override to `true`.

Input	Details
`filterCriteria`	**Type** Apex-defined **Description** A collection of Apex `runtime_industries_cpq.FilterInputRepresentation` records used to filter products. The `filterCriteria` parameter supports only the `name` property. The supported operators are: • `eq` • `in` • `contains` If this parameter contains multiple criteria, all criteria are applied using the `and` operator.
`nextCursor`	**Type** string **Description** A unique identifier that represents the position of the product from which the next set of results are retrieved.
`pageSize`	**Type** integer **Description** Maximum number of recommended products to return in the response.
`priceBookId`	**Type** string **Description** ID of the pricebook from which to retrieve pricing details.
`pricingProcedure`	**Type** string **Description** API name of the pricing procedure used to calculate product prices. If you don't specify a value, the pricing procedure selected on the Product Discovery Settings page from Setup is used.
`qualificationProcedure`	**Type** string

Input	Details
	Description API name of the qualification procedure used to evaluate product eligibility. If you don't specify a value, the qualification procedure selected on the Product Discovery Settings page from Setup is used.
`transactionContextId`	**Type** string **Description** Context ID of the transaction.
`transactionId`	**Type** string **Description** ID of the transaction.
`usePromotions`	**Type** boolean **Description** Indicates whether to fetch promotions for recommended products (`true`) or not (`false`). Applies only when promotions are enabled for the org.
`userContext`	**Type** Apex-defined **Description** An Apex `ConnectApi.UserContextInputRepresentation` record that contains the user details used to evaluate product eligibility and calculate prices.

Outputs

Output	Details
`errorMessages`	**Type** Apex-defined **Description** A list of Apex `runtime_industries_cpq.ProductRecommendationErrorsOutputRepresentation` records that contain error codes and messages returned by the action.

Output	Details
`isSuccessful`	**Type** boolean **Description** Indicates whether the action call succeeded (`true`) or not (`false`).
`nextCursor`	**Type** string **Description** Unique identifier that represents the position of the next product in the dataset. Use this value as an input to retrieve the next page of results.
`recommendedProducts`	**Type** Apex-defined **Description** A list of Apex `runtime_industries_cpq.RecommendedProductsOutputRepresentation` records that contain the recommended products returned by the Constraint Rule Engine.
`transactionContextId`	**Type** string **Description** Context ID of the transaction.

Example

Here's a sample input to call this invocable action from Apex code.

```
Invocable.Action action = Invocable.Action.createStandardAction('getRecommendedProducts');
action.setInvocationParameter('catalogId', '0ZSVW000000AhdB4AS');
action.setInvocationParameter('transactionId', '0Q0VW0000018J6X0AU');
List<Invocable.Action.Result> results = action.invoke();

for (Invocable.Action.Result res : results) {
    if (res.isSuccess()) {
        Map<String, Object> outMap = res.getOutputParameters();
        String jsonOutput = JSON.serialize(outMap);
        System.debug(jsonOutput);
    }
}
```

Here's a sample response for the Get Product Recommendations action.

```

```

Product Discovery Apex Reference

Use built-in Apex classes and interfaces grouped by namespace.

runtime_industries_cpq Namespace

The runtime_industries_cpq namespace provides classes and methods to search products or to manage products, catalogs, and categories.

The `runtime_industries_cpq` namespace includes these classes.

Usage

You can access the `runtime_industries_cpq` classes if your org has the Product Discovery feature.

AdditionalFieldsInput Class

Contains properties to include the additional standard or custom fields in the request.

ApiStatusRepresentation Class

Stores details of the API request such as execution messages, status code, and status message.

AttributeCategoryOutputRepresentation Class

Stores details of an attribute such as code, description, usage type, and so on.

AttributePickListOutputRepresentation Class

Stores details of an attribute picklist.

AttributePickListValueOutputRepresentation Class

Stores details of an attribute picklist value.

BulkProductDetailsInputBody Class

Contains the details of the request to retrieve product details by using product ID and product selling model ID.

BulkProductDetailsInputBodyList Class

Contains details of the request to retrieve a list of products.

BulkProductDetailsRepresentation Class

Get the details of multiple product definitions in a single request. This class is used for bulk product retrieval operations in Product Discovery.

CatalogOutputRepresentation Class

Contains properties to store details of a catalog definition.

ConfigRuleResult Class

Contains the results of configuration rule evaluation, including message rules, product recommendation rules, and visibility rules that are applied during product configuration.

CategoryOutputRepresentation Class

Contains properties to store details of a category.

ContextDataInput Class

Get details of a context.

FacetValueRepresentation Class

Get details of the facet values that are found in the search result.

Filter Class

Contains the criteria property to store the details of a filter criteria, which is used to filter records.

FilterCriteriaInputRepresentation Class

Contains properties to store criteria details to filter records based on supported properties.

FilterInputRepresentation Class

Contains the filter property to filters records based on supported criteria.

GuidedSelectionRepresentation Class

Contains properties to represent a product in a guided selection flow. This class is used in Product Discovery to provide structured product information during guided product selection processes.

GuidedSelectionSearchTerm Class

Represents a search term used in guided product selection. Contains the search term text and associated tags for filtering and searching products in Product Discovery.

GuidedSelectionSearchTermList Class

Contains a list of search terms used in guided product selection. This class is used to pass multiple search terms for filtering and searching products in Product Discovery.

MessageRule Class

Represents a message rule that is evaluated during product configuration. Message rules display informational, warning, or error messages to users based on configuration conditions.

PricingModelOutputRepresentation Class

Contains details of a pricing model in a product configuration.

ProductAttributeOutputRepresentation Class

Contains details about the attribute in a product configuration.

ProductClassificationOutputRepresentation Class

Get details of the product classification in a product configuration.

ProductComponentGroupOutputRepresentation Class

Get details of the product component group in a product classification.

ProductComponentGroupRepresentation Class

Represents a product component group used in bulk product operations. This class is similar to ProductComponentGroupOutputRepresentation but is used specifically for bulk product detail representations where components are represented as BulkProductDetailsRepresentation objects.

ProductDetailsRepresentation Class

Get the details of a product definition.

ProductListRepresentation Class

Get the list of retrieved products.

ProductOutputRepresentation Class

Get the details of a product definition.

ProductPricesOutputRepresentation Class

Get the price details of a product.

ProductQuantityOutputRepresentation Class

Represents the quantity constraints and current quantity for a product in the product discovery context.

ProductRecommendationRule Class

Represents a product recommendation rule that is evaluated during product configuration. Product recommendation rules suggest additional products to users based on configuration conditions.

ProductRelatedComponentOutputRepresentation Class

Represents a related component product in a bundle or product relationship, including component configuration details such as quantity constraints, required status, and relationship metadata.

ProductSellingModelOptionOutputRepresentation Class

Represents a selling model option available for a product, which defines how the product can be sold (such as subscription, one-time, or usage-based).

ProductSellingModelOutputRepresentation Class

Represents a product selling model that defines how a product is sold, including the selling model type, pricing term, and status.

ProductSpecificationRecordTypeOutputRepresentation Class

Represents the record type information for a product specification, which defines the type of record used to store product specification data.

ProductSpecificationTypeOutputRepresentation Class

Represents a product specification type that defines the structure and attributes available for configuring a product.

QocQualificationOutputRepresentation Class

Represents a quote, order, or contract qualification that determines whether a product can be sold based on specific business rules and conditions.

QualificationContextOutputRepresentation Class

Represents the context information used for product qualification, including account, opportunity, and other relevant context data for determining product eligibility.

RelatedObjectFilter Class

Represents a filter for related objects used in product search and discovery, allowing you to filter products based on related object criteria.

RelatedObjectFilterInputRepresentation Class

Represents input criteria for filtering products based on related object information, such as account, opportunity, or contract data.

SearchProductsFacetRepresentation Class

Represents a search facet that provides filtering and categorization options for product search results, such as categories, attributes, or other product characteristics.

SearchProductsRepresentation Class

Represents the results of a product search operation, including the list of products, search facets, pagination information, and total count of matching products.

UnitOfMeasureOutputRepresentation Class

Represents the unit of measure for a product. This class contains information about how product quantities are measured, including the unit code, name, scale, and rounding method.

VisibilityRule Class

Represents a visibility rule that is evaluated during product configuration. Visibility rules control the visibility of products, attributes, or other UI elements based on configuration conditions.

AdditionalContextData Class

Contains properties to include a list of additional context data nodes. These nodes are used along with the context definition nodes for data hydration.

Namespace

runtime_industries_cpq on page 512

AdditionalContextData Properties

Set the AdditionalContextData class property to specify a list of additional nodes for data hydration.

AdditionalContextData Properties

Set the AdditionalContextData class property to specify a list of additional nodes for data hydration.

The `AdditionalContextData` class includes this property.

additionalContextData

Include a list of additional nodes that are used along with the context definition nodes for data hydration. The maximum number of supported nodes is 10.

additionalContextData

Include a list of additional nodes that are used along with the context definition nodes for data hydration. The maximum number of supported nodes is 10.

Signature

```
public List<runtime_industries_cpq.ContextDataInput> additionalContextData {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ContextDataInput on page 548>

AdditionalFields Class

Contains properties to include a map where the key is a string and the value is an instance of the AdditionalFieldsInput class.

Namespace

runtime_industries_cpq on page 512

AdditionalFields Properties

Set the AdditionalFields class property to include a map where the key is a string and the value is an instance of the AdditionalFieldsInput class.

AdditionalFields Properties

Set the AdditionalFields class property to include a map where the key is a string and the value is an instance of the AdditionalFieldsInput class.

The `AdditionalFields` class includes this property.

additionalFields

Includes a map where the key is a string and the value is an instance of the AdditionalFieldsInput class.

additionalFields

Includes a map where the key is a string and the value is an instance of the AdditionalFieldsInput class.

Signature

```
public Map<String,runtime_industries_cpq.AdditionalFieldsInput> additionalFields {get;
set;}
```

Property Value

Type: Map<String,runtime_industries_cpq.AdditionalFieldsInput on page 517>

AdditionalFieldsInput Class

Contains properties to include the additional standard or custom fields in the request.

Namespace

runtime_industries_cpq on page 512

AdditionalFieldsInput Properties
Set the AdditionalFieldsInput class property to include the additional standard or custom fields in the response.

AdditionalFieldsInput Properties

Set the AdditionalFieldsInput class property to include the additional standard or custom fields in the response.

The `AdditionalFieldsInput` class includes this property.

fields
Include the additional standard or custom fields in the response.

`fields`

Include the additional standard or custom fields in the response.

Signature

```
public List<String> fields {get; set;}
```

Property Value

Type: List<String>

ApiStatusRepresentation Class

Stores details of the API request such as execution messages, status code, and status message.

Namespace

runtime_industries_cpq on page 512

ApiStatusRepresentation Properties
Contains properties to include the API response details.

ApiStatusRepresentation Properties

Contains properties to include the API response details.

The `ApiStatusRepresentation` class includes these properties.

[messages](#messages)
Get the status messages of the API execution.

[statusCode](#statuscode)
Get the status code of the API execution.

[statusMessage](#statusmessage)
Get the display label for the API status.

messages

Get the status messages of the API execution.

Signature

```
public List<ConnectApi.CpqMessageOutputRepresentation> messages {get; set;}
```

Property Value

Type: List<ConnectApi.CpqMessageOutputRepresentation>

statusCode

Get the status code of the API execution.

Signature

```
public String statusCode {get; set;}
```

Property Value

Type: String

statusMessage

Get the display label for the API status.

Signature

```
public String statusMessage {get; set;}
```

Property Value

Type: String

AttributeCategoryOutputRepresentation Class

Stores details of an attribute such as code, description, usage type, and so on.

Namespace

runtime_industries_cpq on page 512

AttributeCategoryOutputRepresentation Properties
Contains properties to include details of an attribute.

AttributeCategoryOutputRepresentation Properties

Contains properties to include details of an attribute.

The `AttributeCategoryOutputRepresentation` class includes these properties.

code
Get the code of the attribute category.

description
Get the description of the attribute category.

id
Get the ID of the attribute category.

name
Get the name of the attribute category.

records
Get the attributes of the attribute category.

status
Get the status of the attribute category.

totalSize
Get the total size of the attribute category.

usageType
Get the usage type of the attribute category.

`code`

Get the code of the attribute category.

Signature

```
public String code {get; set;}
```

Property Value

Type: String

`description`

Get the description of the attribute category.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

id

Get the ID of the attribute category.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

name

Get the name of the attribute category.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

records

Get the attributes of the attribute category.

Signature

```
public List<runtime_industries_cpq.ProductAttributeOutputRepresentation> records {get;
set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductAttributeOutputRepresentation on page 571>

status

Get the status of the attribute category.

Signature

```
public String status {get; set;}
```

Property Value

Type: String

`totalSize`

Get the total size of the attribute category.

Signature

`public Integer totalSize {get; set;}`

Property Value

Type: Integer

`usageType`

Get the usage type of the attribute category.

Signature

`public String usageType {get; set;}`

Property Value

Type: String

AttributePickListOutputRepresentation Class

Stores details of an attribute picklist.

Namespace

runtime_industries_cpq on page 512

AttributePickListOutputRepresentation Properties
Contains properties to include details of an attribute picklist.

AttributePickListOutputRepresentation Properties

Contains properties to include details of an attribute picklist.

The `AttributePickListOutputRepresentation` class includes these properties.

description
Get the description of the attribute picklist.

id
Get the ID of the attribute picklist.

name
Get the name of the attribute picklist.

status
Get the status of the attribute picklist.

values
Get the values of the attribute picklist.

dataType
Get the datatype value.

description

Get the description of the attribute picklist.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

id

Get the ID of the attribute picklist.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

name

Get the name of the attribute picklist.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

status

Get the status of the attribute picklist.

Signature

```
public String status {get; set;}
```

Property Value

Type: String

values

Get the values of the attribute picklist.

Signature

```
public List<runtime_industries_cpq.AttributePickListValueOutputRepresentation> values
{get; set;}
```

Property Value

Type: List<runtime_industries_cpq.AttributePickListValueOutputRepresentation on page 523 >

dataType

Get the datatype value.

Signature

```
public String dataType {get; set;}
```

Property Value

Type: String

AttributePickListValueOutputRepresentation Class

Stores details of an attribute picklist value.

Namespace

runtime_industries_cpq on page 512

AttributePickListValueOutputRepresentation Properties
Contains properties to include details of an attribute picklist value.

AttributePickListValueOutputRepresentation Properties

Contains properties to include details of an attribute picklist value.

The `AttributePickListValueOutputRepresentation` class includes these properties.

code
Get the code of the attribute picklist value.

description
Get the description of attribute picklist value.

displayValue
Get the display value of the attribute value.

id
Get the ID of the attribute picklist value.

isBooleanValue
Indicates whether this attribute value is a boolean value (true) or not (false).

label
Get the label of the attribute picklist value.

name
Get the name of the attribute picklist value.

sequence
Get the sequence of the attribute picklist value.

status
Get the status of the attribute picklist value.

textValue
Get the text value of the attribute picklist value.

code

Get the code of the attribute picklist value.

Signature

```
public String code {get; set;}
```

Property Value

Type: String

description

Get the description of attribute picklist value.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

`displayValue`

Get the display value of the attribute value.

Signature

`public String displayValue {get; set;}`

Property Value

Type: String

`id`

Get the ID of the attribute picklist value.

Signature

`public String id {get; set;}`

Property Value

Type: String

`isBooleanValue`

Indicates whether this attribute value is a boolean value (true) or not (false).

Signature

`public Boolean isBooleanValue {get; set;}`

Property Value

Type: Boolean

`label`

Get the label of the attribute picklist value.

Signature

`public String label {get; set;}`

Property Value

Type: String

`name`

Get the name of the attribute picklist value.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

sequence

Get the sequence of the attribute picklist value.

Signature

```
public Integer sequence {get; set;}
```

Property Value

Type: Integer

status

Get the status of the attribute picklist value.

Signature

```
public String status {get; set;}
```

Property Value

Type: String

textValue

Get the text value of the attribute picklist value.

Signature

```
public String textValue {get; set;}
```

Property Value

Type: String

BulkProductDetailsInputBody Class

Contains the details of the request to retrieve product details by using product ID and product selling model ID.

Namespace

runtime_industries_cpq on page 512

[BulkProductDetailsInputBody Properties](#)
Contains properties to retrieve details of products.

BulkProductDetailsInputBody Properties

Contains properties to retrieve details of products.

The `BulkProductDetailsInputBody` class includes these properties.

[productId](#)
Set the ID of the product to return the details for.

[productSellingModelId](#)
Set the ID of the product selling model to return the details for.

`productId`

Set the ID of the product to return the details for.

Signature

```
public String productId {get; set;}
```

Property Value

Type: String

`productSellingModelId`

Set the ID of the product selling model to return the details for.

Signature

```
public String productSellingModelId {get; set;}
```

Property Value

Type: String

BulkProductDetailsInputBodyList Class

Contains details of the request to retrieve a list of products.

Namespace

runtime_industries_cpq on page 512

[BulkProductDetailsInputBodyList Properties](#)
Contains properties to retrieve details of a list of products.

BulkProductDetailsInputBodyList Properties

Contains properties to retrieve details of a list of products.

The `BulkProductDetailsInputBodyList` class includes these properties.

productData
: Set the list of maps that contain product IDs and product selling model IDs.

`productData`

Set the list of maps that contain product IDs and product selling model IDs.

Signature

```
public List<runtime_industries_cpq.BulkProductDetailsInputBody> productData {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.BulkProductDetailsInputBody on page 526 >

BulkProductDetailsRepresentation Class

Get the details of multiple product definitions in a single request. This class is used for bulk product retrieval operations in Product Discovery.

Namespace

runtime_industries_cpq on page 512

BulkProductDetailsRepresentation Constructor
: Learn more about the constructors that are available with the BulkProductDetailsRepresentation class.

BulkProductDetailsRepresentation Properties
: Contains properties to include details of product definitions retrieved in bulk operations.

BulkProductDetailsRepresentation Constructor

Learn more about the constructors that are available with the BulkProductDetailsRepresentation class.

The `BulkProductDetailsRepresentation` class includes these constructors.

BulkProductDetailsRepresentation(apexObj)
: Constructor to create a BulkProductDetailsRepresentation instance from a ConnectApi CPQProductDetailsOutputRepresentation object.

BulkProductDetailsRepresentation()
: Default constructor to create an empty BulkProductDetailsRepresentation instance.

`BulkProductDetailsRepresentation(apexObj)`

Constructor to create a BulkProductDetailsRepresentation instance from a ConnectApi CPQProductDetailsOutputRepresentation object.

Signature

`public BulkProductDetailsRepresentation(ConnectApi.CPQProductDetailsOutputRepresentation apexObj)`

Parameters

apexObj
Type: ConnectApi.CPQProductDetailsOutputRepresentation

The ConnectApi product details representation object to convert to BulkProductDetailsRepresentation.

BulkProductDetailsRepresentation()

Default constructor to create an empty BulkProductDetailsRepresentation instance.

Signature

`public BulkProductDetailsRepresentation()`

BulkProductDetailsRepresentation Properties

Contains properties to include details of product definitions retrieved in bulk operations.

The `BulkProductDetailsRepresentation` class includes these properties.

additionalFields
Get the list of additionalfield.

attributeCategories
Get the list of attributecategorie.

attributes
Get the list of attribute.

availabilityDate
Get the availability date.

catalogs
Get the list of catalog.

childProducts
Get the list of childproduct.

configureDuringSale
Get the configureduringsale value.

description
Get the description of the bulkproductdetails.

discontinuedDate
Get the discontinued date.

displayUrl
Get the displayurl value.

endOfLifeDate

Get the endoflife date.

isActive

Indicates whether the item is active.

isAssetizable

Indicates whether assetizable is true or false.

isComponentRequired

Indicates whether componentrequired is true or false.

id

Get the ID of the product.

isDefaultComponent

Indicates whether defaultcomponent is true or false.

isQuantityEditable

Indicates whether quantityeditable is true or false.

isSoldOnlyWithOtherProds

Indicates whether soldonlywithotherprods is true or false.

name

Get the name of the bulkproductdetails.

nodeType

Get the nodetype value.

prices

Get the list of price.

productClassification

Get the productclassification value.

productCode

Get the productcode value.

productComponentGroups

Get the list of productcomponentgroup.

productInformation

Get the productinformation value.

productPricingInformation

Get the productpricinginformation value.

productQuantity

Get the productquantity value.

productRelatedComponent

Get the productrelatedcomponent value.

productSellingModelOptions

Get the list of productsellingmodeloption.

productSpecificationType

Get the productspecificationtype value.

productType

Get the producttype value.

qualificationContext

Get the qualificationcontext value.

status

Get the status of the bulkproductdetails.

unitOfMeasure

Get the unitofmeasure value.

additionalFields

Get the list of additionalfield.

Signature

```
public List<runtime_industries_cpq.AdditionalFieldsWrapper> additionalFields {get;
set;}
```

Property Value

Type: List<runtime_industries_cpq.AdditionalFieldsWrapper>

attributeCategories

Get the list of attributecategorie.

Signature

```
public List<runtime_industries_cpq.AttributeCategoryOutputRepresentation>
attributeCategories {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.AttributeCategoryOutputRepresentation on page 518>

attributes

Get the list of attribute.

Signature

```
public List<runtime_industries_cpq.ProductAttributeOutputRepresentation> attributes
{get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductAttributeOutputRepresentation on page 571>

`availabilityDate`

Get the availability date.

Signature

`public Datetime availabilityDate {get; set;}`

Property Value

Type: Datetime

`catalogs`

Get the list of catalog.

Signature

`public List<runtime_industries_cpq.CatalogOutputRepresentation> catalogs {get; set;}`

Property Value

Type: List<runtime_industries_cpq.CatalogOutputRepresentation on page 539 >

`childProducts`

Get the list of childproduct.

Signature

`public List<runtime_industries_cpq.BulkProductDetailsRepresentation> childProducts {get; set;}`

Property Value

Type: List<runtime_industries_cpq.BulkProductDetailsRepresentation on page 528 >

`configureDuringSale`

Get the configureduringsale value.

Signature

`public String configureDuringSale {get; set;}`

Property Value

Type: String

`description`

Get the description of the bulkproductdetails.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

discontinuedDate

Get the discontinued date.

Signature

```
public Datetime discontinuedDate {get; set;}
```

Property Value

Type: Datetime

displayUrl

Get the displayurl value.

Signature

```
public String displayUrl {get; set;}
```

Property Value

Type: String

endOfLifeDate

Get the endoflife date.

Signature

```
public Datetime endOfLifeDate {get; set;}
```

Property Value

Type: Datetime

isActive

Indicates whether the item is active.

Signature

```
public Boolean isActive {get; set;}
```

Property Value

Type: Boolean

isAssetizable

Indicates whether assetizable is true or false.

Signature

```
public Boolean isAssetizable {get; set;}
```

Property Value

Type: Boolean

isComponentRequired

Indicates whether componentrequired is true or false.

Signature

```
public Boolean isComponentRequired {get; set;}
```

Property Value

Type: Boolean

id

Get the ID of the product.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

isDefaultComponent

Indicates whether defaultcomponent is true or false.

Signature

```
public Boolean isDefaultComponent {get; set;}
```

Property Value

Type: Boolean

`isQuantityEditable`

Indicates whether quantityeditable is true or false.

Signature

`public Boolean isQuantityEditable {get; set;}`

Property Value

Type: Boolean

`isSoldOnlyWithOtherProds`

Indicates whether soldonlywithotherprods is true or false.

Signature

`public Boolean isSoldOnlyWithOtherProds {get; set;}`

Property Value

Type: Boolean

`name`

Get the name of the bulkproductdetails.

Signature

`public String name {get; set;}`

Property Value

Type: String

`nodeType`

Get the nodetype value.

Signature

`public String nodeType {get; set;}`

Property Value

Type: String

`prices`

Get the list of price.

Signature

```
public List<runtime_industries_cpq.ProductPricesOutputRepresentation> prices {get;
set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductPricesOutputRepresentation on page 617>

productClassification

Get the productclassification value.

Signature

```
public runtime_industries_cpq.ProductClassificationOutputRepresentation
productClassification {get; set;}
```

Property Value

Type: runtime_industries_cpq.ProductClassificationOutputRepresentation on page 579

productCode

Get the productcode value.

Signature

```
public String productCode {get; set;}
```

Property Value

Type: String

productComponentGroups

Get the list of productcomponentgroup.

Signature

```
public List<runtime_industries_cpq.ProductComponentGroupRepresentation>
productComponentGroups {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductComponentGroupRepresentation on page 583>

productInformation

Get the productinformation value.

Signature

```
public String productInformation {get; set;}
```

Property Value

Type: String

productPricingInformation

Get the productpricinginformation value.

Signature

```
public String productPricingInformation {get; set;}
```

Property Value

Type: String

productQuantity

Get the productquantity value.

Signature

```
public runtime_industries_cpq.ProductQuantityOutputRepresentation productQuantity {get;
set;}
```

Property Value

Type: runtime_industries_cpq.ProductQuantityOutputRepresentation on page 620

productRelatedComponent

Get the productrelatedcomponent value.

Signature

```
public runtime_industries_cpq.ProductRelatedComponentOutputRepresentation
productRelatedComponent {get; set;}
```

Property Value

Type: runtime_industries_cpq.ProductRelatedComponentOutputRepresentation on page 624

productSellingModelOptions

Get the list of productsellingmodeloption.

Signature

```
public List<runtime_industries_cpq.ProductSellingModelOptionOutputRepresentation>
productSellingModelOptions {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductSellingModelOptionOutputRepresentation on page 630>

`productSpecificationType`

Get the productspecificationtype value.

Signature

```
public runtime_industries_cpq.ProductSpecificationTypeOutputRepresentation
productSpecificationType {get; set;}
```

Property Value

Type: runtime_industries_cpq.ProductSpecificationTypeOutputRepresentation on page 635

`productType`

Get the producttype value.

Signature

```
public String productType {get; set;}
```

Property Value

Type: String

`qualificationContext`

Get the qualificationcontext value.

Signature

```
public runtime_industries_cpq.QualificationContextOutputRepresentation
qualificationContext {get; set;}
```

Property Value

Type: runtime_industries_cpq.QualificationContextOutputRepresentation on page 637

`status`

Get the status of the bulkproductdetails.

Signature

```
public String status {get; set;}
```

Property Value

Type: String

unitOfMeasure

Get the unitofmeasure value.

Signature

```
public runtime_industries_cpq.UnitOfMeasureOutputRepresentation unitOfMeasure {get;
set;}
```

Property Value

Type: runtime_industries_cpq.UnitOfMeasureOutputRepresentation on page 651

CatalogOutputRepresentation Class

Contains properties to store details of a catalog definition.

Namespace

runtime_industries_cpq on page 512

CatalogOutputRepresentation Properties
Contains properties to include details of a catalog definition.

CatalogOutputRepresentation Properties

Contains properties to include details of a catalog definition.

The `CatalogOutputRepresentation` class includes these properties.

catalogCode
Get the unique ID associated with the catalog.

catalogType
Get the category of an entry in the catalog, which is customizable. For example, catalog types, such as sellable products, services, parts, technical services, or technical resources.

customFields
Get details of the custom fields associated with a catalog.

description
Get the description of the catalog.

effectiveEndDate
Get the date and time from when the catalog isn't available to the end users.

effectiveStartDate

Get the date and time from when the catalog is available to the end users.

id

Get the ID of the catalog.

name

Get the name of the catalog.

numberOfCategories

Get the number of categories in the catalog.

status

Get the status of the catalog.

catalogCode

Get the unique ID associated with the catalog.

Signature

```
public String catalogCode {get; set;}
```

Property Value

Type: String

catalogType

Get the category of an entry in the catalog, which is customizable. For example, catalog types, such as sellable products, services, parts, technical services, or technical resources.

Signature

```
public String catalogType {get; set;}
```

Property Value

Type: String

customFields

Get details of the custom fields associated with a catalog.

Signature

```
public List<runtime_industries_cpq.AdditionalFieldsWrapper> customFields {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.AdditionalFieldsWrapper>

description

Get the description of the catalog.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

effectiveEndDate

Get the date and time from when the catalog isn't available to the end users.

Signature

```
public String effectiveEndDate {get; set;}
```

Property Value

Type: String

effectiveStartDate

Get the date and time from when the catalog is available to the end users.

Signature

```
public String effectiveStartDate {get; set;}
```

Property Value

Type: String

id

Get the ID of the catalog.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

name

Get the name of the catalog.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

`numberOfCategories`

Get the number of categories in the catalog.

Signature

```
public Integer numberOfCategories {get; set;}
```

Property Value

Type: Integer

`status`

Get the status of the catalog.

Signature

```
public String status {get; set;}
```

Property Value

Type: String

ConfigRuleResult Class

Contains the results of configuration rule evaluation, including message rules, product recommendation rules, and visibility rules that are applied during product configuration.

Namespace

runtime_industries_cpq on page 512

ConfigRuleResult Constructor

Learn more about the constructor that's available with the ConfigRuleResult class.

The `ConfigRuleResult` class includes this constructor.

ConfigRuleResult(transactionContextId, messageRules, productRecommendationRules, visibilityRules, errors)
Constructor to create a ConfigRuleResult instance with configuration rule evaluation results.

`ConfigRuleResult(transactionContextId, messageRules, productRecommendationRules, visibilityRules, errors)`

Constructor to create a ConfigRuleResult instance with configuration rule evaluation results.

Signature

```
public ConfigRuleResult(String transactionContextId,
List<runtime_industries_cpq.MessageRule> messageRules,
List<runtime_industries_cpq.ProductRecommendationRule> productRecommendationRules,
List<runtime_industries_cpq.VisibilityRule> visibilityRules, List<String> errors)
```

Parameters

`transactionContextId`
Type: String

The ID of the transaction context for this configuration rule evaluation.

`messageRules`
Type: List<runtime_industries_cpq.MessageRule>

List of message rules that were evaluated during configuration.

`productRecommendationRules`
Type: List<runtime_industries_cpq.ProductRecommendationRule>

List of product recommendation rules that were evaluated during configuration.

`visibilityRules`
Type: List<runtime_industries_cpq.VisibilityRule>

List of visibility rules that were evaluated during configuration.

`errors`
Type: List<String>

List of error messages from the configuration rule evaluation, if any.

ConfigRuleResult Properties

Contains properties to store configuration rule evaluation results.

The `ConfigRuleResult` class includes these properties.

errors
Get the list of error messages.

messageRules
Get the list of messagerule.

productRecommendationRules
Get the list of productrecommendationrule.

transactionContextId
Get the ID of the transactioncontext.

visibilityRules
Get the list of visibilityrule.

`errors`

Get the list of error messages.

Signature

```
public List<String> errors {get; set;}
```

Property Value

Type: List<String>

`messageRules`

Get the list of messagerule.

Signature

```
public List<runtime_industries_cpq.MessageRule> messageRules {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.MessageRule on page 567>

`productRecommendationRules`

Get the list of productrecommendationrule.

Signature

```
public List<runtime_industries_cpq.ProductRecommendationRule> productRecommendationRules
{get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductRecommendationRule on page 621>

`transactionContextId`

Get the ID of the transactioncontext.

Signature

```
public String transactionContextId {get; set;}
```

Property Value

Type: String

`visibilityRules`

Get the list of visibilityrule.

Signature

`public List<runtime_industries_cpq.VisibilityRule> visibilityRules {get; set;}`

Property Value

Type: List<runtime_industries_cpq.VisibilityRule on page 653>

CategoryOutputRepresentation Class

Contains properties to store details of a category.

Namespace

runtime_industries_cpq on page 512

CategoryOutputRepresentation Properties
Learn more about the properties available with the CategoryOutputRepresentation class.

CategoryOutputRepresentation Properties

Learn more about the properties available with the CategoryOutputRepresentation class.

The `CategoryOutputRepresentation` class includes these properties.

catalogId
Get the ID of the catalog that the category is associated with.

description
Get the description of a catalog.

hasSubCategories
Indicates whether the subcategories are available (true) or not (false).

id
Get the ID of the category.

isNavigational
Indicates whether the category node is navigational (true) or not (false).

name
Get the name of the category. If data translation is set up and specified in the org, the translated name is available.

parentCategoryId
Get the ID of the parent category.

qualificationContext
Get the context details of a user, which are used for qualification rules.

sortOrder
Get the display order of the product category relative to the siblings with the same parent category.

childCategories
Get the list of childcategorie.

catalogId

Get the ID of the catalog that the category is associated with.

Signature

```
public String catalogId {get; set;}
```

Property Value

Type: String

description

Get the description of a catalog.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

hasSubCategories

Indicates whether the subcategories are available (true) or not (false).

Signature

```
public Boolean hasSubCategories {get; set;}
```

Property Value

Type: Boolean

id

Get the ID of the category.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

isNavigational

Indicates whether the category node is navigational (true) or not (false).

Signature

```
public Boolean isNavigational {get; set;}
```

Property Value

Type: Boolean

name

Get the name of the category. If data translation is set up and specified in the org, the translated name is available.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

parentCategoryId

Get the ID of the parent category.

Signature

```
public String parentCategoryId {get; set;}
```

Property Value

Type: String

qualificationContext

Get the context details of a user, which are used for qualification rules.

Signature

```
public runtime_industries_cpq.QualificationContextOutputRepresentation
qualificationContext {get; set;}
```

Property Value

Type: runtime_industries_cpq.QualificationContextOutputRepresentation on page 637

sortOrder

Get the display order of the product category relative to the siblings with the same parent category.

Signature

```
public Integer sortOrder {get; set;}
```

Property Value

Type: Integer

childCategories

Get the list of childcategorie.

Signature

```
public List<runtime_industries_cpq.CategoryOutputRepresentation> childCategories {get;
set;}
```

Property Value

Type: List<runtime_industries_cpq.CategoryOutputRepresentation on page 545>

ContextDataInput Class

Get details of a context.

Namespace

runtime_industries_cpq on page 512

ContextDataInput Properties
Learn more about the properties available with the ContextDataInput class.

ContextDataInput Properties

Learn more about the properties available with the ContextDataInput class.

The `ContextDataInput` class includes these properties.

nodeData
Get details of the node.

nodeName
Get the name of the node.

nodeData

Get details of the node.

Signature

```
public Map<String,ANY> nodeData {get; set;}
```

Property Value

Type: Map<String,ANY>

nodeName

Get the name of the node.

Signature

```
public String nodeName {get; set;}
```

Property Value

Type: String

FacetValueRepresentation Class

Get details of the facet values that are found in the search result.

Namespace

runtime_industries_cpq on page 512

FacetValueRepresentation Properties
Learn more about the properties available with the FacetValueRepresentation class.

FacetValueRepresentation Properties

Learn more about the properties available with the FacetValueRepresentation class.

The `FacetValueRepresentation` class includes these properties.

displayName
Get the display name of the facet value.

nameOrId
Get the name or ID of the facet. Reserved for internal use.

displayName

Get the display name of the facet value.

Signature

```
public String displayName {get; set;}
```

Property Value

Type: String

`nameOrId`

Get the name or ID of the facet. Reserved for internal use.

Signature

```
public String nameOrId {get; set;}
```

Property Value

Type: String

Filter Class

Contains the criteria property to store the details of a filter criteria, which is used to filter records.

Namespace

runtime_industries_cpq on page 512

Filter Properties
Learn more about the properties available with the Filter class.

Filter Properties

Learn more about the properties available with the Filter class.

The `Filter` class includes these properties.

criteria
Get the filter criteria to filter the records.

`criteria`

Get the filter criteria to filter the records.

Signature

```
public List<runtime_industries_cpq.FilterCriteriaInputRepresentation> criteria {get;
set;}
```

Property Value

Type: List<runtime_industries_cpq.FilterCriteriaInputRepresentation on page 551>

FilterCriteriaInputRepresentation Class

Contains properties to store criteria details to filter records based on supported properties.

Namespace

runtime_industries_cpq on page 512

FilterCriteriaInputRepresentation Properties

Learn more about the properties available with the FilterCriteriaInputRepresentation class.

FilterCriteriaInputRepresentation Properties

Learn more about the properties available with the FilterCriteriaInputRepresentation class.

The `FilterCriteriaInputRepresentation` class includes these properties.

attributeType

Get details of the search attribute type of the facet for a faceted search.

operator

Get the operator that's used for the filter criteria.

property

Get the property name to use in the filter, which must be the same as the object field. The supported property is name.

value

Get the value for the filter criteria.

`attributeType`

Get details of the search attribute type of the facet for a faceted search.

Signature

```
public String attributeType {get; set;}
```

Property Value

Type: String

Usage

Valid values are:

- `ProductStandard`
- `ProductCustom`
- `ProductDynamicAttribute`
- `ProductAttributeStandard`
- `ProductAttributeCustom`

`operator`

Get the operator that's used for the filter criteria.

Signature

`public String operator {get; set;}`

Property Value

Type: String

Usage

The supported operators are:

- `eq`
- `in`
- `contains`
- `gt`—Specifies a greater than criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only.
- `lt`—Specifies a less than criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only.
- `gte`—Specifies a greater than or equal to criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only.
- `lte`—Specifies a less than or equal to criteria. Available from API version 63.0 and later for Number, Date, and Datetime data types only.

`property`

Get the property name to use in the filter, which must be the same as the object field. The supported property is name.

Signature

`public String property {get; set;}`

Property Value

Type: String

`value`

Get the value for the filter criteria.

Signature

`public String value {get; set;}`

Property Value

Type: String

FilterInputRepresentation Class

Contains the filter property to filters records based on supported criteria.

Namespace

runtime_industries_cpq on page 512

FilterInputRepresentation Properties
Learn more about the available properties with the FilterInputRepresentation class.

FilterInputRepresentation Properties

Learn more about the available properties with the FilterInputRepresentation class.

The `FilterInputRepresentation` class includes these properties.

filter
Filters records based on supported criteria. The supported property is name.

`filter`

Filters records based on supported criteria. The supported property is name.

Signature

```
public runtime_industries_cpq.Filter filter {get; set;}
```

Property Value

Type: runtime_industries_cpq.Filter on page 550

Usage

The supported operators are:

- `eq`
- `in`
- `contains`—This value isn't applicable if the **Use Indexed Data For Product Listing and Search** toggle from the Product Discovery Settings page from Setup is enabled.

If multiple criteria are specified, then the resultant criteria are combined by using the `and` operator.

GuidedSelectionRepresentation Class

Contains properties to represent a product in a guided selection flow. This class is used in Product Discovery to provide structured product information during guided product selection processes.

Namespace

runtime_industries_cpq on page 512

GuidedSelectionRepresentation Properties

Contains properties to include details of a product in a guided selection flow.

GuidedSelectionRepresentation Properties

Contains properties to include details of a product in a guided selection flow.

The `GuidedSelectionRepresentation` class includes these properties.

additionalFields

Get the list of additionalfield.

attributeCategories

Get the list of attributecategorie.

availabilityDate

Get the availability date.

catalogs

Get the list of catalog.

categories

Get the list of categorie.

childProducts

Get the list of childproduct.

configureDuringSale

Get the configureduringsale value.

description

Get the description of the guidedselection.

discontinuedDate

Get the discontinued date.

displayUrl

Get the displayurl value.

endOfLifeDate

Get the endoflife date.

id

Get the ID of the guidedselection.

isActive

Indicates whether the item is active.

isAssetizable

Indicates whether assetizable is true or false.

isComponentRequired

Indicates whether componentrequired is true or false.

isDefaultComponent

Indicates whether defaultcomponent is true or false.

isQuantityEditable

Indicates whether quantityeditable is true or false.

isSoldOnlyWithOtherProds

Indicates whether soldonlywithotherprods is true or false.

name

Get the name of the guidedselection.

nodeType

Get the nodetype value.

prices

Get the list of price.

productClassification

Get the productclassification value.

productCode

Get the productcode value.

productComponentGroups

Get the list of productcomponentgroup.

productInformation

Get the productinformation value.

productPricingInformation

Get the productpricinginformation value.

productQuantity

Get the productquantity value.

productRelatedComponent

Get the productrelatedcomponent value.

productSellingModelOptions

Get the list of productsellingmodeloption.

productSpecificationType

Get the productspecificationtype value.

productType

Get the producttype value.

qualificationContext

Get the qualificationcontext value.

status

Get the status of the guidedselection.

unitOfMeasure

Get the unitofmeasure value.

`additionalFields`

Get the list of additionalfield.

Signature

```
public List<runtime_industries_cpq.AdditionalFieldsWrapper> additionalFields {get;
set;}
```

Property Value

Type: List<runtime_industries_cpq.AdditionalFieldsWrapper>

attributeCategories

Get the list of attributecategorie.

Signature

```
public List<runtime_industries_cpq.AttributeCategoryOutputRepresentation>
attributeCategories {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.AttributeCategoryOutputRepresentation on page 518>

availabilityDate

Get the availability date.

Signature

```
public Datetime availabilityDate {get; set;}
```

Property Value

Type: Datetime

catalogs

Get the list of catalog.

Signature

```
public List<runtime_industries_cpq.CatalogOutputRepresentation> catalogs {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.CatalogOutputRepresentation on page 539>

categories

Get the list of categorie.

Signature

```
public List<runtime_industries_cpq.CategoryOutputRepresentation> categories {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.CategoryOutputRepresentation on page 545>

childProducts

Get the list of childproduct.

Signature

```
public List<runtime_industries_cpq.ProductListRepresentation> childProducts {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductListRepresentation on page 598>

configureDuringSale

Get the configureduringsale value.

Signature

```
public String configureDuringSale {get; set;}
```

Property Value

Type: String

description

Get the description of the guidedselection.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

discontinuedDate

Get the discontinued date.

Signature

```
public Datetime discontinuedDate {get; set;}
```

Property Value

Type: Datetime

`displayUrl`

Get the displayurl value.

Signature

```
public String displayUrl {get; set;}
```

Property Value

Type: String

`endOfLifeDate`

Get the endoflife date.

Signature

```
public Datetime endOfLifeDate {get; set;}
```

Property Value

Type: Datetime

`id`

Get the ID of the guidedselection.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

`isActive`

Indicates whether the item is active.

Signature

```
public Boolean isActive {get; set;}
```

Property Value

Type: Boolean

`isAssetizable`

Indicates whether assetizable is true or false.

Signature

`public Boolean isAssetizable {get; set;}`

Property Value

Type: Boolean

`isComponentRequired`

Indicates whether componentrequired is true or false.

Signature

`public Boolean isComponentRequired {get; set;}`

Property Value

Type: Boolean

`isDefaultComponent`

Indicates whether defaultcomponent is true or false.

Signature

`public Boolean isDefaultComponent {get; set;}`

Property Value

Type: Boolean

`isQuantityEditable`

Indicates whether quantityeditable is true or false.

Signature

`public Boolean isQuantityEditable {get; set;}`

Property Value

Type: Boolean

`isSoldOnlyWithOtherProds`

Indicates whether soldonlywithotherprods is true or false.

Signature

```
public Boolean isSoldOnlyWithOtherProds {get; set;}
```

Property Value

Type: Boolean

`name`

Get the name of the guidedselection.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

`nodeType`

Get the nodetype value.

Signature

```
public String nodeType {get; set;}
```

Property Value

Type: String

`prices`

Get the list of price.

Signature

```
public List<runtime_industries_cpq.ProductPricesOutputRepresentation> prices {get;
set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductPricesOutputRepresentation on page 617 >

`productClassification`

Get the productclassification value.

Signature

```
public runtime_industries_cpq.ProductClassificationOutputRepresentation
productClassification {get; set;}
```

Property Value

Type: runtime_industries_cpq.ProductClassificationOutputRepresentation on page 579

productCode

Get the productcode value.

Signature

```
public String productCode {get; set;}
```

Property Value

Type: String

productComponentGroups

Get the list of productcomponentgroup.

Signature

```
public List<runtime_industries_cpq.ProductComponentGroupOutputRepresentation>
productComponentGroups {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductComponentGroupOutputRepresentation on page 580 >

productInformation

Get the productinformation value.

Signature

```
public String productInformation {get; set;}
```

Property Value

Type: String

productPricingInformation

Get the productpricinginformation value.

Signature

```
public String productPricingInformation {get; set;}
```

Property Value

Type: String

`productQuantity`

Get the productquantity value.

Signature

```
public runtime_industries_cpq.ProductQuantityOutputRepresentation productQuantity {get;
set;}
```

Property Value

Type: runtime_industries_cpq.ProductQuantityOutputRepresentation on page 620

`productRelatedComponent`

Get the productrelatedcomponent value.

Signature

```
public ConnectApi.CPQProductRelatedComponentOutputRepresentation productRelatedComponent
{get; set;}
```

Property Value

Type: ConnectApi.CPQProductRelatedComponentOutputRepresentation

`productSellingModelOptions`

Get the list of productsellingmodeloption.

Signature

```
public List<runtime_industries_cpq.ProductSellingModelOptionOutputRepresentation>
productSellingModelOptions {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductSellingModelOptionOutputRepresentation on page 630 >

`productSpecificationType`

Get the productspecificationtype value.

Signature

```
public runtime_industries_cpq.ProductSpecificationTypeOutputRepresentation
productSpecificationType {get; set;}
```

Property Value

Type: runtime_industries_cpq.ProductSpecificationTypeOutputRepresentation on page 635

productType

Get the producttype value.

Signature

```
public String productType {get; set;}
```

Property Value

Type: String

qualificationContext

Get the qualificationcontext value.

Signature

```
public runtime_industries_cpq.QualificationContextOutputRepresentation
qualificationContext {get; set;}
```

Property Value

Type: runtime_industries_cpq.QualificationContextOutputRepresentation on page 637

status

Get the status of the guidedselection.

Signature

```
public String status {get; set;}
```

Property Value

Type: String

unitOfMeasure

Get the unitofmeasure value.

Signature

```
public runtime_industries_cpq.UnitOfMeasureOutputRepresentation unitOfMeasure {get;
set;}
```

Property Value

Type: runtime_industries_cpq.UnitOfMeasureOutputRepresentation on page 651

GuidedSelectionSearchTerm Class

Represents a search term used in guided product selection. Contains the search term text and associated tags for filtering and searching products in Product Discovery.

Namespace

runtime_industries_cpq on page 512

GuidedSelectionSearchTerm Constructor
Learn more about the constructors that are available with the GuidedSelectionSearchTerm class.

GuidedSelectionSearchTerm Properties
Contains properties to include search term details for guided product selection.

GuidedSelectionSearchTerm Constructor

Learn more about the constructors that are available with the GuidedSelectionSearchTerm class.

The `GuidedSelectionSearchTerm` class includes these constructors.

GuidedSelectionSearchTerm(apexObj)
Constructor to create a GuidedSelectionSearchTerm instance from a ConnectApi CPQGuidedSelectionSearchTermOutputRepresentation object.

GuidedSelectionSearchTerm()
Default constructor to create an empty GuidedSelectionSearchTerm instance.

GuidedSelectionSearchTerm(apexObj)

Constructor to create a GuidedSelectionSearchTerm instance from a ConnectApi CPQGuidedSelectionSearchTermOutputRepresentation object.

Signature

```
public
GuidedSelectionSearchTerm(ConnectApi.CPQGuidedSelectionSearchTermOutputRepresentation
apexObj)
```

Parameters

apexObj

Type: ConnectApi.CPQGuidedSelectionSearchTermOutputRepresentation

The ConnectApi guided selection search term representation object to convert to GuidedSelectionSearchTerm.

`GuidedSelectionSearchTerm()`

Default constructor to create an empty GuidedSelectionSearchTerm instance.

Signature

`public GuidedSelectionSearchTerm()`

GuidedSelectionSearchTerm Properties

Contains properties to include search term details for guided product selection.

The `GuidedSelectionSearchTerm` class includes these properties.

tags
Get the list of tags.

term
Get the term value.

`tags`

Get the list of tags.

Signature

`public List<String> tags {get; set;}`

Property Value

Type: List<String>

`term`

Get the term value.

Signature

`public String term {get; set;}`

Property Value

Type: String

GuidedSelectionSearchTermList Class

Contains a list of search terms used in guided product selection. This class is used to pass multiple search terms for filtering and searching products in Product Discovery.

Namespace

runtime_industries_cpq on page 512

GuidedSelectionSearchTermList Constructor
Learn more about the constructor that's available with the GuidedSelectionSearchTermList class.

GuidedSelectionSearchTermList Properties
Contains properties to include a list of search terms for guided product selection.

GuidedSelectionSearchTermList Constructor

Learn more about the constructor that's available with the GuidedSelectionSearchTermList class.

The `GuidedSelectionSearchTermList` class includes this constructor.

GuidedSelectionSearchTermList()
Default constructor to create an empty GuidedSelectionSearchTermList instance.

`GuidedSelectionSearchTermList()`

Default constructor to create an empty GuidedSelectionSearchTermList instance.

Signature

```
public GuidedSelectionSearchTermList()
```

GuidedSelectionSearchTermList Properties

Contains properties to include a list of search terms for guided product selection.

The `GuidedSelectionSearchTermList` class includes these properties.

searchTerms
Get the list of searchterm.

`searchTerms`

Get the list of searchterm.

Signature

```
public List<runtime_industries_cpq.GuidedSelectionSearchTerm> searchTerms {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.GuidedSelectionSearchTerm on page 564>

MessageRule Class

Represents a message rule that is evaluated during product configuration. Message rules display informational, warning, or error messages to users based on configuration conditions.

Namespace

runtime_industries_cpq on page 512

MessageRule Constructor

Learn more about the constructor that's available with the MessageRule class.

The `MessageRule` class includes this constructor.

`MessageRule(stiId, severity, messages)`

Constructor to create a MessageRule instance with the specified STI ID, severity, and messages.

Signature

```
public MessageRule(String stiId, String severity, List<String> messages)
```

Parameters

stiId
Type: String

The ID of the Sales Transaction Item (STI) associated with this message rule.

severity
Type: String

The severity level of the message (for example, Error, Warning, or Info).

messages
Type: List<String>

List of message strings to display to the user.

MessageRule Properties

Contains properties to store message rule details from configuration rule evaluation.

The `MessageRule` class includes these properties.

[messages](#)
Get the list of messages.

[severity](#)
Get the severity value.

[stiId](#)
Get the ID of the sti.

`messages`

Get the list of messages.

Signature

```
public List<String> messages {get; set;}
```

Property Value

Type: List<String>

`severity`

Get the severity value.

Signature

```
public String severity {get; set;}
```

Property Value

Type: String

`stiId`

Get the ID of the sti.

Signature

```
public String stiId {get; set;}
```

Property Value

Type: String

PricingModelOutputRepresentation Class

Contains details of a pricing model in a product configuration.

Namespace

runtime_industries_cpq on page 512

PricingModelOutputRepresentation Properties
Learn more about the properties available with the PricingModelOutputRepresentation class.

PricingModelOutputRepresentation Properties

Learn more about the properties available with the PricingModelOutputRepresentation class.

The `PricingModelOutputRepresentation` class includes these properties.

frequency
Contains frequency details of the pricing model.

id
Contains the ID of the pricing model.

name
Contains the name of the pricing model.

occurrence
Contains details about the occurrence of the pricing model.

pricingModelType
Contains the type of the pricing model.

unitOfMeasure
Contains details about the unit of measure for the pricing model.

`frequency`

Contains frequency details of the pricing model.

Signature

```
public String frequency {get; set;}
```

Property Value

Type: String

`id`

Contains the ID of the pricing model.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

name

Contains the name of the pricing model.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

occurrence

Contains details about the occurrence of the pricing model.

Signature

```
public Integer occurrence {get; set;}
```

Property Value

Type: Integer

pricingModelType

Contains the type of the pricing model.

Signature

```
public String pricingModelType {get; set;}
```

Property Value

Type: String

unitOfMeasure

Contains details about the unit of measure for the pricing model.

Signature

```
public String unitOfMeasure {get; set;}
```

Property Value

Type: String

ProductAttributeOutputRepresentation Class

Contains details about the attribute in a product configuration.

Namespace

runtime_industries_cpq on page 512

ProductAttributeOutputRepresentation Properties

Learn more about the properties available with the ProductAttributeOutputRepresentation class.

ProductAttributeOutputRepresentation Properties

Learn more about the properties available with the ProductAttributeOutputRepresentation class.

The `ProductAttributeOutputRepresentation` class includes these properties.

additionalFields

Get the key-value pairs of additional standard or custom fields and their values for the product attribute.

attributeCategoryId

Get the ID of the attribute category.

attributeNameOverride

Get the name override value of the attribute.

attributePickList

Get the picklist values of the attribute.

code

Get the code of the attribute.

dataType

Get the data type of the attribute.

defaultHelpText

Get the default help text value of the attribute.

defaultValue

Get the default value of the attribute.

description

Get the description of the attribute.

developerName

Get the developer name of the product attribute.

displayTypeOverride

Get the override value of the display type of the attribute.

hidden

Indicates whether the attribute is hidden (true) or not (false).

id
Get the ID of the attribute.

isCloneable
Indicates whether the attribute is cloneable (true) or not (false).

isConfigurable
Indicates whether the attribute is configurable (true) or not (false).

isEncrypted
Indicates whether the attribute is encrypted (true) or not (false).

isPriceImpacting
Indicates whether this is a price impacting attribute (true) or not (false).

isReadOnly
Indicates whether the attribute is read-only (true) or not (false).

isRequired
Indicates whether the attribute is required (true) or not (false).

label
Get the label of the attribute.

maximumValue
Get the maximum value for the product attribute.

minimumValue
Get the minimum value for the product attribute.

name
Get the name of the attribute.

sequence
Get the sequence values of the attribute.

status
Get the status of the attribute.

stepValue
Get the step value for the attribute.

unitOfMeasure
Get details about the unit of measure associated with an attribute.

userValue
Get the user value of the attribute.

valueDescription
Get the value description of the attribute.

`additionalFields`

Get the key-value pairs of additional standard or custom fields and their values for the product attribute.

Signature

```
public List<runtime_industries_cpq.AdditionalFieldsWrapper> additionalFields {get;
set;}
```

Property Value

Type: List<runtime_industries_cpq.AdditionalFieldsWrapper>

attributeCategoryId

Get the ID of the attribute category.

Signature

```
public String attributeCategoryId {get; set;}
```

Property Value

Type: String

attributeNameOverride

Get the name override value of the attribute.

Signature

```
public String attributeNameOverride {get; set;}
```

Property Value

Type: String

attributePickList

Get the picklist values of the attribute.

Signature

```
public runtime_industries_cpq.AttributePickListOutputRepresentation attributePickList
{get; set;}
```

Property Value

Type: runtime_industries_cpq.AttributePickListOutputRepresentation on page 521

code

Get the code of the attribute.

Signature

`public String code {get; set;}`

Property Value

Type: String

`dataType`

Get the data type of the attribute.

Signature

`public String dataType {get; set;}`

Property Value

Type: String

`defaultHelpText`

Get the default help text value of the attribute.

Signature

`public String defaultHelpText {get; set;}`

Property Value

Type: String

`defaultValue`

Get the default value of the attribute.

Signature

`public String defaultValue {get; set;}`

Property Value

Type: String

`description`

Get the description of the attribute.

Signature

`public String description {get; set;}`

Property Value

Type: String

`developerName`

Get the developer name of the product attribute.

Signature

`public String developerName {get; set;}`

Property Value

Type: String

`displayTypeOverride`

Get the override value of the display type of the attribute.

Signature

`public String displayTypeOverride {get; set;}`

Property Value

Type: String

`hidden`

Indicates whether the attribute is hidden (true) or not (false).

Signature

`public Boolean hidden {get; set;}`

Property Value

Type: Boolean

`id`

Get the ID of the attribute.

Signature

`public String id {get; set;}`

Property Value

Type: String

isCloneable

Indicates whether the attribute is cloneable (true) or not (false).

Signature

```
public Boolean isCloneable {get; set;}
```

Property Value

Type: Boolean

isConfigurable

Indicates whether the attribute is configurable (true) or not (false).

Signature

```
public Boolean isConfigurable {get; set;}
```

Property Value

Type: Boolean

isEncrypted

Indicates whether the attribute is encrypted (true) or not (false).

Signature

```
public Boolean isEncrypted {get; set;}
```

Property Value

Type: Boolean

isPriceImpacting

Indicates whether this is a price impacting attribute (true) or not (false).

Signature

```
public Boolean isPriceImpacting {get; set;}
```

Property Value

Type: Boolean

isReadOnly

Indicates whether the attribute is read-only (true) or not (false).

Signature

```
public Boolean isReadOnly {get; set;}
```

Property Value

Type: Boolean

`isRequired`

Indicates whether the attribute is required (true) or not (false).

Signature

```
public Boolean isRequired {get; set;}
```

Property Value

Type: Boolean

`label`

Get the label of the attribute.

Signature

```
public String label {get; set;}
```

Property Value

Type: String

`maximumValue`

Get the maximum value for the product attribute.

Signature

```
public String maximumValue {get; set;}
```

Property Value

Type: String

`minimumValue`

Get the minimum value for the product attribute.

Signature

```
public String minimumValue {get; set;}
```

Property Value

Type: String

name

Get the name of the attribute.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

sequence

Get the sequence values of the attribute.

Signature

```
public Integer sequence {get; set;}
```

Property Value

Type: Integer

status

Get the status of the attribute.

Signature

```
public String status {get; set;}
```

Property Value

Type: String

stepValue

Get the step value for the attribute.

Signature

```
public String stepValue {get; set;}
```

Property Value

Type: String

unitOfMeasure

Get details about the unit of measure associated with an attribute.

Signature

```
public ConnectApi.UnitOfMeasureOutputRepresentation unitOfMeasure {get; set;}
```

Property Value

Type: ConnectApi.UnitOfMeasureOutputRepresentation

userValue

Get the user value of the attribute.

Signature

```
public String userValue {get; set;}
```

Property Value

Type: String

valueDescription

Get the value description of the attribute.

Signature

```
public String valueDescription {get; set;}
```

Property Value

Type: String

ProductClassificationOutputRepresentation Class

Get details of the product classification in a product configuration.

Namespace

runtime_industries_cpq on page 512

ProductClassificationOutputRepresentation Properties
Learn more about the properties available with the ProductClassificationOutputRepresentation class.

ProductClassificationOutputRepresentation Properties

Learn more about the properties available with the ProductClassificationOutputRepresentation class.

The `ProductClassificationOutputRepresentation` class includes these properties.

[id](#)
Get the ID of the product classification.

id

Get the ID of the product classification.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

ProductComponentGroupOutputRepresentation Class

Get details of the product component group in a product classification.

Namespace

runtime_industries_cpq on page 512

[ProductComponentGroupOutputRepresentation Properties](#)
Learn more about the properties available with the ProductComponentGroupOutputRepresentation class.

ProductComponentGroupOutputRepresentation Properties

Learn more about the properties available with the ProductComponentGroupOutputRepresentation class.

The `ProductComponentGroupOutputRepresentation` class includes these properties.

[childGroups](#)
Get the child groups associated with a product component group.

[classifications](#)
Get the list of classifications for the product component group.

[code](#)
Get the code of the product component group.

[components](#)
Get the details of components within the product component group.

[description](#)
Get the description of the product component group.

[id](#)
Get the ID of the product component group.

[name](#)
Get the name of the product component group.

parentGroupId
Get the ID of the parent group.

parentProductId
Get the parent Product2 ID of the product component group.

sequence
Get the sequence of the product component group.

childGroups

Get the child groups associated with a product component group.

Signature

```
public List<runtime_industries_cpq.ProductComponentGroupOutputRepresentation> childGroups
{get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductComponentGroupOutputRepresentation on page 580>

classifications

Get the list of classifications for the product component group.

Signature

```
public List<runtime_industries_cpq.ProductClassificationOutputRepresentation>
classifications {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductClassificationOutputRepresentation on page 579>

code

Get the code of the product component group.

Signature

```
public String code {get; set;}
```

Property Value

Type: String

components

Get the details of components within the product component group.

Signature

```
public List<runtime_industries_cpq.ProductDetailsRepresentation> components {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductDetailsRepresentation on page 587>

description

Get the description of the product component group.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

id

Get the ID of the product component group.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

name

Get the name of the product component group.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

parentGroupId

Get the ID of the parent group.

Signature

```
public String parentGroupId {get; set;}
```

Property Value

Type: String

`parentProductId`

Get the parent Product2 ID of the product component group.

Signature

`public String parentProductId {get; set;}`

Property Value

Type: String

`sequence`

Get the sequence of the product component group.

Signature

`public Integer sequence {get; set;}`

Property Value

Type: Integer

ProductComponentGroupRepresentation Class

Represents a product component group used in bulk product operations. This class is similar to ProductComponentGroupOutputRepresentation but is used specifically for bulk product detail representations where components are represented as BulkProductDetailsRepresentation objects.

Namespace

runtime_industries_cpq on page 512

ProductComponentGroupRepresentation Constructor

Learn more about the constructor that's available with the ProductComponentGroupRepresentation class.

The `ProductComponentGroupRepresentation` class includes this constructor.

ProductComponentGroupRepresentation(apexObj)

Constructor to create a ProductComponentGroupRepresentation instance from a ConnectApi CPQProductComponentGroupOutputRepresentation object.

`ProductComponentGroupRepresentation(apexObj)`

Constructor to create a ProductComponentGroupRepresentation instance from a ConnectApi CPQProductComponentGroupOutputRepresentation object.

Signature

```
public
ProductComponentGroupRepresentation(ConnectApi.CPQProductComponentGroupOutputRepresentation
apexObj)
```

Parameters

`apexObj`

Type: ConnectApi.CPQProductComponentGroupOutputRepresentation

The ConnectApi product component group representation object to convert to ProductComponentGroupRepresentation.

ProductComponentGroupRepresentation Properties

Contains properties to include details of a product component group used in bulk operations.

The `ProductComponentGroupRepresentation` class includes these properties.

childGroups

Get the list of childgroup.

classifications

Get the list of product classifications.

code

Get the code of the productcomponentgroup.

components

Get the list of component.

description

Get the description of the productcomponentgroup.

id

Get the ID of the productcomponentgroup.

name

Get the name of the productcomponentgroup.

parentGroupId

Get the ID of the parentgroup.

parentProductId

Get the ID of the parentproduct.

sequence
Get the sequence value.

childGroups

Get the list of childgroup.

Signature

```
public List<runtime_industries_cpq.ProductComponentGroupRepresentation> childGroups
{get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductComponentGroupRepresentation on page 583>

classifications

Get the list of product classifications.

Signature

```
public List<runtime_industries_cpq.ProductClassificationOutputRepresentation>
classifications {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductClassificationOutputRepresentation on page 579>

code

Get the code of the productcomponentgroup.

Signature

```
public String code {get; set;}
```

Property Value

Type: String

components

Get the list of component.

Signature

```
public List<runtime_industries_cpq.BulkProductDetailsRepresentation> components {get;
set;}
```

Property Value

Type: List<runtime_industries_cpq.BulkProductDetailsRepresentation on page 528>

description

Get the description of the productcomponentgroup.

Signature

`public String description {get; set;}`

Property Value

Type: String

id

Get the ID of the productcomponentgroup.

Signature

`public String id {get; set;}`

Property Value

Type: String

name

Get the name of the productcomponentgroup.

Signature

`public String name {get; set;}`

Property Value

Type: String

parentGroupId

Get the ID of the parentgroup.

Signature

`public String parentGroupId {get; set;}`

Property Value

Type: String

`parentProductId`

Get the ID of the parentproduct.

Signature

```
public String parentProductId {get; set;}
```

Property Value

Type: String

`sequence`

Get the sequence value.

Signature

```
public Integer sequence {get; set;}
```

Property Value

Type: Integer

ProductDetailsRepresentation Class

Get the details of a product definition.

Namespace

runtime_industries_cpq on page 512

ProductDetailsRepresentation Constructor
Learn more about the constructor that's available with the ProductDetailsRepresentation class.

ProductDetailsRepresentation Properties
Learn more about the properties available with the ProductDetailsRepresentation class.

ProductDetailsRepresentation Constructor

Learn more about the constructor that's available with the ProductDetailsRepresentation class.

The `ProductDetailsRepresentation` class includes this constructor.

ProductDetailsRepresentation()
Constructor to get the product details for a product definition.

`ProductDetailsRepresentation()`

Constructor to get the product details for a product definition.

Signature

`public ProductDetailsRepresentation()`

ProductDetailsRepresentation Properties

Learn more about the properties available with the ProductDetailsRepresentation class.

The `ProductDetailsRepresentation` includes these properties.

additionalFields
Get the key-value pair of additional standard or custom fields with their values.

attributeCategories
Get the list of categorized attributes related to the product.

attributes
Get the list of uncategorized attributes related to the product.

availabilityDate
Get the date when the part is used in the product or is made available for sale.

catalogs
Get the list of the associated catalogs returned with the Product List API (POST) response. The Product By ID API (GET) returns an empty catalog list in the response. Returns the name and id values only.

childProducts
Get the hierarchy of the child products.

configureDuringSale
Determines whether to allow or prevent configuration when a bundle is sold.

description
Get the description of the product.

discontinuedDate
Get the date from when the part can’t be used in the product or sold.

displayUrl
Get the display image URL of the product.

endOfLifeDate
Get the date after which a product isn’t supported, ordered, or maintained.

id
Get the ID of the product.

isActive
Indicates whether the product is active (true) or not (false).

isAssetizable
Indicates whether the product instance remains a customer asset after it's purchased (true) or not (false).

isComponentRequired
Indicates whether the product component is required (true) or not (false).

isDefaultComponent
Indicates whether the product component is the default component (true) or not (false).

isQuantityEditable

Indicates whether the product quantity is editable (true) or not (false).

isSoldOnlyWithOtherProds

Indicates whether the product can't be sold separately (true) or not (false).

name

Get the name of the product.

nodeType

Get the type of the node, such as a product or bundled product.

prices

Get the price details associated with the products.

productClassification

Get the details of the product classification that the product is based on.

productCode

Get the universal product code that's used to track the part that's used in the product.

productComponentGroups

Get the logical grouping of the component products in a bundle and the group cardinality for ordering the product components.

productInformation

Get the details of a product.

productPricingInformation

Get the pricing details of a product.

productQuantity

Get the quantity of a product.

productRelatedComponent

Get the details of the related components of a product.

productSellingModelOptions

Get the details of the product selling model options.

productSpecificationType

Get the details of the product specification type.

productType

Get the product type.

qualificationContext

Get the context details of a user, which are used for qualification rules.

status

Get or set the status of the product, such as Active or Inactive.

unitOfMeasure

Get details about the unit of measure for a specific set of records.

`additionalFields`

Get the key-value pair of additional standard or custom fields with their values.

Signature

```
public List<runtime_industries_cpq.AdditionalFieldsWrapper> additionalFields {get;
set;}
```

Property Value

Type: List<runtime_industries_cpq.AdditionalFieldsWrapper>

attributeCategories

Get the list of categorized attributes related to the product.

Signature

```
public List<runtime_industries_cpq.AttributeCategoryOutputRepresentation>
attributeCategories {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.AttributeCategoryOutputRepresentation on page 518>

attributes

Get the list of uncategorized attributes related to the product.

Signature

```
public List<runtime_industries_cpq.ProductAttributeOutputRepresentation> attributes
{get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductAttributeOutputRepresentation on page 571>

availabilityDate

Get the date when the part is used in the product or is made available for sale.

Signature

```
public Datetime availabilityDate {get; set;}
```

Property Value

Type: Datetime

catalogs

Get the list of the associated catalogs returned with the Product List API (POST) response. The Product By ID API (GET) returns an empty catalog list in the response. Returns the name and id values only.

Signature

```
public List<runtime_industries_cpq.CatalogOutputRepresentation> catalogs {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.CatalogOutputRepresentation on page 539>

childProducts

Get the hierarchy of the child products.

Signature

```
public List<runtime_industries_cpq.ProductDetailsRepresentation> childProducts {get;
set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductDetailsRepresentation on page 587>

configureDuringSale

Determines whether to allow or prevent configuration when a bundle is sold.

Signature

```
public String configureDuringSale {get; set;}
```

Property Value

Type: String

description

Get the description of the product.

If data translation is set up and specified in the org, the translated description is available.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

discontinuedDate

Get the date from when the part can't be used in the product or sold.

Signature

```
public Datetime discontinuedDate {get; set;}
```

Property Value

Type: Datetime

displayUrl

Get the display image URL of the product.

Signature

```
public String displayUrl {get; set;}
```

Property Value

Type: String

endOfLifeDate

Get the date after which a product isn't supported, ordered, or maintained.

Signature

```
public Datetime endOfLifeDate {get; set;}
```

Property Value

Type: Datetime

id

Get the ID of the product.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

isActive

Indicates whether the product is active (true) or not (false).

Signature

```
public Boolean isActive {get; set;}
```

Property Value

Type: Boolean

isAssetizable

Indicates whether the product instance remains a customer asset after it's purchased (true) or not (false).

Signature

```
public Boolean isAssetizable {get; set;}
```

Property Value

Type: Boolean

isComponentRequired

Indicates whether the product component is required (true) or not (false).

Signature

```
public Boolean isComponentRequired {get; set;}
```

Property Value

Type: Boolean

isDefaultComponent

Indicates whether the product component is the default component (true) or not (false).

Signature

```
public Boolean isDefaultComponent {get; set;}
```

Property Value

Type: Boolean

isQuantityEditable

Indicates whether the product quantity is editable (true) or not (false).

Signature

```
public Boolean isQuantityEditable {get; set;}
```

Property Value

Type: Boolean

`isSoldOnlyWithOtherProds`

Indicates whether the product can't be sold separately (true) or not (false).

Signature

```
public Boolean isSoldOnlyWithOtherProds {get; set;}
```

Property Value

Type: Boolean

`name`

Get the name of the product.

If data translation is set up and specified in the org, the translated name is available.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

`nodeType`

Get the type of the node, such as a product or bundled product.

Signature

```
public String nodeType {get; set;}
```

Property Value

Type: String

`prices`

Get the price details associated with the products.

Signature

```
public List<runtime_industries_cpq.ProductPricesOutputRepresentation> prices {get;
set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductPricesOutputRepresentation on page 617 >

productClassification

Get the details of the product classification that the product is based on.

Signature

```
public runtime_industries_cpq.ProductClassificationOutputRepresentation
productClassification {get; set;}
```

Property Value

Type: runtime_industries_cpq.ProductClassificationOutputRepresentation on page 579

productCode

Get the universal product code that's used to track the part that’s used in the product.

Signature

```
public String productCode {get; set;}
```

Property Value

Type: String

productComponentGroups

Get the logical grouping of the component products in a bundle and the group cardinality for ordering the product components.

Signature

```
public List<runtime_industries_cpq.ProductComponentGroupOutputRepresentation>
productComponentGroups {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductComponentGroupOutputRepresentation on page 580 >

productInformation

Get the details of a product.

Signature

```
public String productInformation {get; set;}
```

Property Value

Type: String

`productPricingInformation`

Get the pricing details of a product.

Signature

```
public String productPricingInformation {get; set;}
```

Property Value

Type: String

`productQuantity`

Get the quantity of a product.

Signature

```
public runtime_industries_cpq.ProductQuantityOutputRepresentation productQuantity {get;
set;}
```

Property Value

Type: runtime_industries_cpq.ProductQuantityOutputRepresentation on page 620

`productRelatedComponent`

Get the details of the related components of a product.

Signature

```
public ConnectApi.CPQProductRelatedComponentOutputRepresentation productRelatedComponent
{get; set;}
```

Property Value

Type: ConnectApi.CPQProductRelatedComponentOutputRepresentation

`productSellingModelOptions`

Get the details of the product selling model options.

Signature

```
public List<runtime_industries_cpq.ProductSellingModelOptionOutputRepresentation>
productSellingModelOptions {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductSellingModelOptionOutputRepresentation on page 630 >

productSpecificationType

Get the details of the product specification type.

Signature

```
public runtime_industries_cpq.ProductSpecificationTypeOutputRepresentation
productSpecificationType {get; set;}
```

Property Value

Type: runtime_industries_cpq.ProductSpecificationTypeOutputRepresentation on page 635

productType

Get the product type.

Signature

```
public String productType {get; set;}
```

Property Value

Type: String

qualificationContext

Get the context details of a user, which are used for qualification rules.

Signature

```
public runtime_industries_cpq.QualificationContextOutputRepresentation
qualificationContext {get; set;}
```

Property Value

Type: runtime_industries_cpq.QualificationContextOutputRepresentation on page 637

status

Get or set the status of the product, such as Active or Inactive.

Signature

```
public String status {get; set;}
```

Property Value

Type: String

unitOfMeasure

Get details about the unit of measure for a specific set of records.

Signature

```
public ConnectApi.UnitOfMeasureOutputRepresentation unitOfMeasure {get; set;}
```

Property Value

Type: ConnectApi.UnitOfMeasureOutputRepresentation

ProductListRepresentation Class

Get the list of retrieved products.

Namespace

runtime_industries_cpq on page 512

ProductListRepresentation Properties
Learn more about the properties available with the ProductListRepresentation class.

ProductListRepresentation Properties

Learn more about the properties available with the ProductListRepresentation class.

The following are properties for `ProductListRepresentation`.

additionalFields
Get the key-value pair of additional standard or custom fields with their values.

attributeCategories
Get the list of categorized attributes related to the product.

availabilityDate
Get the date when the part is used in the product or is made available for sale.

catalogs
Get the list of associated catalogs. Returns the name and id values only.

categories
Get the list of associated categories. Returns the name and id values only.

childProducts
Get the hierarchy of the child products.

configureDuringSale
Determines whether to allow or prevent configuration when a bundle is sold.

description
Get the description of the product. If data translation is set up and specified in the org, the translated description is available.

discontinuedDate
Get the date from when the part can't be used in the product or sold.

displayUrl

Get the display image URL of the product.

endOfLifeDate

Get the date after which a product isn't supported, ordered, or maintained.

id

Get the ID of the product.

isActive

Indicates whether the product is active (true) or not (false).

isAssetizable

Indicates whether the product instance remains a customer asset after it's purchased (true) or not (false).

isComponentRequired

Indicates whether the product component is required (true) or not (false).

isDefaultComponent

Indicates whether the product component is the default component (true) or not (false).

isQuantityEditable

Indicates whether the product quantity is editable (true) or not (false).

isSoldOnlyWithOtherProds

Indicates whether the product can't be sold separately (true) or not (false).

name

Get the name of the product. If data translation is set up and specified in the org, the translated name is available.

nodeType

Get the type of the node, such as a product or bundled product.

prices

Get the price details associated with the products.

productClassification

Get the details of the product classification that the product is based on.

productCode

Get the universal product code that's used to track the part that's used in the product.

productComponentGroups

Get the logical grouping of the component products in a bundle and group cardinality for ordering the product components.

productInformation

Get the details of a product.

productPricingInformation

Get the pricing details of a product.

productQuantity

Get the quantity of a product.

productRelatedComponent

Get the details of the related components of a product.

productSellingModelOptions

Get the details of the product selling model options.

productSpecificationType
Get the details of the product specification type.

productType
Get the product type.

qualificationContext
Get the context details of a user, which are used for qualification rules.

status
Get or set the status of the product, such as Active or Inactive.

unitOfMeasure
Get details about the unit of measure for a specific set of records.

additionalFields

Get the key-value pair of additional standard or custom fields with their values.

Signature

```
public List<runtime_industries_cpq.AdditionalFieldsWrapper> additionalFields {get;
set;}
```

Property Value

Type: List<runtime_industries_cpq.AdditionalFieldsWrapper>

attributeCategories

Get the list of categorized attributes related to the product.

Signature

```
public List<runtime_industries_cpq.AttributeCategoryOutputRepresentation>
attributeCategories {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.AttributeCategoryOutputRepresentation on page 518 >

availabilityDate

Get the date when the part is used in the product or is made available for sale.

Signature

```
public Datetime availabilityDate {get; set;}
```

Property Value

Type: Datetime

`catalogs`

Get the list of associated catalogs. Returns the name and id values only.

Signature

```
public List<runtime_industries_cpq.CatalogOutputRepresentation> catalogs {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.CatalogOutputRepresentation on page 539>

`categories`

Get the list of associated categories. Returns the name and id values only.

Signature

```
public List<runtime_industries_cpq.CategoryOutputRepresentation> categories {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.CategoryOutputRepresentation on page 545>

`childProducts`

Get the hierarchy of the child products.

Signature

```
public List<runtime_industries_cpq.ProductListRepresentation> childProducts {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductListRepresentation on page 598>

`configureDuringSale`

Determines whether to allow or prevent configuration when a bundle is sold.

Signature

```
public String configureDuringSale {get; set;}
```

Property Value

Type: String

`description`

Get the description of the product. If data translation is set up and specified in the org, the translated description is available.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

discontinuedDate

Get the date from when the part can't be used in the product or sold.

Signature

```
public Datetime discontinuedDate {get; set;}
```

Property Value

Type: Datetime

displayUrl

Get the display image URL of the product.

Signature

```
public String displayUrl {get; set;}
```

Property Value

Type: String

endOfLifeDate

Get the date after which a product isn't supported, ordered, or maintained.

Signature

```
public Datetime endOfLifeDate {get; set;}
```

Property Value

Type: Datetime

id

Get the ID of the product.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

isActive

Indicates whether the product is active (true) or not (false).

Signature

```
public Boolean isActive {get; set;}
```

Property Value

Type: Boolean

isAssetizable

Indicates whether the product instance remains a customer asset after it's purchased (true) or not (false).

Signature

```
public Boolean isAssetizable {get; set;}
```

Property Value

Type: Boolean

isComponentRequired

Indicates whether the product component is required (true) or not (false).

Signature

```
public Boolean isComponentRequired {get; set;}
```

Property Value

Type: Boolean

isDefaultComponent

Indicates whether the product component is the default component (true) or not (false).

Signature

```
public Boolean isDefaultComponent {get; set;}
```

Property Value

Type: Boolean

`isQuantityEditable`

Indicates whether the product quantity is editable (true) or not (false).

Signature

`public Boolean isQuantityEditable {get; set;}`

Property Value

Type: Boolean

`isSoldOnlyWithOtherProds`

Indicates whether the product can't be sold separately (true) or not (false).

Signature

`public Boolean isSoldOnlyWithOtherProds {get; set;}`

Property Value

Type: Boolean

`name`

Get the name of the product. If data translation is set up and specified in the org, the translated name is available.

Signature

`public String name {get; set;}`

Property Value

Type: String

`nodeType`

Get the type of the node, such as a product or bundled product.

Signature

`public String nodeType {get; set;}`

Property Value

Type: String

`prices`

Get the price details associated with the products.

Signature

```
public List<runtime_industries_cpq.ProductPricesOutputRepresentation> prices {get;
set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductPricesOutputRepresentation on page 617>

productClassification

Get the details of the product classification that the product is based on.

Signature

```
public runtime_industries_cpq.ProductClassificationOutputRepresentation
productClassification {get; set;}
```

Property Value

Type: runtime_industries_cpq.ProductClassificationOutputRepresentation on page 579

productCode

Get the universal product code that's used to track the part that's used in the product.

Signature

```
public String productCode {get; set;}
```

Property Value

Type: String

productComponentGroups

Get the logical grouping of the component products in a bundle and group cardinality for ordering the product components.

Signature

```
public List<runtime_industries_cpq.ProductComponentGroupOutputRepresentation>
productComponentGroups {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductComponentGroupOutputRepresentation on page 580>

productInformation

Get the details of a product.

Signature

```
public String productInformation {get; set;}
```

Property Value

Type: String

productPricingInformation

Get the pricing details of a product.

Signature

```
public String productPricingInformation {get; set;}
```

Property Value

Type: String

productQuantity

Get the quantity of a product.

Signature

```
public runtime_industries_cpq.ProductQuantityOutputRepresentation productQuantity {get;
set;}
```

Property Value

Type: runtime_industries_cpq.ProductQuantityOutputRepresentation on page 620

productRelatedComponent

Get the details of the related components of a product.

Signature

```
public ConnectApi.CPQProductRelatedComponentOutputRepresentation productRelatedComponent
{get; set;}
```

Property Value

Type: ConnectApi.CPQProductRelatedComponentOutputRepresentation

productSellingModelOptions

Get the details of the product selling model options.

Signature

```
public List<runtime_industries_cpq.ProductSellingModelOptionOutputRepresentation>
productSellingModelOptions {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductSellingModelOptionOutputRepresentation on page 630>

`productSpecificationType`

Get the details of the product specification type.

Signature

```
public runtime_industries_cpq.ProductSpecificationTypeOutputRepresentation
productSpecificationType {get; set;}
```

Property Value

Type: runtime_industries_cpq.ProductSpecificationTypeOutputRepresentation on page 635

`productType`

Get the product type.

Signature

```
public String productType {get; set;}
```

Property Value

Type: String

`qualificationContext`

Get the context details of a user, which are used for qualification rules.

Signature

```
public runtime_industries_cpq.QualificationContextOutputRepresentation
qualificationContext {get; set;}
```

Property Value

Type: runtime_industries_cpq.QualificationContextOutputRepresentation on page 637

`status`

Get or set the status of the product, such as Active or Inactive.

Signature

```
public String status {get; set;}
```

Property Value

Type: String

unitOfMeasure

Get details about the unit of measure for a specific set of records.

Signature

```
public ConnectApi.UnitOfMeasureOutputRepresentation unitOfMeasure {get; set;}
```

Property Value

Type: ConnectApi.UnitOfMeasureOutputRepresentation

ProductOutputRepresentation Class

Get the details of a product definition.

Namespace

runtime_industries_cpq on page 512

ProductOutputRepresentation Properties
Learn more about the properties available with the ProductOutputRepresentation class.

ProductOutputRepresentation Properties

Learn more about the properties available with the ProductOutputRepresentation class.

The `ProductOutputRepresentation` class includes these properties.

additionalFields
Get the key-value pair of additional standard or custom fields with their values.

attributeCategories
Get the list of categorized attributes related to the product.

availabilityDate
Get the date when the part is used in the product or is made available for sale.

catalogs
Get the list of associated catalogs. Returns the name and id values only.

configureDuringSale
Determines whether to allow or prevent configuration when a bundle is sold.

description

Get the description of the product. If data translation is set up and specified in the org, the translated description is available.

discontinuedDate

Get the date from when the part can’t be used in the product or sold.

displayUrl

Get the display image URL of the product.

endOfLifeDate

Get the date after which a product isn’t supported, ordered, or maintained.

id

Get the ID of the product.

isActive

Indicates whether the product is active (true) or not (false).

isAssetizable

Indicates whether the product instance remains a customer asset after it's purchased (true) or not (false).

isComponentRequired

Indicates whether the product component is required (true) or not (false).

isDefaultComponent

Indicates whether the product component is the default component (true) or not (false).

isQuantityEditable

Indicates whether the product quantity is editable (true) or not (false).

isSoldOnlyWithOtherProds

Indicates whether the product can't be sold separately (true) or not (false).

name

Get the name of the product. If data translation is set up and specified in the org, the translated name is available.

nodeType

Get the type of the node, such as a product or bundled product.

productClassification

Get the details of the product classification that the product is based on.

productCode

Get the universal product code that's used to track the part that’s used in the product.

productComponentGroups

Get the logical grouping of the component products in a bundle and group cardinality for ordering the product components.

productInformation

Get the details of a product.

productPricingInformation

Get the pricing details of a product.

productQuantity

Get the quantity of a product.

productRelatedComponent

Get the details of the related components of a product.

productSellingModelOptions
Get the details of the product selling model options.

productSpecificationType
Get the details of the product specification type.

productType
Get the product type.

qualificationContext
Get the context details of a user, which are used for qualification rules.

status
Get or set the status of the product, such as Active or Inactive.

additionalFields

Get the key-value pair of additional standard or custom fields with their values.

Signature

```
public List<runtime_industries_cpq.AdditionalFieldsWrapper> additionalFields {get;
set;}
```

Property Value

Type: List<runtime_industries_cpq.AdditionalFieldsWrapper>

attributeCategories

Get the list of categorized attributes related to the product.

Signature

```
public List<runtime_industries_cpq.AttributeCategoryOutputRepresentation>
attributeCategories {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.AttributeCategoryOutputRepresentation on page 518 >

availabilityDate

Get the date when the part is used in the product or is made available for sale.

Signature

```
public Datetime availabilityDate {get; set;}
```

Property Value

Type: Datetime

catalogs

Get the list of associated catalogs. Returns the name and id values only.

Signature

```
public List<runtime_industries_cpq.CatalogOutputRepresentation> catalogs {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.CatalogOutputRepresentation on page 539>

configureDuringSale

Determines whether to allow or prevent configuration when a bundle is sold.

Signature

```
public String configureDuringSale {get; set;}
```

Property Value

Type: String

description

Get the description of the product. If data translation is set up and specified in the org, the translated description is available.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

discontinuedDate

Get the date from when the part can't be used in the product or sold.

Signature

```
public Datetime discontinuedDate {get; set;}
```

Property Value

Type: Datetime

displayUrl

Get the display image URL of the product.

Signature

```
public String displayUrl {get; set;}
```

Property Value

Type: String

endOfLifeDate

Get the date after which a product isn’t supported, ordered, or maintained.

Signature

```
public Datetime endOfLifeDate {get; set;}
```

Property Value

Type: Datetime

id

Get the ID of the product.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

isActive

Indicates whether the product is active (true) or not (false).

Signature

```
public Boolean isActive {get; set;}
```

Property Value

Type: Boolean

isAssetizable

Indicates whether the product instance remains a customer asset after it's purchased (true) or not (false).

Signature

```
public Boolean isAssetizable {get; set;}
```

Property Value

Type: Boolean

`isComponentRequired`

Indicates whether the product component is required (true) or not (false).

Signature

```
public Boolean isComponentRequired {get; set;}
```

Property Value

Type: Boolean

`isDefaultComponent`

Indicates whether the product component is the default component (true) or not (false).

Signature

```
public Boolean isDefaultComponent {get; set;}
```

Property Value

Type: Boolean

`isQuantityEditable`

Indicates whether the product quantity is editable (true) or not (false).

Signature

```
public Boolean isQuantityEditable {get; set;}
```

Property Value

Type: Boolean

`isSoldOnlyWithOtherProds`

Indicates whether the product can't be sold separately (true) or not (false).

Signature

```
public Boolean isSoldOnlyWithOtherProds {get; set;}
```

Property Value

Type: Boolean

name

Get the name of the product. If data translation is set up and specified in the org, the translated name is available.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

nodeType

Get the type of the node, such as a product or bundled product.

Signature

```
public String nodeType {get; set;}
```

Property Value

Type: String

productClassification

Get the details of the product classification that the product is based on.

Signature

```
public runtime_industries_cpq.ProductClassificationOutputRepresentation
productClassification {get; set;}
```

Property Value

Type: runtime_industries_cpq.ProductClassificationOutputRepresentation on page 579

productCode

Get the universal product code that's used to track the part that's used in the product.

Signature

```
public String productCode {get; set;}
```

Property Value

Type: String

productComponentGroups

Get the logical grouping of the component products in a bundle and group cardinality for ordering the product components.

Signature

```
public List<runtime_industries_cpq.ProductComponentGroupOutputRepresentation>
productComponentGroups {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductComponentGroupOutputRepresentation on page 580>

productInformation

Get the details of a product.

Signature

```
public String productInformation {get; set;}
```

Property Value

Type: String

productPricingInformation

Get the pricing details of a product.

Signature

```
public String productPricingInformation {get; set;}
```

Property Value

Type: String

productQuantity

Get the quantity of a product.

Signature

```
public runtime_industries_cpq.ProductQuantityOutputRepresentation productQuantity {get;
set;}
```

Property Value

Type: runtime_industries_cpq.ProductQuantityOutputRepresentation on page 620

productRelatedComponent

Get the details of the related components of a product.

Signature

```
public ConnectApi.CPQProductRelatedComponentOutputRepresentation productRelatedComponent
{get; set;}
```

Property Value

Type: ConnectApi.CPQProductRelatedComponentOutputRepresentation

`productSellingModelOptions`

Get the details of the product selling model options.

Signature

```
public List<runtime_industries_cpq.ProductSellingModelOptionOutputRepresentation>
productSellingModelOptions {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductSellingModelOptionOutputRepresentation on page 630 >

`productSpecificationType`

Get the details of the product specification type.

Signature

```
public runtime_industries_cpq.ProductSpecificationTypeOutputRepresentation
productSpecificationType {get; set;}
```

Property Value

Type: runtime_industries_cpq.ProductSpecificationTypeOutputRepresentation on page 635

`productType`

Get the product type.

Signature

```
public String productType {get; set;}
```

Property Value

Type: String

`qualificationContext`

Get the context details of a user, which are used for qualification rules.

Signature

```
public runtime_industries_cpq.QualificationContextOutputRepresentation
qualificationContext {get; set;}
```

Property Value

Type: runtime_industries_cpq.QualificationContextOutputRepresentation on page 637

status

Get or set the status of the product, such as Active or Inactive.

Signature

```
public String status {get; set;}
```

Property Value

Type: String

ProductPricesOutputRepresentation Class

Get the price details of a product.

Namespace

runtime_industries_cpq on page 512

ProductPricesOutputRepresentation Properties
Learn more about the properties available with the ProductPricesOutputRepresentation class.

ProductPricesOutputRepresentation Properties

Learn more about the properties available with the ProductPricesOutputRepresentation class.

The following are properties for `ProductPricesOutputRepresentation`.

currencyIsoCode
Get or set the ISO currency code for the price.

effectiveFrom
Get or set the date and time when this price becomes effective.

effectiveTo
Get or set the date and time when this price expires.

isDefault
Indicates whether this is the default price for the product.

isDerived
Indicates whether this price is derived from another price.

- isSelected
  Indicates whether this price is currently selected.
- price
  Get or set the price value for the product.
- priceBookEntryId
  Get or set the ID of the price book entry.
- priceBookId
  Get or set the ID of the price book containing this price.
- pricingModel
  Get or set the pricing model associated with this price.

currencyIsoCode

Get or set the ISO currency code for the price.

Signature

```
public String currencyIsoCode {get; set;}
```

Property Value

Type: String

effectiveFrom

Get or set the date and time when this price becomes effective.

Signature

```
public String effectiveFrom {get; set;}
```

Property Value

Type: String

effectiveTo

Get or set the date and time when this price expires.

Signature

```
public String effectiveTo {get; set;}
```

Property Value

Type: String

`isDefault`

Indicates whether this is the default price for the product.

Signature

```
public Boolean isDefault {get; set;}
```

Property Value

Type: Boolean

`isDerived`

Indicates whether this price is derived from another price.

Signature

```
public Boolean isDerived {get; set;}
```

Property Value

Type: Boolean

`isSelected`

Indicates whether this price is currently selected.

Signature

```
public Boolean isSelected {get; set;}
```

Property Value

Type: Boolean

`price`

Get or set the price value for the product.

Signature

```
public Double price {get; set;}
```

Property Value

Type: Double

`priceBookEntryId`

Get or set the ID of the price book entry.

Signature

```
public String priceBookEntryId {get; set;}
```

Property Value

Type: String

priceBookId

Get or set the ID of the price book containing this price.

Signature

```
public String priceBookId {get; set;}
```

Property Value

Type: String

pricingModel

Get or set the pricing model associated with this price.

Signature

```
public runtime_industries_cpq.PricingModelOutputRepresentation pricingModel {get; set;}
```

Property Value

Type: runtime_industries_cpq.PricingModelOutputRepresentation on page 569

ProductQuantityOutputRepresentation Class

Represents the quantity constraints and current quantity for a product in the product discovery context.

Namespace

runtime_industries_cpq on page 512

ProductQuantityOutputRepresentation Properties

The following are properties for `ProductQuantityOutputRepresentation`.

maxQuantity
Get or set the maximum quantity allowed for the product.

minQuantity
Get or set the minimum quantity allowed for the product.

[quantity](#)
Get or set the current quantity of the product.

`maxQuantity`

Get or set the maximum quantity allowed for the product.

Signature

```
public Double maxQuantity {get; set;}
```

Property Value

Type: Double

`minQuantity`

Get or set the minimum quantity allowed for the product.

Signature

```
public Double minQuantity {get; set;}
```

Property Value

Type: Double

`quantity`

Get or set the current quantity of the product.

Signature

```
public Double quantity {get; set;}
```

Property Value

Type: Double

ProductRecommendationRule Class

Represents a product recommendation rule that is evaluated during product configuration. Product recommendation rules suggest additional products to users based on configuration conditions.

Namespace

runtime_industries_cpq on page 512

ProductRecommendationRule Constructor
Learn more about the constructor that's available with the ProductRecommendationRule class.

[ProductRecommendationRule Properties](#)
Contains properties to store product recommendation rule details from configuration rule evaluation.

ProductRecommendationRule Constructor

Learn more about the constructor that's available with the ProductRecommendationRule class.

The `ProductRecommendationRule` class includes this constructor.

[ProductRecommendationRule(referenceId, productIds, message, recordType, target, scope)](#)
Constructor to create a ProductRecommendationRule instance with the specified recommendation details.

`ProductRecommendationRule(referenceId, productIds, message, recordType, target, scope)`

Constructor to create a ProductRecommendationRule instance with the specified recommendation details.

Signature

```
public ProductRecommendationRule(String referenceId, List<String> productIds, String
message, String recordType, String target, String scope)
```

Parameters

referenceId
Type: String

The reference ID of the product recommendation rule.

productIds
Type: List<String>

List of product IDs that are recommended.

message
Type: String

The message to display with the product recommendation.

recordType
Type: String

The record type associated with the recommendation.

target
Type: String

The target of the recommendation rule.

scope
Type: String

The scope of the recommendation rule.

ProductRecommendationRule Properties

Contains properties to store product recommendation rule details from configuration rule evaluation.

The `ProductRecommendationRule` class includes these properties.

- message
  Get the message value.
- productIds
  Get the list of productid.
- recordType
  Get the recordtype value.
- referenceId
  Get the ID of the reference.
- scope
  Get the scope value.
- target
  Get the target value.

`message`

Get the message value.

Signature

```
public String message {get; set;}
```

Property Value

Type: String

`productIds`

Get the list of productid.

Signature

```
public List<String> productIds {get; set;}
```

Property Value

Type: List<String>

`recordType`

Get the recordtype value.

Signature

```
public String recordType {get; set;}
```

Property Value

Type: String

referenceId

Get the ID of the reference.

Signature

```
public String referenceId {get; set;}
```

Property Value

Type: String

scope

Get the scope value.

Signature

```
public String scope {get; set;}
```

Property Value

Type: String

target

Get the target value.

Signature

```
public String target {get; set;}
```

Property Value

Type: String

ProductRelatedComponentOutputRepresentation Class

Represents a related component product in a bundle or product relationship, including component configuration details such as quantity constraints, required status, and relationship metadata.

Namespace

runtime_industries_cpq on page 512

ProductRelatedComponentOutputRepresentation Properties

The following are properties for `ProductRelatedComponentOutputRepresentation`.

childProductId

Get or set the identifier of the child product in the relationship.

childSellingModelId

Get or set the identifier of the child product's selling model in the relationship.

doesBundlePriceIncludeChild

Get or set whether the bundle price includes the price of this child component.

id

Get or set the unique identifier of the product related component relationship.

isComponentRequired

Get or set whether this component is required in the bundle or product relationship.

isDefaultComponent

Get or set whether this component is selected by default in the bundle or product relationship.

isQuantityEditable

Get or set whether the quantity of this component can be edited.

maxQuantity

Get or set the maximum quantity allowed for this component.

minQuantity

Get or set the minimum quantity required for this component.

parentProductId

Get or set the identifier of the parent product in the relationship.

parentSellingModelId

Get or set the identifier of the parent product's selling model in the relationship.

productClassificationId

Get or set the identifier of the product classification for this component.

productComponentGroupId

Get or set the identifier of the product component group that this component belongs to.

productRelationshipTypeId

Get or set the identifier of the product relationship type that defines this relationship.

quantity

Get or set the current quantity of this component.

quantityScaleMethod

Get or set the method used to scale the quantity of this component, such as "PerUnit" or "PerBundle".

sequence

Get or set the display sequence order of this component within the bundle or product relationship.

unitOfMeasure

Get or set the unit of measure for the quantity of this component.

isExcluded
Indicates whether excluded is true or false.

quoteVisibility
Get the quotevisibility value.

childProductId

Get or set the identifier of the child product in the relationship.

Signature

```
public String childProductId {get; set;}
```

Property Value

Type: String

childSellingModelId

Get or set the identifier of the child product's selling model in the relationship.

Signature

```
public String childSellingModelId {get; set;}
```

Property Value

Type: String

doesBundlePriceIncludeChild

Get or set whether the bundle price includes the price of this child component.

Signature

```
public Boolean doesBundlePriceIncludeChild {get; set;}
```

Property Value

Type: Boolean

id

Get or set the unique identifier of the product related component relationship.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

isComponentRequired

Get or set whether this component is required in the bundle or product relationship.

Signature

```
public Boolean isComponentRequired {get; set;}
```

Property Value

Type: Boolean

isDefaultComponent

Get or set whether this component is selected by default in the bundle or product relationship.

Signature

```
public Boolean isDefaultComponent {get; set;}
```

Property Value

Type: Boolean

isQuantityEditable

Get or set whether the quantity of this component can be edited.

Signature

```
public Boolean isQuantityEditable {get; set;}
```

Property Value

Type: Boolean

maxQuantity

Get or set the maximum quantity allowed for this component.

Signature

```
public Double maxQuantity {get; set;}
```

Property Value

Type: Double

minQuantity

Get or set the minimum quantity required for this component.

Signature

```
public Double minQuantity {get; set;}
```

Property Value

Type: Double

parentProductId

Get or set the identifier of the parent product in the relationship.

Signature

```
public String parentProductId {get; set;}
```

Property Value

Type: String

parentSellingModelId

Get or set the identifier of the parent product's selling model in the relationship.

Signature

```
public String parentSellingModelId {get; set;}
```

Property Value

Type: String

productClassificationId

Get or set the identifier of the product classification for this component.

Signature

```
public String productClassificationId {get; set;}
```

Property Value

Type: String

productComponentGroupId

Get or set the identifier of the product component group that this component belongs to.

Signature

```
public String productComponentGroupId {get; set;}
```

Property Value

Type: String

productRelationshipTypeId

Get or set the identifier of the product relationship type that defines this relationship.

Signature

```
public String productRelationshipTypeId {get; set;}
```

Property Value

Type: String

quantity

Get or set the current quantity of this component.

Signature

```
public Double quantity {get; set;}
```

Property Value

Type: Double

quantityScaleMethod

Get or set the method used to scale the quantity of this component, such as "PerUnit" or "PerBundle".

Signature

```
public String quantityScaleMethod {get; set;}
```

Property Value

Type: String

sequence

Get or set the display sequence order of this component within the bundle or product relationship.

Signature

```
public Integer sequence {get; set;}
```

Property Value

Type: Integer

`unitOfMeasure`

Get or set the unit of measure for the quantity of this component.

Signature

`public ConnectApi.UnitOfMeasureOutputRepresentation unitOfMeasure {get; set;}`

Property Value

Type: ConnectApi.UnitOfMeasureOutputRepresentation

`isExcluded`

Indicates whether excluded is true or false.

Signature

`public Boolean isExcluded {get; set;}`

Property Value

Type: Boolean

`quoteVisibility`

Get the quotevisibility value.

Signature

`public String quoteVisibility {get; set;}`

Property Value

Type: String

ProductSellingModelOptionOutputRepresentation Class

Represents a selling model option available for a product, which defines how the product can be sold (such as subscription, one-time, or usage-based).

Namespace

runtime_industries_cpq on page 512

ProductSellingModelOptionOutputRepresentation Properties
Learn more about the properties available with the ProductSellingModelOptionOutputRepresentation class.

ProductSellingModelOptionOutputRepresentation Properties

Learn more about the properties available with the ProductSellingModelOptionOutputRepresentation class.

The `ProductSellingModelOptionOutputRepresentation` class includes these properties.

- id
  Get or set the unique identifier of the product selling model option.
- productId
  Get or set the identifier of the product that this selling model option applies to.
- productSellingModel
  Get or set the product selling model details for this option.
- productSellingModelId
  Get or set the identifier of the product selling model for this option.

`id`

Get or set the unique identifier of the product selling model option.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

`productId`

Get or set the identifier of the product that this selling model option applies to.

Signature

```
public String productId {get; set;}
```

Property Value

Type: String

`productSellingModel`

Get or set the product selling model details for this option.

Signature

```
public runtime_industries_cpq.ProductSellingModelOutputRepresentation productSellingModel
{get; set;}
```

Property Value

Type: runtime_industries_cpq.ProductSellingModelOutputRepresentation

`productSellingModelId`

Get or set the identifier of the product selling model for this option.

Signature

```
public String productSellingModelId {get; set;}
```

Property Value

Type: String

ProductSellingModelOutputRepresentation Class

Represents a product selling model that defines how a product is sold, including the selling model type, pricing term, and status.

Namespace

runtime_industries_cpq on page 512

ProductSellingModelOutputRepresentation Properties
Learn more about the properties available with the ProductSellingModelOutputRepresentation class.

ProductSellingModelOutputRepresentation Properties

Learn more about the properties available with the ProductSellingModelOutputRepresentation class.

The `ProductSellingModelOutputRepresentation` class includes these properties.

id
Get or set the unique identifier of the product selling model.

name
Get or set the name of the product selling model.

pricingTerm
Get or set the pricing term value, which represents the duration or quantity for the pricing term unit.

pricingTermUnit
Get or set the unit for the pricing term, such as "Month", "Year", or "Day".

sellingModelType
Get or set the type of selling model, such as "Subscription", "OneTime", or "Usage".

status
Get or set the status of the product selling model, such as "Active" or "Inactive".

id

Get or set the unique identifier of the product selling model.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

name

Get or set the name of the product selling model.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

pricingTerm

Get or set the pricing term value, which represents the duration or quantity for the pricing term unit.

Signature

```
public Integer pricingTerm {get; set;}
```

Property Value

Type: Integer

pricingTermUnit

Get or set the unit for the pricing term, such as "Month", "Year", or "Day".

Signature

```
public String pricingTermUnit {get; set;}
```

Property Value

Type: String

sellingModelType

Get or set the type of selling model, such as "Subscription", "OneTime", or "Usage".

Signature

```
public String sellingModelType {get; set;}
```

Property Value

Type: String

status

Get or set the status of the product selling model, such as "Active" or "Inactive".

Signature

```
public String status {get; set;}
```

Property Value

Type: String

ProductSpecificationRecordTypeOutputRepresentation Class

Represents the record type information for a product specification, which defines the type of record used to store product specification data.

Namespace

runtime_industries_cpq on page 512

ProductSpecificationRecordTypeOutputRepresentation Properties

Learn more about the properties available with the ProductSpecificationRecordTypeOutputRepresentation class.

The `ProductSpecificationRecordTypeOutputRepresentation` class includes these properties.

isCommercial

Get or set whether this product specification record type is commercial.

Signature

```
public Boolean isCommercial {get; set;}
```

Property Value

Type: Boolean

ProductSpecificationTypeOutputRepresentation Class

Represents a product specification type that defines the structure and attributes available for configuring a product.

Namespace

runtime_industries_cpq on page 512

ProductSpecificationTypeOutputRepresentation Properties

ProductSpecificationTypeOutputRepresentation Properties

Learn more about the properties available with the ProductSpecificationTypeOutputRepresentation class.

The `ProductSpecificationTypeOutputRepresentation` class includes these properties.

name
Get or set the name of the product specification type.

productSpecificationRecordType
Get or set the product specification record type associated with this specification type.

`name`

Get or set the name of the product specification type.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

`productSpecificationRecordType`

Get or set the product specification record type associated with this specification type.

Signature

```
public runtime_industries_cpq.ProductSpecificationRecordTypeOutputRepresentation
productSpecificationRecordType {get; set;}
```

Property Value

Type: runtime_industries_cpq.ProductSpecificationRecordTypeOutputRepresentation

QocQualificationOutputRepresentation Class

Represents a quote, order, or contract qualification that determines whether a product can be sold based on specific business rules and conditions.

Namespace

runtime_industries_cpq on page 512

QocQualificationOutputRepresentation Constructors

The following are constructors for `QocQualificationOutputRepresentation`.

`QocQualificationOutputRepresentation()`

Constructs an empty QocQualificationOutputRepresentation instance.

Signature

```
public QocQualificationOutputRepresentation()
```

QocQualificationOutputRepresentation Properties

Learn more about the properties available with the QocQualificationOutputRepresentation class.

The `QocQualificationOutputRepresentation` class includes these properties.

`productId`

Get or set the identifier of the product being qualified.

Signature

```
public String productId {get; set;}
```

Property Value

Type: String

`qualificationContext`

Get or set the qualification context that contains the qualification result and reason.

Signature

```
public runtime_industries_cpq.QualificationContextOutputRepresentation
qualificationContext {get; set;}
```

Property Value

Type: runtime_industries_cpq.QualificationContextOutputRepresentation

QualificationContextOutputRepresentation Class

Represents the context information used for product qualification, including account, opportunity, and other relevant context data for determining product eligibility.

Namespace

runtime_industries_cpq on page 512

QualificationContextOutputRepresentation Properties
Learn more about the properties available with the QualificationContextOutputRepresentation class.

QualificationContextOutputRepresentation Properties

Learn more about the properties available with the QualificationContextOutputRepresentation class.

The `QualificationContextOutputRepresentation` class includes these properties.

isQualified
Get or set whether the product is qualified based on the qualification rules.

reason
Get or set the reason for the qualification result, explaining why the product is qualified or not qualified.

`isQualified`

Get or set whether the product is qualified based on the qualification rules.

Signature

```
public Boolean isQualified {get; set;}
```

Property Value

Type: Boolean

`reason`

Get or set the reason for the qualification result, explaining why the product is qualified or not qualified.

Signature

```
public String reason {get; set;}
```

Property Value

Type: String

RelatedObjectFilter Class

Represents a filter for related objects used in product search and discovery, allowing you to filter products based on related object criteria.

Namespace

runtime_industries_cpq on page 512

RelatedObjectFilter Properties
Learn more about the properties available with the RelatedObjectFilter class.

RelatedObjectFilter Properties

Learn more about the properties available with the RelatedObjectFilter class.

The `RelatedObjectFilter` class includes these properties.

criteria
Get or set the list of filter criteria to apply to the related object.

objectName
Get or set the name of the related object to filter by, such as "Account" or "Opportunity".

`criteria`

Get or set the list of filter criteria to apply to the related object.

Signature

```
public List<runtime_industries_cpq.FilterCriteriaInputRepresentation> criteria {get;
set;}
```

Property Value

Type: List<runtime_industries_cpq.FilterCriteriaInputRepresentation>

`objectName`

Get or set the name of the related object to filter by, such as "Account" or "Opportunity".

Signature

```
public String objectName {get; set;}
```

Property Value

Type: String

RelatedObjectFilterInputRepresentation Class

Represents input criteria for filtering products based on related object information, such as account, opportunity, or contract data.

Namespace

runtime_industries_cpq on page 512

RelatedObjectFilterInputRepresentation Properties
Learn more about the properties available with the RelatedObjectFilterInputRepresentation

RelatedObjectFilterInputRepresentation Properties

Learn more about the properties available with the RelatedObjectFilterInputRepresentation

The `RelatedObjectFilterInputRepresentation` class includes these properties.

relatedObjectFilter
Get or set the list of related object filters to apply when searching for products.

`relatedObjectFilter`

Get or set the list of related object filters to apply when searching for products.

Signature

```
public List<runtime_industries_cpq.RelatedObjectFilter> relatedObjectFilter {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.RelatedObjectFilter>

SearchProductsFacetRepresentation Class

Represents a search facet that provides filtering and categorization options for product search results, such as categories, attributes, or other product characteristics.

Namespace

runtime_industries_cpq on page 512

SearchProductsFacetRepresentation Properties
Learn more about the properties available with the SearchProductsFacetRepresentation class.

SearchProductsFacetRepresentation Properties

Learn more about the properties available with the SearchProductsFacetRepresentation class.

The `SearchProductsFacetRepresentation` class includes these properties.

attributeType
Get or set the type of attribute this facet represents, such as "Picklist" or "Text".

displayName
Get or set the display name of the search facet.

displayRank
Get or set the display rank that determines the order in which this facet appears in search results.

nameOrId
Get or set the name or identifier of the attribute or category that this facet represents.

values
Get or set the list of facet values available for filtering, each representing a distinct option within this facet.

`attributeType`

Get or set the type of attribute this facet represents, such as "Picklist" or "Text".

Signature

```
public String attributeType {get; set;}
```

Property Value

Type: String

`displayName`

Get or set the display name of the search facet.

Signature

```
public String displayName {get; set;}
```

Property Value

Type: String

`displayRank`

Get or set the display rank that determines the order in which this facet appears in search results.

Signature

`public Integer displayRank {get; set;}`

Property Value

Type: Integer

`nameOrId`

Get or set the name or identifier of the attribute or category that this facet represents.

Signature

`public String nameOrId {get; set;}`

Property Value

Type: String

`values`

Get or set the list of facet values available for filtering, each representing a distinct option within this facet.

Signature

`public List<runtime_industries_cpq.FacetValueRepresentation> values {get; set;}`

Property Value

Type: List<runtime_industries_cpq.FacetValueRepresentation>

SearchProductsRepresentation Class

Represents the results of a product search operation, including the list of products, search facets, pagination information, and total count of matching products.

Namespace

runtime_industries_cpq on page 512

SearchProductsRepresentation Properties
Learn more about the properties available with the SearchProductsRepresentation class.

SearchProductsRepresentation Properties

Learn more about the properties available with the SearchProductsRepresentation class.

The `SearchProductsRepresentation` class includes these properties.

additionalFields
Get or set additional custom fields for the product in the search results.

attributeCategories
Get or set the list of attribute categories that contain product attributes for configuration.

availabilityDate
Get or set the date when the product becomes available for sale.

catalogs
Get or set the list of catalogs that this product belongs to.

configureDuringSale
Get or set whether the product can be configured during the sales process.

description
Get or set the description of the product in the search results. If data translation is set up and specified in the org, the translated description is available.

discontinuedDate
Get or set the date when the product was discontinued.

displayUrl
Get or set the URL to display additional information about the product.

endOfLifeDate
Get or set the end of life date for the product.

id
Get or set the ID of the product in the search results.

isActive
Get or set whether the product is active (true) or not (false) in the search results.

isAssetizable
Get or set whether the product can be converted to an asset after sale.

isComponentRequired
Get or set whether this component is required in a bundle or product relationship.

isDefaultComponent
Get or set whether this component is selected by default in a bundle or product relationship.

isQuantityEditable
Get or set whether the quantity of this product can be edited.

isSoldOnlyWithOtherProds
Get or set whether this product can only be sold with other products.

name
Get or set the name of the product in the search results. If data translation is set up and specified in the org, the translated name is available.

nodeType
Get or set the node type of the product, such as "Product" or "Bundle".

prices
Get or set the list of prices available for this product.

productClassification
Get or set the product classification information for this product.

productCode
Get or set the universal product code that's used to track the part that's used in the product.

productComponentGroups
Get or set the list of product component groups that organize related components.

productInformation
Get or set additional product information details.

productPricingInformation
Get or set the pricing information for this product, including price lists and pricing models.

productQuantity
Get or set the quantity constraints and current quantity for this product.

productRelatedComponent
Get or set the related component information for this product in bundle or product relationships.

productSellingModelOptions
Get or set the list of selling model options available for this product.

productSpecificationType
Get or set the product specification type that defines the structure and attributes for configuring this product.

productType
Get or set the type of product, such as "Product", "Service", or "Bundle".

qualificationContext
Get or set the qualification context that contains the qualification result and reason for this product.

status
Get or set the status of the product, such as "Active" or "Inactive".

unitOfMeasure
Get or set the unit of measure for the quantity of this product.

additionalFields

Get or set additional custom fields for the product in the search results.

Signature

```
public List<runtime_industries_cpq.AdditionalFieldsWrapper> additionalFields {get;
set;}
```

Property Value

Type: List<runtime_industries_cpq.AdditionalFieldsWrapper>

attributeCategories

Get or set the list of attribute categories that contain product attributes for configuration.

Signature

```
public List<runtime_industries_cpq.AttributeCategoryOutputRepresentation>
attributeCategories {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.AttributeCategoryOutputRepresentation>

availabilityDate

Get or set the date when the product becomes available for sale.

Signature

```
public Datetime availabilityDate {get; set;}
```

Property Value

Type: Datetime

catalogs

Get or set the list of catalogs that this product belongs to.

Signature

```
public List<runtime_industries_cpq.CatalogOutputRepresentation> catalogs {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.CatalogOutputRepresentation>

configureDuringSale

Get or set whether the product can be configured during the sales process.

Signature

```
public String configureDuringSale {get; set;}
```

Property Value

Type: String

`description`

Get or set the description of the product in the search results. If data translation is set up and specified in the org, the translated description is available.

Signature

```
public String description {get; set;}
```

Property Value

Type: String

`discontinuedDate`

Get or set the date when the product was discontinued.

Signature

```
public Datetime discontinuedDate {get; set;}
```

Property Value

Type: Datetime

`displayUrl`

Get or set the URL to display additional information about the product.

Signature

```
public String displayUrl {get; set;}
```

Property Value

Type: String

`endOfLifeDate`

Get or set the end of life date for the product.

Signature

```
public Datetime endOfLifeDate {get; set;}
```

Property Value

Type: Datetime

`id`

Get or set the ID of the product in the search results.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

isActive

Get or set whether the product is active (true) or not (false) in the search results.

Signature

```
public Boolean isActive {get; set;}
```

Property Value

Type: Boolean

isAssetizable

Get or set whether the product can be converted to an asset after sale.

Signature

```
public Boolean isAssetizable {get; set;}
```

Property Value

Type: Boolean

isComponentRequired

Get or set whether this component is required in a bundle or product relationship.

Signature

```
public Boolean isComponentRequired {get; set;}
```

Property Value

Type: Boolean

isDefaultComponent

Get or set whether this component is selected by default in a bundle or product relationship.

Signature

```
public Boolean isDefaultComponent {get; set;}
```

Property Value

Type: Boolean

isQuantityEditable

Get or set whether the quantity of this product can be edited.

Signature

```
public Boolean isQuantityEditable {get; set;}
```

Property Value

Type: Boolean

isSoldOnlyWithOtherProds

Get or set whether this product can only be sold with other products.

Signature

```
public Boolean isSoldOnlyWithOtherProds {get; set;}
```

Property Value

Type: Boolean

name

Get or set the name of the product in the search results. If data translation is set up and specified in the org, the translated name is available.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

nodeType

Get or set the node type of the product, such as "Product" or "Bundle".

Signature

```
public String nodeType {get; set;}
```

Property Value

Type: String

prices

Get or set the list of prices available for this product.

Signature

```
public List<runtime_industries_cpq.ProductPricesOutputRepresentation> prices {get;
set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductPricesOutputRepresentation>

productClassification

Get or set the product classification information for this product.

Signature

```
public runtime_industries_cpq.ProductClassificationOutputRepresentation
productClassification {get; set;}
```

Property Value

Type: runtime_industries_cpq.ProductClassificationOutputRepresentation

productCode

Get or set the universal product code that's used to track the part that's used in the product.

Signature

```
public String productCode {get; set;}
```

Property Value

Type: String

productComponentGroups

Get or set the list of product component groups that organize related components.

Signature

```
public List<runtime_industries_cpq.ProductComponentGroupOutputRepresentation>
productComponentGroups {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductComponentGroupOutputRepresentation>

productInformation

Get or set additional product information details.

Signature

```
public String productInformation {get; set;}
```

Property Value

Type: String

productPricingInformation

Get or set the pricing information for this product, including price lists and pricing models.

Signature

```
public String productPricingInformation {get; set;}
```

Property Value

Type: String

productQuantity

Get or set the quantity constraints and current quantity for this product.

Signature

```
public runtime_industries_cpq.ProductQuantityOutputRepresentation productQuantity {get;
set;}
```

Property Value

Type: runtime_industries_cpq.ProductQuantityOutputRepresentation

productRelatedComponent

Get or set the related component information for this product in bundle or product relationships.

Signature

```
public ConnectApi.CPQProductRelatedComponentOutputRepresentation productRelatedComponent
{get; set;}
```

Property Value

Type: ConnectApi.CPQProductRelatedComponentOutputRepresentation

`productSellingModelOptions`

Get or set the list of selling model options available for this product.

Signature

```
public List<runtime_industries_cpq.ProductSellingModelOptionOutputRepresentation>
productSellingModelOptions {get; set;}
```

Property Value

Type: List<runtime_industries_cpq.ProductSellingModelOptionOutputRepresentation>

`productSpecificationType`

Get or set the product specification type that defines the structure and attributes for configuring this product.

Signature

```
public runtime_industries_cpq.ProductSpecificationTypeOutputRepresentation
productSpecificationType {get; set;}
```

Property Value

Type: runtime_industries_cpq.ProductSpecificationTypeOutputRepresentation

`productType`

Get or set the type of product, such as "Product", "Service", or "Bundle".

Signature

```
public String productType {get; set;}
```

Property Value

Type: String

`qualificationContext`

Get or set the qualification context that contains the qualification result and reason for this product.

Signature

```
public runtime_industries_cpq.QualificationContextOutputRepresentation
qualificationContext {get; set;}
```

Property Value

Type: runtime_industries_cpq.QualificationContextOutputRepresentation

`status`

Get or set the status of the product, such as "Active" or "Inactive".

Signature

```
public String status {get; set;}
```

Property Value

Type: String

`unitOfMeasure`

Get or set the unit of measure for the quantity of this product.

Signature

```
public ConnectApi.UnitOfMeasureOutputRepresentation unitOfMeasure {get; set;}
```

Property Value

Type: ConnectApi.UnitOfMeasureOutputRepresentation

UnitOfMeasureOutputRepresentation Class

Represents the unit of measure for a product. This class contains information about how product quantities are measured, including the unit code, name, scale, and rounding method.

Namespace

runtime_industries_cpq on page 512

UnitOfMeasureOutputRepresentation Constructor
Learn more about the constructor that's available with the UnitOfMeasureOutputRepresentation class.

UnitOfMeasureOutputRepresentation Properties
Contains properties to include unit of measure details for products.

UnitOfMeasureOutputRepresentation Constructor

Learn more about the constructor that's available with the UnitOfMeasureOutputRepresentation class.

The `UnitOfMeasureOutputRepresentation` class includes this constructor.

UnitOfMeasureOutputRepresentation(apexObj)
Constructor to create a UnitOfMeasureOutputRepresentation instance from a ConnectApi UnitOfMeasureOutputRepresentation object.

`UnitOfMeasureOutputRepresentation(apexObj)`

Constructor to create a UnitOfMeasureOutputRepresentation instance from a ConnectApi UnitOfMeasureOutputRepresentation object.

Signature

```
public UnitOfMeasureOutputRepresentation(ConnectApi.UnitOfMeasureOutputRepresentation
apexObj)
```

Parameters

apexObj

Type: ConnectApi.UnitOfMeasureOutputRepresentation

The ConnectApi unit of measure representation object to convert to UnitOfMeasureOutputRepresentation.

UnitOfMeasureOutputRepresentation Properties

Contains properties to include unit of measure details for products.

The `UnitOfMeasureOutputRepresentation` class includes these properties.

id

Get the ID of the unitofmeasure.

name

Get the name of the unitofmeasure.

roundingMethod

Get the roundingmethod value.

scale

Get the scale value.

unitCode

Get the unitcode value.

`id`

Get the ID of the unitofmeasure.

Signature

```
public String id {get; set;}
```

Property Value

Type: String

`name`

Get the name of the unitofmeasure.

Signature

```
public String name {get; set;}
```

Property Value

Type: String

`roundingMethod`

Get the roundingmethod value.

Signature

```
public String roundingMethod {get; set;}
```

Property Value

Type: String

`scale`

Get the scale value.

Signature

```
public Integer scale {get; set;}
```

Property Value

Type: Integer

`unitCode`

Get the unitcode value.

Signature

```
public String unitCode {get; set;}
```

Property Value

Type: String

VisibilityRule Class

Represents a visibility rule that is evaluated during product configuration. Visibility rules control the visibility of products, attributes, or other UI elements based on configuration conditions.

Namespace

runtime_industries_cpq on page 512

[VisibilityRule Constructor](#)
Learn more about the constructor that's available with the VisibilityRule class.

[VisibilityRule Properties](#)
Contains properties to store visibility rule details from configuration rule evaluation.

VisibilityRule Constructor

Learn more about the constructor that's available with the VisibilityRule class.

The `VisibilityRule` class includes this constructor.

[VisibilityRule(stiId, prcId, attributeId, attributePicklistValueId, target, scope, type, productIds, message)](#)
Constructor to create a VisibilityRule instance with the specified visibility rule details.

VisibilityRule(stiId, prcId, attributeId, attributePicklistValueId, target, scope, type, productIds, message)

Constructor to create a VisibilityRule instance with the specified visibility rule details.

Signature

```
public VisibilityRule(String stiId, String prcId, String attributeId, String
attributePicklistValueId, String target, String scope, String type, List<String>
productIds, String message)
```

Parameters

stiId
Type: String

The ID of the Sales Transaction Item (STI) associated with this visibility rule.

prcId
Type: String

The ID of the Product Relationship Configuration (PRC) associated with this visibility rule.

attributeId
Type: String

The ID of the attribute associated with this visibility rule.

attributePicklistValueId
Type: String

The ID of the attribute picklist value associated with this visibility rule.

target
Type: String

The target of the visibility rule (for example, product, attribute, or component).

scope
Type: String

The scope of the visibility rule.

type
Type: String

The type of visibility rule (for example, Show or Hide).

productIds
Type: List<String>

List of product IDs affected by this visibility rule.

message
Type: String

The message to display when the visibility rule is applied.

VisibilityRule Properties

Contains properties to store visibility rule details from configuration rule evaluation.

The `VisibilityRule` class includes these properties.

attributeId
Get the ID of the attribute.

attributePicklistValueId
Get the ID of the attributepicklistvalue.

message
Get the message value.

prcId
Get the ID of the prc.

productId
Get the ID of the product.

scope
Get the scope value.

stiId
Get the ID of the sti.

target
Get the target value.

type
Get the type value.

attributeId

Get the ID of the attribute.

Signature

```
public String attributeId {get; set;}
```

Property Value

Type: String

attributePicklistValueId

Get the ID of the attributepicklistvalue.

Signature

```
public String attributePicklistValueId {get; set;}
```

Property Value

Type: String

message

Get the message value.

Signature

```
public String message {get; set;}
```

Property Value

Type: String

prcId

Get the ID of the prc.

Signature

```
public String prcId {get; set;}
```

Property Value

Type: String

productId

Get the ID of the product.

Signature

```
public List<String> productId {get; set;}
```

Property Value

Type: List<String>

`scope`

Get the scope value.

Signature

`public String scope {get; set;}`

Property Value

Type: String

`stiId`

Get the ID of the sti.

Signature

`public String stiId {get; set;}`

Property Value

Type: String

`target`

Get the target value.

Signature

`public String target {get; set;}`

Property Value

Type: String

`type`

Get the type value.

Signature

`public String type {get; set;}`

Property Value

Type: String

Product Discovery Metadata API Types

Metadata API enables you to access some types and feature settings that you can customize in the user interface.

Flow for Product Discovery

Represents the metadata associated with a flow. With Flow, you can create an application that takes users through a series of pages to query and update the records in the database. You can also run logic and provide branching capability based on user input to build dynamic applications.

ProductDiscoverySettings

Represents the settings for Product Discovery.

Flow for Product Discovery

Represents the metadata associated with a flow. With Flow, you can create an application that takes users through a series of pages to query and update the records in the database. You can also run logic and provide branching capability based on user input to build dynamic applications.

FlowActionCall

Product Discovery exposes additional actionType values for the FlowActionCall metadata type.

Field Name	Field Type	Description
`actionType`	InvocableActionType (enumeration of type string)	Required. The action type. Additional valid values for Product Discovery are: • `findProducts`—Search for the products from a catalog, category, or subcategory by using the specified search term. • `GetProducts`—Get products from the specified catalog, category, or subcategory, including product qualification and pricing details. • `GetProductDetails`—Get details such as attributes, hierarchy, and cardinality for the specified product. • `executeQualificationProcedure`—Execute a qualification procedure, which returns the qualification status for the specified products. • `getCatalogDetails`—Get details of a catalog record. • `getCatalogs`—Get a list of catalog records. • `getCategories`—Get the list of categories associated with a catalog record. • `getCategoryDetails`—Get details of a category record. • `getMultipleProductDetails`—Get product details for a list of products. • `searchPrdctWithGuidedSelection`—Use guided product selection to search for products. • `getRecommendedProducts`—Retrieve a list of recommended products for a quote or order by using the Constraint Rule Engine.

ProductDiscoverySettings

Represents the settings for Product Discovery.

Parent Type and Manifest Access

This type extends the Metadata metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See Settings for more details.

File Suffix and Directory Location

`ProductDiscoverySettings` values are stored in the `ProductDiscoverySettings.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there is only one settings file for each settings component.

Version

ProductDiscoverySettings components are available in API version 62.0 and later.

Fields

Field Name	Description
`enableGuidedSelling`	**Field Type** boolean **Description** Indicates whether guided product selection is enabled (`true`) or not (`false`). Using guided product selection, you can manage dynamic forms that assess user requirements and show relevant products. The default value is `false`. Available in API version 63.0 and later.
`enableProdDiscConstraintRules`	**Field Type** boolean **Description** Indicates whether to enable the Constraint Rules Engine within Product Discovery (`true`) or not (`false`). The default value is `false`. If set to `true`, this setting activates constraint-based configuration rules so that the Constraint Rules Engine evaluates product selections during configuration. This step determines valid combinations based on defined constraints. Available in API version 67.0 and later.
`discoverProductsFlowNameOrgValue`	**Field Type** string **Description** Name of the custom flow for browsing and adding products. If this field isn't specified, the Discover Products flow is used for browsing and adding products. Available in API version 63.0 and later.

Field Name	Description
prodDiscBrowseContextDefOrgValue	**Field Type** string **Description** Context definition that gets updated based on the user-selected options and provides summary data.
prodDiscDefaultCatalogOrgValue	**Field Type** string **Description** Default catalog that determines the products to be displayed on the product list page. Available in API version 64.0 and later.
prodDiscPricingEnabledOrgValue	**Field Type** string **Description** Indicates whether pricing is enabled (`true`) or not (`false`). The default value is `false`.
prodDiscProcedureOrgValue	**Field Type** string **Description** Pricing procedure that calculates the list price.
prodDiscQualEnabledOrgValue	**Field Type** string **Description** Indicates whether product qualification is enabled (`true`) or not (`false`). The default value is `false`.
prodDiscQualificationOrgValue	**Field Type** string **Description** Qualification procedure that determines product eligibility.

Declarative Metadata Sample Definition

The following is an example of a ProductDiscoverySettings component.

```
<ProductDiscoverySettings xmlns="http://soap.sforce.com/2006/04/metadata">
    <enableGuidedSelling>true</enableGuidedSelling>

<discoverProductsFlowNameOrgValue>revenue_products__DiscoverProducts</discoverProductsFlowNameOrgValue>

    <prodDiscPricingEnabledOrgValue>true</prodDiscPricingEnabledOrgValue>
```

```
    <prodDiscQualEnabledOrgValue>true</prodDiscQualEnabledOrgValue>
    <prodDiscProcedureOrgValue>PricingProcedure</prodDiscProcedureOrgValue>
    <prodDiscQualificationOrgValue>QualificationProcedure</prodDiscQualificationOrgValue>

<prodDiscBrowseContextDefOrgValue>BrowseContextDefinition</prodDiscBrowseContextDefOrgValue>
</ProductDiscoverySettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>ProductDiscovery</members>
        <name>Settings</name>
    </types>
    <version>67.0</version>
</Package>
```

Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see Settings. For information about using the manifest file, see Deploying and Retrieving Metadata with the Zip File.

CHAPTER 5 Salesforce Pricing

In this chapter ...

Create customized price adjustment methods and pricing procedures. Determine the discounts to apply to your products and services by using price adjustment methods. Get visibility into the pricing calculation process by using pricing procedures.

EDITIONS

Available in: Lightning Experience

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions of Revenue Management where Salesforce Pricing is enabled

Salesforce Pricing Standard Objects

The Salesforce Pricing data model provides objects and fields to manage pricing processes, such as product management and calculation and application of discounts.

AttributeAdjustmentCondition

Represents the condition applied to an attribute that determines the price of a product or service being sold. This object is available in API version 60.0 and later.

AttributeBasedAdjRule

Represents the attribute conditions in a rule associated with the attribute based adjustment made for a product or service being sold. This object is available in API version 60.0 and later.

AttributeBasedAdjustment

Represents the association between the product selling model and the price adjustment for product or service being sold based on its attributes. This object stores information about the attributes that define the price of the product or service, the discounts applied, along with its value for a given date range. This object is available in API version 60.0 and later.

AttributeDefinition

Represents a product, asset, or object attribute, for example, a hardware specification or software detail. This object is available in API version 60.0 and later.

BundleBasedAdjustment

Represents the association between the product selling model and the price adjustment for a product or service being sold as a bundle. This object stores information of the product or service's price, the discounts applied, along with its value for a given date range. This object is available in API version 60.0 and later.

CostBook

Represents the cost book that contains multiple cost book entries. This object is available in API version 61.0 and later.

ContractItemPrice

Represents the price of a product on the contract. This object is available in API version 61.0 and later.

CostBookEntry

Represents the total cost of a product or service that’s determined based on various factors that affect a product's price. For example, when a product is manufactured, the weight of the raw material can be a cost factor based on the amount of material required and its shipping cost. This object is available in API version 61.0 and later.

PriceAdjustmentSchedule

Represents a series of tiered discounts based on the number of items purchased. This object is available in API version 60.0 and later.

PriceAdjustmentTier

Represents a discount tier in a price adjustment schedule. This object is available in API version 60.0 and later.

PriceBook2

Represents a price book that contains the list of products that your org sells. This object is available in API version 60.0 and later.

PriceBookEntry

Represents a product entry (an association between a Pricebook2 and Product2) in a price book. This object is available in API version 60.0 and later.

PriceBookEntryDerivedPrice

Represents the price of a product that’s derived from another source such as a product or an asset. This object is available in API version 61.0 and later.

PriceRevisionPolicy

Represents the guidelines and methods used to modify product or service prices, often incorporating formulas based on price revision entries and various adjustments. For example, a policy might dictate that prices are revised based on a formula that considers the regional Consumer Price Index (CPI) with a specific adjustment percentage, effective from a defined date, and categorized as either a flat adjustment or one directly based on the price revision entry data. This object is available in API version 65.0 and later.

PricingAdjBatchJob

Represents the collective update of multiple records on their prices and other adjustments. This object is available in API version 62.0 and later.

PricingAdjBatchJobLog

Represents the report that contains a list of failed adjustment requests along with an error message that describes the reason for failure. This object is available in API version 62.0 and later.

PricingAPIExecution

Represents the pricing resolution for an pricing element determined using strategy name and formula. This object is available in API version 63.0 and later.

PricingProcedureResolution

Represents a selection for a pricing procedure to execute a pricing process from a list of pricing procedures available. This object is available in API version 60.0 and later.

PricingProcessExecution

Represents a record generated during the execution of a discovery or pricing procedure. Multiple procedures may be performed within a single API call, with each recorded in a Pricing API Execution record. This object is available in API version 63.0 and later.

ProductPriceHistoryLog

Stores historical pricing data based on the product's price range. This object is available in API version 62.0 and later.

ProductPriceRange

Represents the price range of a product determined by using a product selling model that's stored in the relevant price book. This object is available in API version 62.0 and later.

ProductSellingModel

Defines one method by which a product can be sold; for example, as a one-time sale, an evergreen subscription, or a termed subscription. If the product is sold on subscription, this object defines the subscription's term. A product can have multiple product selling models. This object is available in API version 60.0 and later.

ProductSellingModelDataTranslation

Represents the translated values of the data stored within the ProductSellingModel record's fields. This object is available in API version 61.0 and later.

ProductSellingModelOption

A junction object between Product Selling Model and Product2. This object is available in API version 60.0 and later.

ProcedurePlanCriterion

The procedure plan option associated with the procedure plan criterion record. This object is available in API version 67.0 and later.

ProrationPolicy

Represents the proration policy associated with a Product Selling Model Option that determines how a product's price is calculated based on subscription duration or billing periods. This object is available in API version 67.0 and later.

SOAP API Developer Guide: Introduction to SOAP API

AttributeAdjustmentCondition

Represents the condition applied to an attribute that determines the price of a product or service being sold. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Fields

Field	Details
`AttributeBasedAdjRuleId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Specifies the attribute adjustment rule record for which the condition is to be applied. This field is a relationship field. **Relationship Name** AttributeBasedAdjRule **Relationship Type** Lookup **Refers To** AttributeBasedAdjRule
`AttributeDefinitionId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** Specifies the attribute definition record for which the condition is to be applied. This field is a relationship field. **Relationship Name** AttributeDefinition **Relationship Type** Lookup **Refers To** AttributeDefinition
`BooleanValue`	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies the boolean value of the operator. Possible values are: • `False` • `True`
`DateTimeValue`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date time value of the attribute.
`DateValue`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date value of the attribute.
`DoubleValue`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The double value of the attribute.
`IntegerValue`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The integer value of the attribute.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The timestamp for when the current user last referred to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Name of the attribute adjustment condition.
`Operator`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Operator used by the attribute. Possible values are: • `doesnotexistin`—Does Not Exist In • `equals`—Equals • `existsin`—Exists In • `greaterorequal`—Greater Or Equal • `greaterthan`—Greater Than • `lessorequal`—Less Or Equal • `lessthan`—Less Than • `matches`—Matches • `notequals`—Not Equals The default value is `equals`.
`ProductId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update

Field	Details
	Description The ID of the product associated with the attribute adjustment condition. This field is a relationship field. **Relationship Name** Product **Relationship Type** Lookup **Refers To** Product2
`StringValue`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The string value of the attribute.
`UsageType`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The type of record where the attribute adjustment condition is used. Possible values are: • `Pricing` • `Rating`

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AttributeAdjustmentConditionFeed on page 2866
Feed tracking is available for the object.

AttributeAdjustmentConditionHistory on page 2873
History is available for tracked fields of the object.

AttributeBasedAdjRule

Represents the attribute conditions in a rule associated with the attribute based adjustment made for a product or service being sold. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AttributeCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of attributes.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the attribute based adjustment rule was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Name of the attribute based adjustment rule.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** ID of the owner of the attribute based adjustment rule. This field is a polymorphic relationship field.

Field	Details
	Relationship Name Owner **Relationship Type** Lookup **Refers To** Group, User
`UsageType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of record where the attribute-based adjustment rule is used. Possible values are: • `Pricing` • `Rating`

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AttributeBasedAdjRuleFeed on page 2866
Feed tracking is available for the object.

AttributeBasedAdjRuleHistory on page 2873
History is available for tracked fields of the object.

AttributeBasedAdjRuleShare on page 2877
Sharing is available for the object.

AttributeBasedAdjustment

Represents the association between the product selling model and the price adjustment for product or service being sold based on its attributes. This object stores information about the attributes that define the price of the product or service, the discounts applied, along with its value for a given date range. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AdjustmentType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of pricing adjustment being made. Possible values are: • `Amount` • `Override` • `Percentage`
`AdjustmentValue`	**Type** double **Properties** Create, Filter, Sort, Update **Description** The value of the adjustment being made based on the adjustment type.
`AttributeBasedAdjRuleId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The attribute based adjustment rule associated with this attribute based adjustment record. This field is a relationship field. **Relationship Name** AttributeBasedAdjRule **Relationship Type** Lookup **Refers To** AttributeBasedAdjRule
`AttributeCount`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of attributes.

Field	Details
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** ISO code of the currency. Must be one of the valid alphabetic, three-letter currency ISO codes defined by the ISO 4217 standard, such as USD, GBP, or JPY. Must be unique within your organization. Possible values are: • `BHD`—Bahraini Dinar • `JPY`—Japanese Yen • `USD`—U.S. Dollar The default value is `USD`.
`EffectiveFrom`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The date and time when the price list entry comes into effect.
`EffectiveTo`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time till when the price list entry remains effective.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the attribute based adjustment was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.

Field	Details
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Name of the attribute based adjustment.
PriceAdjustmentScheduleId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The price adjustment schedule associated with the attribute based adjustment record. This field is a relationship field. **Relationship Name** PriceAdjustmentSchedule **Relationship Type** Lookup **Refers To** PriceAdjustmentSchedule
PricingTerm	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of pricing term units in the pricing term. Used with PricingTermUnit to define the length of the pricing term. For example, if PricingTermUnit is Months and this field is 1, the subscription is priced monthly.If the selling model is one-time, this field must be null.
PricingTermUnit	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The unit of time used to define the pricing term. Used with PricingTerm to define the length of the pricing term. For example, if this field is Months and PricingTerm is 1, the subscription is priced monthly. If the selling model is one-time, this field must be null. Possible values are: • `Annual`—Years • `Months`

Field	Details
	• `Quarterly` • `Semi-Annual`
`ProductId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the product associated with the product attribute set. This field is a relationship field. **Relationship Name** Product **Relationship Type** Lookup **Refers To** Product2
`ProductSellingModelId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The ID of the ProductSellingModel record associated with this attribute based adjustment record. This field is a relationship field. **Relationship Name** ProductSellingModel **Relationship Type** Lookup **Refers To** ProductSellingModel
`SellingModelType`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Indicates whether the product is sold as a one-time sale, an evergreen subscription, or a subscription with a defined term. Possible values are: • `Evergreen`

Field	Details
	• `OneTime`—One Time • `TermDefined`—Term-Defined The default value is `OneTime`.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AttributeBasedAdjustmentFeed on page 2866
Feed tracking is available for the object.

AttributeBasedAdjustmentHistory on page 2873
History is available for tracked fields of the object.

AttributeDefinition

Represents a product, asset, or object attribute, for example, a hardware specification or software detail. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`Code`	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort, Update **Description** Code for the attribute definition. This field is unique within your organization.
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only if the multicurrency feature is enabled. Contains the ISO code for any currency allowed by the organization. Possible values are:

Field	Details
	• `BHD`—Bahraini Dinar • `JPY`—Japanese Yen • `USD`—U.S. Dollar The default value is `USD`.
`DataType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** The data type of the attribute definition. Possible values are: • `Checkbox` • `Currency` • `Date` • `Datetime` • `Multipicklist` • `Number` • `Percent` • `Picklist` • `Text`
`DefaultHelpText`	**Type** textarea **Properties** Create, Nillable, Update **Description** The default help text for this attribute.
`DefaultValue`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The default value for this attribute.
`Description`	**Type** textarea **Properties** Create, Nillable, Update

Field	Details
	Description Description of this attribute.
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort **Description** The unique name of the attribute definition record. This name must begin with a letter and use only alphanumeric characters and underscores. It can't include spaces, end with an underscore, or have two consecutive underscores.
`IsActive`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates that the attribute definition is active. Active attributes definitions can be selected for products. The default value is `false`.
`IsRequired`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the attribute definition is required for a product. The default value is `false`.
`Label`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The label for the attribute.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The date the attribute definition was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the attribute definition was last viewed.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the attribute.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The owner of the attribute definition. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User
PicklistId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The ID of the attribute picklist with the valid values for this attribute. This field is a relationship field. **Relationship Name** Picklist

Field	Details
	Relationship Type Lookup **Refers To** AttributePicklist
`SourceSystemIdentifier`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The identifier of the attribute definition in an external system.
`ValueDescription`	**Type** textarea **Properties** Create, Nillable, Update **Description** The default value description for this attribute.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AttributeDefinitionFeed on page 2866
Feed tracking is available for the object.

AttributeDefinitionHistory on page 2873
History is available for tracked fields of the object.

AttributeDefinitionShare on page 2877
Sharing is available for the object.

BundleBasedAdjustment

Represents the association between the product selling model and the price adjustment for a product or service being sold as a bundle. This object stores information of the product or service's price, the discounts applied, along with its value for a given date range. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
AdjustmentType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of pricing adjustment being made. Possible values are: • Amount • Override • Percentage
AdjustmentValue	**Type** double **Properties** Create, Filter, Sort, Update **Description** The type of pricing adjustment being made.
CurrencyIsoCode	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** ISO code of the currency. Must be one of the valid alphabetic, three-letter currency ISO codes defined by the ISO 4217 standard, such as USD, GBP, or JPY. Must be unique within your organization. Possible values are: • BHD—Bahraini Dinar • JPY—Japanese Yen • USD—U.S. Dollar The default value is USD.
EffectiveFrom	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The date and time when the bundle based adjustment comes into effect.

Field	Details
EffectiveTo	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time till when the bundle based adjustment remains effective.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the bundle based adjustment was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the bundle based adjustment was last viewed.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the bundle based adjustment record.
ParentProductId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Represents the immediate parent in the product bundle that the price is configured for. This field is a relationship field. **Relationship Name** ParentProduct **Relationship Type** Lookup **Refers To** Product2

Field	Details
ParentProductSellingModelId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The immediate parent node of a product selling model when nodes are represented in a hierarchial structure. This field is a relationship field. **Relationship Name** ParentProductSellingModel **Relationship Type** Lookup **Refers To** ProductSellingModel
PriceAdjustmentScheduleId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The price adjustment schedule associated with the bundle based adjustment record. This field is a relationship field. **Relationship Name** PriceAdjustmentSchedule **Relationship Type** Lookup **Refers To** PriceAdjustmentSchedule
PricingTerm	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of pricing term units in the pricing term. Used with PricingTermUnit to define the length of the pricing term. For example, if PricingTermUnit is Months and this field is 1, the subscription is priced monthly.If the selling model is one-time, this field must be null.
PricingTermUnit	**Type** picklist

Field	Details
	Properties Filter, Group, Nillable, Restricted picklist, Sort **Description** The unit of time used to define the pricing term. Used with PricingTerm to define the length of the pricing term. For example, if this field is Months and PricingTerm is 1, the subscription is priced monthly. If the selling model is one-time, this field must be null. Possible values are: • `Annual`—Years • `Months` • `Quarterly` • `Semi-Annual`
`ProductId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the product associated with the product bundle set. This field is a relationship field. **Relationship Name** Product **Relationship Type** Lookup **Refers To** Product2
`ProductSellingModelId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The ID of the ProductSellingModel record associated with this bundle based adjustment record. This field is a relationship field. **Relationship Name** ProductSellingModel **Relationship Type** Lookup **Refers To** ProductSellingModel

Field	Details
`RootBundleId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Represents the structural root product in a product's bundle that the price is configured for. This field is a relationship field. **Relationship Name** RootBundle **Relationship Type** Lookup **Refers To** Product2
`RootProductSellingModelId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The root product selling model. The primary or base product selling method. This field is a relationship field. **Relationship Name** RootProductSellingModel **Relationship Type** Lookup **Refers To** ProductSellingModel
`SellingModelType`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Indicates whether the product is sold as a one-time sale, an evergreen subscription, or a subscription with a defined term. Possible values are: • `Evergreen` • `OneTime`—One Time • `TermDefined`—Term-Defined The default value is `OneTime`.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

BundleBasedAdjustmentFeed on page 2866
: Feed tracking is available for the object.

BundleBasedAdjustmentHistory on page 2873
: History is available for tracked fields of the object.

CostBook

Represents the cost book that contains multiple cost book entries. This object is available in API version 61.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`EffectiveFrom`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** Date and time when the cost book comes into effect.
`EffectiveTo`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Date and time till when the cost book is no longer in effect.
`IsDefault`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the cost book is default (`true`) or not (`false`). The default value is `true`.

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last referred to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last viewed a record related to this record.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Name of the cost book.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** ID of the user who created the record. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

CostBookFeed on page 2866
Feed tracking is available for the object.

CostBookHistory on page 2873
History is available for tracked fields of the object.

CostBookShare on page 2877
Sharing is available for the object.

ContractItemPrice

Represents the price of a product on the contract. This object is available in API version 61.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`ContractId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The contract record associated with this contract item price record. This field is a relationship field. **Relationship Name** Contract **Relationship Type** Master-detail **Refers To** Contract (the master object)
`CurrencyIsoCode`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Contains the ISO code for any currency allowed by the organization. Available only if the multicurrency feature is enabled. Valid value is: • `USD`—U.S. Dollar

Field	Details
	The default value is `USD`.
`DiscountType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The unit of the discount. Valid values are: • `AdjustmentAmount` • `AdjustmentPercentage`
`DiscountValue`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The value of the discount.
`EndDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time till when the contract item price is no longer in effect.
`ItemId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The ID of the line item record associated with this contract item price record. This field is a polymorphic relationship field. **Relationship Name** Item **Relationship Type** Lookup **Refers To** Product2, ProductCategory

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last referred to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the contract item price record.
Price	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The unit price of the product that's being sold as part of the contract.
ProductSellingModelId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the product selling model record associated with this contract item price record. This field is a relationship field. **Relationship Name** ProductSellingModel **Relationship Type** Lookup **Refers To** ProductSellingModel

Field	Details
SellingModelType	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies whether the line item is sold as a one-time sale, an evergreen subscription, or a subscription with a defined term. Valid values are: • `Evergreen` • `OneTime` • `TermDefined` The default value is `OneTime`.
StartDate	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The date and time when the contract item price comes into effect.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ContractItemPriceFeed on page 2866
Feed tracking is available for the object.

ContractItemPriceHistory on page 2873
History is available for tracked fields of the object.

CostBookEntry

Represents the total cost of a product or service that's determined based on various factors that affect a product's price. For example, when a product is manufactured, the weight of the raw material can be a cost factor based on the amount of material required and its shipping cost. This object is available in API version 61.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`Cost`	**Type** currency **Properties** Create, Filter, Sort, Update **Description** Total cost of the product.
`CostBookId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the Cost Book record with which this record is associated. This field is a relationship field. **Relationship Name** CostBook **Relationship Type** Master-detail **Refers To** CostBook (the master object)
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** ISO code for any currency allowed by the organization. Available only for organizations with the multicurrency feature enabled. Valid values are: • `BHD`—Bahraini Dinar • `JPY`—Japanese Yen • `USD`—U.S. Dollar The default value is `USD`.
`Description`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description Description of this cost book entry record.
EffectiveFrom	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** Date and time when the cost book entry comes into effect.
EffectiveTo	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Date and time till when the cost book entry is no longer in effect.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last referred to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last viewed a record related to this record.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Name of the cost book entry.
ProductId	**Type** reference **Properties** Create, Filter, Group, Sort

Field	Details
	Description Required. ID of the Product2 record with which this record is associated. This field must be specified when creating Product2 records. This field can't be changed in an update. This field is a relationship field. **Relationship Name** Product **Relationship Type** Lookup **Refers To** Product2

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

CostBookEntryFeed on page 2866
Feed tracking is available for the object.

CostBookEntryHistory on page 2873
History is available for tracked fields of the object.

PriceAdjustmentSchedule

Represents a series of tiered discounts based on the number of items purchased. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AdjustmentMethod`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The method for applying tiered pricing. Possible values are: • Range—All items receive the discount of the highest tier the quantity falls in. • Slab—Items receive the discount defined for the tier they fall in.

Field	Details
	Possible values are: • `Range` • `Slab` The default value is `Range`.
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only if the multicurrency feature is enabled. Contains the ISO code for any currency allowed by the organization. Possible values are: • `BHD`—Bahraini Dinar • `JPY`—Japanese Yen • `USD`—U.S. Dollar The default value is `USD`.
`Description`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Text description of the price adjustment schedule.
`EffectiveFrom`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time when the price adjustment schedule comes into effect.
`EffectiveTo`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time when the price adjustment schedule remains effective.
`IsActive`	**Type** boolean

Field	Details
	Properties Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the price adjustment schedule is active (true) or not (false). You can change this field's value as often as necessary. Label is **Active**. Default value is `False`.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates whether the price adjustment schedule has been archived (true) or not (false). This field is read-only.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. The name of the price adjustment schedule. This field is read-only. Label is Price Adjustment Schedule Name.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The Salesforce ID of the sales representative who owns the price adjustment schedule. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup

Field	Details
	Refers To Group, User
`Pricebook2Id`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The price book associated with this price adjustment schedule record. This field is a relationship field. **Relationship Name** Pricebook2 **Relationship Type** Lookup **Refers To** Pricebook2
`ScheduleType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of price adjustment schedule. Possible values are: • `Attribute` • `Bundle` • `Custom` • `Term` • `Volume` The default value is `Volume`.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

PriceAdjustmentScheduleShare on page 2877
Sharing is available for the object.

PriceAdjustmentTier

Represents a discount tier in a price adjustment schedule. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AdjustmentType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type of price adjustment.
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only if the multicurrency feature is enabled. Contains the ISO code for any currency allowed by the organization. Possible values are: • `BHD`—Bahraini Dinar • `JPY`—Japanese Yen • `USD`—U.S. Dollar The default value is `USD`.
`EffectiveFrom`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time when the price adjustment tier comes into effect.
`EffectiveTo`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update

Field	Details
	Description The date and time when the price adjustment tier remains effective.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates when the user last referred to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it’s possible that this record was referenced (LastReferencedDate) and not viewed.
LowerBound	**Type** double **Properties** Create, Filter, Sort, Update **Description** The minimum quantity the discount can be applied to. It must be a positive integer and less than or equal to the upper bound of the tier.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the price adjustment tier.
PriceAdjustmentScheduleId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the price adjustment schedule that the discount is applied to. This field is a relationship field.

Field	Details
	Relationship Name PriceAdjustmentSchedule **Relationship Type** Lookup **Refers To** PriceAdjustmentSchedule
PricingTerm	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of pricing term units in the pricing term. Used with PricingTermUnit to define the length of the pricing term. For example, if PricingTermUnit is Months and this field is 1, the subscription is priced monthly.If the selling model is one-time, this field must be null.
PricingTermUnit	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The unit of time used to define the pricing term. Used with PricingTerm to define the length of the pricing term. For example, if this field is Months and PricingTerm is 1, the subscription is priced monthly. If the selling model is one-time, this field must be null. Possible values are: • `Annual`—Years • `Months`
Product2Id	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the product associated with the price adjustment tier. This field is a relationship field. **Relationship Name** Product2 **Relationship Type** Lookup **Refers To** Product2

Field	Details
`ProductSellingModelId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the ProductSellingModel record associated with this price adjustment tier record. This field is a relationship field. **Relationship Name** ProductSellingModel **Relationship Type** Lookup **Refers To** ProductSellingModel
`SellingModelType`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Indicates whether the product is sold as a one-time sale, an evergreen subscription, or a subscription with a defined term. Possible values are: • `Evergreen` • `OneTime`—One Time • `TermDefined`—Term-Defined The default value is `OneTime`.
`TierType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The unit of the discount. Possible values are: • AdjustmentAmount—An amount discounted from an item's list price • AdjustmentPercentage—A percentage discounted from an item's list price Possible values are: • `AdjustmentAmount`—Amount • `AdjustmentPercentage`—Percentage • `OverrideAmount`—Override

Field	Details
TierValue	**Type** double **Properties** Create, Filter, Sort, Update **Description** The value of the discount.
UpperBound	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The maximum quantity the discount can be applied to. Must be a positive integer. Not inclusive. Set this value one digit higher than the quantity you want the tier to include. For example, if a tier's upper bound is 99, set the value of UpperBound to 100. For the last tier, the value is optional.

Usage

To use PriceAdjustmentTiers, associate them with a PriceAdjustmentSchedule.

Tiers can't overlap, and no gaps are allowed between tiers.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

PriceAdjustmentTierFeed on page 2866
Feed tracking is available for the object.

PriceAdjustmentTierHistory on page 2873
History is available for tracked fields of the object.

PriceBook2

Represents a price book that contains the list of products that your org sells. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only if the multicurrency feature is enabled. Contains the ISO code for any currency allowed by the organization. Possible values are: • `BHD`—Bahraini Dinar • `JPY`—Japanese Yen • `USD`—U.S. Dollar The default value is `USD`.
`Description`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Text description of the price book.
`IsActive`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the price book is active (true) or not (false). Inactive price books are hidden in many areas in the user interface. You can change this field's value as often as necessary. Label is **Active**. The default value is `false`.
`IsArchived`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the price book has been archived (true) or not (false). This field is read only. The default value is `false`.

Field	Details
IsStandard	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the price book is the standard price book for the org (true) or not (false). Every org has one standard price book—all other price books are custom price books. The default value is `false`.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. Name of this object. This field is read-only for the standard price book.
ValidFrom	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time when a price book is initially valid. If this field is null, the price book is valid immediately when active.
ValidTo	**Type** dateTime

Field	Details
	Properties Create, Filter, Nillable, Sort, Update **Description** The date and time when a price book is valid to. If this field is null, the price book is valid until it's deactivated.

Usage

A price book is a list of products that your org sells.

- Each org has one standard price book that defines the standard or generic list price for each product or service that it sells.
- An org can have multiple custom price books to use for specialized purposes, such as for discounts, different channels or markets, or select accounts or opportunities. While your client application can create, delete, and update custom price books, your client application can only update the standard price book.
- For some orgs, the standard price book is the only price needed. If you set up other price books, you can reference the standard price book when setting up list prices in custom price books.

Use this object to query standard and custom price books that have been configured for your org. A common use of this object is to allow your client application to obtain valid Pricebook2 object IDs for use when configuring PricebookEntry records via the API.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

PriceBook2ChangeEvent **on page 2864**
Change events are available for the object.

PriceBook2History **on page 2873**
History is available for tracked fields of the object.

PriceBookEntry

Represents a product entry (an association between a Pricebook2 and Product2) in a price book. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Note: Salesforce Object Search Language (SOSL) allows you to search records across standard and custom objects. When filtering records in the PriceBookEntry object using SOSL, you can only sort by fields related to Product2.

Field	Details
CurrencyIsoCode	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Available only for organizations with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the organization. Possible values are: • BHD—Bahraini Dinar • JPY—Japanese Yen • USD—U.S. Dollar The default value is USD.
IsActive	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this price book entry is active (true) or not (false). Although you can never delete PricebookEntry records, your client application can set this flag to false. Inactive PricebookEntry records are hidden in many areas in the user interface. You can change this flag on a PricebookEntry record as often as necessary. The default value is false.
IsArchived	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the PricebookEntry has been archived (true) or not (false). This field is set to true when the Product2 record it's associated with is archived, or when the Pricebook2 record is archived. This field is read only. The default value is false.
Name	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Name of this price book entry record. This read-only field references the value in the Name field of the Product2 record.

Field	Details
Pricebook2Id	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. ID of the Pricebook2 record with which this record is associated. This field must be specified when creating Pricebook2 records. It can’t be changed in an update. This field is a relationship field. **Relationship Name** Pricebook2 **Relationship Type** Lookup **Refers To** Pricebook2
Product2Id	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Required. ID of the Product2 record with which this record is associated. This field must be specified when creating Product2 records. It can’t be changed in an update. This field is a relationship field. **Relationship Name** Product2 **Relationship Type** Lookup **Refers To** Product2
ProductCode	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Product code for this record. This read-only field references the value in the ProductCode field of the associated Product2 record.
ProductSellingModelId	**Type** reference

Field	Details
	Properties Create, Filter, Group, Nillable, Sort **Description** The ID of the related product selling model. This field is a relationship field. **Relationship Name** ProductSellingModel **Relationship Type** Lookup **Refers To** ProductSellingModel
`UnitPrice`	**Type** currency **Properties** Create, Filter, Sort, Update **Description** Required. Unit price for this price book entry. You can specify a value only if UseStandardPrice is set to false.
`UseStandardPrice`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this price book entry uses the standard price defined in the standard Pricebook2 record (true) or not (false). If set to true, then the UnitPrice field is read-only, and the value is the same as the UnitPrice value in the corresponding PricebookEntry in the standard price book (that is, the PricebookEntry record whose Pricebook2Id refers to the standard price book and whose Product2Id and CurrencyIsoCode are the same as this record). For PricebookEntry records associated with the standard Pricebook2 record, this field must be set to true. The default value is `false`.

Usage

Use this object to define the association between your organization’s products (Product2) and your organization’s standard price book or to custom price books (Pricebook2). Create one PricebookEntry record for each standard or custom price and currency combination for a product in a Pricebook2.

When creating these records, you must specify the IDs of the associated Pricebook2 record and Product2 record. Once these records are created, your client application can’t update these IDs.

This object is defined only for those organizations that have products enabled as a feature. If the organization doesn't have the products feature enabled, then the PricebookEntry object doesn't appear in the describeGlobal call, and you can't access it.

If you delete a PriceBookEntry that is referenced by a line item, the line item is unaffected, but the PriceBookEntry is archived and unavailable from the API. Deleted PriceBookEntry records can't be recovered.

You must load the standard price for a product before you're permitted to load its custom prices.

Create PriceBookEntry records by using this sObject API.

```
https://yourInstance.salesforce.com/services/data/v67.0/sobjects/PricebookEntry
```

This example shows a sample request that specifies the details of a price book entry.

```
{
  "ProductSellingModelId": "0jPxx0000000005EAA",
  "Product2Id": "01tLT00000A0YTlYAN",
  "IsActive": true,
  "Pricebook2Id": "01s1W000000SYXNQA4",
  "UnitPrice": "100.00"
}
```

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

PriceBookEntryChangeEvent on page 2864
Change events are available for the object.

PriceBookEntryHistory on page 2873
History is available for tracked fields of the object.

PriceBookEntryDerivedPrice

Represents the price of a product that's derived from another source such as a product or an asset. This object is available in API version 61.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
ContributingProductId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort

Field	Details
	Description Source product from which the derived price is calculated. The source product is associated with the derived price product. This field is a relationship field. **Relationship Name** ContributingProduct **Relationship Type** Lookup **Refers To** Product2
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** ISO code for any currency allowed by the organization. Available only if the multicurrency feature is enabled. Valid values are: • `BHD`—Bahraini Dinar • `JPY`—Japanese Yen • `USD`—U.S. Dollar The default value is `USD`.
`DerivedPricingScope`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Scope of the product based on which the derived price is calculated. Valid values are: • `Both` • `NonTransactional` • `Transactional`
`EffectiveFrom`	**Type** dateTime **Properties** Create, Filter, Sort, Update

Field	Details
	Description Date and time when the derived pricing comes into effect.
`EffectiveTo`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Date and time when the derived pricing is no longer in effect.
`Formula`	**Type** string **Properties** Create, Filter, Sort, Update **Description** Coded format of the formula used to calculate the derived price of a product from another product or asset.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last referred to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last viewed this record. If this value is null, it’s possible that this record was referenced (`LastReferencedDate`) and not viewed.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Name of the derived price record.
`OwnerId`	**Type** reference

Field	Details
	Properties Create, Defaulted on create, Filter, Group, Sort, Update **Description** ID of the user who created the record. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User
`PricebookEntryId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Price book entry associated with the source product. This field is a relationship field. **Relationship Name** PricebookEntry **Relationship Type** Lookup **Refers To** PricebookEntry
`PricebookId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** Price book associated with the source product. This field is a relationship field. **Relationship Name** Pricebook **Relationship Type** Lookup **Refers To** Pricebook2

Field	Details
PricingSource	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Pricing type used to calculate the derived price of the product. Valid values are: • Header • Product
ProductId	**Type** reference **Properties** Filter, Group, Sort **Description** Product associated with the derived pricing. This field is a relationship field. **Relationship Name** Product **Relationship Type** Lookup **Refers To** Product2
ProductSellingModelId	**Type** reference **Properties** Filter, Group, Sort **Description** Product selling model associated with this record. This field is a relationship field. **Relationship Name** ProductSellingModel **Relationship Type** Lookup **Refers To** ProductSellingModel

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

PriceBookEntryDerivedPriceFeed on page 2866
Feed tracking is available for the object.

PriceBookEntryDerivedPriceHistory on page 2873
History is available for tracked fields of the object.

PriceBookEntryDerivedPriceShare on page 2877
Sharing is available for the object.

PriceRevisionPolicy

Represents the guidelines and methods used to modify product or service prices, often incorporating formulas based on price revision entries and various adjustments. For example, a policy might dictate that prices are revised based on a formula that considers the regional Consumer Price Index (CPI) with a specific adjustment percentage, effective from a defined date, and categorized as either a flat adjustment or one directly based on the price revision entry data. This object is available in API version 65.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`EffectiveFrom`	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** The date and time when the price revision policy comes into effect.
`EffectiveTo`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date and time when the price revision policy is no longer in effect.
`Formula`	**Type** string **Properties** Create, Filter, Group, Sort, Update

Field	Details
	Description The coded format of the formula used to calculate the revised price of a product from a quote and order, or contract.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the price revision policy.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** ID of the user who created the record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
`PolicyType`	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of price revision policy. Valid values are: • `Flat`—You can't define a price index-based formula for revision. • `PriceIndex`—Price Index
`Region`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The region where the price revision policy is valid.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

PriceRevisionPolicyFeed on page 2866
Feed tracking is available for the object.

PriceRevisionPolicyHistory on page 2873
History is available for tracked fields of the object.

PriceRevisionPolicyShare on page 2877
Sharing is available for the object.

PricingAdjBatchJob

Represents the collective update of multiple records on their prices and other adjustments. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`EffectiveFrom`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time when the updated value can be considered for a pricing adjustment batch job.
`EffectiveTo`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time until when the updated value is effective and can be considered for a pricing adjustment batch job.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates whether the pricing adjustment batch job has been archived (`true`) or not (`false`). This field is read-only.
`LastTriggeredDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time when the pricing adjustment batch job was last triggered.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (`LastReferencedDate`) and not viewed.

Field	Details
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the pricing adjustment batch job.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The Salesforce ID of the sales representative who owns the pricing procedure resolution. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
ProcessedRecordsCount	**Type** long **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The total number of records that were successfully updated.
RecordCount	**Type** long **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The total number of records that have been processed.
RecordList	**Type** textarea **Properties** Create **Description** The list of record IDs eligible for a pricing adjustment batch job.

Field	Details
`ShouldSkipBulkRetry`	**Type** boolean **Properties** Create, Filter, Group, Nillable, Sort **Description** For internal use only.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The processing status of the pricing adjustment batch job. Valid values are: • `Completed` • `Failed` • `InProgress` • `New` • `PartiallyCompleted` • `Rerun`
`TargetObject`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** The target object of the pricing adjustment batch job. Valid values are: • `AttributeBasedAdjustment` • `BundleBasedAdjustment` • `PriceAdjustmentTier` • `PricebookEntry`
`UpdateType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of update being made by the pricing adjustment batch job. Valid values are:

Field	Details
	• `Amount` • `Override` • `Percentage`
`UpdateValue`	**Type** double **Properties** Create, Filter, Sort, Update **Description** The numerical value of the update.

Usage

To execute a pricing adjustment batch job through an API request, make a POST request to the `/services/data/v`***`67.0`***`/sobjects/PricingAdjBatchJob` resource. Here's a sample request payload.

```
{
  "TargetObject": "PriceAdjustmentTier",
  "UpdateType": "Amount",
  "UpdateValue": "10",
  "RecordList": "84YDU00000010ig2AA,84YDU00000010ig2AB,84YDU00000010ig2AC",
  "EffectiveFrom": "2024-08-01T10:07:09.000+0000",
  "EffectiveTo": "2024-08-05T10:07:09.000+0000"
}
```

You can specify a comma-separated list of record IDs that are eligible for a pricing adjustment batch job.

To rerun a pricing adjustment batch job, make a PATCH request to the `/services/data/v`***`67.0`***`/sobjects/PricingAdjBatchJob/`***`pricingAdjBatchJobID`*** resource. Here's a sample request payload.

```
{
  "Status": "Rerun"
}
```

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

PricingAdjBatchJobFeed on page 2866
Feed tracking is available for the object.

PricingAdjBatchJobHistory on page 2873
History is available for tracked fields of the object.

PricingAdjBatchJobShare on page 2877
Sharing is available for the object.

PricingAdjBatchJobLog

Represents the report that contains a list of failed adjustment requests along with an error message that describes the reason for failure. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AdjustedValue`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The adjusted value of a record. The stored value is used even if another pricing adjustment batch job is triggered again.
`EffectiveFrom`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time when the failed versioned record is generated. This is only applicable for Price Adjustment records.
`EffectiveTo`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time until when the failed versioned record is available. This is applicable only for Price Adjustment records.
`ErrorCode`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The error code for the failure during the record update process.
`ErrorMessage`	**Type** textarea **Properties** Create, Update **Description** The error message that's generated for the failure during the record update process.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates whether the pricing adjustment batch job has been archived (`true`) or not (`false`). This field is read-only.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (`LastReferencedDate`) and not viewed.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The name of the pricing adjustment batch job.
`PricingAdjBatchJobId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The pricing adjustment batch job associated with the pricing adjustment batch job log. This field is a relationship field.

Field	Details
	Relationship Name PricingAdjBatchJob **Relationship Type** Master-detail **Refers To** PricingAdjBatchJob (the master object)
`TargetRecord`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The ID of the record for which a pricing adjustment error was generated.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

PricingAdjBatchJobLogFeed
Feed tracking is available for the object.

PricingAdjBatchJobLogHistory **on page 2873**
History is available for tracked fields of the object.

PricingAPIExecution

Represents the pricing resolution for an pricing element determined using strategy name and formula. This object is available in API version 63.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`ApiEndpoint`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The unique API endpoint that is called.
`ApiType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies the API type of the pricing API execution. Possible values are: • `NGP` The default value is `NGP`.
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only if the multicurrency feature is enabled. Contains the ISO code for any currency allowed by the organization. Possible values are: • `BHD`—Bahraini Dinar • `JPY`—Japanese Yen • `USD`—U.S. Dollar The default value is `USD`.
`ExecutionKey`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique execution ID generated each time a pricing API runs.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.

Field	Details
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the record.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The Salesforce ID of the sales representative who owns the pricing procedure resolution. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
ReferenceKey	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Optional. The reference ID that a consuming workstream must pass in the API to search for specific logs in the Pricing Operations Console.
Status	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of the API response.

Field	Details
	Possible values are: • `Failure` • `Partial_Success`—Partial Success • `Success` The default value is `Success`.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

PricingAPIExecutionFeed on page 2866
Feed tracking is available for the object.

PricingAPIExecutionHistory on page 2873
History is available for tracked fields of the object.

PricingAPIExecutionShare on page 2877
Sharing is available for the object.

PricingProcedureResolution

Represents a selection for a pricing procedure to execute a pricing process from a list of pricing procedures available. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only if the multicurrency feature is enabled. Contains the ISO code for any currency allowed by the organization. Possible values are: • `BHD`—Bahraini Dinar • `JPY`—Japanese Yen

Field	Details
	• `USD`—U.S. Dollar The default value is `USD`.
`EffectiveFrom`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The date and time when the pricing procedure resolution comes into effect.
`EffectiveTo`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time till when the pricing procedure resolution remains effective.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates whether the pricing procedure resolution has been archived (true) or not (false). This field is read-only.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The name of the pricing procedure resolution.
`OwnerId`	**Type** reference

Field	Details
	Properties Create, Defaulted on create, Filter, Group, Sort, Update **Description** The Salesforce ID of the sales representative who owns the pricing procedure resolution. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User
PricingProcedureId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The pricing procedure record associated with this pricing procedure resolution. This field is a relationship field. **Relationship Name** PricingProcedure **Relationship Type** Lookup **Refers To** ExpressionSet
ProcedureType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The pricing data store associated with this pricing recipe field mappings.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

PricingProcedureResolutionFeed on page 2866
Feed tracking is available for the object.

PricingProcedureResolutionHistory on page 2873
History is available for tracked fields of the object.

PricingProcedureResolutionShare on page 2877
Sharing is available for the object.

PricingProcessExecution

Represents a record generated during the execution of a discovery or pricing procedure. Multiple procedures may be performed within a single API call, with each recorded in a Pricing API Execution record. This object is available in API version 63.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Available only if the multicurrency feature is enabled. Contains the ISO code for any currency allowed by the organization. Possible values are: • `BHD`—Bahraini Dinar • `JPY`—Japanese Yen • `USD`—U.S. Dollar The default value is `USD`.
`ExecutionKey`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The unique execution ID generated each time a pricing API runs.
`ExecutionType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update

Field	Details
	Description The type of execution defined internally within the pricing API. Possible values are: • `Api_Execution`—Api Execution • `Discovery` • `Discovery_Line`—Discovery Line • `Pricing` • `Pricing_Line`—Pricing Line The default value is `Pricing`.
`ExecutionTypeKey`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique execution type ID generated internally for procedure executions, such as pricing or discovery procedures.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (LastReferencedDate) and not viewed.
`Message`	**Type** textarea **Properties** Create, Nillable, Update **Description** The message generated upon running a pricing process.

Field	Details
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the record.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The Salesforce ID of the sales representative who owns the pricing procedure resolution. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
Status	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies the status of the execution type. Possible values are: • `Failure` • `Partial_Success`—Partial Success • `Success` The default value is `Success`.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

PricingProcessExecutionFeed on page 2866
Feed tracking is available for the object.

PricingProcessExecutionHistory on page 2873
History is available for tracked fields of the object.

PricingProcessExecutionShare on page 2877
Sharing is available for the object.

ProductPriceHistoryLog

Stores historical pricing data based on the product's price range. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** ISO code for any currency allowed by the organization. Available only for organizations with the multicurrency feature enabled. Valid values are: • `BHD`—Bahraini Dinar • `JPY`—Japanese Yen • `USD`—U.S. Dollar The default value is `USD`.
`Date`	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** The date when the product price history log record is created.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description Indicates whether the product price history log has been archived (`true`) or not (`false`). This field is read-only.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (`LastReferencedDate`) and not viewed.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The name of the product price history log.
`ProductPriceRangeId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The product price range associated with this product price history log record. This field is a relationship field. **Relationship Name** ProductPriceRange **Relationship Type** Master-detail **Refers To** ProductPriceRange (the master object)
`TrackedPrice`	**Type** currency **Properties** Create, Filter, Sort, Update **Description** The price for a product recorded for a particular date.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ProductPriceHistoryLogFeed on page 2866
Feed tracking is available for the object.

ProductPriceHistoryLogHistory on page 2873
History is available for tracked fields of the object.

ProductPriceRange

Represents the price range of a product determined by using a product selling model that's stored in the relevant price book. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** ISO code for any currency allowed by the organization. Available only for organizations with the multicurrency feature enabled. Valid values are: • `BHD`—Bahraini Dinar • `JPY`—Japanese Yen • `USD`—U.S. Dollar The default value is `USD`.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates whether the product price range has been archived (`true`) or not (`false`). This field is read-only.

Field	Details
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, it's possible that this record was referenced (`LastReferencedDate`) and not viewed.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Required. The name of the product price range.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The Salesforce ID of the sales representative who owns the product price range. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
ProductId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The product for which the price range is being determined. This field is a relationship field. **Relationship Name** Product **Refers To** Product2
ProductSellingModelId	**Type** reference

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The product selling model used to determine the price range of the product. This field is a relationship field. **Relationship Name** ProductSellingModel **Refers To** ProductSellingModel
`RecordedPrice`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The selected price of the product over a range of prices.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ProductPriceRangeFeed on page 2866
Feed tracking is available for the object.

ProductPriceRangeHistory on page 2873
History is available for tracked fields of the object.

ProductPriceRangeShare on page 2877
Sharing is available for the object.

ProductSellingModel

Defines one method by which a product can be sold; for example, as a one-time sale, an evergreen subscription, or a termed subscription. If the product is sold on subscription, this object defines the subscription's term. A product can have multiple product selling models. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates when the user last referred to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Indicates when the user last viewed this record.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name given to the product selling model.
`PricingTerm`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The number of pricing term units in the pricing term. Used with PricingTermUnit to define the length of the pricing term. For example, if PricingTermUnit is Months and this field is 1, the subscription is priced monthly.If the selling model is one-time, this field must be null.
`PricingTermUnit`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The unit of time used to define the pricing term. Used with PricingTerm to define the length of the pricing term. For example, if this field is Months and PricingTerm is 1, the subscription is priced monthly. If the selling model is one-time, this field must be null. Possible values are: • `Months`

Field	Details
	• `Quarterly` • `Semi-Annual` • `Annual`
`SellingModelType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Indicates whether the product is sold as a one-time sale, an evergreen subscription, or a subscription with a defined term. Possible values are: • `Evergreen` • `OneTime` • `TermDefined` The default value is `OneTime`.
`Status`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The status of the product selling model. Possible values are: • `Active` • `Draft` • `Inactive` The default value is `Draft`.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ProductSellingModelFeed on page 2866
Feed tracking is available for the object.

ProductSellingModelHistory on page 2873
History is available for tracked fields of the object.

ProductSellingModelDataTranslation

Represents the translated values of the data stored within the ProductSellingModel record's fields. This object is available in API version 61.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

- Your organization must be using Enterprise, Unlimited, or Developer edition.
- Translation Workbench and data translation must be enabled in your org.
- To view this object, you must have the "View Setup and Configuration" permission.

Fields

Field	Details
`IsOutOfDate`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the translation is out-of-date (`true`) or current (`false`). A translation is out-of-date if the parent Product2 record is updated after the last translation was filed.
`Language`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** The language for these translated values.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The translated value for the ProductSellingModel record name. This field is required to translate the text in other fields.
`ParentId`	**Type** reference

Field	Details
	Properties Create, Filter, Group, Sort, Update **Description** The ID of the ProductSellingModel record associated with the data that's being translated. This field is a relationship field. **Relationship Name** Parent **Relationship Type** Lookup **Refers To** ProductSellingModel

Usage

Use this object to translate the data stored in a ProductSellingModel record into the different languages supported by Salesforce. If data translation is enabled for custom fields on the ProductSellingModel object, additional ProductSellingModelDataTranslation fields exist for translating the data contained within those fields.

You can't use a custom external id field in an upsert call for a ProductSellingModelDataTranslation object.

ProductSellingModelOption

A junction object between Product Selling Model and Product2. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** The description of the product selling model option.
`DisplayName`	**Type** string

Field	Details
	Properties Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the product selling model option to display to customers.
`Increment`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The number of pricing term units that can be used to increase a subscription term.
`IsDefault`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indcates the default product selling model for a product. Setting a default is optional. A product can only have one default product selling model. The default value is `false`. This field requires Industries EPC.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view but not viewed it.
`Maximum`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The maximum number of pricing term units for a subscription term.
`Minimum`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The minimum number of pricing term units for a subscription term.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the product selling model option.
`Product2Id`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the Product2 record associated with this ProductSellingModelOption record. This field is a relationship field. **Relationship Name** Product2 **Relationship Type** Lookup **Refers To** Product2
`ProductSellingModelId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the ProductSellingModel record associated with this ProductSellingModelOption record. This field is a relationship field. **Relationship Name** ProductSellingModel

Field	Details
	Relationship Type Lookup **Refers To** ProductSellingModel
`ProrationPolicyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort **Description** The ID of the ProrationPolicy record associated with this ProductSellingModelOption record. This field is a relationship field. **Relationship Name** ProrationPolicy **Relationship Type** Lookup **Refers To** ProrationPolicy

ProcedurePlanCriterion

The procedure plan option associated with the procedure plan criterion record. This object is available in API version 67.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
`ActualValue`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The user-defined value that is compared to the value of the SObject field value.
`DataType`	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Restricted picklist, Sort, Update **Description** The data type of the field from the selected object.
`FieldPath`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The path of the field used in a procedure in relation to the object that the field belongs to.
`ObjectField`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The object field value used to resolve the procedure plan option.
`Operator`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies the operator used by the procedure plan criterion. Possible values are: • Equals • GreaterThan • GreaterThanOrEquals • In • IsNotNull • IsNull • LessThan • LessThanOrEquals • NotEquals • NotIn
`ProcedurePlanOptionId`	**Type** reference

Field	Details
	Properties Create, Filter, Group, Sort **Description** This field is a relationship field. **Relationship Name** ProcedurePlanOption **Relationship Type** Master-detail **Refers To** ProcedurePlanOption (the master object)
`Sequence`	**Type** int **Properties** Create, Filter, Group, Sort **Description** The sequence in which the conditions defined in the procedure plan criteria are processed.

ProrationPolicy

Represents the proration policy associated with a Product Selling Model Option that determines how a product's price is calculated based on subscription duration or billing periods. This object is available in API version 67.0 and later.

Supported Calls

`create()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`

Fields

Field	Details
`ArePartialPeriodsAllowed`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort **Description** Indicates whether partial periods should be allowed for standard time periods. The default value is false.

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the proration policy was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the proration policy was last viewed.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort **Description** The name of the proration policy.
ProrationPolicyType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** The type of proration policy to be used. Possible values are: • `StandardTimePeriods`—Standard Time Periods
RemainderStrategy	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** The type of remainder strategy to be used.

Salesforce Pricing Fields on Standard Objects

Salesforce Pricing adds standard fields to some standard Salesforce objects of other features to represent information specific to pricing. These fields are available only in orgs where Salesforce Pricing is enabled.

IndexRate

Standard fields extend the IndexRate object for use in Salesforce Pricing to represent information for a given rate. This object is available in API version 65.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`Region`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Specified the region associated with the given rate.
`UsageType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies the usage type associated with the given rate. Possible values are: • `Pricing`

Salesforce Pricing Business APIs

Perform pricing request, create context instance, sync pricing data, and manage pricing recipes and pricing waterfall details by using Salesforce Pricing Business APIs.

This table lists the available Salesforce Pricing resources.

Resource	Description
`/connect/core-pricing/price-contexts/`***`contextid`*** (POST)	Perform a pricing request by using the instance ID of a context.
`/connect/core-pricing/pricing` (POST)	Create and hydrate context instance in a single request. Provide a comprehensive response that contains final pricing details per line items and related errors, if any.
`/connect/core-pricing/sync/`***`pricingSyncOrigin`*** (GET)	Sync pricing data to ensure that the lookup tables contain the latest pricing data.
`/connect/core-pricing/recipe` (GET)	Get the mapping details of pricing recipes to the associated pricing recipe table.
`/connect/core-pricing/recipe/mapping` (POST)	Create a mapping between the pricing recipe and the Decision Tables. Post recipes with lookup tables or procedures.
`/connect/core-pricing/versioned-revise-details` (POST)	Create revisions of a pricing request with versions for adjustment entities.
`/connect/core-pricing/waterfall/`***`lineItemId`***`/`***`executionId`*** (GET)	Get the persisted price waterfall that stores the process logs. Price waterfall provides insights into every step of the pricing process.
`/connect/core-pricing/waterfall` (POST)	Create a log of price waterfall. Price waterfall provides insights into every step of the pricing process.
`/connect/core-pricing/pbeDerivedPricingSourceProduct` (POST)	Get the source product for the Price Book Entry (PBE) derived pricing.

Resource	Description
/connect/core-pricing/apiexecutionlogs/*executionId* (GET)	Get the log details of a pricing API execution record by using the execution ID.
/connect/core-pricing/pricing-process-execution/*executionId* (GET)	Get the execution details of a pricing process by using the execution ID.
/connect/core-pricing/pricing-process-execution/lineitems/*executionId*/*executionType* (GET)	Get the pricing execution details for the line items of a pricing process by using the execution ID and execution type.
/connect/core-pricing/simulationInputVariablesWithData (GET)	Get details of the pricing simulation input variables along with associated data.

This section lists the available Procedure Plan Definition-related resources. Use procedure plan definitions to define criteria for all pricing process-related requirements in one central location, and to set up the procedures based on these requirements.

Resource	Description
`/connect/procedure-plan-definitions` (GET, POST)	Get the records of procedure plan definitions. Additionally, create a record of a procedure plan definition.
`/connect/procedure-plan-definitions/`***`procedurePlanDefinitionId`***(GET, PATCH, DELETE)	Get, update, or delete a procedure plan definition record by using the record ID.
`/connect/procedure-plan-definitions/evaluate` (POST)	Evaluate a procedure plan definition based on a primary object to check for prerequisites such as usage type and context mapping details.
`/connect/procedure-plan-definitions/evaluate/`***`procedurePlanDefinitionName`*** (POST)	Evaluate a procedure plan definition based on the name of a definition to check for prerequisites such as usage type and context mapping details.
`/connect/procedure-plan-definitions/`***`procedurePlanDefinitionId`***`/version` (POST)	Create records of a procedure plan version with details.
`/connect/procedure-plan-definitions/versions/`***`procedurePlanVersionId`*** (GET, PATCH, DELETE)	Get, update, or delete a procedure plan definition version record by using the record ID.

Connect REST API Developer Guide: Introduction

Resources

Learn more about the available Salesforce Pricing resources.

PBE Derived Pricing (POST)

Get the source product for the Price Book Entry (PBE) derived pricing.

Price Context (POST)

Perform a pricing request by using the instance ID of a context.

Pricing (POST)

Create and hydrate context instance in a single request. Provide a comprehensive response that contains final pricing details per line items and related errors, if any.

API Execution Logs (GET)

Get the log details of a pricing API execution record by using the execution ID.

Pricing Process Execution (GET)

Get the execution details of a pricing process by using the execution ID.

Pricing Process Execution for Line Items (GET)

Get the pricing execution details for the line items of a pricing process by using the execution ID and execution type.

Pricing Data Sync (GET)

Sync pricing data to ensure that the lookup tables contain the latest pricing data.

Pricing Recipe (GET)

Get the mapping details of pricing recipes to the associated pricing recipe table.

Pricing Recipe Mapping (POST)

Create a mapping between the pricing recipe and the Decision Tables. Post recipes with lookup tables or procedures.

Pricing Versioned Revision Details (POST)

Create revisions of a pricing request with versions for adjustment entities.

Pricing Waterfall (GET)

Get the persisted price waterfall that stores the process logs. Price waterfall provides insights into every step of the pricing process.

Pricing Waterfall (POST)

Create a log of price waterfall. Price waterfall provides insights into every step of the pricing process.

Procedure Plan Definitions (GET, POST)

Get the records of procedure plan definitions. Additionally, create a record of a procedure plan definition.

Procedure Plan Definition By ID (GET, PATCH, DELETE)

Get, update, or delete a procedure plan definition record by using the record ID.

Procedure Plan Evaluation By Object (POST)

Evaluate a procedure plan definition based on a primary object to check for prerequisites such as usage type and context mapping details.

Procedure Plan Evaluation By Definition Name (POST)

Evaluate a procedure plan definition based on the name of a definition to check for prerequisites such as usage type and context mapping details.

Procedure Plan Version (POST)

Create records of a procedure plan version with details.

Procedure Plan Version Details (GET, PATCH, DELETE)

Get, update, or delete a procedure plan definition version record by using the record ID.

Pricing Simulation Input Variables With Data (GET)

Get details of the pricing simulation input variables along with associated data.

PBE Derived Pricing (POST)

Get the source product for the Price Book Entry (PBE) derived pricing.

Resource

```
/connect/core-pricing/pbeDerivedPricingSourceProduct
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/core-pricing/pbeDerivedPricingSourceProduct
```

Available version

61.0

HTTP methods

POST

Request body for POST

JSON example

```
{
"productId":"01txx0000006i2SAAQ",
"pricebookEntryId":"01uxx0000008yYcAAI",
"effectiveFrom":"2020-01-01T22:53:20.000Z",
"effectiveTo":"2021-01-01T22:53:20.000Z"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
effectiveFrom	String	Date from when the price book entry is effective.	Required	61.0

Name	Type	Description	Required or Optional	Available Version
`effectiveTo`	String	Date until when the price book entry is effective.	Required	61.0
`pricebookEntryId`	String	ID of the price book entry.	Required	61.0
`productId`	String	ID of the price book.	Required	61.0

Response body for POST

PBE Derived Pricing

Price Context (POST)

Perform a pricing request by using the instance ID of a context.

If price waterfall is disabled from Salesforce Pricing Setup in your org, this API doesn't return the waterfall details. You can use the Price Waterfall API to retrieve the waterfall details if price waterfall persistence is enabled in Salesforce Pricing Setup.

Resource

```
/connect/core-pricing/price-contexts/contextid
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/core-pricing/price-contexts/0U3RM00000000SR0AY
```

Available version

60.0

  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`configurationOverrides`	Configuration Override Input	Parameters to override the pricing configuration.	Optional	60.0
`contextDefinitionId`	String	ID of the context definition that defines the structure of the input data.	Required	60.0
`contextMappingId`	String	ID of the context mapping that maps the input data to the context instance.	Required	60.0
`jsonDataString`	String	Data to hydrate the context, which must be in JSON format and passed as String. Pass the JSON data as String by using the stringify() method to convert the object to string. The keys in the `jsonDataString` property must be in accordance to the `contextMappingId` property sent in the request. Make sure that the `businessObjectType` value within this property node is set to the sObject used in the context mappings.	Required	60.0

Name	Type	Description	Required or Optional	Available Version
pricing ProcedureId	String	ID or API name of the pricing procedure used for calculating the prices. A pricing procedure is represented as an Expression Set Definition in the system. If you're an Experience Cloud user, specify the name of the pricing procedure.	Optional	60.0

Response body for POST

Pricing Output

API Execution Logs (GET)

Get the log details of a pricing API execution record by using the execution ID.

Resource

```
/connect/core-pricing/apiexecutionlogs/executionId
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/core-pricing/apiexecutionlogs/29646938297972
```

Available version

63.0

HTTP methods

GET

Path parameter for GET

Parameter Name	Type	Description	Required or Optional	Available Version
executionId	String	ID of the pricing process execution record.	Required	63.0

Response body for GET

Pricing Execution Waterfall Response

Pricing Process Execution (GET)

Get the execution details of a pricing process by using the execution ID.

Resource

```
/connect/core-pricing/pricing-process-execution/executionId
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/core-pricing/pricing-process-execution/29646938297972
```

Available version

63.0

HTTP methods

GET

Path parameter for GET

Parameter Name	Type	Description	Required or Optional	Available Version
`executionId`	String	ID of the pricing process execution record. The ID is generated each time a pricing process is executed.	Required	63.0

Query parameter for GET

Parameter Name	Type	Description	Required or Optional	Available Version
`executionType`	String	Type of execution that's defined internally within the pricing API. Valid values are: • `API_Execution` • `Discovery`—Discovery procedure • `Discovery_Line`—Discovery procedure for the line items. • `Pricing`—Pricing procedure • `Pricing_Line`—Pricing procedure for the line items. If the `executionType` parameter isn't specified, the API retrieves records for all the execution types that are associated with the specified execution ID.	Optional	63.0

Response body for GET

Pricing Process Execution Response

Pricing Process Execution for Line Items (GET)

Get the pricing execution details for the line items of a pricing process by using the execution ID and execution type.

Resource

```
/connect/core-pricing/pricing-process-execution/lineitems/executionId/executionType
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/core-pricing/pricing-process-execution/lineitems/29646938297972/Pricing_Line
```

Available version

63.0

HTTP methods

GET

Path parameters for GET

Parameter Name	Type	Description	Required or Optional	Available Version
executionId	String	ID of the pricing process execution record.	Required	63.0
executionType	String	Type of the execution that's defined internally within the pricing API. Valid values are: • Pricing_Line • Discovery_Line	Required	63.0

Response body for GET

Pricing Process Execution Details for Line Items

Pricing Data Sync (GET)

Sync pricing data to ensure that the lookup tables contain the latest pricing data.

To partially synchronize pricing data, use the Decision Table Refresh Action in a Flow. See Decision Table Refresh Action.

Resource

```
/connect/core-pricing/sync/pricingSyncOrigin
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/core-pricing/sync/syncData
```

This example shows a sample resource to filter by pricing recipe.

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/core-pricing/sync/syncData?pricingRecipeId=12Gxx0000005IzhEAE
```

Available version

60.0

HTTP methods

GET

Request parameters for GET

Parameter Name	Type	Description	Required or Optional	Available Version
`pricingRecipeId`	String	ID of the pricing recipe whose decision tables you want to sync. If not specified, the default pricing recipe is used.	Optional	67.0

Response body for GET

Pricing Generic Response

Pricing Recipe (GET)

Get the mapping details of pricing recipes to the associated pricing recipe table.

Resource

```
/connect/core-pricing/recipe
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/core-pricing/recipe
```

Available version

60.0

HTTP methods

GET

Response body for GET

Pricing Recipe Response

Pricing Recipe Mapping (POST)

Create a mapping between the pricing recipe and the Decision Tables. Post recipes with lookup tables or procedures.

Resource

```
/connect/core-pricing/recipe/mapping
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/core-pricing/recipe/mapping
```

Available version

60.0

HTTP methods

POST

Request body for POST

JSON example

```
{
```

```
    "recipeId" : "12Gxx0000005J9MEAU",
    "pricingRecipeLookUpTableInputRepresentations": [
    {
      lookupId: “12Gxx0000005J9MEAU”,
      pricingComponentType: “CustomDiscount”
  },
    {
      lookupId: “12Gxx0000005J9MEAU”,
      pricingComponentType: “CustomDiscount”
  }
 ],
    "pricingRecipeProcedureInputRepresentation" : {
    "procedureId" : "9QLxx0000004C92GAE"
}
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`pricingRecipeLookUpTableInputRepresentations`	Pricing Recipe LookUp Table Input[]	Input representation of the recipe mapping.	Required	60.0
`pricingRecipeProcedureInputRepresentation`	Pricing Recipe Procedure Input	Input representation of the procedure that's used in the pricing recipe.	Required	60.0
`recipeId`	String	ID of the pricing recipe.	Required	60.0

Response body for POST

Pricing Recipe Post

Pricing Versioned Revision Details (POST)

Create revisions of a pricing request with versions for adjustment entities.

Resource

```
/connect/core-pricing/versioned-revise-details
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/core-pricing/versioned-revise-details
```

Available version

60.0

HTTP methods

POST

Request body for POST

JSON example

This example shows the input for versioned revision details for attribute-based adjustment.

```
{
        "entityName":"AttributeBasedAdjustment",
        "id":"entityId",
        "priceAdjustmentId":"priceAdjustmentScheduleId",
        "productId":"ProductId",
        "productSellingModelId":"PsmId",
        "adjustmentType":"AdjustmentType",
        "adjustmentValue":"AdjustmentValue(Numeric)"",
        "effectiveFrom":"EffectiveFrom date",
        "effectiveTo":"EffectiveTo Date",
        "additionalFieldsToValueMap":{
        "attributeBasedAdjRuleId":"AttributeBasedAdjRuleId"
}
}
```

This example shows the input for versioned revision details for bundle-based adjustment.

```
 {
        "entityName": "BundleBasedAdjustment",
        "id": "entityId",
        "priceAdjustmentScheduleId": "priceAdjustmentScheduleId",
        "productId": "ProductId",
        "productSellingModelId": "PsmId",
        "adjustmentType": "AdjustmentType",
        "adjustmentValue": "AdjustmentValue(Numeric)",
        "effectiveFrom":"EffectiveFrom date",
        "effectiveTo":"EffectiveTo Date",
        "additionalFieldsToValueMap": {
          "rootBundleId": "RootBundleId",
          "parentProductId": "ParentProductId"
        }
 }
```

Properties

Name	Type	Description	Required or Optional	Available Version
additional Fields ToValueMap	Map<String, String>	Map containing the additional fields specific to the entity.	Optional	60.0
adjustment Type	String	Adjustment type such as, percentage, amount, or override.	Required	60.0
adjustment Value	String	Value for the adjustment.	Required	60.0

Name	Type	Description	Required or Optional	Available Version
`effectiveFrom`	String	Date from when the adjustment is effective.	Required	60.0
`effectiveTo`	String	Date until when the adjustment is effective.	Optional	60.0
`entityName`	String	Name of the entity such as AttributeBasedAdjustment entity or BundleBasedAdjustment entity.	Required	60.0
`id`	String	ID of the record.	Required	60.0
`priceAdjustmentScheduleId`	String	ID of the price adjustment schedule record.	Required	60.0
`productId`	String	Product ID of the record.	Required	60.0
`productSellingModelId`	String	Product selling model ID associated to the record.	Optional	60.0

Response body for POST

Pricing Versioned Revision Details

Pricing Waterfall (GET)

Get the persisted price waterfall that stores the process logs. Price waterfall provides insights into every step of the pricing process.

If price waterfall persistence is disabled from Salesforce Pricing Setup in your org, this API doesn't return the waterfall details. You can view the waterfall details in the Pricing API or Price Context API response if price waterfall is enabled in Salesforce Pricing Setup.

Advanced Price Logs

You can set up advanced price logs to capture exception details for complex pricing elements. The API response captures input and output values to trace any exceptions. Refer to the diagnostic data available in the price waterfall details to identify and fix performance issues. See Advanced Price Logs.

Resource

```
/connect/core-pricing/waterfall/lineItemId/executionId
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/core-pricing/waterfall/Gold/2yHdNNEFOZr9jAe4gHS7?tagsToFilter=UnitPrice
```

Available version

60.0

HTTP methods

GET

Query parameters

Name	Type	Description	Required or Optional	Available Version
`tagsToFilter`	String	Comma-separated tags to filter.	Optional	61.0
`usageType`	String	Usage type of the waterfall log record. Valid values are: • `Pricing` • `Discovery` • `Rating`—Specifies that the record type is `Rating`. If this value is specified, the API creates a log of rating waterfall. See Rating Waterfall. The default value is `Pricing`.	Optional	62.0

Response body for GET

Line Item Waterfall Response

Pricing Waterfall (POST)

Create a log of price waterfall. Price waterfall provides insights into every step of the pricing process.

Resource

```
/connect/core-pricing/waterfall
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/core-pricing/waterfall
```

Properties

Name	Type	Description	Required or Optional	Available Version
`contextDefinitionVersionId`	String	Context definition version ID of the pricing procedure.	Optional	60.0
`contextMappingId`	String	Context mapping ID of the pricing procedure.	Optional	60.0
`currencyCode`	String	Currency code such as, USD or INR.	Optional	60.0
`executionEndTimestamp`	String	End timestamp of procedure execution.	Optional	60.0
`executionId`	String	Execution ID for a particular execution of a pricing procedure.	Required	60.0
`executionStartTimestamp`	String	Start timestamp of procedure execution.	Optional	60.0
`lineItemId`	String	Line item ID for which the price is being calculated.	Required	60.0
`output`	Map<String, Object>	Output of the pricing procedure.	Optional	60.0
`waterfall`	Pricing Waterfall Input[]	Details of the pricing waterfall.	Required	60.0

Response body for POST

Pricing Generic Response

Procedure Plan Definitions (GET, POST)

Get the records of procedure plan definitions. Additionally, create a record of a procedure plan definition.

Resource

```
/connect/procedure-plan-definitions
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/
procedure-plan-definitions?isTemplate=true
```

Available version

62.0

HTTP methods

GET, POST

Request parameters for GET

Parameter Name	Type	Description	Required or Optional	Available Version
`isTemplate`	Boolean	Indicates whether to return a list of file-based definitions (`true`) or not (`false`). This API request returns a list of database-based definitions, by default.	Optional	62.0

Response body for GET

Procedure Plan Definitions

Request body for POST

JSON example

This example shows a sample request to create a procedure plan definition record by using the Procedure Plan Definitions (POST) API.

```
  {
  "description": "Definition for Quote",
  "developerName": "Quote_Definition_Sample",
  "name": "Quote_Definition_Sample",
  "processType": "Default",
  "primaryObject": "BusinessHours",

Properties

Name	Type	Description	Required or Optional	Available Version
`description`	String	Description of the procedure plan definition.	Optional	62.0
`developerName`	String	Developer name of the procedure plan definition.	Required if you're invoking the Procedure Plan Definitions API (POST).	62.0
`name`	String	Name of the procedure plan definition.	Optional	62.0
`primaryObject`	String	Source object that's used to create a procedure with rule-based criteria. This property value must be a valid object name and must be unique in the ProcedurePlanDefinition object.	Required if you're invoking the Procedure Plan Definitions API (POST) and if you're creating a procedure with rule-based criteria.	62.0
`procedurePlanDefinitionVersions`	Procedure Plan Definition Version Input[]	List of versions of a procedure plan definition.	Required	62.0
`processType`	String	Specifies the business processes that need a procedure plan for each sObject and definition. Valid values are: • `Billing` • `DRO` • `DeepClone` • `ProductDiscovery` • `Revenue Cloud` These values can be used based on the available license. If unspecified, the value is set to `Default`.	Required	63.0
`recordId`	String	ID of the procedure plan definition record.	Required if you're invoking the Procedure Plan Definition By ID API (PATCH).	62.0

Response body for POST

Procedure Plan Generic

Procedure Plan Definition By ID (GET, PATCH, DELETE)

Get, update, or delete a procedure plan definition record by using the record ID.

Resource

```
/connect/procedure-plan-definitions/procedurePlanDefinitionId
```

The `procedurePlanDefinitionId` property value is the ID or name of the procedure plan definition record to perform the request for.

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/procedure-plan-definitions/1FNxx0000004EsOGAU
```

Available version

62.0

HTTP methods

DELETE, GET, PATCH

You can delete a procedure plan definition only if it doesn't include any active procedure plan version.

Response body for GET

Procedure Plan Definition

Request body for PATCH

JSON example

This example shows a sample request to update a procedure plan definition by using the Procedure Plan Definition By ID (PATCH) API.

Note: The properties that aren't specified in the input are deleted when updating the record.

```
{
  "description": "Default definition patch update",
  "developerName": "Quote_Definition",
  "name": "Quote_Definition",
  "primaryObject": "Quote",
  "recordId": "1FNxx0000004EsOGAU"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
description	String	Description of the procedure plan definition.	Optional	62.0
developerName	String	Developer name of the procedure plan definition.	Required if you're invoking the Procedure Plan Definitions API (POST).	62.0
name	String	Name of the procedure plan definition.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
primary Object	String	Source object that's used to create a procedure with rule-based criteria. This property value must be a valid object name and must be unique in the ProcedurePlanDefinition object.	Required if you're invoking the Procedure Plan Definitions API (POST) and if you're creating a procedure with rule-based criteria.	62.0
procedurePlan Definition Versions	Procedure Plan Definition Version Input[]	List of versions of a procedure plan definition.	Required	62.0
processType	String	Specifies the business processes that need a procedure plan for each sObject and definition. Valid values are: • `Billing` • `DRO` • `DeepClone` • `ProductDiscovery` • `Revenue Cloud` These values can be used based on the available license. If unspecified, the value is set to `Default`.	Required	63.0
recordId	String	ID of the procedure plan definition record.	Required if you're invoking the Procedure Plan Definition By ID API (PATCH).	62.0

Response body for PATCH

Procedure Plan Definition

Procedure Plan Evaluation By Object (POST)

Evaluate a procedure plan definition based on a primary object to check for prerequisites such as usage type and context mapping details.

Resource

```
/connect/procedure-plan-definitions/evaluate
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/
procedure-plan-definitions/evaluate
```

Available version

62.0

HTTP methods

POST

Request body for POST

JSON example

This example shows a sample request to evaluate a procedure plan definition by using a primary object.

```
{
  "idList": ["a01DU000000BylcYAC"],
  "evaluationDate": "2024-07-08T10:15:30.000Z",
  "processType": "Default",
  "sectionType": ["PricingProcedure"],
  "subSectionType": ["Revenue"]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`evaluationDate`	String	Date when the evaluation is applicable. This property value must be within the date range when the procedure plan definition is effective.	Required	62.0
`idList`	String[]	List of record IDs of the procedure plan definitions to be evaluated.	Required only if you're invoking the Procedure Plan Evaluation By Object (POST) API.	62.0
`processType`	String	Specifies the business processes that need a procedure plan for each sObject and definition. Valid values based on the available are: • `Billing` • `DRO` • `DeepClone` • `ProductDiscovery` • `Revenue Cloud` These values can be used based on the available license. If unspecified, the value is set to `Default`.	Optional	63.0

Name	Type	Description	Required or Optional	Available Version
		If a procedure plan definition exist in the org with `processType` value as `null`, modify the value to `Default`.		
`sectionType`	String[]	Name of section to be evaluated. Valid values are: • `PricingProcedure` • `ProductDiscoveryProcedure` • `ProductQualificationProcedure` • `PricingDiscoveryProcedure` • `DiscountSpreadServiceProcedure` • `RatingProcedure` • `Custom` • `RatingDiscoveryProcedure`	Optional	62.0
`subSectionType`	String[]	Name of subsection to be evaluated.	Optional	62.0

The combination of the `sectionType` and `subSectionType` property values must be unique for every procedure plan version.

Response body for POST

Procedure Plan Evaluation Response

Procedure Plan Evaluation By Definition Name (POST)

Evaluate a procedure plan definition based on the name of a definition to check for prerequisites such as usage type and context mapping details.

Resource

```
/connect/procedure-plan-definitions/evaluate/procedurePlanDefinitionName
```

Resource example

```
https://yourInstance.salesforce.com/services/data
/v67.0/connect/procedure-plan-definitions/evaluate/Sample_Definition
```

Available version

62.0

HTTP methods

POST

Request body for POST

JSON example

This example shows a sample request to evaluate a procedure plan definition by using a definition name.

```
{
  "evaluationDate": "2024-07-08T10:15:30.000Z",
  "processType": "Default",
  "sectionType": ["PricingProcedure"],
  "subSectionType": ["Revenue"]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`evaluationDate`	String	Date when the evaluation is applicable. This property value must be within the date range when the procedure plan definition is effective.	Required	62.0
`idList`	String[]	List of record IDs of the procedure plan definitions to be evaluated.	Required only if you're invoking the Procedure Plan Evaluation By Object (POST) API.	62.0
`processType`	String	Specifies the business processes that need a procedure plan for each sObject and definition. Valid values based on the available are: • `Billing` • `DRO` • `DeepClone` • `ProductDiscovery` • `Revenue Cloud` These values can be used based on the available license. If unspecified, the value is set to `Default`. If a procedure plan definition exist in the org with `processType` value as `null`, modify the value to `Default`.	Optional	63.0
`sectionType`	String[]	Name of section to be evaluated. Valid values are: • `PricingProcedure` • `ProductDiscoveryProcedure` • `ProductQualificationProcedure`	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
		• `PricingDiscoveryProcedure` • `DiscountSpreadServiceProcedure` • `RatingProcedure` • `Custom` • `RatingDiscoveryProcedure`		
`subSectionType`	String[]	Name of subsection to be evaluated.	Optional	62.0

The combination of the `sectionType` and `subSectionType` property values must be unique for every procedure plan version.

Response body for POST

Procedure Plan Evaluation Response

Procedure Plan Version (POST)

Create records of a procedure plan version with details.

Resource

```
/connect/procedure-plan-definitions/procedurePlanDefinitionId/version
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/
procedure-plan-definitions/1FNxx0000004EsOGAU/version
```

Available version

62.0

Note: The properties that aren’t specified in the input are deleted when updating the record.

Properties

Name	Type	Description	Required or Optional	Available Version
`active`	Boolean	Indicates whether this procedure plan definition version is active (`true`) or not (`false`). You can’t edit or delete a procedure plan version that’s in the active state.	Required	62.0

Name	Type	Description	Required or Optional	Available Version
`contextDefinition`	String	Context definition that's associated with the procedure plan definition version record.	Required	62.0
`developerName`	String	Unique developer name of the procedure plan definition version.	Required	62.0
`effectiveFrom`	String	Date and time from when the procedure plan definition version comes into effect.	Required	62.0
`effectiveTo`	String	Date and time from when the procedure plan definition version is no longer in effect.	Required	62.0
`inheritedFrom`	String	Template this procedure plan definition version is created from.	This property is read-only.	62.0
`procedurePlanSections`	Procedure Plan Section Input[]	Procedure setup sections for a procedure plan definition. Each section enables the setup of a procedure type by using a rule-based criteria. Keep these considerations in mind when you modify this property. • You can edit or delete a procedure plan section if it isn't associated with an active procedure plan version. • You can create a procedure plan section with rule-based resolution type if the primary object isn't empty in the definition.	Required	62.0
`rank`	Integer	Current rank of the procedure plan definition version that's used to decide the sequence of execution of a procedure plan definition version.	Required	62.0
`readContextMapping`	String	Mapping that's used to read data from the mapped object and populate the context definition. This property value must be associated with a context definition.	Optional	62.0
`recordId`	String	ID of the procedure plan definition version record.	Required	62.0

Name	Type	Description	Required or Optional	Available Version
`saveContextMapping`	String	Mapping that's used to save data from the context definition and populate the mapped object. This property value must be associated with a context definition.	Optional	62.0
`status`	String	Status of the procedure plan definition version record.	Optional	62.0

Response body for POST

Procedure Plan Generic

Procedure Plan Version Details (GET, PATCH, DELETE)

Get, update, or delete a procedure plan definition version record by using the record ID.

Resource

```
/connect/procedure-plan-definitions/versions/procedurePlanVersionId
```

The `procedurePlanVersionId` property value is the ID or name of the procedure plan version record to perform the request for.

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/
procedure-plan-definitions/versions/1Cvxx0000004E1ACAU
```

Available version

62.0

HTTP methods

DELETE, GET, PATCH

You can't delete a procedure plan version if it's the only procedure plan version in a procedure plan definition.

Response body for GET

Procedure Plan Definition Version

Request body for PATCH

Pricing Simulation Input Variables With Data

Request Bodies

Learn more about the available Salesforce Pricing API request bodies.

Adjustment Details Input

Input representation of the adjustment details.

Configuration Override Input

Input representation of the details to override for a Pricing API configuration.

PBE Derived Pricing Input

Input representation of the request to get the source product for the Price Book Entry (PBE) derived pricing.

Pricing Input

Input representation of the details of a Pricing API request.

Pricing Recipe Input

Input representation to set up a pricing recipe page.

Pricing Recipe LookUp Table Input

Input representation of the lookup tables for the setup page recipe.

Pricing Recipe Procedure Input

Input representation of the procedure for the setup page recipe.

Pricing Request Input

Input representation of a pricing request.

Pricing Versioned Revision Details Input

Input representation of the versioned revision details.

Pricing Waterfall Input

Input representation of the pricing waterfall details.

Pricing Waterfall Log Input

Input representation of the request to create an explainability action log.

Procedure Plan Criterion Input

Input representation of the details of a procedure plan criterion.

Procedure Plan Definition Input

Input representation of the details of a procedure plan definition.

Procedure Plan Definition Version Input

Input representation of the details of a procedure plan definition version.

[Procedure Plan Evaluation Input](#)

Input representation of the details used to evaluate a procedure plan definition.

[Procedure Plan Section Input](#)

Input representation of the details of a procedure plan section.

[Procedure Plan Option Input](#)

Input representation of the details of a procedure plan option.

Adjustment Details Input

Input representation of the adjustment details.

JSON example

```
  "pricingElement": {
    "adjustments": [{
    "AdjustmentValue": "15.00",
    "AdjustmentType": "Percentage"
 }],
  "description": null,
  "elementType": "VolumeDiscount",
  "name": "Volume Discount"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`adjustments`	Map<String, Object>[]	Details of the pricing element.	Optional	60.0
`description`	String	Description of the pricing element.	Optional	60.0
`elementType`	String	Type of the pricing element.	Optional	60.0
`name`	String	Name of the pricing element.	Optional	60.0

Configuration Override Input

Input representation of the details to override for a Pricing API configuration.

JSON example

```
   "configurationOverrides": {
        "skipWaterfall": true,
        "useSessionScopedContext": true,
        "persistContext": true,
        "referenceKey": "referenceKey-12345",
        "displayContext" : false,
        "taggedData": false,
```

```
        "isHighVolumeLineItems": false
    }
```

Properties

Name	Type	Description	Required or Optional	Available Version
discovery Procedure	String	Name of the discovery procedure to use to fetch the details of assets.	Optional	61.0
display Context	Boolean	Indicates whether the context structure for pricing must be displayed (`true`) or not (`false`).	Optional	61.0
isHighVolume LineItems	Boolean	Indicates whether the pricing API returns pricing details for more than 100 line items (`true`) or not (`false`).	Optional	63.0
persist Context	Boolean	Indicates whether the context must be persisted as per the mapping (`true`) or not (`false`). If set to `true`, the user must have edit access to all sObject fields used in the context mapping.	Optional	60.0
referenceKey	String	Reference ID that a consuming workstream provides in the API to search for specific logs in the Pricing Operations Console.	Optional	63.0
skipDiscovery	Boolean	Indicates whether the discovery procedure must be skipped (`true`) or not (`false`).	Optional	61.0
skipWaterfall	Boolean	Indicates whether the price waterfall must be skipped in the output response (`true`) or not (`false`).	Optional	60.0
taggedData	Boolean	Indicates whether the JSON data string can specify tags in the input instead of attributes (`true`) or not (`false`).	Optional	60.0
useSession ScopedContext	Boolean	Indicates whether a session scoped context must be created (`true`) or request scoped context (`false`). The default is `false`.	Optional	60.0

PBE Derived Pricing Input

Input representation of the request to get the source product for the Price Book Entry (PBE) derived pricing.

JSON example

```
{
"productId":"01txx0000006i2SAAQ",
"pricebookEntryId":"01uxx0000008yYcAAI",
```

```
"effectiveFrom":"2020-01-01T22:53:20.000Z",
"effectiveTo":"2021-01-01T22:53:20.000Z"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`effectiveFrom`	String	Date from when the price book entry is effective.	Required	61.0
`effectiveTo`	String	Date until when the price book entry is effective.	Required	61.0
`pricebook EntryId`	String	ID of the price book entry.	Required	61.0
`productId`	String	ID of the price book.	Required	61.0

Pricing Input

Input representation of the details of a Pricing API request.

JSON example

```
{
  "contextDefinitionId": "11Oxx0000006PdxEAE",
  "contextMappingId": "11jxx0000004LDDAA2",
  "jsonDataString": {

    "displayContext" : false,
```

```
    "taggedData": false,
    "isHighVolumeLineItems": false
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`configurationOverrides`	Configuration Override Input	Parameters to override the pricing configuration.	Optional	60.0
`contextDefinitionId`	String	ID of the context definition that defines the structure of the input data.	Required	60.0
`contextMappingId`	String	ID of the context mapping that maps the input data to the context instance.	Required	60.0
`jsonDataString`	String	Data to hydrate the context, which must be in JSON format and passed as String. Pass the JSON data as String by using the stringify() method to convert the object to string. The keys in the `jsonDataString` property must be in accordance to the `contextMappingId` property sent in the request. Make sure that the `businessObjectType` value within this property node is set to the sObject used in the context mappings.	Required	60.0
`pricingProcedureId`	String	ID or API name of the pricing procedure used for calculating the prices. A pricing procedure is represented as an Expression Set Definition in the system. If you're an Experience Cloud user, specify the name of the pricing procedure.	Optional	60.0

Pricing Recipe Input

Input representation to set up a pricing recipe page.

JSON example

```
{
    "recipeId" : "12Gxx0000005J9MEAU",
    "pricingRecipeLookUpTableInputRepresentations": [
    {
      lookupId: "12Gxx0000005J9MEAU",
      pricingComponentType: "CustomDiscount"
  },
    {
      lookupId: "12Gxx0000005J9MEAU",
      pricingComponentType: "CustomDiscount"
  }
 ],
    "pricingRecipeProcedureInputRepresentation" : {
    "procedureId" : "9QLxx0000004C92GAE"
}
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`pricingRecipeLookUpTableInputRepresentations`	Pricing Recipe LookUp Table Input[]	Input representation of the recipe mapping.	Required	60.0
`pricingRecipeProcedureInputRepresentation`	Pricing Recipe Procedure Input	Input representation of the procedure that's used in the pricing recipe.	Required	60.0
`recipeId`	String	ID of the pricing recipe.	Required	60.0

Pricing Recipe LookUp Table Input

Input representation of the lookup tables for the setup page recipe.

JSON example

```
    "pricingRecipeLookUpTableInputRepresentations": [
    {
      lookupId: "12Gxx0000005J9MEAU",
      pricingComponentType: "CustomDiscount"
  },
    {
      lookupId: "12Gxx0000005J9MEAU",
```

```
        pricingComponentType: “CustomDiscount”
    }
  ]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`lookupTableId`	String	ID of the decision table.	Optional	60.0
`pricingComponentType`	String	Pricing component types such as volume discount, custom discount, attribute-based discount, and bundle-based discount.	Optional	60.0

Pricing Recipe Procedure Input

Input representation of the procedure for the setup page recipe.

JSON example

```
    "pricingRecipeProcedureInputRepresentation" : {
    "procedureId" : "9QLxx0000004C92GAE"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`procedureId`	String	ID of the expression set.	Required	60.0

Pricing Request Input

Input representation of a pricing request.

JSON example

```
{
    "configurationOverrides": {
       "skipWaterfall": true,
       "useSessionScopedContext": true,
       "persistContext": true,
       "taggedData": false
    }
    "procedureName": "ES1"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`configurationOverrides`	Configuration Override Input	Parameters to override pricing configuration.	Optional	60.0
`procedureName`	String	Name of the pricing procedure.	Optional	60.0

Pricing Versioned Revision Details Input

Input representation of the versioned revision details.

JSON example

This example shows the input for versioned revision details for attribute-based adjustment.

```
{
        "entityName":"AttributeBasedAdjustment",
        "id":"entityId",
        "priceAdjustmentId":"priceAdjustmentScheduleId",
        "productId":"ProductId",
        "productSellingModelId":"PsmId",
        "adjustmentType":"AdjustmentType",
        "adjustmentValue":"AdjustmentValue(Numeric)"",
        "effectiveFrom":"EffectiveFrom date",
        "effectiveTo":"EffectiveTo Date",
        "additionalFieldsToValueMap":{
        "attributeBasedAdjRuleId":"AttributeBasedAdjRuleId"
}
}
```

This example shows the input for versioned revision details for bundle-based adjustment.

```
 {
        "entityName": "BundleBasedAdjustment",
        "id": "entityId",
        "priceAdjustmentScheduleId": "priceAdjustmentScheduleId",
        "productId": "ProductId",
        "productSellingModelId": "PsmId",
        "adjustmentType": "AdjustmentType",
        "adjustmentValue": "AdjustmentValue(Numeric)",
        "effectiveFrom":"EffectiveFrom date",
        "effectiveTo":"EffectiveTo Date",
        "additionalFieldsToValueMap": {
          "rootBundleId": "RootBundleId",
          "parentProductId": "ParentProductId"
        }
 }
```

Properties

Name	Type	Description	Required or Optional	Available Version
additionalFieldsToValueMap	Map<String, String>	Map containing the additional fields specific to the entity.	Optional	60.0
adjustmentType	String	Adjustment type such as, percentage, amount, or override.	Required	60.0
adjustmentValue	String	Value for the adjustment.	Required	60.0
effectiveFrom	String	Date from when the adjustment is effective.	Required	60.0
effectiveTo	String	Date until when the adjustment is effective.	Optional	60.0
entityName	String	Name of the entity such as AttributeBasedAdjustment entity or BundleBasedAdjustment entity.	Required	60.0
id	String	ID of the record.	Required	60.0
priceAdjustmentScheduleId	String	ID of the price adjustment schedule record.	Required	60.0
productId	String	Product ID of the record.	Required	60.0
productSellingModelId	String	Product selling model ID associated to the record.	Optional	60.0

Pricing Waterfall Input

Input representation of the pricing waterfall details.

JSON example

```
      "waterfall": [{
        "fieldToTagNameMapping": {
            "Product2Id": "ItemProduct",
            "Subtotal": "Subtotal",
            "Pricebook2Id": "Pricebook",
            "Quantity": "ItemQuantity",
            "LineItemId": "SalesTransactionSource",
            "ListPrice": "ItemListPrice"
  },
      "inputParameters": {
```

```
            "Product2Id": "01txx0000006i44AAA",
            "Pricebook2Id": "01sxx0000005q9xAAA",
            "Quantity": 5,
            "LineItemId": "item1"
     },
       "outputParameters": {
            "Subtotal": 50,
            "ListPrice": 10
       },
       "pricingElement": {
            "adjustments": [{
                "AdjustmentValue": "95.00",
                "AdjustmentType": "Amount"
             }],
            "description": null,
            "elementType": "ListPrice",
            "name": "List Price"
       },
            "sequence": 1
     },
     {
         "fieldToTagNameMapping": {
              "PriceAdjustmentScheduleId": "ItemDescription",
              "NetUnitPrice": "ItemNetUnitPrice",
              "Product2Id": "ItemProduct",
              "LowerBound": "ItemQuantity",
              "UpperBound": "ItemQuantity",
              "Subtotal": "Subtotal",
              "Quantity": "ItemQuantity",
              "LineItemId": "SalesTransactionSource",
              "InputUnitPrice": "ItemListPrice"
       },
         "inputParameters": {
              "PriceAdjustmentScheduleId": "84Xxx0000004CGSEA2",
              "Product2Id": "01txx0000006i44AAA",
              "LowerBound": 5,
              "UpperBound": 5,
              "Quantity": 5,
              "LineItemId": "item1",
              "InputUnitPrice": 10
        },
         "outputParameters": {
                "NetUnitPrice": 8.5,
                "Subtotal": 42.5
   },
         "pricingElement": {
                "adjustments": [{
                "AdjustmentValue": "15.00",
                "AdjustmentType": "Percentage"
   }],
       "description": null,
       "elementType": "VolumeDiscount",
       "name": "Volume Discount"
     },
```

```
        "sequence": 2
        }
  ]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`fieldToTagNameMapping`	Map<String, String>	Mappings of field to tag names.	Optional	60.0
`inputParameters`	Map<String, Object>	Input parameters of the pricing element.	Optional	60.0
`outputParameters`	Map<String, Object>	Output parameters of the pricing element.	Optional	60.0
`pricingElement`	Adjustment Details Input	Details of the pricing element.	Optional	60.0
`sequence`	Integer	Sequence of the pricing element execution.	Optional	60.0

Pricing Waterfall Log Input

Input representation of the request to create an explainability action log.

JSON example

```
{
      "currencyCode": "USD",
      "executionEndTimestamp": "2023-07-31T20:11:29.625Z",
      "executionId": "executionId1",
      "executionStartTimestamp": null,
      "lineItemId": "item1",
      "output": {
          "Subtotal": 38.25,
          "ListPrice": 10,
          "NetUnitPrice": 7.65
  },
      "waterfall": [{
        "fieldToTagNameMapping": {
            "Product2Id": "ItemProduct",
            "Subtotal": "Subtotal",
            "Pricebook2Id": "Pricebook",
            "Quantity": "ItemQuantity",
            "LineItemId": "SalesTransactionSource",
            "ListPrice": "ItemListPrice"
  },
      "inputParameters": {
          "Product2Id": "01txx0000006i44AAA",
```

```
          "Pricebook2Id": "01sxx0000005q9xAAA",
          "Quantity": 5,
          "LineItemId": "item1"
    },
      "outputParameters": {
          "Subtotal": 50,
          "ListPrice": 10
      },
      "pricingElement": {
          "adjustments": [{
              "AdjustmentValue": "95.00",
              "AdjustmentType": "Amount"
           }],
          "description": null,
          "elementType": "ListPrice",
          "name": "List Price"
      },
          "sequence": 1
    },
    {
        "fieldToTagNameMapping": {

            "LowerBound": 5,
            "UpperBound": 5,
            "Quantity": 5,
            "LineItemId": "item1",
            "InputUnitPrice": 10
       },
        "outputParameters": {
              "NetUnitPrice": 8.5,
              "Subtotal": 42.5
  },
        "pricingElement": {
              "adjustments": [{
              "AdjustmentValue": "15.00",
              "AdjustmentType": "Percentage"
  }],
      "description": null,
      "elementType": "VolumeDiscount",
      "name": "Volume Discount"
    },
      "sequence": 2
```

```
      }
  ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
contextDefinitionVersionId	String	Context definition version ID of the pricing procedure.	Optional	60.0
contextMappingId	String	Context mapping ID of the pricing procedure.	Optional	60.0
currencyCode	String	Currency code such as, USD or INR.	Optional	60.0
executionEndTimestamp	String	End timestamp of procedure execution.	Optional	60.0
executionId	String	Execution ID for a particular execution of a pricing procedure.	Required	60.0
executionStartTimestamp	String	Start timestamp of procedure execution.	Optional	60.0
lineItemId	String	Line item ID for which the price is being calculated.	Required	60.0
output	Map<String, Object>	Output of the pricing procedure.	Optional	60.0
waterfall	Pricing Waterfall Input[]	Details of the pricing waterfall.	Required	60.0

Procedure Plan Criterion Input

Input representation of the details of a procedure plan criterion.

JSON example

```
          "procedurePlanCriterion": [
            {
              "conditionSequence": 1,
              "fieldObject": "BillingCountry",
              "fieldPath": "BillingCountry",
              "literalValue": "test",
              "operator": "Equals",
              "dataType": "Text"
            },
            {
              "conditionSequence": 2,
```

```
        "fieldObject": "BillingPostalCode",
        "fieldPath": "BillingPostalCode",
        "literalValue": "sample",
        "operator": "Equals",
        "dataType": "Text"
      },
      {
        "conditionSequence": 3,
        "fieldObject": "LastActivityDate",
        "fieldPath": "LastActivityDate",
        "literalValue": "2024-07-14",
        "operator": "LessThan",
        "dataType": "Date"
      }
    ]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`conditionSequence`	Integer	Sequence to be followed to process the conditions defined in the procedure plan option. This property value must be unique within a procedure plan option.	Required	62.0
`dataType`	String	Data type of the field from the selected object.	Required	62.0
`fieldObject`	String	Value of the object field that's used to resolve the procedure plan option. This property value must belong to the primary object that's associated with the procedure plan definition, at a maximum two levels up in the hierarchy.	Required	62.0
`fieldPath`	String	Path of the field that's used in a procedure in relation to the object that the field belongs to. The field path must end with the object field that's associated with the procedure plan criterion.	Required	62.0
`literalValue`	String	User-defined value that's compared to the value of the sObject field value.	Optional	62.0
`operator`	String	Operator that's used by the procedure plan criterion.	Required	62.0
`recordId`	String	ID of the procedure plan criterion record.	Required	62.0

Procedure Plan Definition Input

Input representation of the details of a procedure plan definition.

JSON example

This example shows a sample request to create a procedure plan definition record by using the Procedure Plan Definitions (POST) API.

```
  {
  "description": "Definition for Quote",
  "developerName": "Quote_Definition_Sample",
  "name": "Quote_Definition_Sample",
  "processType": "Default",
  "primaryObject": "BusinessHours",
  "procedurePlanDefinitionVersions": [
    {
      "active": false,
      "contextDefinition": "SalesTransactionContext__stdctx",
      "readContextMapping": "QuoteEntitiesMapping",
      "saveContextMapping": "QuoteEntitiesMapping",
      "effectiveFrom": "2024-07-15T10:15:30.000Z",
      "developerName": "Quote_Definition_V1",
      "rank": 1
    }
  ]
}
```

This example shows a sample request to update a procedure plan definition by using the Procedure Plan Definition By ID (PATCH) API.

Note: The properties that aren't specified in the input are deleted when updating the record.

```
{
  "description": "Default definition patch update",
  "developerName": "Quote_Definition",
  "name": "Quote_Definition",
  "primaryObject": "Quote",
  "recordId": "1FNxx0000004EsOGAU"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
description	String	Description of the procedure plan definition.	Optional	62.0
developerName	String	Developer name of the procedure plan definition.	Required if you're invoking the Procedure Plan Definitions API (POST).	62.0
name	String	Name of the procedure plan definition.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
`primaryObject`	String	Source object that's used to create a procedure with rule-based criteria. This property value must be a valid object name and must be unique in the ProcedurePlanDefinition object.	Required if you're invoking the Procedure Plan Definitions API (POST) and if you're creating a procedure with rule-based criteria.	62.0
`procedurePlan Definition Versions`	Procedure Plan Definition Version Input[]	List of versions of a procedure plan definition.	Required	62.0
`processType`	String	Specifies the business processes that need a procedure plan for each sObject and definition. Valid values are: • `Billing` • `DRO` • `DeepClone` • `ProductDiscovery` • `Revenue Cloud` These values can be used based on the available license. If unspecified, the value is set to `Default`.	Required	63.0
`recordId`	String	ID of the procedure plan definition record.	Required if you're invoking the Procedure Plan Definition By ID API (PATCH).	62.0

Procedure Plan Definition Version Input

Input representation of the details of a procedure plan definition version.

JSON example

```
{
  "active": false,
  "developerName": "sample_version_input",
  "effectiveFrom": "2024-07-09T00:00:00.000Z",
  "contextDefinition": "SalesTransactionContext__stdctx",
  "procedurePlanSections": [
    {
      "isInherited": false,
      "procedurePlanOptions": [
```

```
        {
          "saveContextMapping": "AssetToSalesTransactionMapping",
          "expressionSetDefinition": "9QAZ60000004ECOOA2",
          "expressionSetLabel": "Revenue_Default_Pricing_Procedure",
          "expressionSetApiName": "Revenue Default Pricing Procedure",
          "logic": "1 AND 2 AND 3",
          "priority": 1,
          "procedurePlanCriterion": [
            {
              "conditionSequence": 1,
              "fieldObject": "BillingCountry",
              "fieldPath": "BillingCountry",
              "literalValue": "test",
              "operator": "Equals",
              "dataType": "Text"
            },
            {
              "conditionSequence": 2,
              "fieldObject": "BillingPostalCode",
              "fieldPath": "BillingPostalCode",
              "literalValue": "sample",
              "operator": "Equals",
              "dataType": "Text"
            },
            {
              "conditionSequence": 3,
              "fieldObject": "LastActivityDate",
              "fieldPath": "LastActivityDate",
              "literalValue": "2024-07-14",
              "operator": "LessThan",
              "dataType": "Date"
            }
          ]
        }
      ],
      "resolutionType": "RuleBased",
      "sectionType": "PricingProcedure",
      "sequence": 1,
      "subSectionType": "PricingProcedure",
      "recordId": "1FRZ60000008OIAOA2"
    }
  ],
  "rank": 1,
  "readContextMapping": "ProductDiscoveryContextMapping",
  "saveContextMapping": "OrderEntitiesMapping"
}
```

Note: The properties that aren't specified in the input are deleted when updating the record.

Properties

Name	Type	Description	Required or Optional	Available Version
`active`	Boolean	Indicates whether this procedure plan definition version is active (`true`) or not (`false`). You can't edit or delete a procedure plan version that's in the active state.	Required	62.0
`contextDefinition`	String	Context definition that's associated with the procedure plan definition version record.	Required	62.0
`developerName`	String	Unique developer name of the procedure plan definition version.	Required	62.0
`effectiveFrom`	String	Date and time from when the procedure plan definition version comes into effect.	Required	62.0
`effectiveTo`	String	Date and time from when the procedure plan definition version is no longer in effect.	Required	62.0
`inheritedFrom`	String	Template this procedure plan definition version is created from.	This property is read-only.	62.0
`procedurePlanSections`	Procedure Plan Section Input[]	Procedure setup sections for a procedure plan definition. Each section enables the setup of a procedure type by using a rule-based criteria. Keep these considerations in mind when you modify this property. • You can edit or delete a procedure plan section if it isn't associated with an active procedure plan version. • You can create a procedure plan section with rule-based resolution type if the primary object isn't empty in the definition.	Required	62.0
`rank`	Integer	Current rank of the procedure plan definition version that's used to decide the sequence of execution of a procedure plan definition version.	Required	62.0
`readContextMapping`	String	Mapping that's used to read data from the mapped object and populate the context definition.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
		This property value must be associated with a context definition.		
`recordId`	String	ID of the procedure plan definition version record.	Required	62.0
`saveContextMapping`	String	Mapping that's used to save data from the context definition and populate the mapped object. This property value must be associated with a context definition.	Optional	62.0
`status`	String	Status of the procedure plan definition version record.	Optional	62.0

Procedure Plan Evaluation Input

Input representation of the details used to evaluate a procedure plan definition.

JSON example

This example shows a sample request to evaluate a procedure plan definition by using a primary object.

```
{
  "idList": ["a01DU000000BylcYAC"],
  "evaluationDate": "2024-07-08T10:15:30.000Z",
  "processType": "Default",
  "sectionType": ["PricingProcedure"],
  "subSectionType": ["Revenue"]
}
```

This example shows a sample request to evaluate a procedure plan definition by using a definition name.

```
{
  "evaluationDate": "2024-07-08T10:15:30.000Z",
  "processType": "Default",
  "sectionType": ["PricingProcedure"],
  "subSectionType": ["Revenue"]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`evaluationDate`	String	Date when the evaluation is applicable. This property value must be within the date range when the procedure plan definition is effective.	Required	62.0

Name	Type	Description	Required or Optional	Available Version
`idList`	String[]	List of record IDs of the procedure plan definitions to be evaluated.	Required only if you're invoking the Procedure Plan Evaluation By Object (POST) API.	62.0
`processType`	String	Specifies the business processes that need a procedure plan for each sObject and definition. Valid values based on the available are: • `Billing` • `DRO` • `DeepClone` • `ProductDiscovery` • `Revenue Cloud` These values can be used based on the available license. If unspecified, the value is set to `Default`. If a procedure plan definition exist in the org with `processType` value as `null`, modify the value to `Default`.	Optional	63.0
`sectionType`	String[]	Name of section to be evaluated. Valid values are: • `PricingProcedure` • `ProductDiscoveryProcedure` • `ProductQualificationProcedure` • `PricingDiscoveryProcedure` • `DiscountSpreadServiceProcedure` • `RatingProcedure` • `Custom` • `RatingDiscoveryProcedure`	Optional	62.0
`subSectionType`	String[]	Name of subsection to be evaluated.	Optional	62.0

The combination of the `sectionType` and `subSectionType` property values must be unique for every procedure plan version.

Procedure Plan Section Input

Input representation of the details of a procedure plan section.

JSON example

```
"procedurePlanSections": [
  {
    "isInherited": false,
    "procedurePlanOptions": [
      {
        "saveContextMapping": "AssetToSalesTransactionMapping",
        "expressionSetDefinition": "9QAZ60000004ECOOA2",
        "expressionSetLabel": "Revenute_Default_Pricing_Procedure",
        "expressionSetApiName": "Revenue Default Pricing Procedure",
        "logic": "1 AND 2 AND 3",
        "priority": 1,
        "procedurePlanCriterion": [
          {
            "conditionSequence": 1,
            "fieldObject": "BillingCountry",
            "fieldPath": "BillingCountry",
            "literalValue": "test",
            "operator": "Equals",
            "dataType": "Text"
          },
          {
            "conditionSequence": 2,
            "fieldObject": "BillingPostalCode",
            "fieldPath": "BillingPostalCode",
            "literalValue": "sample",
            "operator": "Equals",
            "dataType": "Text"
          },
          {
            "conditionSequence": 3,
            "fieldObject": "LastActivityDate",
            "fieldPath": "LastActivityDate",
            "literalValue": "2024-07-14",
            "operator": "LessThan",
            "dataType": "Date"
          }
        ]
      }
    ],
    "resolutionType": "RuleBased",
    "sectionType": "PricingProcedure",
    "sequence": 1,
    "subSectionType": "PricingProcedure",
    "recordId": "1FRZ60000008OIAOA2"
  }
]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`isInherited`	Boolean	Indicates whether the procedure plan section is inherited from a template (`true`) or not (`false`).	This property is read-only.	62.0
`procedurePlanOptions`	Procedure Plan Option Input[]	List of procedure plan options that defines a group of criteria. You can edit or delete a procedure plan option only if it isn't associated with an active procedure plan version.	Required	62.0
`recordId`	String	ID of the procedure plan section record.	Required	62.0
`resolutionType`	String	Type of resolution used to filter the procedure. You can't edit this property value if the procedure plan section includes a procedure plan option record.	Required	62.0
`sectionType`	String	Type of section. Valid values are: • `PricingProcedure` • `ProductDiscoveryProcedure` • `ProductQualificationProcedure` • `PricingDiscoveryProcedure` • `DiscountSpreadServiceProcedure` • `RatingProcedure` • `Custom` • `RatingDiscoveryProcedure`	Required	62.0
`sequence`	Integer	Sequence to be followed for the processing of the procedures. This property value must be greater than 0 and must be unique for a procedure plan section associated with a procedure plan version.	Required	62.0
`subSectionType`	String	Procedure subsection added to the procedure plan definition.	Required	62.0

Procedure Plan Option Input

Input representation of the details of a procedure plan option.

JSON example

```
      "procedurePlanOptions": [
        {
          "saveContextMapping": "AssetToSalesTransactionMapping",
          "expressionSetDefinition": "9QAZ60000004ECOOA2",
          "expressionSetLabel": "Revenute_Default_Pricing_Procedure",
          "expressionSetApiName": "Revenue Default Pricing Procedure",
          "logic": "1 AND 2 AND 3",
          "priority": 1,
          "procedurePlanCriterion": [
            {
              "conditionSequence": 1,
              "fieldObject": "BillingCountry",
              "fieldPath": "BillingCountry",
              "literalValue": "test",
              "operator": "Equals",
              "dataType": "Text"
            },
            {
              "conditionSequence": 2,
              "fieldObject": "BillingPostalCode",
              "fieldPath": "BillingPostalCode",
              "literalValue": "sample",
              "operator": "Equals",
              "dataType": "Text"
            },
            {
              "conditionSequence": 3,
              "fieldObject": "LastActivityDate",
              "fieldPath": "LastActivityDate",
              "literalValue": "2024-07-14",
              "operator": "LessThan",
              "dataType": "Date"
            }
          ]
        }
      ]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`expressionSetApiName`	String	API name of the expression set.	Optional	62.0
`expressionSetDefinition`	String	Expression set definition that's associated with this procedure plan option record.	Required	62.0
`expressionSetLabel`	String	Label of the expression set that's associated with this procedure plan option record.	Optional	62.0

Name	Type	Description	Required or Optional	Available Version
`logic`	String	Computation logic for the conditions applied to a procedure plan option. This property value must be blank if the resolution type is default.	Optional	62.0
`priority`	Integer	Priority for the specified criteria. This property value must be greater than 0 and must be unique within a procedure plan section.	Required	62.0
`procedurePlanCriterion`	Procedure Plan Criterion Input[]	Details of the rule-based criteria for the procedure. You can edit or delete a procedure plan criterion only if it isn't associated with an active procedure plan version.	Optional	62.0
`readContextMapping`	String	Mapping that's used to read from the mapped object and populate the context definition. This property value must be associated with a context definition.	Optional	62.0
`recordId`	String	ID of the procedure plan option record.	Required	62.0
`saveContextMapping`	String	Mapping that's used to save data from the context definition and populate the mapped object. This property value must be associated with a context definition.	Optional	62.0

Response Bodies

Learn more about the available Salesforce Pricing API response bodies.

Adjustment Details
Output representation of a pricing adjustment request.

API Execution Log Response
Output representation of the execution log of a pricing waterfall request.

Line Item Waterfall Response
Output representation of the line item waterfall response.

PBE Derived Pricing
Output representation of the response that includes the source product for the Price Book Entry (PBE) derived pricing.

[Pricing Error Response]
Output representation of the pricing error response.

[Pricing Execution Waterfall Response]
Output representation of the execution process that's associated with a pricing waterfall.

[Pricing Generic Response]
Output representation of a pricing data sync request.

[Pricing Output]
Output representation of a Salesforce pricing request.

[Pricing Recipe LookUp Table Response]
Output representation of a pricing recipe lookup table.

[Pricing Recipe]
Output representation of the pricing recipe information table.

[Pricing Recipe Post]
Output representation of the pricing recipe after the API request.

[Pricing Recipe Response]
Output representation of the pricing recipe.

[Pricing Response]
Output representation of the pricing request.

[Pricing Result]
Output representation of the pricing result.

[Pricing Result Error]
Output representation of the pricing result error.

[Pricing Versioned Revision Details]
Output representation of the versioned revision details.

[Pricing Waterfall Response]
Output representation of a pricing waterfall request.

[Procedure Plan Criterion]
Output representation of the details of a procedure plan criterion.

[Procedure Plan Definition]
Output representation of the details of a single procedure plan definition.

[Procedure Plan Definition Version]
Output representation of the version details of a procedure plan definition.

[Procedure Plan Definitions]
Output representation of the details of procedure plan definitions.

[Procedure Plan Generic]
Output representation of the details of the created procedure plan definition record.

[Procedure Plan Generic Error]
Output representation of the error details related to the procedure plan definitions.

[Procedure Plan Option]
Output representation of the details of a procedure plan option.

Procedure Plan Section

Output representation of the details of a procedure plan section.

Procedure Plan Section Evaluation Runtime

Output representation of the results from the procedure plan evaluation.

Procedure Plan Evaluation

Output representation of the evaluation details of a procedure plan definition.

Procedure Plan Evaluation Response

Output representation of the evaluation details of a procedure plan definition.

Procedure Plan Evaluation Result

Output representation of the evaluation result of a procedure plan definition.

Pricing Process Execution Details for Line Items

Output representation of the pricing process execution details for the line items along with the error details and response generation status.

Line Item Details Response

Output representation of the pricing process execution details for the line items.

Pricing Process Execution Response

Output representation of the details of a pricing process execution.

Pricing Process Execution List

Output representation of the execution details for different types of the pricing processes.

Pricing Simulation Input Variables With Data

Output representation of the pricing simulation variables with data.

Adjustment Details

Output representation of a pricing adjustment request.

JSON example

```
"pricingElement": {
      "adjustments": [{
      "adjustmentType": null,
      "adjustmentValue": null
    }],
      "name": "List Price",
      "elementType": "ListPrice"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`adjustments`	Map<String, Object>[]	Details of the pricing element.	Small, 60.0	60.0
`description`	String	Description of the pricing element.	Small, 60.0	60.0
`elementType`	String	Type of the pricing element.	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
name	String	Name of the pricing element.	Small, 60.0	60.0

API Execution Log Response

Output representation of the execution log of a pricing waterfall request.

JSON example

```
{
  "message": {The Pricing API execution was successful.},
  "pricingElement": {
    "adjustments": [
      {
        "adjustmentType": null,
        "adjustmentValue": null
      }
    ],
    "name": "List Price",
    "elementType": "ListPrice"
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
message	String []	Message of the API execution.	Small, 63.0	63.0
pricingElement	Adjustment Details	Details of the price adjustment of a pricing element.	Small, 63.0	63.0

Line Item Waterfall Response

Output representation of the line item waterfall response.

JSON example

```
{
       "currencyCode": "USD",
       "error": null,
       "executionEndTimestamp": "2023-07-31T20:11:29.625Z",
       "executionId": "gdLVwn2x1uats2xWMAjV",
       "executionStartTimestamp": null,
       "lineItemId": "item1",
       "success": true,
       "usageType":"Pricing",
       "output": {
          "quantity": "10",
          "netUnitPrice": "10",
          "subtotal": "100"
```

```
        },
        "waterfall": []
}
```

This sample response includes diagnostic data if you've enabled Advanced Logging settings under Salesforce Pricing from Setup.

```

Property Name	Type	Description	Filter Group and Version	Available Version
`contextDefinitionVersionId`	String	Context definition version ID of the pricing procedure.	Small, 60.0	60.0
`contextMappingId`	String	Context mapping ID of the record.	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
currencyCode	String	Currency code. For example, USD or INR.	Small, 60.0	60.0
error	Pricing Error Response	Details of any errors.	Small, 60.0	60.0
executionEnd Timestamp	String	End timestamp of procedure execution.	Small, 60.0	60.0
executionId	String	Execution ID of a particular execution of a pricing procedure.	Small, 60.0	60.0
execution Start Timestamp	String	Start timestamp of procedure execution.	Small, 60.0	60.0
lineItemId	String	Line item ID for which the price is being calculated.	Small, 60.0	60.0
output	Map<String, Object>	Output of the pricing procedure.	Small, 60.0	60.0
success	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Small, 60.0	60.0
usageType	String	Usage type of the waterfall log record.	Small, 62.0	62.0
waterfall	Pricing Waterfall Response[]	Details of the price waterfall.	Small, 60.0	60.0

PBE Derived Pricing

Output representation of the response that includes the source product for the Price Book Entry (PBE) derived pricing.

JSON example

```
{
"productId":"01txx0000006i2SAAQ",
"pricebookEntryId":"01uxx0000008yYcAAI",
"effectiveFrom":"2020-01-01T22:53:20.000Z",
"effectiveTo":"2021-01-01T22:53:20.000Z"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
error	Pricing Error Response[]	Displays the error while processing the request.	Small, 61.0	61.0
isSuccess	Boolean	Indicates whether the request is successful (`true`) or not (`false`).	Small, 61.0	61.0

Property Name	Type	Description	Filter Group and Version	Available Version
`source ProceductId`	String	ID of the source product.	Small, 61.0	61.0

Pricing Error Response

Output representation of the pricing error response.

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Indicates the error code.	Small, 60.0	60.0
`message`	String	Specifies the message stating the reason for the error, if any.	Small, 60.0	60.0

Pricing Execution Waterfall Response

Output representation of the execution process that's associated with a pricing waterfall.

JSON example

```
{
  "apiEndpoint": "/connect/core-pricing/pricing",
  "apiExecutionId": "263369316770986",
  "apiExecutionLogRepresentationList": [
    {
      "message": [
        "The Pricing API couldn't be run. Try again, and if the issue persists, ask your
 admin for help."
      ]
    }
  ],
  "currencyCode": "USD",
  "executionId": "263369316895959",
  "id": "263369316895960",
  "lineItemId": null,
  "referenceKey": "referenceKey-ABCD",
  "success": false,
  "usageType": "Api_Execution"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`apiEndpoint`	String	API endpoint that ran during the pricing request.	Small, 63.0	Small, 63.0
`apiExecutionId`	String	Unique execution ID that's generated each time a pricing API is executed.	Small, 63.0	Small, 63.0

Property Name	Type	Description	Filter Group and Version	Available Version
`apiExecutionLogRepresentationList`	API Execution Log Response[]	List of API execution logs.	Small, 63.0	63.0
`currencyCode`	String	Currency code that's stored in each API log record for the pricing execution.	Small, 67.0	Small, 67.0
`error`	Pricing Error Response	Error details of the pricing execution process.	Small, 63.0	Small, 63.0
`executionId`	String	Unique ID that's generated each time a pricing process is executed.	Small, 63.0	Small, 63.0
`id`	String	Unique record ID of the waterfall response.	Small, 65.0	Small, 65.0
`lineItemId`	String	Unique ID of the line item that's associated with this pricing execution.	Small, 59.0	Small, 59.0
`referenceKey`	String	The reference ID that a consuming workstream provides in the API to search for the specific logs in the Pricing Operations Console.	Small, 63.0	Small, 63.0
`success`	Boolean	Indicates whether the API execution is successful (`true`) or not (`false`).	Small, 63.0	Small, 63.0
`usageType`	String	Usage type of the API execution.	Small, 63.0	Small, 63.0

Pricing Generic Response

Output representation of a pricing data sync request.

JSON example

```
{
  "success": true
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`error`	Pricing Error Response	Details from the pricing error response.	Small, 60.0	60.0
`success`	Boolean	Indicates whether the request is successful (`true`) or not (`false`).	Small, 60.0	60.0

Pricing Output

Output representation of a Salesforce pricing request.

JSON example

```
{
"apiExecutionId": "612228038743152",
"pricingExecutionId": "612229738898095",
"pricingResult": {
"subtotal": [
{
"dataPath": [
"cart_1001",
"lineItem_1002"
],
"value": 300.0,
"errors": [],
"isSuccess": true
},
{
"dataPath": [
"cart_1001",
"lineItem_1001"
],
"value":400.0,
"errors": [],
"isSuccess": true
}
],
"netunitprice": [
{
"dataPath": [
"cart_1001",
"lineItem_1002"
],
"value": xx,
"errors": [],
"isSuccess": true
},
{
"dataPath": [
"cart_1001",
"lineItem_1001"
],
"value": xx,
"errors": [],
"isSuccess": true
}
]
},
"pricingResultErrors": [],
"status": "Completed",
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
apiExecutionId	String	Unique ID that's generated each time a pricing API is executed.	Small, 63.0	63.0
error	Pricing Error Response	Displays the error encountered when the request is processed. For example, a pricing procedure isn't found.	Small, 60.0	60.0
pricingExecutionId	String	Unique ID that's generated each time a pricing process is executed.	Small, 63.0	63.0
pricingResult	Pricing Result	Represents the outcomes associated with the output tags defined in the contextual definition for which the pricing engine establishes values. The initial attribute name is substituted for the output tag's designation. For instance, if the original attribute name specified in the Context Definition is "Subtotal," but during contextual setup, the output tag is denoted as "Total Price," the API output exhibits the initial attribute name "Subtotal" in the response.	Small, 60.0	60.0
pricingResult Errors	Pricing Result Error[]	Errors from the pricing request, if any.	Small, 60.0	60.0
status	String	Status of the pricing request. Valid values are: • Completed — Pricing is completed for all the line items. • Partially Completed — Pricing is completed for some line items. • Failed — Pricing isn't completed for the line items.	Small, 60.0	60.0

Pricing Recipe LookUp Table Response

Output representation of a pricing recipe lookup table.

JSON example

```
"decisionTables": [
  {
    "id": "0lDxx00000000T3EAI",
    "isInternal": true,
    "pricingComponentType": "ListPrice"
  },
```

```
        {
          "id": "0lDxx00000000T4EAI",
          "isInternal": true,
          "pricingComponentType": "VolumeDiscount"
        },
        {
          "id": "0lDxx00000000HlEAI",
          "isInternal": false,
          "pricingComponentType": "CustomDiscount"
        }
      ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`id`	String	ID of the pricing recipe table mapping.	Small, 60.0	60.0
`isInternal`	Boolean	Indicates if the decision table is available (`true`) or not (`false`).	Small, 60.0	60.0
`pricing ComponentType`	String	Price component types such as, custom discount, volume discount, attribute-based discount, bundle-based discount, and list price.	Small, 60.0	60.0

Pricing Recipe

Output representation of the pricing recipe information table.

JSON example

```
  "recipes": [
    {
      "active": false,
      "createdBy": "autoproc@00dxx0000006gmjea2",
      "createdOn": "2023-07-15T13:12:38.000Z",
      "decisionTables": [
        {
          "id": "0lDxx00000000T3EAI",
          "isInternal": true,
          "pricingComponentType": "ListPrice"
        },
        {
          "id": "0lDxx00000000T4EAI",
          "isInternal": true,
          "pricingComponentType": "VolumeDiscount"
        },
        {
          "id": "0lDxx00000000HlEAI",
          "isInternal": false,
          "pricingComponentType": "CustomDiscount"
        }
      ],
```

```
        "developerName": "NGPDefaultRecipe",
        "id": "12Gxx0000005Ka4EAE",
        "name": "NGPDefaultRecipe",
        "procedureCreatedBy": "",
        "procedureCreatedOn": "2023-09-19T11:39:18.983Z",
        "procedureId": "",
        "procedureName": ""
    }]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`active`	Boolean	Indicates whether the recipe is active (`true`) or not (`false`).	Small, 60.0	60.0
`createdBy`	String	Details on who created the recipe.	Small, 60.0	60.0
`createdOn`	String	Date when the recipe was created.	Small, 60.0	60.0
`decision Tables`	Pricing Recipe LookUp Table Response []	Decision tables linked to the recipe.	Small, 60.0	60.0
`developerName`	String	API name of the recipe.	Small, 60.0	60.0
`id`	String	ID of the recipe.	Small, 60.0	60.0
`name`	String	Name of the recipe.	Small, 60.0	60.0
`procedure CreatedBy`	String	Details on who created the procedure.	Small, 60.0	60.0
`procedure CreatedOn`	String	Date when the procedure was created.	Small, 60.0	60.0
`procedureId`	String	ID of the procedure.	Small, 60.0	60.0
`procedureName`	String	Name of the procedure.	Small, 60.0	60.0

Pricing Recipe Post

Output representation of the pricing recipe after the API request.

JSON example

```
{
isSuccess : true
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`error`	Pricing Error Response	Details from the pricing error response.	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
`isSuccess`	Boolean	Indicates whether the response was calculated successfully (`true`) or not (`false`).	Small, 60.0	60.0

Pricing Recipe Response

Output representation of the pricing recipe.

JSON example

```
{
  "recipes": [
    {
      "active": false,
      "createdBy": "autoproc@00dxx0000006gmjea2",
      "createdOn": "2023-07-15T13:12:38.000Z",
      "decisionTables": [
        {
          "id": "0lDxx00000000T3EAI",
          "isInternal": true,
          "pricingComponentType": "ListPrice"
        },
        {
          "id": "0lDxx00000000T4EAI",
          "isInternal": true,
          "pricingComponentType": "VolumeDiscount"
        },
        {
          "id": "0lDxx00000000HlEAI",
          "isInternal": false,
          "pricingComponentType": "CustomDiscount"
        }
      ],
      "developerName": "NGPDefaultRecipe",
      "id": "12Gxx0000005Ka4EAE",
      "name": "NGPDefaultRecipe",
      "procedureCreatedBy": "",
      "procedureCreatedOn": "2023-09-19T11:39:18.983Z",
      "procedureId": "",
      "procedureName": ""
    }],
  "success": true
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`recipes`	Pricing Recipe Output Representation[]	Representation of the pricing recipe.	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
`success`	Boolean	Indicates if the request is successful (`true`) or not (`false`).	Small, 60.0	60.0

Pricing Response

Output representation of the pricing request.

JSON example

```
{
    "success": true,
    "executionId": "zu81o5hBCrFzyd5LWZk"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`error`	Pricing Error Response	Errors while processing the request, if any.	Small, 60.0	60.0
`executionId`	String	Auto-generated alphanumeric string for correlation to extract async waterfall and context persistence status.	Small, 60.0	60.0
`success`	Boolean	Indicates if the request is successful (`true`) or not (`false`).	Small, 60.0	60.0

Pricing Result

Output representation of the pricing result.

JSON example

```
"pricingResult": {
"subtotal": [
{
"dataPath": [
"cart_1001",
"lineItem_1002"
],
"value": 300.0,
"errors": [],
"isSuccess": true
},
{
"dataPath": [
"cart_1001",
"lineItem_1001"
],
```

```
"value":400.0,
"errors": [],
"isSuccess": true
}
],
"netunitprice": [
{
"dataPath": [
"cart_1001",
"lineItem_1002"
],
"value": xx,
"errors": [],
"isSuccess": true
},
{
"dataPath": [
"cart_1001",
"lineItem_1001"
],
"value": xx,
"errors": [],
"isSuccess": true
}
]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`dataPath`	String	Includes the entire data route for the specific element starting from the root node. The request must include the ID to construct the accurate data route. For example, if a `jsonDataString` property comprises a Cart [Id = Cart1] and its associated Cart Item [Id = CartItem1], then the data route for CartItem appears as [Cart1, CartItem1].	Small, 60.0	60.0
`errors`	Pricing Error Response[]	Displays processing errors related to the element as recognized by the data path.	Small, 60.0	60.0
`isSuccess`	Boolean	Displays if processing of the element for the specified data path is successful or not.	Small, 60.0	60.0
`value`	Object	Displays the value of the element into consideration. Element is uniquely identify by the data path.	Small, 60.0	60.0

Pricing Result Error

Output representation of the pricing result error.

JSON example

```
"pricingResultErrors": {
"Aggregateprice": [
{
"dataPath": [
"cart_1001",
],

"errors": [
{
"errorCode": "Dummy"
"message":
 }
        ]
   }
 ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
dataPath	String[]	Includes the entire data route for the specific element starting from the root node. The request must include the ID to construct the accurate data route. For example, if a `jsonDataString` property comprises a Cart [Id = Cart1] and its associated Cart Item [Id = CartItem1], then the data route for CartItem appears as [Cart1, CartItem1].	Small, 60.0	60.0
errors	Pricing Error Response	Displays processing errors related to the element as recognized by the data path.	Small, 60.0	60.0

Pricing Versioned Revision Details

Output representation of the versioned revision details.

Property Name	Type	Description	Filter Group and Version	Available Version
error	Pricing Error Response	Details from the pricing error response.	Small, 60.0	60.0
success	Boolean	Indicates whether the request is successful (`true`) or not (`false`).	Small, 60.0	60.0

Pricing Waterfall Response

Output representation of a pricing waterfall request.

JSON example

```
{
  "inputParameters": {
    "productId": "01txx0000006i2SAAQ",
    "pricebookId": "01sxx0000005ptpAAA",
    "pricingModelType": "OneTime"
  },
  "fieldToTagNameMapping": {
    "Product2Id": "ItemProduct",
    "Subtotal": "Subtotal",
    "Pricebook2Id": "Pricebook",
    "Quantity": "ItemQuantity",
    "LineItemId": "SalesTransactionSource",
    "ListPrice": "ItemListPrice"
  },
  "sequence": 0,
  "outputParameters": {
    "listPrice": "10"
  },
  "pricingElement": {
    "adjustments": [
      {
        "adjustmentType": null,
        "adjustmentValue": null
      }
    ],
    "name": "List Price"
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`fieldToTagNameMapping`	Map<String, String>	Mappings of field to tag names.	Small, 60.0	60.0
`inputParameters`	Map<String, Object>	Parameters of pricing element input.	Small, 60.0	60.0
`outputParameters`	Map<String, Object>	Parameters of pricing element output.	Small, 60.0	60.0
`pricingElement`	Adjustment Details	Details of the price adjustment of a pricing element.	Small, 60.0	60.0
`sequence`	Integer	Sequence of pricing element execution.	Small, 60.0	60.0

Procedure Plan Criterion

Output representation of the details of a procedure plan criterion.

JSON example

```
"procedurePlanCriterion": [
        {
          "conditionSequence": 1,
          "dataType": "Text",
          "fieldObject": "BillingCountry",
          "fieldPath": "BillingCountry",
          "isSuccess": true,
          "literalValue": "test",
          "operator": "Equals",
          "recordId": "1FiZ60000004C9cKAE"
         },
         {
          "conditionSequence": 2,
          "dataType": "Text",
          "fieldObject": "BillingPostalCode",
          "fieldPath": "BillingPostalCode",
          "isSuccess": true,
          "literalValue": "pramit",
          "operator": "Equals",
          "recordId": "1FiZ60000004C9dKAE"
          },
          {
            "conditionSequence": 3,
            "dataType": "Date",
            "fieldObject": "LastActivityDate",
            "fieldPath": "LastActivityDate",
            "isSuccess": true,
            "literalValue": "2024-07-14",
            "operator": "LessThan",
            "recordId": "1FiZ60000004C9eKAE"
           }
         ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`conditionSequence`	Integer	Sequence to be followed to process the conditions defined in the procedure plan option.	Small, 62.0	62.0
`dataType`	String	Data type of the field from the selected object.	Small, 62.0	62.0
`error`	Procedure Plan Generic Error[]	Details of the error encountered during the processing of the API request.	Small, 62.0	62.0
`fieldObject`	String	Value of the object field that's used to resolve the procedure plan option.	Small, 62.0	62.0

Property Name	Type	Description	Filter Group and Version	Available Version
`fieldPath`	String	Path of the field that's used in a procedure in relation to the object that the field belongs to.	Small, 62.0	62.0
`isSuccess`	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Small, 62.0	62.0
`literalValue`	String	User-defined value that's compared to the value of the sObject field value.	Small, 62.0	62.0
`operator`	String	Operator that's used by the procedure plan criterion.	Small, 62.0	62.0
`recordId`	String	ID of the procedure plan criterion record.	Small, 62.0	62.0

Procedure Plan Definition

Output representation of the details of a single procedure plan definition.

JSON example

This example shows a sample response for the Procedure Plan Definition By ID (GET) request.

```
       {
     "description": "Default Definition",
     "developerName": "Quote_Definition",
     "name": "Quote_Definition",
     "primaryObject": "Quote",
     "procedurePlanDefinitionVersions": [
     {
      "active": false,
      "contextDefinition": "11Oxx0000006PZ7EAM",
      "effectiveFrom": "2024-02-03T10:15:30.000Z",
      "effectiveTo": "2024-02-03T10:15:30.000Z",
      "readContextMapping": "MedicalHistoryMapping",
      "recordId": "1Cvxx0000004E1ACAU",
      "saveContextMapping": "MedicalHistoryMapping",
      "success": true,
      "processType": "Default"
    }
  ],
  "recordId": "1FNxx0000004GkWGAU",
  "processType": "Default",
  "success": true
}
```

This example shows a sample response for the Procedure Plan Definition By ID (PATCH) request.

```
  {
  "procedurePlanDefinitionVersions":[],
  "recordId":"1FNDU00000000EX4AY",
  "processType": "Default",
```

```
"success":true
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`description`	String	Description for the procedure plan definition.	Small, 62.0	62.0
`developerName`	String	Developer name of the procedure plan definition.	Small, 62.0	62.0
`error`	Procedure Plan Generic Error[]	Details of the error encountered during the processing of the API request.	Small, 62.0	62.0
`name`	String	Name of the procedure plan definition.	Small, 62.0	62.0
`primaryObject`	String	Object that's associated with the procedure plan definition.	Small, 62.0	62.0
`procedurePlanDefinitionVersions`	Procedure Plan Definition Version[]	Details of the versions of a procedure plan definition.	Small, 62.0	62.0
`processType`	String	Business processes that's specified that requires a procedure plan for each sObject and definition.	Small, 63.0	63.0
`recordId`	String	ID of the procedure plan definition record.	Small, 62.0	62.0
`success`	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Small, 62.0	62.0

Procedure Plan Definition Version

Output representation of the version details of a procedure plan definition.

JSON example

```
"procedurePlanDefinitionVersions": [
 {
   "active": false,
   "developerName": "sample_test",
   "effectiveFrom": "2024-07-09T00:00:00.000Z",
   "contextDefinition": "SalesTransactionContext__stdctx",
   "procedurePlanSections": [],
   "rank": 1,
   "readContextMapping": "ProductDiscoveryContextMapping",
   "recordId": "1CvZ60000008OIaKAM",
   "success": true,
   "processType": "Default"
 }
]
```

Property Name	Type	Description	Filter Group and Version	Available Version
active	Boolean	Indicates whether the procedure plan definition version is active (true) or not (false).	Small, 62.0	62.0
context Definition	String	Context definition that's associated with the procedure plan definition version.	Small, 62.0	62.0
developerName	String	Developer name of the procedure plan definition version.	Small, 62.0	62.0
effectiveFrom	String	Date and time from when the procedure plan definition version is effective.	Small, 62.0	62.0
effectiveTo	String	Date and time until when the procedure plan definition version is effective.	Small, 62.0	62.0
error	Procedure Plan Generic Error[]	Details of the error encountered during the processing of the API request.	Small, 62.0	62.0
inheritedFrom	String	Name of the template the procedure plan definition is extended from.	Small, 62.0	62.0
procedure PlanSections	Procedure Plan Section[]	List of sections of the procedure plan definition that you can organize in any order. Each section must include a procedure or a set of procedures to be executed for a specific criteria.	Small, 62.0	62.0
processType	String	Business processes that's specified that requires a procedure plan for each sObject and definition.	Small, 64.0	64.0
rank	Integer	Rank or the order of sequence to follow for the processing of the procedure plan definition version.	Small, 62.0	62.0
readContext Mapping	String	Mapping that's used to read data from the mapped object and populate the context definition.	Small, 62.0	62.0
recordId	String	ID of the procedure plan definition version record.	Small, 62.0	62.0
saveContext Mapping	String	Mapping that's used to save data from the context definition and populate the mapped object.	Small, 62.0	62.0
success	Boolean	Indicates whether the API request is successful (true) or not (false).	Small, 62.0	62.0

Procedure Plan Definitions

Output representation of the details of procedure plan definitions.

JSON example

```
{
             "isSuccess": true,
             "procedurePlanDefinitions": [
                 {

                             "success": true
                         }
                     ],
                     "recordId": "1FNZ6000000CaSAOA0",
                     "success": true
                 }
                 ]
             }
```

Property Name	Type	Description	Filter Group and Version	Available Version
`error`	Procedure Plan Generic Error[]	Details of the error encountered during the processing of the API request.	Small, 62.0	62.0
`isSuccess`	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Small, 62.0	62.0
`procedurePlanDefinitions`	Procedure Plan Definition[]	Details of a single procedure plan definition.	Small, 62.0	62.0

Procedure Plan Generic

Output representation of the details of the created procedure plan definition record.

JSON example

This example shows a sample response of the details of a procedure plan definition record, created by using the Procedure Plan Definitions (POST) API.

```
{
 "isSuccess":true,
 "recordId":"1FNDU00000000EX4AY"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`error`	Procedure Plan Generic Error[]	Details of the error encountered during the processing of the API request.	Small, 62.0	62.0
`isSuccess`	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Small, 62.0	62.0
`recordId`	String	ID of the created procedure plan definition record.	Small, 62.0	62.0

Procedure Plan Generic Error

Output representation of the error details related to the procedure plan definitions.

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Code indicating the type of error.	Small, 62.0	62.0
`message`	String	Message stating the reason for the error, if any.	Small, 62.0	62.0

Procedure Plan Option

Output representation of the details of a procedure plan option.

JSON example

```
                "procedurePlanOptions": [
                  {
                    "expressionSetApiName": "Revenue_Mgmt_Default_Pricing_Procedure",
                    "expressionSetDefinition": "9QAZ60000004ECOOA2",
                 "expressionSetLabel": "Revenue Management Default Pricing Procedure",

                    "isSuccess": true,
                    "logic": "1 AND 2 AND 3",
                    "primaryObject": "Account",
                    "priority": 1,
                    "procedurePlanCriterion": [
                      {
                        "conditionSequence": 1,
                        "dataType": "Text",
                        "fieldObject": "BillingCountry",
                        "fieldPath": "BillingCountry",
                        "isSuccess": true,

                       }
                     ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`error`	Procedure Plan Generic Error[]	Details of the error encountered during the processing of the API request.	Small, 62.0	62.0

Property Name	Type	Description	Filter Group and Version	Available Version
expression SetApiName	String	API name of the expression set.	Small, 62.0	62.0
expressionSet Definition	String	Expression set definition that's associated with this procedure plan option record.	Small, 62.0	62.0
expression SetLabel	String	Label of the expression set that's associated with this procedure plan option record.	Small, 62.0	62.0
isSuccess	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Small, 62.0	62.0
logic	String	Computation logic for the conditions applied to a procedure plan option.	Small, 62.0	62.0
primaryObject	String	Source object that's used to create a procedure with rule-based criteria.	Small, 62.0	62.0
priority	Integer	Priority for the specified criteria.	Small, 62.0	62.0
procedure PlanCriterion	Procedure Plan Criterion[]	Details of the rule-based criteria for the procedure.	Small, 62.0	62.0
readContext Mapping	String	Mapping that's used to read from the mapped object and populate the context definition.	Small, 62.0	62.0
recordId	String	ID of the procedure plan option record.	Small, 62.0	62.0
saveContext Mapping	String	Mapping that's used to save data from the context definition and populate the mapped object.	Small, 62.0	62.0

Procedure Plan Section

Output representation of the details of a procedure plan section.

JSON example

```
                "procedurePlanSections": [
              {
                 "isInherited": false,

                      "saveContextMapping": "AssetToSalesTransactionMapping"
                       }
                       ],
                     "recordId": "1FRZ60000008OIAOA2",
                     "resolutionType": "RuleBased",
                     "sectionType": "PricingProcedure",
                     "sequence": 1,
                     "subSectionType": "PricingProcedure"
                   }
               ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`error`	Procedure Plan Generic Error[]	Details of the error encountered during the processing of the API request.	Small, 62.0	62.0
`isInherited`	Boolean	Indicates whether the procedure plan section is inherited from a template (`true`) or not (`false`).	Small, 62.0	62.0

Property Name	Type	Description	Filter Group and Version	Available Version
isSuccess	Boolean	Indicates whether the API request is successful (true) or not (false).	Small, 62.0	62.0
procedure PlanOptions	Procedure Plan Option[]	List of procedure plan options.	Small, 62.0	62.0
recordId	String	ID of the procedure plan option record.	Small, 62.0	62.0
resolution Type	String	Type of resolution that's used to filter the procedure.	Small, 62.0	62.0
sectionType	String	Type of section. Valid values are: • PricingProcedure • ProductDiscoveryProcedure • ProductQualificationProcedure • PricingDiscoveryProcedure • DiscountSpreadServiceProcedure • RatingProcedure • Custom • RatingDiscoveryProcedure	Small, 62.0	62.0
sequence	Integer	Sequence that's followed for the processing of the procedures.	Small, 62.0	62.0
subSection Type	String	Subsection that's added to the procedure plan definition.	Small, 62.0	62.0

Procedure Plan Section Evaluation Runtime

Output representation of the results from the procedure plan evaluation.

JSON example

```
                "procedurePlanSections": [
                    {
                        "expressionSetApiName": "pricingProcedure_usageType_3",
                        "expressionSetDefinitionId": "9QAZ60000004Ef6OAE",
                        "expressionSetLabel": "pricingProcedure_usageType_3",
                        "sectionType": "PricingProcedure",
                        "sequence": 1,
                        "subSectionType": "Section1",
                        "usageType": "DefaultPricing"
                    },
                    {
                        "expressionSetApiName": "productQualification_usageType_3",
                        "expressionSetDefinitionId": "9QAZ60000004EfFOAU",
                        "expressionSetLabel": "productQualification_usageType_3",
                        "sectionType": "ProductQualificationProcedure",
```

```
                "sequence": 3,
                "subSectionType": "Section2",
                "usageType": "ProductQualification"
            },
            {
                "expressionSetApiName": "rating_usageType_2",
                "expressionSetDefinitionId": "9QAZ60000004EfHOAU",
                "expressionSetLabel": "rating_usageType_2",
                "sectionType": "RatingProcedure",
                "sequence": 2,
                "subSectionType": "Section3",
                "usageType": "DefaultRating"
            }
        ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`expression SetApiName`	String	API name of the expression set.	Small, 62.0	62.0
`expressionSet DefinitionId`	String	ID of the expression set definition.	Small, 62.0	62.0
`expression SetLabel`	String	Label of the expression set.	Small, 62.0	62.0
`readContext Mapping`	String	Mapping that's used to read data from the mapped object and populate the context definition.	Small, 62.0	62.0
`saveContext Mapping`	String	Mapping that's used to save data from the context definition and populate the mapped object.	Small, 62.0	62.0
`sectionType`	String	Name of the evaluated section. Valid values are: • `PricingProcedure` • `ProductDiscoveryProcedure` • `ProductQualificationProcedure` • `PricingDiscoveryProcedure` • `DiscountSpreadServiceProcedure` • `RatingProcedure` • `Custom` • `RatingDiscoveryProcedure`	Small, 62.0	62.0
`sequence`	Integer	Sequence that's followed for the processing of the procedures.	Small, 62.0	62.0
`subSection Type`	String	Name of the evaluated subsection.	Small, 62.0	62.0

Property Name	Type	Description	Filter Group and Version	Available Version
`usageType`	String	Usage type of the procedure.	Small, 62.0	62.0

Procedure Plan Evaluation

Output representation of the evaluation details of a procedure plan definition.

JSON example

```
"procedurePlanEvaluations":[
{
  "errorMessage":"",
  "id":"a01DU000000BylcYAC",
  "isSuccess":true,
  "primaryObject":"SignallingCustomEvaluation__c",
  "result":{
  "contextDefinition":"11ODU00000008Sw2AI",
  "procedurePlanSections":[]
}
}
]
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errorMessage`	String	Message indicating the error details, if any.	Small, 62.0	62.0
`id`	String	ID of the object used for evaluation.	Small, 62.0	62.0
`isSuccess`	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Small, 62.0	62.0
`primaryObject`	String	Name of the object used for evaluation.	Small, 62.0	62.0
`result`	Procedure Plan Evaluation Result[]	Results from the procedure plan evaluation.	Small, 62.0	62.0

Procedure Plan Evaluation Response

Output representation of the evaluation details of a procedure plan definition.

JSON example

```
{
"isSuccess":true,
"procedurePlanEvaluations":[
{
  "errorMessage":"",
  "id":"a01DU000000BylcYAC",
  "isSuccess":true,
  "primaryObject":"SignallingCustomEvaluation__c",
```

```
    "result":{
    "contextDefinition":"11ODU00000008Sw2AI",
    "procedurePlanSections":[]
  }
  }
  ]
  }
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errorMessage`	String	Message indicating the error details, if any.	Small, 62.0	62.0
`isSuccess`	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Small, 62.0	62.0
`procedurePlanDefinitionName`	String	Name of the procedure plan definition.	Small, 62.0	62.0
`procedurePlanEvaluations`	Procedure Plan Evaluation[]	Evaluation details of the procedure plan.	Small, 62.0	62.0

Procedure Plan Evaluation Result

Output representation of the evaluation result of a procedure plan definition.

JSON example

```
    "result":{
    "contextDefinition":"11ODU00000008Sw2AI",
    "procedurePlanSections":[]
  }
```

Property Name	Type	Description	Filter Group and Version	Available Version
`contextDefinition`	String	Context definition that's associated with the procedure plan evaluation.	Small, 62.0	62.0
`procedurePlanSections`	Procedure Plan Section Evaluation Runtime[]	Results from the procedure plan evaluation.	Small, 62.0	62.0

Pricing Process Execution Details for Line Items

Output representation of the pricing process execution details for the line items along with the error details and response generation status.

JSON example

```
 {
```

```
  "error": {},
  "isSuccess": true,
  "lineItemDetailsList": [
    {
      "lineItemId": "LineItem1",
      "status": "Success"
    },
    {
      "lineItemId": "LineItem2",
      "status": "Success"
    },
    {
      "lineItemId": "LineItem3",
      "status": "Failure"
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`error`	Pricing Error Response	Error encountered during the processing of the API request.	Small, 63.0	63.0
`isSuccess`	Boolean	Indicates whether the response was generated successfully (`true`) or not (`false`).	Small, 63.0	63.0
`lineItemDetailsList`	Line Item Details Response []	List of the line items for which the pricing process is executed.	Small, 63.0	63.0

Line Item Details Response

Output representation of the pricing process execution details for the line items.

JSON example

```
 {
  "lineItemDetailsList": [
    {
      "lineItemId": "LineItem1",
      "status": "Success"
    },
    {
      "lineItemId": "LineItem2",
      "status": "Success"
    },
    {
      "lineItemId": "LineItem3",
      "status": "Failure"
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`lineItemId`	String	ID of the line item that the pricing process is executed for.	Small, 63.0	63.0
`status`	String	Specifies whether the pricing process execution for the line item is successful or has failed. Valid values are: • `Success` • `Failure`	Small, 63.0	63.0

Pricing Process Execution Response

Output representation of the details of a pricing process execution.

JSON example

```
{
 "error": {},
 "isSuccess": true,
 "pricingProcessExecutionList": [
   {
     "executionId": "12345",
     "executionType": "Pricing_Line",
     "executionTypeId": "111_LineItem1",
     "message": "The Pricing API execution was successful.",
     "status": "Success"
   },
   {
     "executionId": "12345",
     "executionType": "Api_Execution",
     "executionTypeId": "333",
     "status": "Partial_Success"
   },
   {
     "executionId": "12345",
     "executionType": "Discovery",
     "executionTypeId": "222",
     "status": "Success"
   },
   {
     "executionId": "12345",
     "executionType": "Pricing",
     "executionTypeId": "111",
     "status": "Failure"
   },
   {
     "executionId": "12345",
     "executionType": "Discovery_Line",
     "executionTypeId": "222_LineItem1",
     "status": "Partial_Success"
```

```
    },
    {
      "executionId": "12345",
      "executionType": "Pricing_Line",
      "executionTypeId": "111_LineItem2",
      "status": "Failure"
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`error`	Pricing Error Response	Error encountered during the processing of the API request.	Small, 63.0	63.0
`isSuccess`	Boolean	Indicates whether the response was generated successfully (`true`) or not (`false`).	Small, 63.0	63.0
`pricingProcessExecutionList`	Pricing Process Execution List []	List of the execution details of the pricing process.	Small, 63.0	63.0

Pricing Process Execution List

Output representation of the execution details for different types of the pricing processes.

JSON example

```
{
 "pricingProcessExecutionList": [
    {
      "executionId": "12345",
      "executionType": "Pricing_Line",
      "executionTypeId": "111_LineItem1",
      "message": "The Pricing API execution was successful.",
      "status": "Success"
    },
    {
      "executionId": "12345",
      "executionType": "Api_Execution",
      "executionTypeId": "333",
      "status": "Success"
    },
    {
      "executionId": "12345",
      "executionType": "Discovery",
      "executionTypeId": "222",
      "status": "Success"
    },
    {
      "executionId": "12345",
      "executionType": "Pricing",
```

```
      "executionTypeId": "111",
      "status": "Failure"
    },
    {
      "executionId": "12345",
      "executionType": "Discovery_Line",
      "executionTypeId": "222_LineItem1",
      "status": "Success"
    },
    {
      "executionId": "12345",
      "executionType": "Pricing_Line",
      "executionTypeId": "111_LineItem2",
      "status": "Failure"
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`executionId`	String	Unique ID that's generated each time a pricing process is executed.	Small, 63.0	63.0
`executionType`	String	Type of the execution that's defined internally within the pricing API.	Small, 63.0	63.0
`executionTypeId`	String	Unique execution type ID that's generated internally for process executions, such as pricing or discovery procedures.	Small, 63.0	63.0
`message`	String	Message that's generated when a pricing process is executed.	Small, 63.0	63.0
`status`	String	Execution process status for a line item. Valid values are: • `Failure` • `Partial_Success`—Applies to `Pricing` and `Discovery` procedures when execution for some line items fails. • `Success`	Small, 63.0	63.0

Pricing Simulation Input Variables With Data

Output representation of the pricing simulation variables with data.

JSON example

```
{
  "error": "",
  "simulationInputJsonWithData": "{\"SalesTransaction\": [{\"PriceBooks\":
```

```
\"01sxx0000005ptpAAA\",\"SalesTransactionItem\": [{\"LineItemQuantity\":
4,\"ProductSellingModel\": null,\"Product\": \"01txx0000006i2SAAQ\",\"LineItem\":
\"0QLxx0000004C92GAE\"},{\"LineItemQuantity\": 3,\"ProductSellingModel\":
null,\"Product\": \"01txx0000006i2TAAQ\",\"LineItem\": \"0QLxx0000004C93GAE\"}]}]}",
  "success": true
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`error`	String	Returns the cause of error, if any. For a successful request, this API returns an empty string.	Small, 64.0	64.0
`simulationInputJsonWithData`	String	Resultant simulation input variables with quote or order data such as ID, which was specified in the query parameters.	Small, 64.0	64.0
`success`	Boolean	Indicates whether the request was successful (`true`) or not (`false`).	Small, 64.0	64.0

Salesforce Pricing Apex Reference

Use built-in Apex classes and interfaces grouped by namespace.

RevSignaling Namespace
The RevSignaling Namespace includes properties and methods to extend the standard procedure plan implementation through custom logic. Using this extension support, you can tailor implementations to your unique requirements.

SEE ALSO:

Apex Developer Guide: Getting Started with Apex

RevSignaling Namespace

The RevSignaling Namespace includes properties and methods to extend the standard procedure plan implementation through custom logic. Using this extension support, you can tailor implementations to your unique requirements.

Usage

To use this namespace, enable the **Procedure Plan Orchestration for Pricing** toggle from the Revenue Settings page from Setup.

The `RevSignaling` namespace includes these classes.

ProcedurePlan Class
Represents the instance of the current pricing procedure plan that you're working on.

SignalingApexProcessor Interface
Defines the context-driven orchestration logic based on procedure plan instance and contextual instance.

TransactionRequest Class

Represents the transaction request to the signaling Apex processor.

TransactionResponse Class

Represents the transaction response from the signaling Apex processor.

TransactionStatus Enum

Specifies the status of the transaction request.

ProcedurePlan Class

Represents the instance of the current pricing procedure plan that you're working on.

Namespace

RevSignaling on page 843

ProcedurePlan Properties

Learn more about the properties that are available with the ProcedurePlan class.

ProcedurePlan Properties

Learn more about the properties that are available with the ProcedurePlan class.

The `ProcedurePlan` class includes these properties.

prevStepOutput

Output of the previous step that's executed and passed to the next step.

`prevStepOutput`

Output of the previous step that's executed and passed to the next step.

Signature

`public Map<String,ANY> prevStepOutput {get; set;}`

```
RevSignaling.ProcedurePlan, prevStepOutput
```

Property Value

Type: Map<String,Object>

SignalingApexProcessor Interface

Defines the context-driven orchestration logic based on procedure plan instance and contextual instance.

Namespace

RevSignaling on page 843

Usage

Here's a sample implementation of the SignalingApexProcessor interface.

```
public class SignalingApexProcessorImpl implements RevSignaling.SignalingApexProcessor {

   public RevSignaling.TransactionResponse execute(RevSignaling.TransactionRequest request)
 {
        System.debug('Executing SampleValidClass...');
        System.debug('Procedure Plan: ' + request.procedurePlanInstance);
        System.debug('Context Instance: ' + request.ctxInstanceId);

        // Add your logic here

        // Return the response
       RevSignaling.TransactionResponse response = new RevSignaling.TransactionResponse();

        response.status = RevSignaling.TransactionStatus.SUCCESS;
        response.message = 'Apex method was successfully executed!';
        return response;
    }
}
```

Refer to Customize Your Pricing Procedures With Apex Hooks for additional samples that cover unique pricing scenarios by implementing this interface.

SignalingApexProcessor Methods

The SignalingApexProcessor method executes the specified transaction request, which returns the corresponding response.

SignalingApexProcessor Example Implementation

Refer to the example implementation of the SignalingApexProcessor interface to define a context-driven orchestration logic.

SignalingApexProcessor Methods

The SignalingApexProcessor method executes the specified transaction request, which returns the corresponding response.

The `SignalingApexProcessor` class includes these methods.

execute(var1)

Executes the parameter that's specified in the instance of a transaction request.

execute(var1)

Executes the parameter that's specified in the instance of a transaction request.

Signature

`public RevSignaling.TransactionResponse execute(RevSignaling.TransactionRequest var1)`

```
RevSignaling.SignalingApexProcessor, execute, [RevSignaling.TransactionRequest],
RevSignaling.TransactionResponse
```

Parameters

var1

Type: RevSignaling.TransactionRequest on page 846

Instance of the TransactionRequest class containing the execution parameter.

Return Value

Type: RevSignaling.TransactionResponse on page 848

Response from the orchestration.

SignalingApexProcessor Example Implementation

Refer to the example implementation of the SignalingApexProcessor interface to define a context-driven orchestration logic.

This is an example implementation of the `RevSignaling.SignalingApexProcessor` interface.

```
public class SignalingApexProcessorImpl implements RevSignaling.SignalingApexProcessor {

    public RevSignaling.TransactionResponse execute(RevSignaling.TransactionRequest request)
 {
        System.debug('Executing SampleValidClass...');
        System.debug('Procedure Plan: ' + request.procedurePlanInstance);
        System.debug('Context Instance: ' + request.ctxInstanceId);

        // Add your logic here

        // Return the response
       RevSignaling.TransactionResponse response = new RevSignaling.TransactionResponse();

        response.status = RevSignaling.TransactionStatus.SUCCESS;
        response.message = 'Apex method was successfully executed!';
        return response;
    }
}
```

TransactionRequest Class

Represents the transaction request to the signaling Apex processor.

Namespace

RevSignaling on page 843

TransactionRequest Constructors

Learn more about the available constructors with the TransactionRequest class.

TransactionRequest Properties

Learn more about the properties that are available with the TransactionRequest class.

TransactionRequest Constructors

Learn more about the available constructors with the TransactionRequest class.

The `TransactionRequest` class includes these constructors.

TransactionRequest(procedurePlanInstance, ctxInstanceId)
Creates an instance of the TransactionRequest class to specify the procedure plan and context instance ID.

TransactionRequest(procedurePlanInstance, ctxInstanceId)

Creates an instance of the TransactionRequest class to specify the procedure plan and context instance ID.

Signature

`public TransactionRequest(RevSignaling.ProcedurePlan procedurePlan, String ctxInstanceId)`

```
RevSignaling.TransactionRequest, newinstance, [RevSignaling.ProcedurePlan, String],
RevSignaling.TransactionRequest
```

Parameters

procedurePlan
Type: RevSignaling.ProcedurePlan on page 844

Instance of the procedure plan.

ctxInstanceId
Type: String

ID of the context.

TransactionRequest Properties

Learn more about the properties that are available with the TransactionRequest class.

The `TransactionRequest` class includes these properties.

ctxInstanceId
Set the context ID.

procedurePlanInstance
Set the instance of the procedure plan.

ctxInstanceId

Set the context ID.

Signature

`public String ctxInstanceId {get; set;}`

```
RevSignaling.TransactionRequest, ctxInstanceId
```

Property Value

Type: String

`procedurePlanInstance`

Set the instance of the procedure plan.

Signature

`public RevSignaling.ProcedurePlan procedurePlanInstance {get; set;}`

```
RevSignaling.TransactionRequest, procedurePlanInstance
```

Property Value

Type: RevSignaling.ProcedurePlan on page 844

TransactionResponse Class

Represents the transaction response from the signaling Apex processor.

Namespace

RevSignaling on page 843

TransactionResponse Properties
Learn more about the properties that are available with the TransactionResponse class.

TransactionResponse Properties

Learn more about the properties that are available with the TransactionResponse class.

The `TransactionResponse` class includes these properties.

message
Get the message from the transaction response.

status
Get the status of the request from the transaction response.

`message`

Get the message from the transaction response.

Signature

`public String message {get; set;}`

```
RevSignaling.TransactionResponse, message
```

Property Value

Type: String

`status`

Get the status of the request from the transaction response.

Signature

`public RevSignaling.TransactionStatus status {get; set;}`

```
RevSignaling.TransactionResponse, status
```

Property Value

Type: RevSignaling.TransactionStatus on page 849

TransactionStatus Enum

Specifies the status of the transaction request.

Enum Values

The `RevSignaling.TransactionStatus` enum includes these values.

Value	Description
`FAILED` `RevSignaling.TransactionStatus, FAILED`	The transaction request has failed.
`SUCCESS` `RevSignaling.TransactionStatus, SUCCESS`	The transaction request was successful.

Salesforce Pricing Standard Invocable Actions

Learn more about the standard invocable actions available with Salesforce Pricing.

Run Salesforce Headless Pricing Action
Invoke the Pricing Connect API by providing the pricing data and details of a context, pricing procedure, and price waterfall.

Run Salesforce Pricing Action

Invoke the Pricing Connect API by providing the context, pricing procedure, and price waterfall details.

SEE ALSO:

Actions Developer Guide: Overview

REST API Developer Guide: Invocable Actions Standard

Run Salesforce Headless Pricing Action

Invoke the Pricing Connect API by providing the pricing data and details of a context, pricing procedure, and price waterfall.

This action is available in API version 60.0 and later.

Special Access Rules

The Run Salesforce Headless Pricing action is available in Enterprise, Unlimited, and Developer Editions where Salesforce Pricing is enabled.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/runSalesforceHeadlessPricing`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer token`

Inputs

Input	Details
`contextDefinitionId`	**Type** string **Description** Required. ID of the context definition record that's used to build the pricing data.
`contextMappingId`	**Type** string **Description** Required.

Input	Details
	ID of the context-mapping record that identifies which Salesforce object and mappings to use to build the pricing data.
`discoveryProcedure`	**Type** string **Description** Name of the discovery procedure that's used to execute the discovery process.
`displayContext`	**Type** boolean **Description** Indicates whether to display the context structure for pricing (`true`) or not (`false`).
`effectiveDate`	**Type** string **Description** Date when the pricing rules, as specified in the pricing procedure, are applied. The `effectiveDate` parameter determines which pricing procedure to execute when multiple active versions of pricing procedures are available with different date ranges.
`isHighVolumeLineItems`	**Type** boolean **Description** Indicates whether the pricing API returns pricing details for more than 100 line items (`true`) or not (`false`).
`isSkipWaterfall`	**Type** boolean **Description** Indicates whether to generate the price waterfall data (`true`) or not (`false`).
`persistContext`	**Type** boolean **Description** Indicates whether to store the context (`true`) or not (`false`). If set to `true`, the user must have edit access to all sObject fields used in the context mapping.
`pricingData`	**Type** string

Input	Details
	Description Required. JSON data that's used to build the pricing data. The JSON must be escaped. If you're using this data within a Flow, then the JSON data must not be escaped. Also, make sure that the `businessObjectType` value within the `pricingData` property node is set to the sObject used in the context mappings.
`pricingProcedureId`	**Type** string **Description** Required. ID or API name of the pricing procedure used for calculating the prices. A pricing procedure is represented as an Expression Set Definition in the system. If you're an Experience Cloud user, specify the name of the pricing procedure.
`skipDiscovery`	**Type** boolean **Description** Indicates whether to skip executing the discovery procedure (`true`) or not (`false`).
`taggedData`	**Type** boolean **Description** Indicates whether the associated context node contains a key (`true`) or not (`false`).
`useSessionScopedContext`	**Type** boolean **Description** Indicates whether to store the context in a session (`true`) or a request (`false`).

Outputs

Output	Details
`contextDetails`	**Type** string **Description** Context structure for pricing that's generated when the `displayContext` parameter is set to `true`.

Output	Details
`executionId`	**Type** string **Description** ID of the executed pricing data.
`pricingProcessErrors`	**Type** string **Description** Errors that are generated due to context tags in a pricing process.
`pricingProcessStatus`	**Type** string **Description** Status of the pricing process, which is executed as an API call.
`pricingResult`	**Type** string **Description** Outcome of the executed pricing process that's based on the output tags defined in the associated context definition.

Example

POST

This sample request is for the Run Salesforce Headless Pricing action.

```
{
  "inputs": [

Salesforce Help: Invoke Salesforce Headless Pricing in a Flow

Run Salesforce Pricing Action

Invoke the Pricing Connect API by providing the context, pricing procedure, and price waterfall details.

This action is available in API version 60.0 and later. You can use this action with Flows only. To use this action with an API tool such as Postman, see Run Salesforce Headless Pricing Action.

Special Access Rules

The Run Salesforce Pricing action is available in Developer, Enterprise, and Unlimited Editions where Salesforce Pricing is enabled.

Supported REST HTTP Methods

URI

/services/data/v***67.0***/actions/standard/runSalesforcePricing

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer` ***`token`***

Inputs

Input	Details
`contextInstanceId`	**Type** string **Description** Required. ID of the context data that's used to build the pricing procedure. Get the context instance ID by invoking the Context Service API. See Context Service (POST).
`discoveryProcedure`	**Type** string **Description** Name of the discovery procedure that's used to execute the discovery process of the pricing data.
`effectiveDate`	**Type** string **Description** Date when the pricing rules, as specified in the pricing procedure, are applied. The `effectiveDate` parameter determines which pricing procedure to execute when multiple active versions of pricing procedures are available with different date ranges.
`isDeveloperName`	**Type** boolean **Description** Indicates whether the input value in a procedure must use the API name of the pricing (`true`) or the field name (`false`).
`isSkipWaterfall`	**Type** boolean **Description** Indicates whether the price waterfall data must be generated (`true`) or not (`false`).
`pricingProcedureName`	**Type** string

Input	Details
	Description Required. Name of the pricing procedure record that's used to execute the pricing process.
`skipDiscovery`	**Type** boolean **Description** Indicates whether to skip executing the discovery procedure (`true`) or not (`false`).

Outputs

Output	Details
`executionId`	**Type** string **Description** ID of the executed pricing data.

Example

POST

This sample request is for the Run Salesforce Pricing action.

```
{
  "inputs": [
    {
      "contextInstanceId": "32f2c894-ba5e-41c0-91e4-2ab5826f579b",
      "pricingProcedureName": "PricingAction",
      "isSkipWaterfall": false,
      "skipDiscovery": false,
      "isDeveloperName": true,
      "effectiveDate": "2023-11-16T12:20:00.000Z",
      "discoveryProcedure": "ES1"
    }
  ]
}
```

This sample response is for the Run Salesforce Pricing action.

```
{
  "actionName": "runSalesforcePricing",
  "errors": null,
  "isSuccess": true,
  "outputValues": {
    "executionId": "2QTurzG2NRQ5bgrjvvqyh"
```

```
  },
  "version": 1
}
```

Salesforce Pricing Metadata API Types

Metadata API enables you to access some types and feature settings that you can customize in the user interface.

Flow for Salesforce Pricing

Represents the metadata associated with a flow. With Flow, you can create an application that navigates users through a series of screens to query and update records in the database. You can also execute logic and provide branching capability based on user input to build dynamic applications.

IndustriesPricingSettings

Represents the settings for Salesforce Pricing.

PricingActionParameters

Represents the pricing action that's associated with a context definition and pricing procedure.

PricingRecipe

Represents the data models or sets of objects of a particular cloud that the pricing data store consumes during design time and run time.

ProcedureOutputResolution

Represents the pricing resolution for a pricing element determined by using strategy name and formula.

SEE ALSO:

Metadata API Developer Guide: Understanding Metadata API

Flow for Salesforce Pricing

Represents the metadata associated with a flow. With Flow, you can create an application that navigates users through a series of screens to query and update records in the database. You can also execute logic and provide branching capability based on user input to build dynamic applications.

FlowActionCall

Salesforce Pricing exposes additional actionType values for the FlowActionCall Metadata type.

Field Name	Field Type	Description
`actionType`	InvocableActionType (enumeration of type string)	Required. The action type. Additional valid values only for Salesforce Pricing include:

Field Name	Field Type	Description
		• `runSalesforcePricing`—Invoke the Pricing Connect API by providing the context, pricing procedure, and price waterfall details. • `runSalesforceHeadlessPricing`—Invoke the Pricing Connect API by providing the pricing data and details of a context, pricing procedure, and price waterfall.

IndustriesPricingSettings

Represents the settings for Salesforce Pricing.

Parent Type and Manifest Access

This type extends the Metadata metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See Settings for more details.

File Suffix and Directory Location

`IndustriesPricingSettings` values are stored in the `IndustriesPricingSettings.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there's only one settings file for each settings component.

Version

IndustriesPricingSettings components are available in API version 60.0 and later.

Special Access Rules

This metadata type is available with Salesforce Pricing.

Fields

Field Name	Description
`enableDebugPriceLogs`	**Field Type** boolean **Description** Indicates whether to use price logs to diagnose and resolve pricing issues (`true`) or not (`false`). The default value is `false`. Available in API version 63.0 and later.
`enableHighAvailability`	**Field Type** boolean

Field Name	Description
	Description Reserved for internal use.
enableHighestPriceCompliance	**Field Type** boolean **Description** Indicates whether to track the maximum price of a product over a period of 30 days (`true`) or not (`false`). The default value is `false`. Available in API version 64.0 and later.
enableLowestPriceCompliance	**Field Type** boolean **Description** Indicates whether to track the minimum price of a product over a period of 30 days (`true`) or not (`false`). The default value is `false`. Available in API version 62.0 and later.
enablePricingProcParallelization	**Field Type** boolean **Description** Indicates whether to run pricing elements in parallel within a pricing procedure to optimize the performance of the pricing execution process (`true`) or not (`false`). The default value is `false`. Available in API version 64.0 and later.
enablePricingWaterfall	**Field Type** boolean **Description** Indicates whether to enable Price Waterfall (`true`) or not (`false`). The default value is `false`. Price Waterfall provides insights that include price breakups and reasons for every step of the pricing process.
enablePricingWaterfallPersistence	**Field Type** boolean **Description** Indicates whether to enable Price Waterfall Persistence (`true`) or not (`false`). The default value is `false`. Price Waterfall Persistence stores the process logs that provide insights into the internal pricing processes.
enableSalesforcePricing	**Field Type** boolean **Description** Indicates whether to enable Salesforce Pricing (`true`) or not (`false`). The default value is `false`.

Declarative Metadata Sample Definition

This example shows a sample IndustriesPricingSettings component.

```
<IndustriesPricingSettings xmlns="http://soap.sforce.com/2006/04/metadata">
     <enableDebugPriceLogs>true</enableDebugPriceLogs>
     <enableHighAvailability>true</enableHighAvailability>
     <enableHighestPriceCompliance>true</enableHighestPriceCompliance>
     <enableLowestPriceCompliance>true</enableLowestPriceCompliance>
     <enablePricingProcParallelization>true</enablePricingProcParallelization>
     <enablePricingWaterfall>true</enablePricingWaterfall>
     <enablePricingWaterfallPersistence>true</enablePricingWaterfallPersistence>
     <enableSalesforcePricing>true</enableSalesforcePricing>
</IndustriesPricingSettings>
```

This example shows a sample `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>IndustriesPricing</members>
        <name>Settings</name>
    </types>
    <version>67.0</version>
</Package>
```

Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see Settings. For information about using the manifest file, see Deploying and Retrieving Metadata with the Zip File.

PricingActionParameters

Represents the pricing action that's associated with a context definition and pricing procedure.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Parent Type

This type extends the Metadata metadata type and inherits its `fullName` field.

File Suffix and Directory Location

PricingActionParameters components have the suffix `.pricingActionParameters` and are stored in the `pricingActionParameters` folder.

Version

PricingActionParameters components are available in API version 60.0 and later.

Special Access Rules

This metadata type is available with Salesforce Pricing.

Fields

Field Name	Description
`contextDefinition`	**Field Type** string **Description** Required. Context definition record that's associated with the pricing action.
`contextMapping`	**Field Type** string **Description** Required. Context mapping record that's associated with the pricing action.
`developerName`	**Field Type** string **Description** Required. Unique name of the pricing action parameter record. The name must begin with a letter and use only alphanumeric characters and underscores. The name must not include spaces, end with an underscore, or have two consecutive underscores.
`effectiveFrom`	**Field Type** dateTime **Description** Required. Date and time from when the pricing action becomes effective.
`effectiveTo`	**Field Type** dateTime **Description** Date and time till when the pricing action is in effect.
`masterLabel`	**Field Type** string

Field Name	Description
	Description Required. Master label of the pricing action parameter.
objectName	**Field Type** string **Description** Name of the object that's associated with the pricing action. Valid values are: • Case • Contract • Opportunity • Order • Quote • SalesAgreement • WorkOrder
pricingProcedure	**Field Type** string **Description** Pricing procedure record that's associated with this pricing action.

Declarative Metadata Sample Definition

The following is an example of a PricingActionParameters component.

```
<PricingActionParameters xmlns="http://soap.sforce.com/2006/04/metadata">
    <developerName>CMEDefaultActionParameters</developerName>
    <objectName>ORDER</objectName>
    <pricingProcedure>PP</pricingProcedure>
    <effectiveFrom>2024-04-08T07:32:00.000Z</effectiveFrom>
    <effectiveTo>2024-04-11T07:32:00.000Z</effectiveTo>
    <contextDefinition>SalesTransactionContext__stdctx</contextDefinition>
    <contextMapping>SalesAgreementEntitiesMapping</contextMapping>
    <masterLabel>PAP_test</masterLabel>
</PricingActionParameters>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>*</members>
        <name>PricingActionParameters</name>
    </types>
```

```
    <version>67.0</version>
</Package>
```

Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see Deploying and Retrieving Metadata with the Zip File.

PricingRecipe

Represents the data models or sets of objects of a particular cloud that the pricing data store consumes during design time and run time.

Parent Type

This type extends the Metadata metadata type and inherits its `fullName` field.

File Suffix and Directory Location

PricingRecipe components have the suffix `.pricingRecipe` and are stored in the `pricingRecipe` folder.

Version

PricingRecipe components are available in API version 60.0 and later.

Special Access Rules

This metadata type is available with Salesforce Pricing.

Fields

Field Name	Description
`defaultPricingProcedure`	**Field Type** ExpressionSetDefinition **Description** Expression set definition that's associated with this pricing recipe setting.
`defaultPricingProcedureDeveloperName`	**Field Type** string **Description** For internal use only.
`defaultPricingProcedureId`	**Field Type** string

Field Name	Description
	Description ID of the pricing procedure of the pricing recipe.
`developerName`	**Field Type** string **Description** Required. API name of the pricing recipe.
`isActive`	**Field Type** boolean **Description** Indicates whether the pricing recipe is active (`true`) or not (`false`). The default value is `false`
`isInternal`	**Field Type** boolean **Description** Indicates whether the price recipe record is created internally by the Salesforce platform (`true`) or not (`false`). The default value is `false`
`masterLabel`	**Field Type** string **Description** Required. Name for pricing recipe that's defined when the pricing recipe is created.
`pricingRecipeTableMapping`	**Field Type** PricingRecipeTableMapping[] **Description** Mapping of the pricing components of a lookup table with the chosen pricing recipe.

PricingRecipeTableMapping

Represents the mapping of the lookup table with the chosen pricing recipe.

Field Name	Description
`isInternal`	**Field Type** boolean

Field Name	Description
	Description Indicates whether the price recipe field mapping record is created internally by the Salesforce platform (`true`) or not (`false`). The default value is `false`.
`lookupTable`	**Field Type** DecisionTable DecisionMatrixDefinition **Description** Lookup table that's associated with either a decision matrix or decision table.
`lookupTableDeveloperName`	**Field Type** string **Description** For internal use only.
`pricingComponentType`	**Field Type** string **Description** Pricing component field data that the decision table is built on. Valid values are: • `AttributeDiscount` • `BundleDiscount` • `DerivedPricing` • `ListPrice` • `PriceAdjustmentMatrix` • `PromotionsDiscount` • `VolumeDiscount` • `VolumeTierDiscount` • `DiscountDistributionService`. This value is available in API version 60.0 and later. • `MinimumPrice`. Available in API version 62.0 and later.
`pricingProcedureOutputMapList`	**Field Type** PricingProcedureOutputMap[] **Description** List of the mappings of the outputs of the pricing procedures to the associated lookup tables. Available in API version 60.0 and later.
`pricingRecipe`	**Field Type** string

Field Name	Description
	Description Required. Pricing data store that's associated with this pricing recipe field mapping.

PricingProcedureOutputMap

Represents the mapping of the outputs of the pricing procedures to the associated lookup tables. Each record specifies the output mapping of the associated lookup table based on the pricing component type specified in the PricingRecipeTableMapping object.

Field Name	Description
`fieldName`	**Field Type** string **Description** For internal use only.
`isPricingRecipeActive`	**Field Type** boolean **Description** Indicates whether the associated pricing recipe is active (`true`) or not (`false`). The default value is `false`.
`outputFieldName`	**Field Type** string **Description** Field name that contains the output type that's generated from the pricing element.
`outputFieldNameString`	**Field Type** string **Description** Derived field that references a specific column in a decision table or decision matrix.
`outputType`	**Field Type** string **Description** Output type that's generated from a pricing element. Valid values are: • `AdjustmentType` • `AdjustmentValue` • `CustomOutput` • `HashOutput`

Field Name	Description
	• `UnitPrice`
`pricingElementType`	**Field Type** PricingElementType (enumeration of type string) **Description** Type of pricing element, which is a derived field from `PricingRecipeTableMapping.PricingComponentType`. Valid values are: • `AssetDiscovery` • `AttributeDiscount` • `BundleDiscount` • `DerivedPricing` • `DiscountDistributionService` • `ListPrice` • `MinimumPrice` • `PriceAdjustmentMatrix` • `PriceRevision` • `PromotionsDiscount` • `RuleFetch` • `VolumeDiscount` • `VolumeTierDiscount`

Declarative Metadata Sample Definition

The following is an example of a PricingRecipe component.

```
<PricingRecipe xmlns="http://soap.sforce.com/2006/04/metadata">
    <defaultPricingProcedureId> </defaultPricingProcedureId>
    <developerName>CMEDefaultRecipe</developerName>
    <isActive>false</isActive>
    <isInternal>false</isInternal>
    <masterLabel>CMEDefaultRecipe</masterLabel>
    <pricingRecipeTableMapping>
        <isInternal>false</isInternal>

<lookupTableDeveloperName>Bundle_Based_Adjustment_Decision_Table</lookupTableDeveloperName>

        <pricingComponentType>CUSTOMDISCOUNT</pricingComponentType>
        <fileBasedDecisionTableName>Bundle Based Adjustment
Entries</fileBasedDecisionTableName>
        <pricingProcedureOutputMapList>
            <fieldName>AdjustmentValue</fieldName>
            <isPricingRecipeActive>false</isPricingRecipeActive>
            <outputFieldName>0lPxx000000000f</outputFieldName>
```

```
            <outputFieldNameString>false</outputFieldNameString>
            <outputType>AdjustmentValue</outputType>
      <pricingElementType>BundleDiscount</pricingElementType>
        </pricingProcedureOutputMapList>
        <pricingProcedureOutputMapList>
            <fieldName>AdjustmentType</fieldName>
            <isPricingRecipeActive>false</isPricingRecipeActive>
            <outputFieldName>01Pxx000000000m</outputFieldName>
            <outputFieldNameString>false</outputFieldNameString>
            <outputType>AdjustmentType</outputType>
      <pricingElementType>BundleDiscount</pricingElementType>
        </pricingProcedureOutputMapList>
        <pricingRecipe>CMEDefaultRecipe</pricingRecipe>
    </pricingRecipeTableMapping>
</PricingRecipe>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>*</members>
        <name>PricingRecipe</name>
    </types>
    <version>67.0</version>
</Package>
```

Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see Deploying and Retrieving Metadata with the Zip File.

ProcedureOutputResolution

Represents the pricing resolution for a pricing element determined by using strategy name and formula.

Parent Type

This type extends the Metadata metadata type and inherits its `fullName` field.

File Suffix and Directory Location

ProcedureOutputResolution components have the suffix `.procedureOutputResolution` and are stored in the `procedureOutputResolution` folder.

Version

ProcedureOutputResolution components are available in API version 63.0 and later.

Special Access Rules

This metadata type is available with Salesforce Pricing.

Fields

Field Name	Description
`developerName`	**Field Type** string **Description** Required. API name of the procedure output resolution.
`formula`	**Field Type** string **Description** Required. Stores the encoded formula as text.
`isActive`	**Field Type** boolean **Description** Required. Indicates whether the strategy is active (`true`) or not (`false`).
`isInternal`	**Field Type** boolean **Description** Reserved for internal use.
`masterLabel`	**Field Type** string **Description** Required. A user-friendly name for the procedure output resolution, which is defined when the ProcedureOutputResolution record is created.
`pricingElement`	**Field Type** string **Description** Required.

Field Name	Description
	Pricing element on which the procedure output resolution is defined.

Declarative Metadata Sample Definition

Here's an example of a ProcedureOutputResolution component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ProcedureOutputResolution xmlns="http://soap.sforce.com/2006/04/metadata">
    <developerName>ProcedureOutputResolution</developerName>
    <isActive>false</isActive>
    <isInternal>false</isInternal>
    <masterLabel>Procedure Output Resolution</masterLabel>
    <pricingElement>ListPrice</pricingElement>
    <formula>MAX(ListPrice)</formula>
</ProcedureOutputResolution>
```

Here's an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>*</members>
        <name>ProcedureOutputResolution</name>
    </types>
    <version>67.0</version>
</Package>
```

Wildcard Support in the Manifest File

This metadata type supports the wildcard character `*` (asterisk) in the `package.xml` manifest file. For information about using the manifest file, see Deploying and Retrieving Metadata with the Zip File.

Salesforce Pricing Tooling API Objects

Tooling API exposes metadata used in developer tooling that you can access through REST or SOAP. Tooling API's SOQL capabilities for many metadata types allow you to retrieve smaller pieces of metadata.

PricingActionParameters

Represents a pricing action associated to a context definition and a pricing procedure. This object is available in API version 60.0 and later.

PricingProcedureOutputMap

Represents the mapping of the outputs of the pricing procedures to the associated lookup tables. Each record specifies the output mapping of the associated lookup table based on the pricing component type specified in the Pricing Recipe Table Mapping object. This object is available in API version 60.0 and later.

PricingRecipe

Represents one out of various data models or sets of entities of a particular cloud that'll be consumed by the pricing data store during design and run time. This object is available in API version 60.0 and later.

PricingRecipeTableMapping

Represents the mapping of pricing components of a lookup table with the chosen pricing recipe. This object is available in API version 60.0 and later.

ProcedureOutputResolution

Represents the pricing resolution for an pricing element determined using strategy name and formula. This object is available in API version 63.0 and later.

ProcedurePlanCriterion

Represents a criterion within a procedure plan option record. This object is available in API version 62.0 and later.

ProcedurePlanDefinition

Represents the setup of a unified procedure from a list of multiple procedures that can be sequenced in any order based on business needs. Each procedure plan definition contains sections and subsections where procedures can be configured by using a lookup table or rule-based criteria. This object is available in API version 62.0 and later.

ProcedurePlanDefinitionVersion

Represents the versions for a procedure plan definition. Multiple versions under a procedure plan definition must be active at a time, which can be resolved at run time using the rank field. This object is available in API version 62.0 and later.

ProcedurePlanOption

Represents the selection criteria of how a procedure can be configured for a selected procedure plan section record. This object is available in API version 62.0 and later.

ProcedurePlanSection

Represents various procedure setup sections for a procedure plan definition. Each section enables the setup of a procedure of a type that can be further determined by using a rule-based criteria or it can be set based on a selected lookup table. This object is available in API version 62.0 and later.

ProcedurePlanVariable

Represents the setup for any adhoc user-defined variable that can be linked to a procedure plan definition record. This object is available in API version 62.0 and later.

Tooling API Developer Guide: Introducing Tooling API

PricingActionParameters

Represents a pricing action associated to a context definition and a pricing procedure. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
ContextDefinition	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The context definition record associated with the pricing action.
ContextMapping	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The context mapping record that's associated with the pricing action.
DeveloperName	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique name of the pricing action parameter record. This name must begin with a letter and use only alphanumeric characters and underscores. It can't include spaces, end with an underscore, or have two consecutive underscores.
EffectiveFrom	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The date and time when the pricing action comes into effect.
EffectiveTo	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time till when the pricing action is in effect.
Language	**Type** picklist

Field	Details
	Properties Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The language of the pricing action parameter. Possible values are: • `da`—Danish • `de`—German • `en_US`—English • `es`—Spanish • `es_MX`—Spanish (Mexico) • `fi`—Finnish • `fr`—French • `it`—Italian • `ja`—Japanese • `ko`—Korean • `nl_NL`—Dutch • `no`—Norwegian • `pt_BR`—Portuguese (Brazil) • `ru`—Russian • `sv`—Swedish • `th`—Thai • `zh_CN`—Chinese (Simplified) • `zh_TW`—Chinese (Traditional)
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The master label of the pricing action parameter.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the namespacePrefix__componentName notation.

Field	Details
	The namespace prefix can have one of the following values. • In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There's an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. • In organizations that are Developer Edition organizations, NamespacePrefix is only set for objects that are part of an installed managed package. There's no namespace prefix for all other objects.
`ObjectName`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies the object associated to the pricing action. Possible values are: • `Case` • `Contract` • `Opportunity` • `Order` • `Quote` • `SalesAgreement` • `WorkOrder`
`PricingProcedure`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The pricing procedure record associated with this pricing action.

PricingProcedureOutputMap

Represents the mapping of the outputs of the pricing procedures to the associated lookup tables. Each record specifies the output mapping of the associated lookup table based on the pricing component type specified in the Pricing Recipe Table Mapping object. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
`IsPricingRecipeActive`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates if the pricing recipe is active (true) or not (false). The default value is `false`.
`LookupField`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Definition of the fields that are used for this lookup.
`OutputFieldNameId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The field name containing the output type generated from the pricing element. This field is a polymorphic relationship field. **Relationship Name** OutputFieldName **Relationship Type** Lookup **Refers To** CalculationMatrixColumn, DecisionTableParameter
`OutputFieldNameString`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** This is a derived field that references a specific column in a decision table or decision matrix.
`OutputType`	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Restricted picklist, Sort, Update **Description** The output type generated from a pricing element. Possible values are: • `AdjustmentType`—Adjustment Type • `AdjustmentValue`—Adjustment Value • `CustomOutput`—Custom Output • `HashOutput`—Hash Output • `PriceIndex`—Price Index • `UnitPrice`—Unit Price • `UpperBound`—Unit Price • `LowerBound`—Unit Price • `TierValue`—Unit Price • `TierType`—Unit Price
`PricingComponentType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The pricing component field data on which the decision table is built. Possible values are: • `AttributeDiscount`—Attribute Based Discount • `BundleDiscount`—Bundle Based Discount • `DerivedPricing` • `DiscountDistributionService`—Discount Distribution Service • `ListPrice`—List Price • `PriceAdjustmentMatrix` • `PromotionsDiscount` • `VolumeDiscount`—Volume Based Discount • `VolumeTierDiscount`—Tier Discount • `RuleFetch` • `AssetDiscovery`
`PricingRecipeTableMappingId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update

Field	Details
	Description The mapping of pricing components of a lookup table with the chosen pricing recipe. This field is a relationship field. **Relationship Name** PricingRecipeTableMapping **Relationship Type** Lookup **Refers To** PricingRecipeTableMapping

PricingRecipe

Represents one out of various data models or sets of entities of a particular cloud that'll be consumed by the pricing data store during design and run time. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

Fields

Field	Details
`DefaultPricingProcedureId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The expression set definition or Salesforce flow definition associated with this pricing recipe settings. This field is a relationship field. **Relationship Name** DefaultPricingProcedure **Relationship Type** Lookup **Refers To** ExpressionSetDefinition

Field	Details
DeveloperName	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The developer name of the pricing recipe.
IsActive	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the pricing recipe is active (true) or not (false). The default value is `false`.
IsInternal	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates if the price recipe record is created internally by the Salesforce platform (true) or not (false). The default value is `false`.
Language	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The languages in which pricing recipe is supported. Possible values are: • `da`—Danish • `de`—German • `en_US`—English • `es`—Spanish • `es_MX`—Spanish (Mexico) • `fi`—Finnish • `fr`—French • `it`—Italian • `ja`—Japanese

Field	Details
	• `ko`—Korean • `nl_NL`—Dutch • `no`—Norwegian • `pt_BR`—Portuguese (Brazil) • `ru`—Russian • `sv`—Swedish • `th`—Thai • `zh_CN`—Chinese (Simplified) • `zh_TW`—Chinese (Traditional)
MasterLabel	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** A user-friendly name for pricing recipe, which is defined when the pricing recipe is created.
NamespacePrefix	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the namespacePrefix__componentName notation. The namespace prefix can have one of the following values. • In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There's an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. • In organizations that are Developer Edition organizations, NamespacePrefix is only set for objects that are part of an installed managed package. There's no namespace prefix for all other objects.

PricingRecipeTableMapping

Represents the mapping of pricing components of a lookup table with the chosen pricing recipe. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
`FileBasedDecisionTableName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Name of the file-based decision table.
`IsInternal`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates if the price recipe field mapping record is created internally by the Salesforce platform (true) or not (false). The default value is `false`.
`LookupTableId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The lookup table associated with the mapped fields. This field is a polymorphic relationship field. **Relationship Name** LookupTable **Relationship Type** Lookup **Refers To** DecisionMatrixDefinition, DecisionTable
`PricingComponentType`	**Type** Pricing Element Type enumerated list **Properties** Create, Filter, Group, Restricted picklist, Sort, Update

Field	Details
	Description The pricing component field data on which the decision table is built. Possible values are: • `AttributeDiscount`—Attribute Based Discount • `BundleDiscount`—Bundle Based Discount • `DerivedPricing` • `ListPrice`—List Price • `PriceAdjustmentMatrix` • `PromotionsDiscount` • `VolumeDiscount`—Volume Based Discount • `VolumeTierDiscount`—Tier Discount • `DiscountDistributionService`. This value is available in API version 60.0 and later. • `MinimumPrice`. This value is available in API version 62.0 and later. • `RuleFetch`. This value is available in API version 64.0 and later. • `AssetDiscovery`. This value is available in API version 64.0 and later.
`PricingRecipeId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The pricing data store associated with this pricing recipe field mappings. This field is a relationship field. **Relationship Name** PricingRecipe **Relationship Type** Lookup **Refers To** PricingRecipe

ProcedureOutputResolution

Represents the pricing resolution for an pricing element determined using strategy name and formula. This object is available in API version 63.0 and later.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
BusinessVertical	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The business vertical associated with the procedure output resolution record. Possible values are: • RLM
DeveloperName	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The name of the procedure output resolution.
Formula	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The formula function used to determine the minimum or maximum price of a product. The supported operations are MIN and MAX.
IsActive	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the procedure output resolution is active (true) or not (false). Only active procedure output resolutions can be applied to a procedure. The default value is `false`.
IsInternal	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort

Field	Details
	Description Indicates if the procedure output resolution record is created internally by the Salesforce platform (true) or not (false). The default value is `false`.
`Language`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The languages in which pricing recipe is supported. Possible values are: • `da`—Danish • `de`—German • `en_US`—English • `es`—Spanish • `es_MX`—Spanish (Mexico) • `fi`—Finnish • `fr`—French • `it`—Italian • `ja`—Japanese • `ko`—Korean • `nl_NL`—Dutch • `no`—Norwegian • `pt_BR`—Portuguese (Brazil) • `ru`—Russian • `sv`—Swedish • `th`—Thai • `zh_CN`—Chinese (Simplified) • `zh_TW`—Chinese (Traditional)
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** A user-friendly name for procedure output resolution, which is defined when the procedure output resolution record is created.

Field	Details
NamespacePrefix	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the namespacePrefix__componentName notation. The namespace prefix can have one of the following values. • In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There's an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. • In organizations that are Developer Edition organizations, NamespacePrefix is only set for objects that are part of an installed managed package. There's no namespace prefix for all other objects.
PricingElement	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies the pricing element on which the procedure output resolution is defined. Possible values are: • `ListPrice`—List Price • `MinimumPrice`—Price Tracking • `PriceAdjustmentMatrix`—Price Adjustment Matrix

ProcedurePlanCriterion

Represents a criterion within a procedure plan option record. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported SOAP API Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Supported REST API Methods

DELETE, GET, HEAD, PATCH, POST, Query

Fields

Field	Details
ActualValue	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The user-defined value that's compared to the value of the sObject field value.
DataType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The data type of the field from the selected object.
FieldPath	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The path of the field used in a procedure in relation to the object that the field belongs to.
ObjectField	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The Salesforce object field value used to resolve the procedure plan option.
Operator	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The operator used by the procedure plan criterion. Valid values are:

Field	Details
	• `Equals` • `GreaterThan` • `GreaterThanOrEquals` • `In` • `IsNotNull` • `IsNull` • `LessThan` • `LessThanOrEquals` • `NotEquals` • `NotIn`
`ProcedurePlanOptionId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The procedure plan option associated with the procedure plan criterion record. This field is a relationship field. **Relationship Name** ProcedurePlanOption **Relationship Type** Master-detail **Refers To** ProcedurePlanOption (the master object)
`Sequence`	**Type** int **Properties** Create, Filter, Group, Sort **Description** The sequence in which the conditions defined in the procedure plan criteria are processed.

ProcedurePlanDefinition

Represents the setup of a unified procedure from a list of multiple procedures that can be sequenced in any order based on business needs. Each procedure plan definition contains sections and subsections where procedures can be configured by using a lookup table or rule-based criteria. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported SOAP API Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Supported REST API Methods

`DELETE, GET, HEAD, PATCH, POST, Query`

Fields

Field	Details
`Description`	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The description of the procedure plan definition.
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique name of the procedure plan definition record. This name must begin with a letter and use only alphanumeric characters and underscores. It can't include spaces, end with an underscore, or have two consecutive underscores.
`Language`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The language of the procedure plan definition. Valid values are: • `da`—Danish • `de`—German • `en_US`—English • `es`—Spanish • `es_MX`—Spanish (Mexico) • `fi`—Finnish • `fr`—French • `it`—Italian

Field	Details
	• `ja`—Japanese • `ko`—Korean • `nl_NL`—Dutch • `no`—Norwegian • `pt_BR`—Portuguese (Brazil) • `ru`—Russian • `sv`—Swedish • `th`—Thai • `zh_CN`—Chinese (Simplified) • `zh_TW`—Chinese (Traditional)
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The master label of the procedure plan definition.
`NamespacePrefix`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The namespace prefix that is associated with this object. Each Developer Edition org that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the namespacePrefix__componentName notation. The namespace prefix can have one of the following values. • In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There's an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer. • In organizations that are Developer Edition organizations, NamespacePrefix is only set for objects that are part of an installed managed package. There's no namespace prefix for all other objects.
`PrimaryObject`	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort

Field	Details
	Description The object associated to the procedure plan definition. The fields in the object are used as variables in the procedure plan criterion.
ProcessType	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Identify the business processes that need a procedure plan for each SObject and definition. Possible values are: • `Billing` • `DRO` • `DeepClone`—Deep Clone • `Default` • `ProductDiscovery`—Product Discovery • `RLM` The default value is `Default`.

ProcedurePlanDefinitionVersion

Represents the versions for a procedure plan definition. Multiple versions under a procedure plan definition must be active at a time, which can be resolved at run time using the rank field. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported SOAP API Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Supported REST API Methods

`DELETE, GET, HEAD, PATCH, POST, Query`

Fields

Field	Details
`ContextDefinition`	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Restricted picklist, Sort, Update **Description** The context definition associated with the procedure plan definition record. Valid values are: • `11ODU00000007Zx2AI` • `11ODU000000084F2AQ` • `CollectionPlanEvent__stdctx` • `CommerceCartContextDefinition__stdctx` • `SalesTransactionContext__stdctx` • `TestContextService__stdctx` • `TestDynamicAttribute__stdctx` • `TestExtendedDefinition__stdctx`
`DefaultReadContextMapping`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The default read context mapping used to read from the mapped object and populate the context definition.
`DefaultSaveContextMapping`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The save context mapping used to save from the context definition and populate the mapped object.
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique name of the procedure plan definition version record. This name must begin with a letter and use only alphanumeric characters and underscores. It can't include spaces, end with an underscore, or have two consecutive underscores.
`EffectiveFrom`	**Type** dateTime

Field	Details
	Properties Create, Filter, Sort, Update **Description** The date and time when the procedure plan definition comes into effect.
EffectiveTo	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time when the procedure plan definition is no longer in effect.
InheritedFrom	**Type** string **Properties** Create, Filter, Group, idLookup, Nillable, Sort **Description** The template from which this procedure plan definition is created.
IsActive	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates if this procedure plan definition version is active (`true`) or not (`false`). The default value is `false`.
ProcedurePlanDefinitionId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The procedure plan definition associated with this procedure plan definition version record. This field is a relationship field. **Relationship Name** ProcedurePlanDefinition **Relationship Type** Master-detail **Refers To** ProcedurePlanDefinition (the master object)

Field	Details
`Rank`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The current rank of the procedure plan definition version that's used to determine which procedure plan definition version is executed .

ProcedurePlanOption

Represents the selection criteria of how a procedure can be configured for a selected procedure plan section record. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported SOAP API Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Supported REST API Methods

`DELETE, GET, HEAD, PATCH, POST, Query`

Fields

Field	Details
`ApexClassId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The Apex class associated with the procedure plan option record. This field is a relationship field. **Relationship Name** ApexClass **Refers To** ApexClass
`ApexClassName`	**Type** string

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The name of the Apex class associated with the procedure plan option record.
CriteriaLogic	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The computation logic for the various conditions applied to an option.
CtxDefinitionOutputFieldId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The context definition field that's associated with the decision table. This field is a relationship field. **Relationship Name** CtxDefinitionOutputField **Refers To** DecisionTableParameter
CtxMappingOutputFieldId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The context mapping field that's associated with the decision table. This field is a relationship field. **Relationship Name** CtxMappingOutputField **Refers To** DecisionTableParameter
DecisionTableId	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The decision table associated with the pricing procedure. This field is a relationship field. **Relationship Name** DecisionTable **Refers To** DecisionTable
`ExpressionSetApiName`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The API name of the expression set.
`ExpressionSetDefinitionId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The expression set definition associated with the procedure plan option record. This field is a relationship field. **Relationship Name** ExpressionSetDefinition **Refers To** ExpressionSetDefinition
`ExpressionSetLabel`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The label of the expression set definition.
`ExpressionSetOutputFieldId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The expression set output field that’s associated with the decision table. This field is a relationship field.

Field	Details
	Relationship Name ExpressionSetOutputField **Refers To** DecisionTableParameter
`PrimaryObject`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The procedure plan definition associated with the procedure plan option record.
`Priority`	**Type** int **Properties** Create, Filter, Group, Sort **Description** The order in which the options are executed.
`ProcedurePlanSectionId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The procedure plan section associated with the procedure plan option record. This field is a relationship field. **Relationship Name** ProcedurePlanSection **Relationship Type** Master-detail **Refers To** ProcedurePlanSection (the master object)
`ReadContextMapping`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The read context mapping used to read from the mapped object and populate the context definition.

Field	Details
SaveContextMapping	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The save context mapping used to save from the context definition and populate the mapped object.

ProcedurePlanSection

Represents various procedure setup sections for a procedure plan definition. Each section enables the setup of a procedure of a type that can be further determined by using a rule-based criteria or it can be set based on a selected lookup table. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported SOAP API Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Supported REST API Methods

`DELETE, GET, HEAD, PATCH, POST, Query`

Fields

Field	Details
Description	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The description of the procedure plan section.
IsInherited	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort **Description** Indicates if the section is inherited from a template (`true`) ot not (`false`).

Field	Details
	The default value is `false`.
`Phase`	**Type** string **Properties** Create, Filter, Nillable, Sort, Update **Description** The phase associated with the procedure plan section record.
`ProcedurePlanVersionId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The procedure plan version associated with this procedure plan section record. This field is a relationship field. **Relationship Name** ProcedurePlanVersion **Relationship Type** Master-detail **Refers To** ProcedurePlanDefinitionVersion (the master object)
`ResolutionType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of resolution used to filter the procedure. Valid values are: • `Default` • `RuleBased`
`SectionType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** The type of procedure section. Valid values are:

Field	Details
	• `Custom` • `PricingDiscoveryProcedure` • `PricingProcedure` • `ProductDiscoveryProcedure`
`Sequence`	**Type** int **Properties** Create, Filter, Group, Sort, Update **Description** The sequence in which the procedures are processed.
`SubSectionType`	**Type** string **Properties** Create, Filter, Group, Sort **Description** The procedure subsection added to the procedure plan definition.

ProcedurePlanVariable

Represents the setup for any adhoc user-defined variable that can be linked to a procedure plan definition record. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported SOAP API Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Supported REST API Methods

`DELETE, GET, HEAD, PATCH, POST, Query`

Fields

Field	Details
`DataType`	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Restricted picklist, Sort, Update **Description** The data type of the input procedure plan variable.
`DefaultValue`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The default value for the user-defined procedure plan variable.
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The unique name of the procedure plan variable record. This name must begin with a letter and use only alphanumeric characters and underscores. It can't include spaces, end with an underscore, or have two consecutive underscores.
`Label`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The label of the procedure plan variable.
`ProcedurePlanVersionId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The procedure plan version associated with the procedure plan variable record. This field is a relationship field. **Relationship Name** ProcedurePlanVersion **Relationship Type** Master-detail **Refers To** ProcedurePlanDefinitionVersion (the master object)

CHAPTER 6 Rate Management

In this chapter ...

Quote and price products based on predefined rates for future use of the product or service.

EDITIONS

Available in: Lightning Experience

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions of Revenue Management where Rate Management is enabled

Rate Management Standard Objects

The Rate Management data model provides objects and fields to manage rates and discounts for a product's resource consumption.

BindingObjectCustomExt

Represents the external or custom target object that's bound to the entitlements granted with the sellable product. This object is available in API version 64.0 and later.

BindingObjectRateAdjustment

Represents the rate adjustments of the usage resource associated with the binding object that's used to charge over consumption. This object is available in API version 64.0 and later.

BindingObjectRateCardEntry

Represents the rate card entry details of the usage resource associated with the binding object that's used to charge over consumption. This object is available in API version 64.0 and later.

PriceBookRateCard

Represents a junction between price book and rate card objects. This object is available in API version 62.0 and later.

RateAdjustmentByAttribute

Represents the adjustments that determine the rate of a resource based on its rate-impacting attributes. These attributes are linked to the usage product record. Rates are then influenced by conditions specified in the Attribute Based Adjustment Condition object. Finally, the charge rate is determined by using the Attribute Based Adjustment Rule object. This object is available in API version 62.0 and later.

RateAdjustmentByTier

Represents the adjustments for the rate of a resource that’s determined based on the specified tiers. This object stores information about the type of adjustment used, the value of the adjustment type, and any applicable boundaries. This object is available in API version 62.0 and later.

RateCard

Represents the rules used to rate the consumption of a group of resources within a product. Usage of a resource is billed at a specified rate if the user consumes more than their allowance for a time period. This object is available in API version 62.0 and later.

RateCardEntry

Represents a rule that determines the charge rate for using a product's resource. Each entry is linked to one rate card exclusively, and its activation or deactivation can be controlled by assigning effective dates. This object is available in API version 62.0 and later.

RatingFrequencyPolicy

Represents the policy that defines the frequency at which rating is triggered for the ratable summary records. This object is available in API version 62.0 and later.

RatingRequest

Represents the common run-time parameters, such as context definition and rating procedure for a set of records in the rateable summary table. This object is available in API version 62.0 and later.

RatingRequestBatchJob

Represents a junction between the rating request and batch job objects. This object is available in API version 62.0 and later.

Object Reference for the Salesforce Platform: Overview of Salesforce Objects and Fields

SOAP API Developer Guide: Introduction to SOAP API

BindingObjectCustomExt

Represents the external or custom target object that's bound to the entitlements granted with the sellable product. This object is available in API version 64.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

- This object is available in Revenue Management when Rate Management is enabled.
- Users with any Rate Management permission set (Admin, Manager, Designtime, Runtime) can view records. Only Admins can create, edit, and delete records.

Fields

Field	Details
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the binding custom object record.
`OwnerId`	**Type** reference

Field	Details
	Properties Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the product usage grant. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User

BindingObjectRateAdjustment

Represents the rate adjustments of the usage resource associated with the binding object that's used to charge over consumption. This object is available in API version 64.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`

Special Access Rules

- This object is available in Revenue Management when Rate Management is enabled.
- Users with any Rate Management permission set (Admin, Manager, Designtime, Runtime) can view records.

Fields

Field	Details
`AdjustmentType`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The type of rate adjustment related to the associated rate card entry. Valid values are: • `Amount` • `Override` • `Percentage`

Field	Details
AdjustmentValue	**Type** double **Properties** Filter, Sort **Description** The value of the rate adjustment based on the adjustment type.
BindingObjectRateCardEntryId	**Type** reference **Properties** Filter, Group, Sort **Description** The binding object rate card entry associated with the binding object rate adjustment. This field is a relationship field. **Relationship Name** BindingObjectRateCardEntry **Relationship Type** Master-detail **Refers To** BindingObjectRateCardEntry (the master object)
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last referred to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last viewed a record related to this record.
LowerBound	**Type** double **Properties** Filter, Sort

Field	Details
	Description The minimum quantity of the rate adjustment value that can be applied to the binding object rate adjustment record. This must be a positive number that's less than or equal to the upper bound of the tier.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The autogenerated identifier for the binding object rate adjustment record.
`UpperBound`	**Type** double **Properties** Filter, Nillable, Sort **Description** The maximum quantity of the rate adjustment value that can be applied to the binding object rate adjustment record. This must be a positive number. Set this value one digit higher than the quantity you want the tier to include.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

BindingObjectRateAdjustmentFeed
Feed tracking is available for the object.

BindingObjectRateAdjustmentHistory
History is available for tracked fields of the object.

BindingObjectRateAdjustmentShare
Sharing is available for the object.

BindingObjectRateCardEntry

Represents the rate card entry details of the usage resource associated with the binding object that's used to charge over consumption. This object is available in API version 64.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`

Special Access Rules

- This object is available in Revenue Management when Rate Management is enabled.
- Users with any Rate Management permission set (Admin, Manager, Designtime, Runtime) can view records.

Fields

Field	Details
`BindingObjectId`	**Type** reference **Properties** Filter, Group, Sort **Description** The object associated with the entitlements that are granted with the sellable product. This field is a polymorphic relationship field. **Relationship Name** BindingObject **Refers To** Account, BindingObjectCustomExt, Contract
BindingObjectRateOrder	**Type** double **Properties** Filter, Nillable, Sort **Description** The order that determines the applicable binding object rate when multiple rates are defined for an Anchor target within an effective period. Available in API version 65.0 and later.
`BindingObjectUsageResourceKey`	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** Specifies the autogenerated composite key combining the BindingObjectId and UsageResourceId fields. The format used is `BindingObjectId_UsageResourceId` and must be within 18 characters. The key is generated on saving the BindingObjectRateCardEntry record. For example,`001xx000003Gc4FAAS_1BRxx0000004C95GAE`. Available in API version 66.0 and later.
`EffectiveFrom`	**Type** dateTime

Field	Details
	Properties Filter, Sort **Description** The date and time when the associated rate card entry comes into effect.
`EffectiveTo`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time until which the associated rate card entry remains effective.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last referred to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last viewed a record related to this record.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The autogenerated identifier for the binding object rate card entry record. For example, `BORCE-00004` or `BORCE-4567`.
`NegotiatedRate`	**Type** double **Properties** Filter, Nillable, Sort **Description** The rate negotiated for the associated binding object.

Field	Details
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the user who created the record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
RateCardEntryId	**Type** reference **Properties** Filter, Group, Sort **Description** The rate card entry associated with the binding object. This field is a relationship field. **Relationship Name** RateCardEntry **Refers To** RateCardEntry
RateCardId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The rate card associated to the binding object. This field is a relationship field. **Relationship Name** RateCard **Refers To** RateCard
RateCardType	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort

Field	Details
	Description The type of the rate card associated with the binding object rate card entry. Valid values are: • `Attribute` • `Base` • `Tier`
`RateUnitOfMeasureId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The standard unit of measure associated with the rate defined for the binding object. This field is a relationship field. **Relationship Name** RateUnitOfMeasure **Refers To** UnitOfMeasure
`SourceAssetId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The asset that's used to create the binding object rate card entry. This field is a relationship field. **Relationship Name** SourceAsset **Refers To** Asset
`UsageResourceId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The usage resource associated with the binding object rate card entry. This field is a relationship field. **Relationship Name** UsageResource

Field	Details
	Refers To UsageResource

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

BindingObjectRateAdjustmentFeed
Feed tracking is available for the object.

BindingObjectRateAdjustmentHistory
History is available for tracked fields of the object.

BindingObjectRateAdjustmentShare
Sharing is available for the object.

PriceBookRateCard

Represents a junction between price book and rate card objects. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last referred to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description Timestamp for when the current user last viewed a record related to this record.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Auto-generated identifier for the price book rate card record.
PriceBookId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Price book ID that's associated with the rate cards IDs. For Quote, Order, and Contracts, the price book IDs identify the associated rate cards. This field is a relationship field. **Relationship Name** PriceBook **Relationship Type** Master-detail **Refers To** Pricebook2 (the master object)
RateCardId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** Rate card ID that's associated with the price book. This field is a relationship field. **Relationship Name** RateCard **Relationship Type** Master-detail **Refers To** RateCard (the detail object)
RateCardType	**Type** picklist

Field	Details
	Properties Filter, Group, Restricted picklist, Sort **Description** Type of rate card associated with the price book. Valid values are: • `Attribute` • `Base` • `Tier`

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

PriceBookRateCardFeed
Feed tracking is available for the object.

PriceBookRateCardHistory
History is available for tracked fields of the object.

RateAdjustmentByAttribute

Represents the adjustments that determine the rate of a resource based on its rate-impacting attributes. These attributes are linked to the usage product record. Rates are then influenced by conditions specified in the Attribute Based Adjustment Condition object. Finally, the charge rate is determined by using the Attribute Based Adjustment Rule object. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AdjustmentType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Type of rate adjustment.

Field	Details
	Valid values are: • `Amount` • `Override` • `Percentage`
`AdjustmentValue`	**Type** double **Properties** Create, Filter, Sort, Update **Description** Value of the rate adjustment based on the selected adjustment type.
`AttributeBasedAdjRuleId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** ID of the attribute based adjustment rule associated with this rate adjustment by attribute record. This field is a relationship field. **Relationship Name** AttributeBasedAdjRule **Refers To** AttributeBasedAdjRule
`EffectiveFrom`	**Type** dateTime **Properties** Filter, Sort **Description** Date and time when the associated rate card entry comes into effect.
`EffectiveTo`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Date and time until when the associated rate card entry remains effective.
`LastReferencedDate`	**Type** dateTime

Field	Details
	Properties Filter, Nillable, Sort **Description** Timestamp for when the current user last referred to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last viewed a record related to this record.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Auto-generated identifier for the rate adjustment by attribute record.
ProductId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the product whose resource is being used as the associated rate card entry. This field is a relationship field. **Relationship Name** Product **Refers To** Product2
ProductSellingModelId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the product selling model for the associated rate card entry. This field is a relationship field. **Relationship Name** ProductSellingModel

Field	Details
	Refers To ProductSellingModel
RateCardEntryId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the rate card entry associated with this rate adjustment by attribute record. This field is a relationship field. **Relationship Name** RateCardEntry **Relationship Type** Master-detail **Refers To** RateCardEntry (the master object)
RateCardEntryStatus	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Status of the rate card entry associated with this rate adjustment by attribute. Valid values are: • `Active` • `Draft` • `Inactive` The default value is `Draft`. Available in API version 63.0 and later.
RateCardId	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the rate card of the associated rate card entry. This field is a relationship field. **Relationship Name** RateCard **Refers To** RateCard

Field	Details
RateUnitOfMeasureId	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the standard unit of measure record of the associated rate card entry. This field is a relationship field. **Relationship Name** RateUnitOfMeasure **Refers To** UnitOfMeasure
RateUnitOfMeasureName	**Type** string **Properties** Filter, Group, Sort **Description** Name of the standard unit of measure record of the associated rate card entry.
UsageResourceId	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the resource selected for the associated rate card entry. This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

RateAdjustmentByAttributeFeed
Feed tracking is available for the object.

RateAdjustmentByAttributeHistory
History is available for tracked fields of the object.

RateAdjustmentByTier

Represents the adjustments for the rate of a resource that's determined based on the specified tiers. This object stores information about the type of adjustment used, the value of the adjustment type, and any applicable boundaries. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AdjustmentType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Type of rate adjustment. Valid values are: • `Amount` • `Override` • `Percentage`
`AdjustmentValue`	**Type** double **Properties** Create, Filter, Sort, Update **Description** Value of the rate adjustment based on the selected adjustment type.
`EffectiveFrom`	**Type** dateTime **Properties** Filter, Sort **Description** Date and time when the associated rate card entry comes into effect.
`EffectiveTo`	**Type** dateTime

Field	Details
	Properties Filter, Nillable, Sort **Description** Date and time until when the associated rate card entry remains effective.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last referred to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last viewed a record related to this record.
LowerBound	**Type** double **Properties** Create, Filter, Sort, Update **Description** Minimum quantity of the rate adjustment value that can be applied to the record. This value must be a positive integer and must be less than the upper bound of the tier.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Auto-generated identifier for the rate adjustment by tier record.
ProductId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the product whose resource is being used as the associated rate card entry. This field is a relationship field.

Field	Details
	Relationship Name Product **Refers To** Product2
`ProductSellingModelId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the product selling model for the associated rate card entry record. This field is a relationship field. **Relationship Name** ProductSellingModel **Refers To** ProductSellingModel
`RateCardEntryId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the rate card entry associated with this rate adjustment by tier record. This field is a relationship field. **Relationship Name** RateCardEntry **Relationship Type** Master-detail **Refers To** RateCardEntry (the master object)
`RateCardEntryStatus`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Status of the rate card entry associated with this rate adjustment by tier. Valid values are: • `Active` • `Draft`

Field	Details
	• `Inactive` The default value is `Draft`. Available in API version 63.0 and later.
`RateCardId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the rate card of the associated rate card entry. This field is a relationship field. **Relationship Name** RateCard **Refers To** RateCard
`RateUnitOfMeasureId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the standard unit of measure record of the associated rate card entry. This field is a relationship field. **Relationship Name** RateUnitOfMeasure **Refers To** UnitOfMeasure
`RateUnitOfMeasureName`	**Type** string **Properties** Filter, Group, Sort **Description** Name of the standard unit of measure record of the associated rate card entry.
`UpperBound`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Maximum quantity of the rate adjustment value that can be applied to the record. This value must be a positive double and must be greater than the lower bound of the tier.

Field	Details
`UsageResourceId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the resource selected for the associated rate card entry. This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

RateAdjustmentByTierFeed
Feed tracking is available for the object.

RateAdjustmentByTierHistory
History is available for tracked fields of the object.

RateCard

Represents the rules used to rate the consumption of a group of resources within a product. Usage of a resource is billed at a specified rate if the user consumes more than their allowance for a time period. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`Description`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Description about the rate card.

Field	Details
EffectiveFrom	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** Date and time when the rate card becomes effective.
EffectiveTo	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Date and time until when the rate card remains effective.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last referred to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last viewed a record related to this record.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Name of the rate card.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** ID of the user who created the record.

Field	Details
	This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
`Type`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Type of rate card. Valid values are: • `Attribute` • `Base` • `Tier`

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

RateCardFeed
Feed tracking is available for the object.

RateCardHistory
History is available for tracked fields of the object.

RateCardShare
Sharing is available for the object.

RateCardEntry

Represents a rule that determines the charge rate for using a product's resource. Each entry is linked to one rate card exclusively, and its activation or deactivation can be controlled by assigning effective dates. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
DefaultUnitOfMeasureClassId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the default unit of measure classification record associated with this rate card entry. This field is a relationship field. **Relationship Name** DefaultUnitOfMeasureClass **Refers To** UnitOfMeasureClass
DefaultUnitOfMeasureId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the default unit of measure record associated with this rate card entry. This field is a relationship field. **Relationship Name** DefaultUnitOfMeasure **Refers To** UnitOfMeasure
EffectiveFrom	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** Date and time when the rate card entry comes into effect.
EffectiveTo	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** Date and time until when the rate card entry remains effective.

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last referred to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last viewed a record related to this record.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Auto-generated identifier for the rate card entry record.
ProductId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the product whose resource is being used as a rate card entry. This field is a relationship field. **Relationship Name** Product **Refers To** Product2
ProductSellingModelId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the product selling model associated with this rate card entry. This field is a relationship field.

Field	Details
	Relationship Name ProductSellingModel **Refers To** ProductSellingModel
`Rate`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Value of the rate card entry.
`RateCardId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the rate card associated with this rate card entry. This field is a relationship field. **Relationship Name** RateCard **Relationship Type** Master-detail **Refers To** RateCard (the master object)
`RateCardType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Type of rate card associated with this rate card entry. Valid values are: • `Attribute` • `Base` • `Tier` Available in API version 63.0 and later.
`RateNegotiation`	**Type** picklist

Field	Details
	Properties Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Type of rate negotiation applicable to the rate card entry. Valid values are: • `Negotiable` • `NonNegotiable` The default value is `Negotiable`. Available in API version 63.0 and later.
`RateUnitOfMeasureClassId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the unit of measure classification record associated with this rate card entry. This field is a relationship field. **Relationship Name** RateUnitOfMeasureClass **Refers To** UnitOfMeasureClass
`RateUnitOfMeasureId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** ID of the standard unit of measure record associated with this rate card entry. This field is a relationship field. **Relationship Name** RateUnitOfMeasure **Refers To** UnitOfMeasure
`RateUnitOfMeasureName`	**Type** string **Properties** Filter, Group, Sort **Description** Name of the standard unit of measure record of the associated rate card entry.

Field	Details
Status	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Status of the rate card entry. • Active • Draft • Inactive The default value is Draft. Available in API version 63.0 and later.
UsageProductId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** ID of the product associated with the resource for which the rate is specified. This field is a relationship field. **Relationship Name** UsageProduct **Refers To** Product2
UsageResourceId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** ID of the resource associated with this rate card entry. This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

RateCardEntryFeed
Feed tracking is available for the object.

RateCardEntryHistory
History is available for tracked fields of the object.

RatingFrequencyPolicy

Represents the policy that defines the frequency at which rating is triggered for the ratable summary records. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last referred to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last viewed a record related to this record.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Name of the rating frequency policy. This is a mandatory field.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update

Field	Details
	Description ID of the user who created the record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
ProductId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the product for which the rating policy is defined. This field is a relationship field. This field is deprecated and will be retired in a future version. **Relationship Name** Product **Refers To** Product2
RatingDelayDuration	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Duration of delay—in hours—post the billing period after which the rating is to be triggered.
RatingDelayDurationUnit	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies the unit for the specified rating delay duration. Available in API version 65.0 and later. Valid values are: • Days • Hours
RatingPeriod	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Restricted picklist, Sort, Update **Description** Period for which the usage of a product and usage resource combination is to be rated. Valid values are: • `Daily` • `Monthly`
`UsageResourceId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** ID of the usage resource for which the rating policy is defined. This field is a relationship field. This field is deprecated and will be retired in a future version. **Relationship Name** UsageResource **Refers To** UsageResource

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

RatingFrequencyPolicyFeed
Feed tracking is available for the object.

RatingFrequencyPolicyHistory
History is available for tracked fields of the object.

RatingFrequencyPolicyOwnerSharingRule
Sharing rules are available for the object.

RatingFrequencyPolicyShare
Sharing is available for the object.

RatingRequest

Represents the common run-time parameters, such as context definition and rating procedure for a set of records in the rateable summary table. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`ContextDefinition`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Context definition that's used for context instance creation, which encapsulates all aggregated records that are stamped for the rating request.
`ContextMapping`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Context mapping that's used for context instance creation, which encapsulates all aggregated records that are stamped for the rating request. If no ID is provided, default context mapping is used.
`DoesExcludeWaterfall`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether the waterfall isn't generated for the rating request (`true`) or is generated (`false`). The default value is `false`. Available in API version 64.0 and later.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last referred to this record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description Timestamp for when the current user last viewed a record related to this record.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Auto-generated identifier for the rating request record.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** ID of the user who created the record. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
`RatingProcedureName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Procedure name that's used to rate the aggregated records that are stamped for rating request.
`Status`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Status of the rating request. Valid values are: • `Failed` • `Pending` • `RatingComplete` • `RatingInProgress`

Field	Details
	• `ReadyForRating`

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

RatingRequestFeed
Feed tracking is available for the object.

RatingRequestHistory
History is available for tracked fields of the object.

RatingRequestShare
Sharing is available for the object.

RatingRequestBatchJob

Represents a junction between the rating request and batch job objects. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`BatchJobId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** ID of the batch job that triggered the rating request on the aggregated records. This field is a relationship field. **Relationship Name** BatchJob **Refers To** BatchJob

Field	Details
ErrorCode	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Error code that defines the batch job failure. Valid values are: • BadRequest • InternalError
ErrorMessage	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Error message that describes the cause of the batch job failure.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last referred to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp for when the current user last viewed a record related to this record.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Name of the rating request batch job record.
RatingRequestId	**Type** reference

Field	Details
	Properties Create, Filter, Group, Sort **Description** ID of the rating request record associated with the batch job. This field is a relationship field. **Relationship Name** RatingRequest **Relationship Type** Master-detail **Refers To** RatingRequest (the master object)

Associated Objects

This object has these associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

RatingRequestBatchJobFeed
Feed tracking is available for the object.

RatingRequestBatchJobHistory
History is available for tracked fields of the object.

Rate Management Metadata API Types

Metadata API enables you to access some types and feature settings that you can customize in the user interface.

IndustriesRatingSettings
Represents the settings for Rate Management.

Flow for Rate Management
Represents the metadata associated with a flow. With Flow, you can create an application that takes users through a series of pages to query and update the records in the database. You can also run logic and provide branching capability based on user input to build dynamic applications.

IndustriesRatingSettings

Represents the settings for Rate Management.

Parent Type and Manifest Access

This type extends the Metadata metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See Settings for more details.

File Suffix and Directory Location

The `IndustriesRatingSettings` values are stored in the `IndustriesRating.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there's only one settings file for each settings component.

Version

IndustriesRatingSettings components are available in API version 62.0 and later.

Special Access Rules

This metadata type is available with Rate Management.

Fields

Field Name	Description
`enableRating`	**Field Type** boolean **Description** Indicates whether to enable Rate Management (`true`) or not (`false`). The default value is `false`.
`enableRatingWaterfall`	**Field Type** boolean **Description** Indicates whether to enable Rating Waterfall (`true`) or not (`false`). The default value is `false`. Rating Waterfall provides insights into the rating data, which you can synchronize with your rating lookup tables.
`enableRatingWaterfallPersistence`	**Field Type** boolean **Description** Indicates whether to enable Rating Waterfall Persistence (`true`) or not (`false`). The default value is `false`. Rating Waterfall Persistence stores rating data, which you can use to enhance the internal processes and increase efficiency.

Declarative Metadata Sample Definition

The following is an example of an IndustriesRatingSettings component.

```
<IndustriesRatingSettings xmlns="http://soap.sforce.com/2006/04/metadata">
     <enableRating>true</enableRating>
     <enableRatingWaterfall>true</enableRatingWaterfall>
     <enableRatingWaterfallPersistence>true</enableRatingWaterfallPersistence>
</IndustriesRatingSettings>
```

The following is an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>IndustriesRating</members>
        <name>Settings</name>
    </types>
    <version>67.0</version>
</Package>
```

Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see Settings. For information about using the manifest file, see Deploying and Retrieving Metadata with the Zip File.

Flow for Rate Management

Represents the metadata associated with a flow. With Flow, you can create an application that takes users through a series of pages to query and update the records in the database. You can also run logic and provide branching capability based on user input to build dynamic applications.

FlowActionCall

Rate Management exposes additional actionType values for the FlowActionCall metadata type.

Field Name	Field Type	Description
`actionType`	InvocableActionType (enumeration of type string)	Required. The action type. Additional valid values for Rate Management include: • `invokeRatingService`—Invoke the rating service to rate the usage records.

Rate Management Business APIs

Use the Rate Management Business APIs to get rate plan and persisted rating waterfall details.

Resources
Learn more about the available Rate Management API resources.

Response Bodies
Learn more about the available response bodies of Rate Management APIs.

SEE ALSO:

Connect REST API Developer Guide: Introduction

Resources

Learn more about the available Rate Management API resources.

Rate Plan (GET)
: Get a rate plan for a specified set of context input. Use this API to retrieve rate cards, rate card entries, and related adjustments based on the filter criteria for the context input.

Rating Waterfall (GET)
: Get the persisted rating waterfall that stores the process logs. Rating waterfall provides insights into the internal rating process.

Rate Plan (GET)

Get a rate plan for a specified set of context input. Use this API to retrieve rate cards, rate card entries, and related adjustments based on the filter criteria for the context input.

Keep these considerations in mind when you use this API.

- This API request supports one pricebook and one sellable product.
- The ID of the product is required to invoke this API.
- Invoke this API even if a hydrated context is available to fetch the rate card, rate card entry, and adjustment details.

Special Access Rules

The org must have the Rate Management: Run Time User permission set to use this API. Additionally, the org must also have a default usage rating discovery procedure defined in the Revenue Settings from Setup.

Resource

```
/connect/core-rating/rate-plan
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/core-rating/rate-plan
?contextId=858a3ad3e5a0e5c319652a6ab92f6fdb2b4fa8be72b390506d014596c6da62c9&procedure
ApiName=SampleProcedure
```

Available version

62.0

HTTP methods

GET

Request parameters for GET

Parameter Name	Type	Description	Required or Optional	Available Version
`contextId`	String	ID of the context to specify as an input to the procedure.	Required	62.0
`procedureApiName`	String	API name of the procedure to be executed.	Required	62.0

Response body for GET

[Rate Plan Response]

Rating Waterfall (GET)

Get the persisted rating waterfall that stores the process logs. Rating waterfall provides insights into the internal rating process.

Resource

```
/connect/core-pricing/waterfall/lineItemId/executionId
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/core-pricing/waterfall/Gold/2yHbNNEFOZr9jAe4gH57?tagsToFilter=UnitPrice&usageType=Rating
```

Available version

62.0

HTTP methods

GET

Query parameters

Name	Type	Description	Required or Optional	Available Version
`tagsToFilter`	String	Comma-separated tags to filter.	Optional	62.0
`usageType`	String	Usage type of the waterfall log record. Valid values are: • `Rating` • `Pricing`—Specifies that the record type is `Pricing`. If this value is specified, the API creates a log of pricing waterfall. See Pricing Waterfall. The default value is `Pricing`.	Optional	62.0

Response body for GET

[Line Item Waterfall Response]

Response Bodies

Learn more about the available response bodies of Rate Management APIs.

[Adjustment Details]

Output representation of a rate adjustment request.

[Line Item Waterfall Response]

Output representation of the line item waterfall response.

Rate Plan Response

Output representation of the details of a rate plan.

Rating Error Response

Output representation of the error details related to the API request.

Rating Waterfall Response

Output representation of a rating waterfall request.

Adjustment Details

Output representation of a rate adjustment request.

JSON example

```
 "pricingElement": {
      "adjustments": [{
      "adjustmentType": null,
      "adjustmentValue": null
    }],
      "name": "List Price",
      "elementType": "ListPrice"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
adjustments	Map<String, Object>[]	Details of the rate element.	Small, 60.0	60.0
description	String	Description of the rate element.	Small, 60.0	60.0
elementType	String	Type of the rate element.	Small, 60.0	60.0
name	String	Name of the rate element.	Small, 60.0	60.0

Line Item Waterfall Response

Output representation of the line item waterfall response.

JSON example

```
{
       "currencyCode": "USD",
       "error": null,
       "executionEndTimestamp": "2023-07-31T20:11:29.625Z",
       "executionId": "gdLVwn2x1uats2xWMAjV",
       "executionStartTimestamp": null,
       "lineItemId": "item1",
       "success": true,
       "usageType":"Rating",
       "output": {
          "quantity": "10",
          "netUnitPrice": "10",
```

```
            "subtotal": "100"
        },
        "waterfall": []
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
contextDefinitionVersionId	String	Context definition version ID of the rating procedure.	Small, 62.0	62.0
contextMappingId	String	Context mapping ID of the record.	Small, 62.0	62.0
currencyCode	String	Currency code. For example, USD or INR.	Small, 62.0	62.0
error	Rating Error Response	Details of any errors.	Small, 62.0	62.0
executionEndTimestamp	String	End timestamp of procedure execution.	Small, 62.0	62.0
executionId	String	Execution ID of a particular execution of a rating procedure.	Small, 62.0	62.0
executionStartTimestamp	String	Start timestamp of procedure execution.	Small, 62.0	62.0
lineItemId	String	Line item ID for which the price is being calculated.	Small, 62.0	62.0
output	Map<String, Object>	Output of the rating procedure.	Small, 62.0	62.0
success	Boolean	Indicates whether the API request is successful (`true`) or not (`false`).	Small, 62.0	62.0
usageType	String	Usage type of the waterfall log record.	Small, 62.0	62.0
waterfall	Rating Waterfall Response[]	Details of the rating waterfall.	Small, 62.0	62.0

Rate Plan Response

Output representation of the details of a rate plan.

JSON example

```
{
  "success": true,
  "executionId" : "a521d592-71c3-4db3-8048-r64504df1605",
  "error": {}
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`error`	Rating Error Response[]	Error response for the API request, if any.	Small, 62.0	62.0
`executionId`	String	ID of the procedure execution record.	Small, 62.0	62.0
`success`	Boolean	Indicates whether the request is successful (`true`) or not (`false`)	Small, 62.0	62.0

Rating Error Response

Output representation of the error details related to the API request.

Property Name	Type	Description	Filter Group and Version	Available Version
`errorCode`	String	Code indicating the type of error.	Small, 62.0	62.0
`message`	String	Message stating the reason for error, if any.	Small, 62.0	62.0

Rating Waterfall Response

Output representation of a rating waterfall request.

JSON example

```
{
  "inputParameters": {
    "productId": "01txx0000006i2SAAQ",
    "pricebookId": "01sxx0000005ptpAAA",
    "pricingModelType": "OneTime"
  },
  "fieldToTagNameMapping": {
    "Product2Id": "ItemProduct",
    "Subtotal": "Subtotal",
    "Pricebook2Id": "Pricebook",
    "Quantity": "ItemQuantity",
    "LineItemId": "SalesTransactionSource",
    "ListPrice": "ItemListPrice"
  },
  "sequence": 0,
  "outputParameters": {
    "listPrice": "10"
  },
  "pricingElement": {
    "adjustments": [
      {
        "adjustmentType": null,
        "adjustmentValue": null
      }
```

```
    ],
    "name": "List Price"
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`fieldToTagNameMapping`	Map<String, String>	Mappings of field to tag names.	Small, 62.0	62.0
`inputParameters`	Map<String, Object>	Parameters of rating element input.	Small, 62.0	62.0
`outputParameters`	Map<String, Object>	Parameters of rating element output.	Small, 62.0	62.0
`pricingElement`	Adjustment Details	Details of the rate adjustment of a rating element.	Small, 62.0	62.0
`sequence`	Integer	Sequence of rating element execution.	Small, 62.0	62.0

Rate Management Standard Invocable Actions

Learn more about the standard invocable actions available with Rate Management.

Invoke Rating Service Action
Invoke the rating service to rate the usage records.

SEE ALSO:

Actions Developer Guide: Overview

REST API Developer Guide: Invocable Actions Standard

Metadata API Developer Guide: Understanding Metadata API

Invoke Rating Service Action

Invoke the rating service to rate the usage records.

The Invoke Rating Service action acts as a connector between batch management and the rating service. This action is available in API version 62.0 and later.

Special Access Rules

The Invoke Rating Service action is available in Enterprise, Unlimited, and Developer Editions where Rate Management is enabled.

Supported REST HTTP Methods

URI

`/services/data/v67.0/actions/standard/invokeRatingService`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer token`

Inputs

Input	Details
`attributeRateCardID`	**Type** string **Description** ID of the rate card that's used to define adjustments based on the attributes that impact the rate.
`baseRateCardID`	**Type** string **Description** ID of the rate card that includes the base rate for the resource to be rated, based on its consumption.
`contextDefinitionId`	**Type** string **Description** Required. ID of the context definition that's used to create the context instance.
`contextMappingID`	**Type** string **Description** ID of the context mapping that maps a standard object, context definition object, or any other input data source to the node that's defined in the context definition.
`isSkipWaterfall`	**Type** boolean **Description** Indicates whether to skip the generation of price waterfall data (`true`) or not (`false`).

Input	Details
`procedureName`	**Type** string **Description** Name of the rating procedure that's used to calculate the rates.
`recordID`	**Type** reference **Description** Required. ID of the usage ratable summary record to be rated.
`tierRateCardID`	**Type** string **Description** ID of the rate card that's used to define adjustments for different tiers of a resource.

Outputs

None

Example

POST

This example shows a sample request for the Invoke Rating Service action.

```
{
  "inputs": [
    {
      "recordIDs": "56jSB000002Bn12CXC",
      "contextMappingId": "11jSB000002Bn13YAC",
      "contextDefinitionId": "11OSB0000000WSv2AM",
      "procedureName": "Invoke Rate",
      "isSkipWaterfall": false,
      "baseRateCardID": "11jSB000002Bn13YAC",
      "tierRateCardID": "fgjjSB0sdf987dsf",
      "attributeRateCardID": "asdfgh563034lk"
    }
  ]
}
```

This example shows a sample response for the Invoke Rating Service action.

```
[
    {
        "actionName": "invokeRatingService",
        "errors": null,
```

```
        "isSuccess": true,
        "outputValues": {}
    }
]
```

CHAPTER 7 Product Configurator

In this chapter ...

Customize the components and attributes of a product to align with specific business requirements.

EDITIONS

Available in: Lightning Experience

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions of Revenue Management where Product Configurator is enabled

Product Configurator Standard Objects

The Product Configurator data model provides objects and fields to manage the product configurator flow.

ExpressionSetConstraintObj
Represents the association between a Product object and the constraint model tags defined in a given constraint model. This object is available in API version 63.0 and later.

ProductConfigurationFlow
Specifies the many-to-many relationship between Product Classification, Product, and Flow Definition objects. The flow definition is used to configure standalone and bundled products of a specific product classification along with the product attributes, quantities, and product selling models. This object is available in API version 60.0 and later.

ProductConfigFlowAssignment
A junction object that represents the many-to-many relationship between Product Configuration Flow, Product, and Product Classification. This object is available in API version 60.0 and later.

ProductConfigurationRule
Represents the validation, inclusion, and exclusion rules for products in the context of the selling process. The selling process can be quoting, configuration, or ordering. This object is available in API version 61.0 and later.

SEE ALSO:
Object Reference for the Salesforce Platform: Overview of Salesforce Objects and Fields
SOAP API Developer Guide: Introduction to SOAP API

ExpressionSetConstraintObj

Represents the association between a Product object and the constraint model tags defined in a given constraint model. This object is available in API version 63.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available in orgs where Revenue Cloud is enabled.

Fields

Field	Details
`ConstraintModelTag`	**Type** string **Properties** Create, Filter, Group, Sort, Update

Field	Details
	Description The product tag that is defined in the constraint model, for example, `Laptop`.
`ConstraintModelTagType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of the product tag that is defined in the constraint model. Possible values are: • `Port` • `Type` The default value is `Type`.
`ExpressionSetId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The expression set associated with the expression set constraint object. This field is a relationship field. **Relationship Name** ExpressionSet **Refers To** ExpressionSet
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user accessed this record or list view (LastReferencedDate) but didn't view it.

Field	Details
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the expression set constraint.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** For internal use only. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
`ReferenceObjectId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The object associated with the expression set constraint object. This field is a polymorphic relationship field. **Relationship Name** ReferenceObject **Refers To** Product2, ProductClassification, ProductRelatedComponent

ProductConfigurationFlow

Specifies the many-to-many relationship between Product Classification, Product, and Flow Definition objects. The flow definition is used to configure standalone and bundled products of a specific product classification along with the product attributes, quantities, and product selling models. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`FlowIdentifier`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Stores the flow API name.
`IsDefault`	**Type** Boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates the default configurator flow. The default value is `false`.
`Status`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Indicates the status of the product configuration flow. Possible values include Draft, Active, and Inactive Possible values are: • `Active` • `Draft` • `Inactive` The default value is `Draft`.

ProductConfigFlowAssignment

A junction object that represents the many-to-many relationship between Product Configuration Flow, Product, and Product Classification. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AssignmentType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies whether the Product Configuration Flow is assigned to the primary product or classification, or to dynamic components added within a bundle. Valid values are: • `DynamicAdditionFlow` • `PrimaryConfiguratorFlow` The default value is `PrimaryConfiguratorFlow`. Available in API version 65.0 and later.
`ProductClassificationId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The product classification associated with the Product Configuration Flow. This field is a relationship field. **Relationship Name** ProductClassification **Relationship Type** Lookup **Refers To** ProductClassification
`ProductConfigurationFlowId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The Product Configuration Flow associated with the Product Classification or Product. This field is a relationship field. **Relationship Name** ProductConfigurationFlow **Relationship Type** Lookup

Field	Details
	Refers To ProductConfigurationFlow
`ProductId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The product associated with the Product Configuration Flow. This field is a relationship field. **Relationship Name** Product **Relationship Type** Lookup **Refers To** Product2

ProductConfigurationRule

Represents the validation, inclusion, and exclusion rules for products in the context of the selling process. The selling process can be quoting, configuration, or ordering. This object is available in API version 61.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`ApiName`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description**
`ConfigurationRuleDefinition`	**Type** textarea **Properties** Create, Nillable, Update

Field	Details
	Description The configuration rule criteria and actions.
Description	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The description of the configuration rule.
EffectiveFromDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time from which the configuration rules comes into effect.
EffectiveToDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time to which the configuration rules ceases to be in effect.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the configuration rule record was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date the configuration rule record was last viewed.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update

Field	Details
	Description The name of the configuration rule.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the configuraion rule owner. This field is a polymorphic relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** Group, User
`ProcessScope`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The scope of the configuration rule. Possible values are: • `Bundle` • `Product` The default value is `Product`.
`RuleSubType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** The segregation of products into subsets such that the configuration rules only apply to the products that fall under the ambit of the selected rule subtype. Possible values are: • `BundleProduct` • `BundleProductClassification` • `Product` • `ProductClassification`

Field	Details
	The default value is `Product`.
`RuleType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Indicates the industry vertical or the feature of the industry vertical that's using the configuration rule. Possible values are: • `Configurator` • `Promotions` The default value is `Configurator`.
`Sequence`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** Indicates the order for executing the configuration rule. Rules with lower numbers run first when multiple rules are triggered at once.
`Status`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** The lifecycle status of the configuration rule. Possible values are: • `Active` • `Draft` • `Inactive` The default value is `Draft`.

Product Configurator Business APIs

Use the Product Configurator Business APIs to customize a product or a service according to your business-specific requirements.

Perform product configuration-related operations by using the Product Configurator Business APIs. Integrate these APIs with any front-end application to access the configurator capabilities.

These APIs are stateless and don't recall prior user actions between calls unless state is explicitly persisted and reloaded.

For example, if a user deselects a child product and later reselects it, the engine treats the request as adding a new item that doesn't currently exist in the model. It can't infer that this request is a re-selection of a previously removed item. As a result, the original line item isn't restored and a new line item is created.

This table lists the available Product Configurator resources.

Resource	Description
`/connect/cpq/configurator/actions/configure` (POST)	Retrieve and update a product's configuration from a configurator. Execute configuration rules and notify users of any violations for changes to product bundle, attributes, or product quantity within a bundle. Additionally, get pricing details for the configured bundle.
`/connect/cpq/configurator/actions/load-instance` (POST)	Create a session for the product configuration instance using the transaction ID. Get the session ID that includes the results of actions, such as configuration rules, qualification rules, and pricing management.
`/connect/cpq/configurator/actions/set-instance` (POST)	Set a product configuration instance. This API is used in scenarios where the configuration instance is available in a different database than Salesforce and the product catalog management data is in Salesforce.
`/connect/cpq/configurator/actions/get-instance` (POST)	Fetch the JSON representation of a product configuration. Use the response to display the details of the product configuration instance on the Salesforce user interface, or save the product configuration instance to an external system.
`/connect/cpq/configurator/actions/save-instance` (POST)	Save a configuration instance after a successful product configuration.
`/connect/cpq/configurator/actions/set-product-quantity` (POST)	Set the quantity of a product through the runtime system.

Resource	Description
`/connect/cpq/configurator/actions/add-nodes` (POST)	Add a node to the context through the runtime system without using the Salesforce user interface.
`/connect/cpq/configurator/actions/update-nodes` (POST)	Update nodes in a product configuration.
`/connect/cpq/configurator/actions/delete-nodes` (POST)	Delete nodes from a product configuration.
`/revenue/product-configurator/rules/actions/execute` (POST)	Run rules for a specific quote or order based on a context ID or transaction ID.

Resources

Learn more about the available Product Configurator API resources.

Configuration (POST)

Retrieve and update a product's configuration from a configurator. Execute configuration rules and notify users of any violations for changes to product bundle, attributes, or product quantity within a bundle. Additionally, get pricing details for the configured bundle.

Saved Configuration (GET, POST)

Save and reuse a record's configurations, and get a list of the saved configurations for a record.

Saved Configuration (DELETE, PUT)

Update or delete a record's saved configuration by using the configuration ID.

Configuration Get Instance (POST)

Fetch the JSON representation of a product configuration. Use the response to display the details of the product configuration instance on the Salesforce user interface, or save the product configuration instance to an external system.

Configuration Load Instance (POST)

Create a session for the product configuration instance using the transaction ID. Get the session ID that includes the results of actions, such as configuration rules, qualification rules, and pricing management.

Configuration Save Instance (POST)
: Save a configuration instance after a successful product configuration.

Configuration Set Instance (POST)
: Set a product configuration instance. This API is used in scenarios where the configuration instance is available in a different database than Salesforce and the product catalog management data is in Salesforce.

Configurator Add Nodes (POST)
: Add a node to the context through the runtime system without using the Salesforce user interface.

Configurator Delete Nodes (POST)
: Delete nodes from a product configuration.

Configurator Update Nodes (POST)
: Update nodes in a product configuration.

Product Set Quantity (POST)
: Set the quantity of a product through the runtime system.

Config Rules (POST)
: Run rules for a specific quote or order based on a context ID or transaction ID.

Configuration (POST)

Retrieve and update a product's configuration from a configurator. Execute configuration rules and notify users of any violations for changes to product bundle, attributes, or product quantity within a bundle. Additionally, get pricing details for the configured bundle.

```

Properties

Name	Type	Description	Required or Optional	Available Version
`addedNodes`	Configurator Added Node Input[]	List of added context nodes that's passed to the product configurator.	Optional	60.0
`configuratorOptions`	Configurator Options Input[]	Options to pass to the configurator.	Optional	60.0
`contextResponseType`	String	Specifies the type of transaction context response. Valid values are: • `Delta`—Returns the sales transaction items that are added or updated. • `Full`—Returns all sales transaction items in a transaction. • `None`—Returns empty transaction context response. • `Product`—Returns the sales transaction items related to the product that's being configured.	Required for large sales transactions with more than 1000 line items and less than 15K line items.	65.0
`correlationId`	String	ID that's specified for traceability of logs.	Optional	60.0
`deletedNodes`	Configurator Deleted Node Input[]	List of deleted context nodes that's passed to the product configurator.	Optional	60.0
`qualificationContext`	User Context Input[]	Details such as account ID, contact ID, and context ID that are used for executing qualification rules.	Optional	60.0
`transactionContextId`	String	ID of the transaction context.	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
`transactionId`	String	ID of the sales transaction that's being configured such as a quote or an order.	Required	60.0
`transactionLineId`	String	ID of the top-level line item that's being configured.	Optional	60.0
`updatedNodes`	Configurator Updated Node Input[]	List of updated context nodes that's passed to the product configurator.	Optional	60.0

Response body for POST

Configuration Details

Saved Configuration (GET, POST)

Save and reuse a record's configurations, and get a list of the saved configurations for a record.

Resource

```
/connect/cpq/configurator/saved-configuration
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/cpq/configurator/saved-configuration
```

Available version

63.0

HTTP methods

GET, POST

Request parameters for GET

Parameter Name	Type	Description	Required or Optional	Available Version
`referenceRecordId`	String	ID of the record whose saved configurations must be retrieved.	Required	63.0

Response body for GET

Configuration List

Request body for POST

JSON example

```
{
  "data":
[illegible]
 Built-in
[illegible]
```

```
[redacted]
  "description": "This configuration is saved for reuse.",
  "name": "Favorite Configuration",
  "referenceRecordId": "01txx0000006iCFAAY"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`data`	String	JSON object that contains the details of the sales transaction, formatted as a string.	Optional	63.0
`description`	String	Description of the saved configuration.	Optional	63.0
`name`	String	Name of the saved configuration.	Optional	63.0
`referenceRecordId`	String	ID of the record for which the configuration must be saved.	Required	63.0

Response body for POST

Configuration Record Save

Salesforce Help: Considerations to Save and Reuse Configurations

Saved Configuration (DELETE, PUT)

Update or delete a record's saved configuration by using the configuration ID.

Resource

```
/connect/cpq/configurator/saved-configuration/id
```

The `id` parameter is the ID of the configuration that you want to update or delete.

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/cpq/configurator/saved-configuration/5KPxx0025063GSmSAX
```

Available version

63.0

HTTP methods

DELETE, PUT

Request body for PUT

JSON example

```
{
  "data":
[illegible]
 Built-in
[illegible]

[illegible]

  "description": "This configuration is updated.",
  "name": "Updated Configuration"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`data`	String	JSON object that contains the details of the sales transaction, formatted as a string.	Required	63.0
`description`	String	Description of the configuration.	Required	63.0
`name`	String	Name of the configuration.	Required	63.0

Response body for PUT

Configuration Update

Salesforce Help: Considerations to Save and Reuse Configurations

Configuration Get Instance (POST)

Fetch the JSON representation of a product configuration. Use the response to display the details of the product configuration instance on the Salesforce user interface, or save the product configuration instance to an external system.

Resource

```
/connect/cpq/configurator/actions/get-instance
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/cpq/configurator/actions/get-instance
```

Available version

60.0

HTTP methods

POST

Request body for POST

JSON example

```
{
"contextId": "008d27d7-e004-4906-a949-ee7d7c323c77"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`contextId`	String	Transaction context ID of the product configuration instance that's to be fetched.	Required	60.0

Response body for POST

Configuration Get Instance

Configuration Load Instance (POST)

Create a session for the product configuration instance using the transaction ID. Get the session ID that includes the results of actions, such as configuration rules, qualification rules, and pricing management.

Resource

```
/connect/cpq/configurator/actions/load-instance
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/cpq/configurator/actions/load-instance
```

Available version

60.0

HTTP methods

POST

Request body for POST

JSON example

```
{
    "configuratorOptions":
      {
        "addDefaultConfiguration": true,
        "executeConfigurationRules": true,
        "executePricing": true,
        "qualifyAllProductsInTransaction": true,
        "validateAmendRenewCancel": true,
        "validateProductCatalog": true
    },
    "qualificationContext": {
```

```
        "accountId": "001DU000001nHUGYA2"
    },
    "transactionId": "0Q0DU0000000XoN0AU"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
configurator Options	Configurator Options Input	List of the configurator options to execute.	Optional	60.0
context MappingId	String	ID of the context mapping record.	Optional	60.0
qualification Context	User Context Input	Context details that are used for the qualification rules.	Optional	60.0
transaction Id	String	Transaction ID of the header entity that's used to create a session. For example, a Quote or an Order.	Required	60.0

Response body for POST

Configuration Load Instance

Configuration Save Instance (POST)

Save a configuration instance after a successful product configuration.

Use the Configuration Save Instance API to save the changes to the source after a successful configuration. For example, save changes to the quote line item of a product, which is the source used to load the configuration.

Resource

```
/connect/cpq/configurator/actions/save-instance
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/cpq/configurator/actions/save-instance
```

Available version

60.0

HTTP methods

POST

Request body for POST

JSON example

```
{
"contextId": "008d27d7-e004-4906-a949-ee7d7c323c77"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`contextId`	String	Transaction context ID of the product configuration instance that's to be saved.	Required	60.0

Response body for POST

Configuration Save Instance

Configuration Set Instance (POST)

Set a product configuration instance. This API is used in scenarios where the configuration instance is available in a different database than Salesforce and the product catalog management data is in Salesforce.

Resource

```
/connect/cpq/configurator/actions/set-instance
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/cpq/configurator/actions/set-instance
```

Available version

60.0

HTTP methods

POST

Request body for POST

JSON example

```
{
  "configuratorOptions": {
    "addDefaultConfiguration": true,
    "executeConfigurationRules": true,
    "executePricing": false,
    "qualifyAllProductsInTransaction": false,
    "validateAmendRenewCancel": false,
    "validateProductCatalog": false
  },
  "contextMappingId": "11jEk000017YdyUIAS",
  "qualificationContext": {
    "accountId": "001DU000001nHUGYA2"
  },
  "transaction":
[illegible]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`configuratorOptions`	Configurator Options Input	List of the configurator options to execute.	Optional	60.0
`contextMappingId`	String	ID of the context mapping record.	Required	60.0
`qualificationContext`	User Context Input	Context details that are used for the qualification rules.	Optional	60.0
`transaction`	String	Transaction JSON payload representing an object in an external system that's used to create a session.	Required	60.0

Response body for POST

Configuration Set Instance

Configurator Add Nodes (POST)

Add a node to the context through the runtime system without using the Salesforce user interface.

Resource

```
/connect/cpq/configurator/actions/add-nodes
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/cpq/configurator/actions/add-nodes
```

Available version

    "contextId": "008d27d7-e004-4906-a949-ee7d7c323c77",
    "updatedNodes": [
        {
            "path": ["0Q0DE000000ISHJs81", "0QLDE000000IBXw4AO"],
            "updatedAttributes": {
                "Quantity": 5
            }
        }
    ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`configuratorOptions`	Configurator Options Input	List of the configuration options to execute.	Optional	60.0
`contextId`	String	ID of the context object that's being considered.	Required	60.0
`qualificationContext`	User Context Input	Context details that are used for the qualification rules.	Optional	60.0
`updatedNodes`	Configurator Updated Node Input[]	List of the nodes to be updated.	Required	60.0

Response body for POST

Configurator Update Nodes

Product Set Quantity (POST)

Set the quantity of a product through the runtime system.

Resource

```
/connect/cpq/configurator/actions/set-product-quantity
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/cpq/configurator/actions/set-product-quantity
```

Available version

60.0

HTTP methods

POST

Request body for POST

JSON example

```
{
    "configuratorOptions": {
        "executePricing": true,
        "returnProductCatalogData": true,
        "qualifyAllProductsInTransaction": true,
        "validateProductCatalog": true,
        "validateAmendRenewCancel": true,
        "executeConfigurationRules": true,
        "addDefaultConfiguration": true
    },
    "qualificationContext": {
        "accountId": "001xx0000000001AAA",
        "contactId": "003xx00000000D7AAI"
    },
    "contextId": "008d27d7-e004-4906-a949-ee7d7c323c77",
    "quantity": 20,
    "transactionLinePath": "Quote.QuoteLineItem.Quantity"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`configuratorOptions`	Configurator Options Input	List of the configuration options to execute.	Optional	60.0
`contextId`	String	ID of the context object that's being considered.	Required	60.0
`qualificationContext`	User Context Input	Context details that are used for the qualification rules.	Optional	60.0
`quantity`	Integer	Value of the product quantity.	Required	60.0
`transactionLinePath`	String[]	Path to the line item where the update to the quantity is applied. For example, Quote.QuoteLineItem.Quantity.	Required	60.0

Response body for POST

Product Quantity Set Configurator

Config Rules (POST)

Run rules for a specific quote or order based on a context ID or transaction ID.

Resource

```
/revenue/product-configurator/rules/actions/execute
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/revenue/product-configurator/rules/actions/execute
```

Available version

67.0

HTTP methods

POST

Request body for POST

JSON example

```
{
  "transactionContextId": "008d27d7-e004-4906-a949-ee7d7c323c77",
  "transactionId": "0Q0DU0000005tJh0AI",
  "ruleOptions": {
    "isUpdateContextRequired": false
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`ruleOptions`	Config Rule Options Input[]	Details of the options to run specific steps in rules.	Optional	67.0
`transactionContextId`	String	ID of the sales transaction context instance.	Required if the `transactionId` property isn't specified.	67.0
`transactionId`	String	ID of the quote or order.	Required if the `transactionContextId` property isn't specified.	67.0

Response body for POST

Configuration Rule Response

Request Bodies

Learn more about the available Product Configurator API request bodies.

Configuration Get Instance Input

Input representation of the request to get a product configuration instance.

Configuration Load Instance Input

Input representation of the request to load a product configuration instance.

Configuration Save Input

Input representation of the details to save a configuration.

Configuration Update Input

Input representation of the details to update a configuration.

Configuration Save Instance Input

Input representation of the request to save a product configuration instance.

Configuration Set Instance Input

Input representation of the request to set a product configuration instance.

Configurator Add Nodes Input

Input representation of the request to add nodes within a root node.

Configurator Added Node Input

Input representation of the nodes to be added to a product configuration.

Configurator Delete Nodes Input

Input representation of the request to delete nodes from a product configuration.

Configurator Deleted Node Input

Input representation of the nodes to be deleted from a product configuration.

Configurator Input

Input representation of the request to modify the product configuration.

Configurator Options Input

Input representation of the request to get the product configuration options that's passed to the configurator.

Configuration Rule Input

Input representation of the details of a configuration rule.

Configurator Update Nodes Input

Input representation of the request to update the nodes in a product configuration.

Configurator Updated Node Input

Input representation of the nodes to be updated in a product configuration.

Product Quantity Set Configurator Input

Input representation of the request to set the quantity of a product.

User Context Input

Input representation of the request to get the context details of a user, which are used for qualification rules.

Configuration Get Instance Input

Input representation of the request to get a product configuration instance.

JSON example

```
{
"contextId": "008d27d7-e004-4906-a949-ee7d7c323c77"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
contextId	String	Transaction context ID of the product configuration instance that's to be fetched.	Required	60.0

Configuration Load Instance Input

Input representation of the request to load a product configuration instance.

JSON example

```
{
    "configuratorOptions":
      {
        "addDefaultConfiguration": true,
        "executeConfigurationRules": true,
        "executePricing": true,
        "qualifyAllProductsInTransaction": true,
        "validateAmendRenewCancel": true,
        "validateProductCatalog": true
    },
    "qualificationContext": {
        "accountId": "001DU000001nHUGYA2"
    },
    "transactionId": "0Q0DU0000000XoN0AU"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
configurator Options	Configurator Options Input	List of the configurator options to execute.	Optional	60.0
context MappingId	String	ID of the context mapping record.	Optional	60.0
qualification Context	User Context Input	Context details that are used for the qualification rules.	Optional	60.0
transactionId	String	Transaction ID of the header entity that's used to create a session. For example, a Quote or an Order.	Required	60.0

Configuration Save Input

Input representation of the details to save a configuration.

JSON example

```
{
  "data":
[illegible]
 Built-in
[illegible]

[illegible]

  "description": "This configuration is saved for reuse.",
  "name": "Favorite Configuration",
  "referenceRecordId": "01txx0000006iCFAAY"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
data	String	JSON object that contains the details of the sales transaction, formatted as a string.	Optional	63.0
description	String	Description of the saved configuration.	Optional	63.0
name	String	Name of the saved configuration.	Optional	63.0
referenceRecordId	String	ID of the record for which the configuration must be saved.	Required	63.0

Configuration Update Input

Input representation of the details to update a configuration.

JSON example

```
{
  "data":
[illegible]
 Built-in
[illegible]

[illegible]

  "description": "This configuration is updated.",
  "name": "Updated Configuration"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
data	String	JSON object that contains the details of the sales transaction, formatted as a string.	Required	63.0

Name	Type	Description	Required or Optional	Available Version
`description`	String	Description of the configuration.	Required	63.0
`name`	String	Name of the configuration.	Required	63.0

Configuration Save Instance Input

Input representation of the request to save a product configuration instance.

JSON example

```
{
"contextId": "008d27d7-e004-4906-a949-ee7d7c323c77"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`contextId`	String	Transaction context ID of the product configuration instance that's to be saved.	Required	60.0

Configuration Set Instance Input

Input representation of the request to set a product configuration instance.

JSON example

```
{
  "configuratorOptions": {
    "addDefaultConfiguration": true,
    "executeConfigurationRules": true,
    "executePricing": false,
    "qualifyAllProductsInTransaction": false,
    "validateAmendRenewCancel": false,
    "validateProductCatalog": false
  },
  "contextMappingId": "11jEk000017YdyUIAS",
  "qualificationContext": {
    "accountId": "001DU000001nHUGYA2"
  },
  "transaction":
[illegible]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`configuratorOptions`	Configurator Options Input	List of the configurator options to execute.	Optional	60.0
`contextMappingId`	String	ID of the context mapping record.	Required	60.0
`qualificationContext`	User Context Input	Context details that are used for the qualification rules.	Optional	60.0
`transaction`	String	Transaction JSON payload representing an object in an external system that's used to create a session.	Required	60.0

Configurator Add Nodes Input

Input representation of the request to add nodes within a root node.

JSON example

```
{
  "configuratorOptions": {
    "executePricing": true,
    "returnProductCatalogData": true,
    "qualifyAllProductsInTransaction": true,
    "validateProductCatalog": true,
    "validateAmendRenewCancel": true,
    "executeConfigurationRules": true,
    "addDefaultConfiguration": true
  },
  "qualificationContext": {
    "accountId": "001xx0000000001AAA",
    "contactId": "003xx00000000D7AAI"
  },
  "contextId": "008d27d7-e004-4906-a949-ee7d7c323c77",
  "addedNodes": [
    {
      "path": [
        "0Q0xx0000004EvcCAE",
        "ref_d3a3f8d2_e031_4517_ae28_69ce16cb6589"
      ],
      "addedObject": {
        "id": "ref_d3a3f8d2_e031_4517_ae28_69ce16cb6589",
        "SalesTransactionItemSource": "ref_d3a3f8d2_e031_4517_ae28_69ce16cb6589",
        "SalesTransactionItemParent": "0Q0xx0000004EvcCAE",
        "PricebookEntry": "01uxx00000090VuAAI",
        "ProductSellingModel": "0jPxx00000001KHEAY",
        "UnitPrice": 15.26,
        "Quantity": 1,
        "Product": "01txx0000006lfHAAQ",
```

```
          "businessObjectType": "QuoteLineItem"
        }
      },
      {
        "path": [
          "0Q0xx0000004EvcCAE",
          "ref_d3a3f8d2_e031_4517_ae28_69ce16cb6589",
          "ref_d85b036d_d305_4bb6_aba8_a1dff645a664"
        ],
        "addedObject": {
          "id": "ref_d85b036d_d305_4bb6_aba8_a1dff645a664",
          "MainItem": "0QLxx0000004QdRGAU",
          "AssociatedItem": "ref_d3a3f8d2_e031_4517_ae28_69ce16cb6589",
          "ProductRelatedComponent": "0dSxx00000001p6EAA",
          "ProductRelationshipType": null,
          "AssociatedItemPricing": "NotIncludedInBundlePrice",
          "AssociatedQuantScaleMethod": "Proportional",
          "businessObjectType": "QuoteLineRelationship"
        }
      }
    ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
addedNodes	Configurator Added Node Input[]	List of the nodes to be added.	Required	60.0
configurator Options	Configurator Options Input	List of the configuration options to execute.	Optional	60.0
contextId	String	ID of the context object that's being considered.	Required	60.0
qualification Context	User Context Input	Context details that are used for the qualification rules.	Optional	60.0

Configurator Added Node Input

Input representation of the nodes to be added to a product configuration.

JSON example

```
{
  "addedNodes": [
    {
      "path": [
        "0Q0xx0000004EvcCAE",
        "ref_d3a3f8d2_e031_4517_ae28_69ce16cb6589"
      ],
      "addedObject": {
```

```
        "id": "ref_d3a3f8d2_e031_4517_ae28_69ce16cb6589",
        "SalesTransactionItemSource": "ref_d3a3f8d2_e031_4517_ae28_69ce16cb6589",
        "SalesTransactionItemParent": "0Q0xx0000004EvcCAE",
        "PricebookEntry": "01uxx00000090VuAAI",
        "ProductSellingModel": "0jPxx00000001KHEAY",
        "UnitPrice": 15.26,
        "Quantity": 1,
        "Product": "01txx0000006lfHAAQ",
        "businessObjectType": "QuoteLineItem"
      }
    },
    {
      "path": [
        "0Q0xx0000004EvcCAE",
        "ref_d3a3f8d2_e031_4517_ae28_69ce16cb6589",
        "ref_d85b036d_d305_4bb6_aba8_a1dff645a664"
      ],
      "addedObject": {
        "id": "ref_d85b036d_d305_4bb6_aba8_a1dff645a664",
        "MainItem": "0QLxx0000004QdRGAU",
        "AssociatedItem": "ref_d3a3f8d2_e031_4517_ae28_69ce16cb6589",
        "ProductRelatedComponent": "0dSxx00000001p6EAA",
        "ProductRelationshipType": null,
        "AssociatedItemPricing": "NotIncludedInBundlePrice",
        "AssociatedQuantScaleMethod": "Proportional",
        "businessObjectType": "QuoteLineRelationship"
      }
    }
  ]
}
```

This example shows a sample request for orders.

```
{
  "addedNodes": [
    {
      "path": [
        "0Q0xx0000004EvcCAE",
        "ref_d3a3f8d2_e031_4517_ae28_69ce16cb6589"
      ],
      "addedObject": {
        "id": "ref_d3a3f8d2_e031_4517_ae28_69ce16cb6589",
        "SalesTransactionItemSource": "ref_d3a3f8d2_e031_4517_ae28_69ce16cb6589",
        "SalesTransactionItemParent": "0Q0xx0000004EvcCAE",
        "PricebookEntry": "01uxx00000090VuAAI",
        "ProductSellingModel": "0jPxx00000001KHEAY",
        "UnitPrice": 15.26,
        "Quantity": 1,
        "Product": "01txx0000006lfHAAQ",
        "businessObjectType": "OrderItem"
      }
    },
    {
      "path": [
        "0Q0xx0000004EvcCAE",
```

```
          "ref_d3a3f8d2_e031_4517_ae28_69ce16cb6589",
          "ref_d85b036d_d305_4bb6_aba8_a1dff645a664"
        ],
        "addedObject": {
          "id": "ref_d85b036d_d305_4bb6_aba8_a1dff645a664",
          "MainItem": "0QLxx0000004QdRGAU",
          "AssociatedItem": "ref_d3a3f8d2_e031_4517_ae28_69ce16cb6589",
          "ProductRelatedComponent": "0dSxx00000001p6EAA",
          "ProductRelationshipType": null,
          "AssociatedItemPricing": "NotIncludedInBundlePrice",
          "AssociatedQuantScaleMethod": "Proportional",
          "businessObjectType": "OrderItemRelationship"
        }
      }
    ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`addedObject`	Map<String, Object>	Details of the object that's being added. This property supports fields of objects from the Sales Transaction context definition, including custom objects and fields in your extended context definition.	Required	60.0
`path`	String[]	Path to the node that's being added. The path includes the unique ID of the context node in the data structure. This ID must match the ID of the sales transaction item source such as a quote line or an order line item. Keep these considerations in mind when setting the `path` value. • If the `businessObjectType` property value is `QuoteLineItem`, the path must contain 2 IDs. The first ID is the quote ID, and the second ID is the quote line item ID. • If the `businessObjectType` property value is `QuoteLineItem`, the path must contain `SalesTransactionItemSource` and `SalesTransactionItemParent`. • If the `businessObjectType` property value is `QuoteLineItemRelationship`,	Required	60.0

Name	Type	Description	Required or Optional	Available Version
		the path must contain 3 IDs. The first ID is the quote ID. The second ID is the quote line item ID. The third ID is the quote line item relationship ID.		

Configurator Delete Nodes Input

Input representation of the request to delete nodes from a product configuration.

JSON example

```
{
    "configuratorOptions": {
        "executePricing": true,
        "returnProductCatalogData": true,
        "qualifyAllProductsInTransaction": true,
        "validateProductCatalog": true,
        "validateAmendRenewCancel": true,
        "executeConfigurationRules": true,
        "addDefaultConfiguration": true
    },
    "qualificationContext": {
        "accountId": "001xx0000000001AAA",
        "contactId": "003xx00000000D7AAI"
    },
    "contextId": "008d27d7-e004-4906-a949-ee7d7c323c77",
    "deletedNodes": [
        {
            "path": ["0Q0DE000000ISHJs81", "0QLDE000000IBXw4AO"]
        }
    ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`configuratorOptions`	Configurator Options Input	List of the configuration options to execute.	Optional	60.0
`contextId`	String	ID of the context object that's being considered.	Required	60.0
`deletedNodes`	Configurator Deleted Node Input[]	List of the nodes to be deleted.	Required	60.0
`qualificationContext`	User Context Input	Context details that are used for the qualification rules.	Optional	60.0

Configurator Deleted Node Input

Input representation of the nodes to be deleted from a product configuration.

JSON example

```
"deletedNodes": [
    {
        "path": ["0Q0DE000000ISHJs81", "0QLDE000000IBXw4AO"]
    }
]
```

Properties

Name	Type	Description	Required or Optional	Available Version
`path`	String[]	Path to the node that's being deleted.	Required	60.0

Configurator Input

Input representation of the request to modify the product configuration.

JSON example

This example shows a sample to initiate a context based on a transaction ID.

```
{
    "transactionLineId": "0QLDE000000IBXw4AO",
    "transactionId": "0Q0xx0000000001GAA",
    "correlationId": "c95246d4-102c-4ecd-a263-f74ac525d1e5",
    "configuratorOptions": {
        "executePricing": true,
        "returnProductCatalogData": true
    },
    "qualificationContext": {
        "accountId": "001xx0000000001AAA",
        "contactId": "003xx00000000D7AAI"
    }
}
```

This example shows a sample to add, update, or delete a node in an existing context.

```
{
    "transactionLineId": "0QLDE000000IBXw4AO",
    "transactionId": "0Q0DE000000ISHJs81",
    "correlationId": "c95246d4-102c-4ecd-a263-f74ac525d1e5",
    "configuratorOptions": {
        "executePricing": true,
        "returnProductCatalogData": true,
        "qualifyAllProductsInTransaction": true,
        "validateProductCatalog": true,
        "validateAmendRenewCancel": true,
        "executeConfigurationRules": true,
        "addDefaultConfiguration": true
    },
```

```
    "contextResponseType": "Full",
    "qualificationContext": {
        "accountId": "001xx0000000001AAA",
        "contactId": "003xx00000000D7AAI"
    },
    "transactionContextId": "008d27d7-e004-4906-a949-ee7d7c323c77",

    ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
addedNodes	Configurator Added Node Input[]	List of added context nodes that's passed to the product configurator.	Optional	60.0
configurator Options	Configurator Options Input[]	Options to pass to the configurator.	Optional	60.0
context ResponseType	String	Specifies the type of transaction context response. Valid values are: • Delta—Returns the sales transaction items that are added or updated. • Full—Returns all sales transaction items in a transaction. • None—Returns empty transaction context response. • Product—Returns the sales transaction items related to the product that's being configured.	Required for large sales transactions with more than 1000 line items and less than 15K line items.	65.0
correlationId	String	ID that's specified for traceability of logs.	Optional	60.0
deletedNodes	Configurator Deleted Node Input[]	List of deleted context nodes that's passed to the product configurator.	Optional	60.0
qualification Context	User Context Input[]	Details such as account ID, contact ID, and context ID that are used for executing qualification rules.	Optional	60.0
transaction ContextId	String	ID of the transaction context.	Optional	60.0
transactionId	String	ID of the sales transaction that's being configured such as a quote or an order.	Required	60.0
transaction LineId	String	ID of the top-level line item that's being configured.	Optional	60.0
updatedNodes	Configurator Updated Node Input[]	List of updated context nodes that's passed to the product configurator.	Optional	60.0

Configurator Options Input

Input representation of the request to get the product configuration options that's passed to the configurator.

JSON example

```
"configuratorOptions":
  {
    "addDefaultConfiguration": true,
    "executeConfigurationRules": true,
    "executePricing": true,
    "qualifyAllProductsInTransaction": true,
    "validateAmendRenewCancel": true,
    "validateProductCatalog": true
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`addDefault Configuration`	Boolean	Indicates whether to add the default configurations (`true`) or not (`false`).	Optional	60.0
`execute Configuration Rules`	Boolean	Indicates whether to execute the configuration rules (`true`) or not (`false`).	Optional	60.0
`execute Pricing`	Boolean	Indicates whether to execute pricing (`true`) or not (`false`).	Optional	60.0
`explainability Enabled`	Boolean	Indicates whether additional metadata about how the solver achieved the execution request solution must be collected and made available to the caller (`true`) or not (`false`). If you set this property to `true`, you can get explainability action logs by using the Action Logs API. See Troubleshoot Product Configurations to set up configuration logs.	Optional	66.0
`pricing Procedure`	String	Name of the pricing procedure to use during the API calls to Salesforce Pricing Management.	Optional	60.0
`qualifyAll ProductsIn Transaction`	Boolean	Indicates whether to run the qualification rules on all the products in the context (`true`) or not (`false`).	Optional	60.0
`returnProduct CatalogData`	Boolean	Indicates whether to return the product catalog data (`true`) or not (`false`).	Optional	60.0

Name	Type	Description	Required or Optional	Available Version
		Exclude this property or specify the property value as `false` if you're using the API without the Product Configurator UI.		
`validateAmendRenewCancel`	Boolean	Indicates whether to run the amend, renew, cancel-related validations (`true`) or not (`false`).	Optional	60.0
`validateProductCatalog`	Boolean	Indicates whether to run the validations against the product catalog (`true`) or not (`false`).	Optional	60.0

Configuration Rule Input

Input representation of the details of a configuration rule.

JSON example

```
{
  "transactionContextId": "008d27d7-e004-4906-a949-ee7d7c323c77",
  "transactionId": "0Q0DU0000005tJh0AI",
  "ruleOptions": {
    "isUpdateContextRequired": false
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`ruleOptions`	Config Rule Options Input[]	Details of the options to run specific steps in rules.	Optional	67.0
`transactionContextId`	String	ID of the sales transaction context instance.	Required if the `transactionId` property isn't specified.	67.0
`transactionId`	String	ID of the quote or order.	Required if the `transactionContextId` property isn't specified.	67.0

Configuration Rule Options Input

Input representation of the details of the configuration rule options.

Configuration Rule Options Input

Input representation of the details of the configuration rule options.

JSON example

```
{
  "ruleOptions": {
    "isUpdateContextRequired": false
  }
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
isUpdateContextRequired	Boolean	Indicates whether context update is required with the capability to automatically add or delete a product and its components (`true`) or not (`false`). If Place Sales Transaction API is invoked with configuration enabled, set this property to `false` to avoid any redundant execution of context logic.	Optional	67.0

Configurator Update Nodes Input

Input representation of the request to update the nodes in a product configuration.

JSON example

```
{
    "configuratorOptions": {
        "executePricing": true,
        "returnProductCatalogData": true,
        "qualifyAllProductsInTransaction": true,
        "validateProductCatalog": true,
        "validateAmendRenewCancel": true,
        "executeConfigurationRules": true,
        "addDefaultConfiguration": true
    },
    "qualificationContext": {
        "accountId": "001xx0000000001AAA",
        "contactId": "003xx00000000D7AAI"
    },
    "contextId": "008d27d7-e004-4906-a949-ee7d7c323c77",
    "updatedNodes": [
        {
            "path": ["0Q0DE000000ISHJs81", "0QLDE000000IBXw4AO"],
            "updatedAttributes": {
                "Quantity": 5
            }
```

```
        }
    ]
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
configurator Options	Configurator Options Input	List of the configuration options to execute.	Optional	60.0
contextId	String	ID of the context object that's being considered.	Required	60.0
qualification Context	User Context Input	Context details that are used for the qualification rules.	Optional	60.0
updatedNodes	Configurator Updated Node Input[]	List of the nodes to be updated.	Required	60.0

Configurator Updated Node Input

Input representation of the nodes to be updated in a product configuration.

JSON example

```
    "updatedNodes": [
        {
            "path": ["0Q0DE000000ISHJs81", "0QLDE000000IBXw4AO"],
            "updatedAttributes": {
                "Quantity": 5
            }
        }
    ]
```

Properties

Name	Type	Description	Required or Optional	Available Version
path	String[]	Path to the node that's being updated.	Required	60.0
updated Attributes	Map<String, Object>	Details of the object that's being updated. This property supports fields of objects from the Sales Transaction context definition, including custom objects and fields in your extended context definition.	Required	60.0

Product Quantity Set Configurator Input

Input representation of the request to set the quantity of a product.

JSON example

```
{
    "configuratorOptions": {
        "executePricing": true,
        "returnProductCatalogData": true,
        "qualifyAllProductsInTransaction": true,
        "validateProductCatalog": true,
        "validateAmendRenewCancel": true,
        "executeConfigurationRules": true,
        "addDefaultConfiguration": true
    },
    "qualificationContext": {
        "accountId": "001xx0000000001AAA",
        "contactId": "003xx00000000D7AAI"
    },
    "contextId": "008d27d7-e004-4906-a949-ee7d7c323c77",
    "quantity": 20,
    "transactionLinePath": "Quote.QuoteLineItem.Quantity"
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
`configuratorOptions`	Configurator Options Input	List of the configuration options to execute.	Optional	60.0
`contextId`	String	ID of the context object that's being considered.	Required	60.0
`qualificationContext`	User Context Input	Context details that are used for the qualification rules.	Optional	60.0
`quantity`	Integer	Value of the product quantity.	Required	60.0
`transactionLinePath`	String[]	Path to the line item where the update to the quantity is applied. For example, Quote.QuoteLineItem.Quantity.	Required	60.0

User Context Input

Input representation of the request to get the context details of a user, which are used for qualification rules.

JSON example

```
    "qualificationContext": {
        "accountId": "001DU000001nHUGYA2",
        "contactId": "003xx00000000D7AAI"
    }
```

Properties

Name	Type	Description	Required or Optional	Available Version
`accountId`	String	ID of the account in a user context.	Optional	60.0
`contactId`	String	ID of the contact in a user context.	Optional	60.0
`contextId`	String	ID of the context that represents the created session.	Optional	60.0

Response Bodies

Learn more about the available Product Configurator API response bodies.

Configuration Details
Output representation of the product configuration details.

Configuration Get Instance
Output representation of the request to retrieve the configuration instance.

Configuration Load Instance
Output representation of the details of the context or session that are returned with a load configuration request.

Configuration Save Details
Output representation of the details of a saved configuration.

Configuration Record Save
Output representation of the details of a saved configuration.

Configuration List
Output representation of the details of the saved configuration.

Configuration Save Instance
Output representation of the response that's returned with a save configuration request.

Configuration Set Instance
Output representation of the details of the context or session that are returned with a set configuration request.

Configurator Add Nodes
Output representation of the configuration request details to add nodes.

Configurator Additional Fields
Output representation of the additional fields of a product configuration.

Configurator Attribute
Output representation of the attribute in a product configuration.

Configurator Attribute Category
Output representation of the attribute category in a product configuration.

Configurator Attribute Picklist
Output representation of the attribute picklist in a product configuration.

Configurator Attribute Picklist Value

Output representation of the values of an attribute picklist in a product configuration.

Configurator Delete Nodes

Output representation of the details of the configuration request to delete nodes.

Configurator Message

Output representation of the messages of a product configurator.

Configurator Price

Output representation of the pricing details in a product configuration.

Configurator Pricing Model

Output representation of the details of a pricing model in a product configuration.

Configurator Product Catalog

Output representation of the product catalog.

Configurator Product Classification

Output representation of the product classification in a product configuration.

Configurator Product Component Group

Output representation of the product component group in a product classification.

Configurator Product Recommendations

Output representation of the details of the product recommendations.

Configurator Product Related Component

Output representation of the product related component in a product configuration.

Configurator Product Selling Model

Output representation of the product selling model in a product configuration.

Configurator Product Selling Model Option

Output representation of the product selling model option in a product configuration.

Configurator Qualification Context

Output representation of the qualification context in a product configuration.

Configurator UI Treatment

Output representation of the details of the UI treatments of a product configurator. The details include the product configuration rule actions to override the disable or hide behavior in the UI for product options, product attributes, and attribute picklist values.

Configurator Unit Of Measure

Output representation of the details of the unit of measure record.

Configurator Update Nodes

Output representation of the configuration request details to update nodes.

Configuration Update

Output representation of the details of the updated configuration.

Error Response

Output representation of the details of the error.

Product Quantity Set Configurator

Output representation of the request details to set product quantity.

Configuration Rule Response

Output representation of the details of the configuration rule response.

Configuration Details

Output representation of the product configuration details.

Property Name	Type	Description	Filter Group and Version	Available Version
catalog Products	Configurator Product Catalog[]	Structure that contains the product catalog data.	Small, 61.0	61.0
errors	ConnectApiErrorResponse	List of errors that contains a message and an error code.	Small, 60.0	60.0
messages	Map<String, Configurator Message>>	Messages from the validation, Business Rules Engine (BRE), or Salesforce Pricing calls.	Small, 60.0	60.0
product Recommendations	Configurator Product Recommendations	List of product recommendations.	Small, 65.0	65.0
success	Boolean	Indicates whether the request is successful (`true`) or not (`false`).	Small, 60.0	60.0
transaction Context	Map<String, Object>	Serialized JSON representation of the transaction context.	Small, 60.0	60.0
transaction ContextId	String	ID of the transaction context.	Small, 60.0	60.0
transactionContext MappingId	String	ID of the context mapping.	Small, 60.0	60.0
transaction Qualification	Map<String, Configurator Qualification Context>	Map of the product IDs to the qualification context.	Small, 60.0	60.0
uiTreatments	Configurator UI Treatment[]	Details of the UI treatments that specify the product configuration rule actions to override the disable or hide behavior in the UI for product options, product attributes, and attribute picklist values.	Small, 62.0	62.0

Configuration Get Instance

Output representation of the request to retrieve the configuration instance.

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Error Response	List of errors, which contains an error code and a message.	Small, 60.0	60.0
`success`	Boolean	Indicates whether the call was successful (`true`) not (`false`).	Small, 60.0	60.0
`transaction`	Map<String, Object>	Transaction JSON payload representing an object in an external system that's used to create a session.	Small, 60.0	60.0

Configuration Load Instance

Output representation of the details of the context or session that are returned with a load configuration request.

JSON Example

```

Property Name	Type	Description	Filter Group and Version	Available Version
`configurator Messages`	Map<String, <Configurator Message>>	Map of the product IDs to the list of configurator messages. Configurator messages are results from any validations, Business Rules Engines (BRE) calls, or Salesforce Pricing calls.	Small, 60.0	60.0
`configurator UITreatments`	Configurator UI Treatment[]	Details of the UI treatments that specify the product configuration rule actions to override the disable or hide behavior in the UI for product options, product attributes, and attribute picklist values.	Small, 62.0	62.0
`contextId`	String	ID of the transaction context.	Small, 60.0	60.0
`errors`	Error Response	List of errors, which contains an error code and a message.	Small, 60.0	60.0
`product Qualifications`	Map<String, Configurator Qualification Context>	Map of the product IDs to the execution results from qualification rules.	Small, 60.0	60.0
`success`	Boolean	Indicates whether the call was successful (`true`) not (`false`).	Small, 60.0	60.0

Configuration Save Details

Output representation of the details of a saved configuration.

JSON example

```
{
  "savedConfigurations": [
    {
      "data":
[illegible]
 Built-in
[illegible]

[illegible]

      "description": "This configuration is for cline XYZ",
      "id": "1Nyxx0000004CFUCA2",
      "name": "Client XYZ Favorite",
      "referenceRecordId": "01txx0000006iCFAAY"
    },
    {
```

```
      "data":
[illegible]
 Built-in
[illegible]

[illegible]

      "description": "This configuration is for cline XYZ",
      "id": "1Nyxx0000004CH6CAM",
      "name": "Client XYZ Favorite",
      "referenceRecordId": "01txx0000006iCFAAY"
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
data	String	JSON object that contains the details of the sales transaction, formatted as a string.	Small, 63.0	63.0
description	String	Description of the saved configuration.	Small, 63.0	63.0
id	String	ID of the saved configuration.	Small, 63.0	63.0
name	String	Name of the saved configuration.	Small, 63.0	63.0
referenceRecordId	String	ID of the record that the saved configuration belongs to.	Small, 63.0	63.0

Configuration Record Save

Output representation of the details of a saved configuration.

JSON example

This example shows a sample when the save operation is successful.

```
{
  "errors": [],
  "id": "1Nyxx0000004CNYCA2"
}
```

This example shows a sample when the save operation has errors.

```
{
  "errors": [{
  "code": "INTERNAL_SERVER_ERROR",
  "message": "INVALID_REFERENCEOBJECTID"
}]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Error Response	List of errors that contains a message and an error code.	Small, 63.0	63.0
`id`	String	ID of the configuration that's saved. This property isn't shown if the operation has errors.	Small, 63.0	63.0

Configuration List

Output representation of the details of the saved configuration.

JSON example

```
{
  "errors": [],
  "savedConfigurations": [
    {
      "data":
[illegible]
 Built-in
[illegible]

[illegible]

      "description": "This configuration is saved for reuse.",
      "id": "1Nyxx0000004CFUCA2",
      "name": "Favorite Configuration",
      "referenceRecordId": "01txx0000006iCFAAY"
    },
    {
      "data":
[illegible]
 Built-in
[illegible]

[illegible]

      "description": "This configuration is saved for reuse.",
      "id": "1Nyxx0000004CH6CAM",
      "name": "Configuration 2",
      "referenceRecordId": "01txx0000006iCFAAY"
    }
  ],
  "success": true
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Error Response	List of errors that contains a message and an error code.	Small, 63.0	63.0
`saved Configurations`	Configuration Save Details	Configuration details associated with the `referenceRecordID` request parameter.	Small, 63.0	63.0
`success`	Boolean	Indicates whether the operation is successful (`true`) or not (`false`).	Small, 63.0	63.0

Configuration Save Instance

Output representation of the response that's returned with a save configuration request.

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Error Response	List of errors, which contains an error code and a message.	Small, 60.0	60.0
`success`	Boolean	Indicates whether the call was successful (`true`) not (`false`).	Small, 60.0	60.0

Configuration Set Instance

Output representation of the details of the context or session that are returned with a set configuration request.

JSON Example

```
{
  "configuratorMessages": {},
  "configuratorUITreatments": [
    {
      "details": {
        "attributeId": "0tjxx0000000007AAA",
        "prcId": "0dSxx0000000007EAA",
        "stiId": "0QLxx0000004CU0GAM",
        "attributePicklistValueId": "0v6xx0000000005AAA"
      },
      "uiTreatmentScope": "Bundle",
      "uiTreatmentTarget": "Attribute_Picklist_Value",
      "uiTreatmentType": "Hide"
    },
    {
      "details": {
        "stiId": "ref_f0f2da7b_c431_482d_bf4b_599052f3a2e1"
      },
      "uiTreatmentScope": "Product",
      "uiTreatmentTarget": "Component",
      "uiTreatmentType": "Disable"
```

```
    }
  ],
  "contextId": "831f07b01cf0cbd2d046adf5350420f85f0611b4b1e22e183921a063857a1377",
  "errors": [],
  "productQualifications": {
    "01tDU000000EOTCYA4": {
      "isQualified": true
    }
  },
  "success": true
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
configurator Messages	Map<String, <Configurator Message>>	Map of the product IDs to the list of configurator messages. Configurator messages are results from any validations, Business Rules Engines (BRE) calls, or Salesforce Pricing calls.	Small, 60.0	60.0
configurator UITreatments	Configurator UI Treatment[]	Details of the UI treatments that specify the product configuration rule actions to override the disable or hide behavior in the UI for product options, product attributes, and attribute picklist values.	Small, 62.0	62.0
contextId	String	ID of the transaction context.	Small, 60.0	60.0
errors	Error Response	List of errors, which contains an error code and a message.	Small, 60.0	60.0
product Qualifications	Map<String, Configurator Qualification Context>	Map of the product IDs to the execution results from qualification rules.	Small, 60.0	60.0
success	Boolean	Indicates whether the call was successful (`true`) not (`false`).	Small, 60.0	60.0

Configurator Add Nodes

Output representation of the configuration request details to add nodes.

JSON Example

```
{
  "configuratorMessages": {},
  "configuratorUITreatments": [
    {
      "details": {
        "attributeId": "0tjxx0000000007AAA",
        "prcId": "0dSxx0000000007EAA",
```

```
          "stiId": "0QLxx0000004CU0GAM",
          "attributePicklistValueId": "0v6xx0000000005AAA"
        },
        "uiTreatmentScope": "Bundle",
        "uiTreatmentTarget": "Attribute_Picklist_Value",
        "uiTreatmentType": "Hide"
      },
      {
        "details": {
          "stiId": "ref_f0f2da7b_c431_482d_bf4b_599052f3a2e1"
        },
        "uiTreatmentScope": "Product",
        "uiTreatmentTarget": "Component",
        "uiTreatmentType": "Disable"
      }
    ],
    "errors": [],
    "productQualifications": {
      "01tDU000000EOTCYA4": {
        "isQualified": true
      }
    },
    "success": true
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
configurator Messages	Map<String, Configurator Message>	Map of the product IDs to the list of configurator messages. Configurator messages are results from any validations, Business Rules Engines (BRE) calls, or Salesforce Pricing calls.	Small, 60.0	60.0
configurator UITreatments	Configurator UI Treatment[]	Details of the UI treatments that specify the product configuration rule actions to override the disable or hide behavior in the UI for product options, product attributes, and attribute picklist values.	Small, 62.0	62.0
errors	Error Response	List of errors, which contains an error code and a message.	Small, 60.0	60.0
product Qualifications	Map<String, Configurator Qualification Context>	Map of the product IDs to the qualification rule execution results.	Small, 60.0	60.0
success	Boolean	Indicates whether the call was successful (`true`) not (`false`).	Small, 60.0	60.0

Configurator Additional Fields

Output representation of the additional fields of a product configuration.

Property Name	Type	Description	Filter Group and Version	Available Version
`fieldApiName`	String	API name of the field.	Small, 60.0	60.0
`fieldName`	String	Name of the field.	Small, 60.0	60.0
`value`	String	Value of the field.	Small, 60.0	60.0

Configurator Attribute

Output representation of the attribute in a product configuration.

JSON example

```
    "attributeCategories": [
      {
        "attributes": [
          {
            "attributeCategoryId": "0v3xx0000000001AAA",

Property Name	Type	Description	Filter Group and Version	Available Version
`attributes`	Configurator Attribute[]	Attributes of the attribute category.	Small, 60.0	60.0
`code`	String	Code of the attribute category.	Small, 60.0	60.0
`description`	String	Description of the attribute category.	Small, 60.0	60.0
`id`	String	ID of the attribute category.	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
name	String	Name of the attribute category.	Small, 60.0	60.0
status	String	Status of the attribute category.	Small, 60.0	60.0
totalSize	Integer	Total size of the attribute category.	Small, 60.0	60.0
usageType	String	Usage type of the attribute category.	Small, 60.0	60.0

Configurator Attribute Picklist

Output representation of the attribute picklist in a product configuration.

Property Name	Type	Description	Filter Group and Version	Available Version
description	String	Description of the attribute picklist.	Small, 60.0	60.0
id	String	ID of the attribute picklist.	Small, 60.0	60.0
name	String	Name of the attribute picklist.	Small, 60.0	60.0
status	String	Status of the attribute picklist.	Small, 60.0	60.0
values	Configurator Attribute Picklist Value[]	Values of the attribute picklist.	Small, 60.0	60.0

Configurator Attribute Picklist Value

Output representation of the values of an attribute picklist in a product configuration.

Property Name	Type	Description	Filter Group and Version	Available Version
code	String	Code of the attribute value.	Small, 60.0	60.0
description	String	Description of the attribute value.	Small, 60.0	60.0
displayValue	String	Display value of the attribute value.	Small, 60.0	60.0
id	String	ID of the attribute value.	Small, 60.0	60.0
isBooleanValue	Boolean	Indicates if this attribute value is a boolean value (true) or not (false).	Small, 60.0	60.0
label	String	Label of the attribute value.	Small, 60.0	60.0
name	String	Name of the attribute value.	Small, 60.0	60.0
sequence	Integer	Sequence of the attribute value.	Small, 60.0	60.0
status	String	Status of the attribute value.	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
textValue	String	Text value of the attribute value.	Small, 60.0	60.0

Configurator Delete Nodes

Output representation of the details of the configuration request to delete nodes.

JSON Example

```
{
  "configuratorMessages": {},
  "configuratorUITreatments": [
    {

  },
  "success": true
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
configurator Messages	Map<String, Configurator Message>	Map of the product IDs to the list of configurator messages. Configurator messages are results from any validations, Business Rules Engine (BRE) calls, or Salesforce Pricing calls.	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
configurator UITreatments	Configurator UI Treatment[]	Details of the UI treatments that specify the product configuration rule actions to override the disable or hide behavior in the UI for product options, product attributes, and attribute picklist values.	Small, 62.0	62.0
errors	Error Response	List of errors, which contains an error code and a message.	Small, 60.0	60.0
product Qualifications	Map<String, Configurator Qualification Context>	Map of the product IDs to the qualification rule execution results.	Small, 60.0	60.0
success	Boolean	Indicates whether the call was successful (`true`) not (`false`).	Small, 60.0	60.0

Configurator Message

Output representation of the messages of a product configurator.

JSON example

```
{
  "messages": {
    "0Q0xx0000004CDsCAM": [
      {
        "message": "This is a quote with warranty",

      }
    ]
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`category`	String	Category or type of the error message. Valid values are: • `ArcResolutionService` • `ArcValidationService` • `BundleValidation` • `ConfigurationRules` • `Pricing`	Small, 60.0	60.0
`groupByValue`	String	Specifies the value from Constraint Modeling Language rule action details.	Small, 67.0	67.0
`message`	String	Message that contains the error details.	Small, 60.0	60.0
`messageType`	String	Type of error message. Valid values are: • `Error` • `Info` • `Warning`	Small, 60.0	60.0
`primary RecordId`	String	Primary record ID that contains the error.	Small, 60.0	60.0
`related RecordId`	String	Related record ID for the error, if any.	Small, 60.0	60.0

Configurator Price

Output representation of the pricing details in a product configuration.

Property Name	Type	Description	Filter Group and Version	Available Version
currency IsoCode	String	Currency ISO code of the price book entry.	Small, 60.0	60.0
effectiveFrom	String	Date from when the price book entry is effective.	Small, 60.0	60.0
effectiveTo	String	Date until when the price book entry is effective.	Small, 60.0	60.0
isDefault	Boolean	Indicates if this price book entry is the default pricing model (true) or not (false).	Small, 60.0	60.0
isSelected	Boolean	Indicates if this price book entry is selected (true) or not (false).	Small, 60.0	60.0
pricebook EntryId	String	ID of the price book entry.	Small, 60.0	60.0
pricebookId	String	Pricebook2 ID of the price book entry.	Small, 60.0	60.0
pricingModel	Configurator Pricing Model[]	Pricing model details of the price book entry.	Small, 60.0	60.0
unitPrice	Double	Unit price of the price book entry.	Small, 60.0	60.0

Configurator Pricing Model

Output representation of the details of a pricing model in a product configuration.

Property Name	Type	Description	Filter Group and Version	Available Version
frequency	String	Frequency of the pricing model.	Small, 60.0	60.0
id	String	ID of the pricing model.	Small, 60.0	60.0
name	String	Name of the pricing model.	Small, 60.0	60.0
occurrence	Integer	Occurrence of the pricing model.	Small, 60.0	60.0
pricing ModelType	String	Type of the pricing model.	Small, 60.0	60.0
unitOfMeasure	String	Unit of measure for the pricing model.	Small, 60.0	60.0

Configurator Product Catalog

Output representation of the product catalog.

Property Name	Type	Description	Filter Group and Version	Available Version
additional Fields	Configurator Additional Fields[]	Additional fields for this product.	Small, 60.0	60.0
attribute Categories	Configurator Attribute Category[]	List of attribute categories. The categories that aren't categorized are specified in the uncategorized entry in this list.	Small, 60.0	60.0
availability Date	String	Availability date of this product.	Small, 60.0	60.0
description	String	Description of this product.	Small, 60.0	60.0
discontinued Date	String	Date when this product is discontinued.	Small, 60.0	60.0
displayUrl	String	Display URL of this product.	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
endOfLifeDate	String	End of life date for this product.	Small, 60.0	60.0
id	String	ID of the product.	Small, 60.0	60.0
isActive	Boolean	Indicates whether this product is active (true) or not (false).	Small, 60.0	60.0
isAssetizable	Boolean	Indicates whether this product is assetizable (true) or not (false).	Small, 60.0	60.0
isComponent Required	Boolean	Indicates whether the component is required (true) or not (false).	Small, 60.0	60.0
is Configurable	Boolean	Indicates whether the component is configurable (true) or not (false).	Small, 60.0	60.0
isDefault Component	Boolean	Indicates whether the component is a default component (true) or not (false).	Small, 60.0	60.0
isQuantity Editable	Boolean	Indicates whether the quantity of the component is editable (true) or not (false).	Small, 60.0	60.0
isSoldOnly WithOtherProds	Boolean	Indicates whether this product is sold only with other products (true) or not (false).	Small, 60.0	60.0
name	String	Name of the product.	Small, 60.0	60.0
nodeType	String	Node type of the product.	Small, 60.0	60.0
prices	Configurator Price[]	List of prices from the product catalog.	Small, 60.0	60.0
product Classification	Configurator Product Classification[]	Classification details of the product.	Small, 60.0	60.0
productCode	String	Code of the product.	Small, 60.0	60.0
product ComponentGroups	Configurator Product Component Group[]	List of product component groups for this product.	Small, 60.0	60.0
product RelatedComponent	Configurator Product Related Component[]	Details of the product related component of this product.	Small, 60.0	60.0
productSelling ModelOptions	Configurator Product Selling Model Option[]	List of product selling model options for this product.	Small, 60.0	60.0
productType	String	Type of product.	Small, 60.0	60.0
qualification Context	Configurator Qualification Context[]	Details of the qualification context of the product.	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
`status`	String	Status of the product.	Small, 60.0	60.0
`unitOfMeasure`	Configurator Unit Of Measure[]	Details about the unit of measure associated with a product.	Small, 63.0	63.0

Configurator Product Classification

Output representation of the product classification in a product configuration.

JSON example

```
"productClassification": {
  "id": "11Bxx000002CC02EAG"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`id`	String	ID of the product classification.	Small, 60.0	60.0

Configurator Product Component Group

Output representation of the product component group in a product classification.

JSON example

```

Property Name	Type	Description	Filter Group and Version	Available Version
classifications	Configurator Product Classification[]	List of classifications for this product component group.	Small, 60.0	60.0
code	String	Code of the product component group.	Small, 60.0	60.0
components	Configurator Product Catalog[]	Components within the product component group.	Small, 60.0	60.0
description	String	Description of the product component group.	Small, 60.0	60.0
id	String	ID of the product component group.	Small, 60.0	60.0
maxBundle Components	Integer	Maximum number of bundle components within the product component group.	Small, 60.0	60.0
minBundle Components	Integer	Minimum number of bundle components within the product component group.	Small, 60.0	60.0
name	String	Name of the product component group.	Small, 60.0	60.0
parent ProductId	String	Parent Product2 ID of the product component group.	Small, 60.0	60.0
sequence	Integer	Sequence of the product component group.	Small, 60.0	60.0

Configurator Product Recommendations

Output representation of the details of the product recommendations.

JSON Example

```
{
  "productRecommendations": [
```

```
    {
      "referenceId": "CORE_BUNDLE_001",
      "productIds": [
        "01t000000001234",
        "01t000000005678"
      ]
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
productIds	String[]	List of recommended product IDs.	Small, 65.0	65.0
referenceId	String	Reference ID for the recommendation.	Small, 65.0	65.0

Configurator Product Related Component

Output representation of the product related component in a product configuration.

JSON example

```
        "productRelatedComponent": {
          "childProductId": "01txx0000006jmWAAQ",
          "childSellingModelId": "0jPxx000000004rEAA",
          "doesBundlePriceIncludeChild": true,
          "id": "0dSxx000000001dEAA",
          "isComponentRequired": false,
          "isDefaultComponent": false,
          "isQuantityEditable": false,
          "parentProductId": "01txx0000006jkuAAA",
          "parentSellingModelId": "0jPxx000000004rEAA",
          "productComponentGroupId": "0y7xx000000001dAAA",
          "productRelationshipTypeId": "0yoxx00000001IfAAI",
          "quantity": 1,
          "quantityScaleMethod": "Proportional",
          "quoteVisibility": "Quote Document Only"
        }
```

Property Name	Type	Description	Filter Group and Version	Available Version
childProductId	String	ID of the child product in the bundle.	Small, 60.0	60.0
childSellingModelId	String	ID of the child product selling model record.	Small, 60.0	60.0
doesBundlePriceIncludeChild	Boolean	Indicates whether the price of the bundle includes the child product (`true`) or not (`false`).	Small, 60.0	60.0

Property Name	Type	Description	Filter Group and Version	Available Version
id	String	ID of the product related component.	Small, 60.0	60.0
isComponentRequired	Boolean	Indicates whether the component is required in the bundle (true) or not (false).	Small, 60.0	60.0
isDefaultComponent	Boolean	Indicates whether to select the component in the bundle group by default (true) or not (false).	Small, 60.0	60.0
isQuantityEditable	Boolean	Indicates whether to allow changes to the quantity of the component in the bundle (true) or not (false).	Small, 60.0	60.0
maxQuantity	Double	Maximum quantity of the product in the opportunity, quote, or order line item.	Small, 60.0	60.0
minQuantity	Double	Minimum quantity of the product in the opportunity, quote, or order line item.	Small, 60.0	60.0
parentProductId	String	ID of the parent product.	Small, 60.0	60.0
parentSellingModelId	String	ID of the parent product selling model record.	Small, 60.0	60.0
productClassificationId	String	ID of the product classification record.	Small, 60.0	60.0
productComponentGroupId	String	ID of the product component group.	Small, 60.0	60.0
productRelationshipTypeId	String	ID of the product relationship type record.	Small, 60.0	60.0
quantity	Double	Quantity of the child products.	Small, 60.0	60.0
quantityScaleMethod	String	Method to scale the quantity of the child product in relation to the quantity of the parent. Valid values are: • Constant • Proportional	Small, 60.0	60.0
quoteVisibility	String	Specifies whether a quote line item must be shown on the transaction line editor or quote document. Valid values are: • Always	Small, 64.0	64.0

Property Name	Type	Description	Filter Group and Version	Available Version
		• `Transaction Line Editor Only`—Specifies whether to show a quote line item on quote editor only. • `Quote Document Only`—Specifies whether to show a quote line item on quote proposal only. • `Never` The API returns this property only if the CoreCPQ permission set is available.		
`sequence`	Integer	Order in which the child products are displayed.	Small, 60.0	60.0

Configurator Product Selling Model

Output representation of the product selling model in a product configuration.

JSON example

```
    "productSellingModel": {
        "id": "0jPxx0000000085EAA",
        "name": "Evergreen Annually",
        "pricingTerm": 1,
        "pricingTermUnit": "Annual",
        "sellingModelType": "Evergreen",
        "status": "Active"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`id`	String	ID of the product selling model.	Small, 60.0	60.0
`name`	String	Name of the product selling model.	Small, 60.0	60.0
`pricingTerm`	Integer	Pricing term of the product selling model.	Small, 60.0	60.0
`pricing TermUnit`	String	Pricing term unit of the product selling model.	Small, 60.0	60.0
`selling ModelType`	String	Selling model type of the product selling model.	Small, 60.0	60.0
`status`	String	Status of the product selling model.	Small, 60.0	60.0

Configurator Product Selling Model Option

Output representation of the product selling model option in a product configuration.

JSON example

```
        "productSellingModelOptions": [
          {
            "id": "0iOxx000000009hEAA",
            "productId": "01txx0000006jmWAAQ",
            "productSellingModel": {
              "id": "0jPxx000000004rEAA",
           "name": "Termed Annually",
              "pricingTerm": 1,
              "pricingTermUnit": "Annual",
              "sellingModelType": "TermDefined",
              "status": "Active"
            },
            "productSellingModelId": "0jPxx000000004rEAA"
          },
          {
            "id": "0iOxx00000000PpEAI",
            "productId": "01txx0000006jmWAAQ",
            "productSellingModel": {
              "id": "0jPxx0000000085EAA",
              "name": "Evergreen Annually",
              "pricingTerm": 1,
              "pricingTermUnit": "Annual",
              "sellingModelType": "Evergreen",
              "status": "Active"
            },
            "productSellingModelId": "0jPxx0000000085EAA"
          }
        ]
```

Property Name	Type	Description	Filter Group and Version	Available Version
id	String	ID of the product selling model option.	Small, 60.0	60.0
productId	String	ID of the product that's associated with the product selling model option.	Small, 60.0	60.0
product SellingModel	Configurator Product Selling Model[]	Product selling model that's associated with the product selling model option.	Small, 60.0	60.0
product Selling ModelId	String	ID of the product selling model that's associated with the product selling model option.	Small, 60.0	60.0

Configurator Qualification Context

Output representation of the qualification context in a product configuration.

Property Name	Type	Description	Filter Group and Version	Available Version
isQualified	Boolean	Indicates whether the product is qualified (true) or not (false).	Small, 60.0	60.0
reason	String	Reason for the qualification of this product.	Small, 60.0	60.0

Configurator UI Treatment

Output representation of the details of the UI treatments of a product configurator. The details include the product configuration rule actions to override the disable or hide behavior in the UI for product options, product attributes, and attribute picklist values.

JSON Example

```
[
  {
    "details": {
      "attributeId": "0tjxx0000000007AAA",
      "prcId": "0dSxx0000000007EAA",
      "stiId": "0QLxx0000004CU0GAM",
      "attributePicklistValueId": "0v6xx0000000005AAA"
    },
    "uiTreatmentScope": "Bundle",
    "uiTreatmentTarget": "Attribute_Picklist_Value",
    "uiTreatmentType": "Hide"
  },
  {
    "details": {
      "stiId": "ref_f0f2da7b_c431_482d_bf4b_599052f3a2e1"
    },
    "uiTreatmentScope": "Product",
    "uiTreatmentTarget": "Component",
    "uiTreatmentType": "Disable"
  }
]
```

Property Name	Type	Description	Filter Group and Version	Available Version
details	Map<String, Object>	Key-value pair that specifies the items to apply the rules on, which includes these details. • ID of the sales transaction item • ID of the product-related component • ID of the attribute • ID of the attribute picklist value	Small, 62.0	62.0
uiTreatment Scope	String	Type of the UI treatment to be performed. Valid values are:	Small, 62.0	62.0

Property Name	Type	Description	Filter Group and Version	Available Version
		• `Product`—UI treatment is applicable to a certain product only. • `Bundle`—UI treatment is applicable to the whole bundle.		
`uiTreatment Target`	String	Target of the UI treatment. Valid values are: • `Component`—Represents a product option or bundle component. • `Quantity`—Represents a quantity field. • `Attribute`—Represents a certain attribute of the product. • `Attribute_Picklist_Value`—Represents one of the picklist values of a product attribute.	Small, 62.0	62.0
`uiTreatment Type`	String	Type of UI treatment to be performed. Valid values are: • `Hide`—Hide the associated target. • `Disable`—Disable the associated target.	Small, 62.0	62.0

Configurator Unit Of Measure

Output representation of the details of the unit of measure record.

JSON Example

```
{
  "unitOfMeasure": {
    "id": "0hEXR00000000BJ2AY",
    "name": "Litres",
    "roundingMethod": "Down",
    "scale": 2,
    "unitCode": "Ltrs"
  }
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`id`	String	ID of the unit of measure record.	Small, 63.0	63.0
`name`	String	Name of the unit of measure record.	Small, 63.0	63.0

Property Name	Type	Description	Filter Group and Version	Available Version
roundingMethod	String	Rounding method associated with the unit of measure record.	Small, 63.0	63.0
scale	Integer	Scale associated with the unit of measure record.	Small, 63.0	63.0
unitCode	String	Unit code associated with the unit of measure record.	Small, 63.0	63.0

Configurator Update Nodes

Output representation of the configuration request details to update nodes.

JSON Example

```
{
  "configuratorMessages": {},
  "configuratorUITreatments": [
    {
      "details": {
        "attributeId": "0tjxx0000000007AAA",
        "prcId": "0dSxx0000000007EAA",
        "stiId": "0QLxx0000004CU0GAM",
        "attributePicklistValueId": "0v6xx0000000005AAA"
      },
      "uiTreatmentScope": "Bundle",
      "uiTreatmentTarget": "Attribute_Picklist_Value",
      "uiTreatmentType": "Hide"
    },
    {
      "details": {
        "stiId": "ref_f0f2da7b_c431_482d_bf4b_599052f3a2e1"
      },
      "uiTreatmentScope": "Product",
      "uiTreatmentTarget": "Component",
      "uiTreatmentType": "Disable"
    }
  ],
  "errors": [],
  "productQualifications": {
    "01tDU000000EOTCYA4": {
      "isQualified": true
    }
  },
  "success": true
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`configuratorMessages`	Map<String, Configurator Message>	Map of the product IDs to the list of configurator messages. Configurator messages are results from any validations, Business Rules Engines (BRE) calls, or Salesforce Pricing calls.	Small, 60.0	60.0
`configuratorUITreatments`	Configurator UI Treatment[]	Details of the UI treatments that specify the product configuration rule actions to override the disable or hide behavior in the UI for product options, product attributes, and attribute picklist values.	Small, 62.0	62.0
`errors`	Error Response	List of errors, which contains an error code and a message.	Small, 60.0	60.0
`productQualifications`	Map<String, Configurator Qualification Context>	Map of the product IDs to the qualification rule execution results.	Small, 60.0	60.0
`success`	Boolean	Indicates whether the call was successful (`true`) not (`false`).	Small, 60.0	60.0

Configuration Update

Output representation of the details of the updated configuration.

JSON example

This example shows a sample when the update operation is successful.

```
{
  "errors": [],
  "success": true
}
```

This example shows a sample when the update operation has errors.

```
{
  "errors": [
    {
      "code": "INTERNAL_SERVER_ERROR",
      "message": "INVALID_REFERENCEOBJECTID"
    }
  ],
  "success": false
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`errors`	Error Response	List of errors that contains a message and an error code.	Small, 63.0	63.0
`success`	Boolean	Indicates whether the update operation is successful (`true`) or not (`false`)	Small, 63.0	63.0

Error Response

Output representation of the details of the error.

JSON example

```
{
  "errors": [
    {
      "code": "BAD_REQUEST",
      "message": "MISSING_REFERENCEOBJECTID"
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`code`	String	Code of the error.	Small, 63.0	63.0
`message`	String	Description of the error.	Small, 63.0	63.0

Product Quantity Set Configurator

Output representation of the request details to set product quantity.

JSON Example

```
{
  "configuratorMessages": {},
  "configuratorUITreatments": [
    {
      "details": {
        "attributeId": "0tjxx0000000007AAA",
        "prcId": "0dSxx0000000007EAA",
        "stiId": "0QLxx0000004CU0GAM",
        "attributePicklistValueId": "0v6xx0000000005AAA"
      },
      "uiTreatmentScope": "Bundle",
      "uiTreatmentTarget": "Attribute_Picklist_Value",
      "uiTreatmentType": "Hide"
    },
    {
      "details": {
```

```
        "stiId": "ref_f0f2da7b_c431_482d_bf4b_599052f3a2e1"
      },
      "uiTreatmentScope": "Product",
      "uiTreatmentTarget": "Component",
      "uiTreatmentType": "Disable"
    }
  ],
  "errors": [],
  "productQualifications": {
    "01tDU000000EOTCYA4": {
      "isQualified": true
    }
  },
  "success": true
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`configurator Messages`	Map<String, Configurator Message>	Map of the product IDs to the list of configurator messages. Configurator messages are results from any validations, Business Rules Engines (BRE) calls, or Salesforce Pricing calls.	Small, 60.0	60.0
`configurator UITreatments`	Configurator UI Treatment[]	Details of the UI treatments that specify the product configuration rule actions to override the disable or hide behavior in the UI for product options, product attributes, and attribute picklist values.	Small, 62.0	62.0
`errors`	Error Response	List of errors, which contains an error code and a message.	Small, 60.0	60.0
`product Qualifications`	Map<String, Configurator Qualification Context>	Map of the product IDs to the qualification rule execution results.	Small, 60.0	60.0
`success`	Boolean	Indicates whether the call was successful (`true`) not (`false`).	Small, 60.0	60.0

Configuration Rule Response

Output representation of the details of the configuration rule response.

JSON example

```
{
  "errors": [],
  "messageRules": [
    {
      "message": "You have a 128GB LRDIMM QLI",
```

```
      "messageType": "error",
      "primaryRecordId": "0Q0VW000000z8yN0AQ"
    },
    {
      "message": "You have a 16GB RDIMM QLI",
      "messageType": "warning",
      "primaryRecordId": "0Q0VW000000z8yN0AQ"
    },
    {

Property Name	Type	Description	Filter Group and Version	Available Version
errors	Config Rule Errors[]	List of error messages from the configuration rule evaluation, if any.	Small, 67.0	67.0
messageRules	Message Rules[]	List of message rules that were evaluated during configuration.	Small, 67.0	67.0
product RecommendationRules	Product Recommendation Rules[]	List of product recommendation rules that were evaluated during configuration.	Small, 67.0	67.0
success	Boolean	Indicates whether the API request is successful (true) or not (false).	Small, 67.0	67.0
transaction ContextId	String	ID of the transaction context for this configuration rule evaluation.	Small, 67.0	67.0
visibility Rules	Visibility Rules[]	List of visibility rules that were evaluated during configuration.	Small, 67.0	67.0

Configuration Rule Errors
Output representation of the error details, if applicable, when you run config rules.

Message Rules
Output representation of the details of the message rules.

Product Recommendation Rules
Output representation of the details of the product recommendation rules.

Visibility Rules
Output representation of the details of the visibility rules.

Configuration Rule Errors

Output representation of the error details, if applicable, when you run config rules.

Property Name	Type	Description	Filter Group and Version	Available Version
errorCode	String	Code indicating the type of error.	Small, 67.0	67.0
message	String	Message stating the reason for error, if any.	Small, 67.0	67.0

Message Rules

Output representation of the details of the message rules.

JSON example

```
{
  "message": "Constraints is running for laptop",
  "messageType": "Info",
  "primaryRecordId": "0QLxx0000004CU0GAM",
  "relatedRecordId": "0QLxx0000004CU1GAM"
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`message`	String	List of message strings to display to the user.	Small, 67.0	67.0
`messageType`	String	Severity level of the message. Valid values are: • `INFO` • `WARNING` • `ERROR`	Small, 67.0	67.0
`primaryRecordId`	String	ID of the primary sales transaction item record.	Small, 67.0	67.0
`relatedRecordId`	String	ID of the related record.	Small, 67.0	67.0

Product Recommendation Rules

Output representation of the details of the product recommendation rules.

JSON example

```
{
  "productRecommendationRules": [
    {
      "message": "32GB RDIMM recommends 16GB RDIMM",
      "productIds": [
        "01tVW00000317uaYAA"
      ],
      "recordType": "Type",
      "referenceId": "0Q0VW000000z8yN0AQ"
    },
    {
      "message": "32GB RDIMM recommends 64GB RDIMM",
      "productIds": [
        "01tVW00000317v6YAA"
      ],
      "recordType": "Type",
      "referenceId": "0Q0VW000000z8yN0AQ"
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
message	String	Message to display with the product recommendation.	Small, 67.0	67.0
productIds	String[]	List of recommended Product IDs.	Small, 67.0	67.0
recordType	String	Record type associated with the recommendation.	Small, 67.0	67.0
referenceId	String	Reference ID of the product recommendation rule.	Small, 67.0	67.0

Visibility Rules

Output representation of the details of the visibility rules.

JSON example

```
{
  "visibilityRules": [
    {
      "message": "128GB LRDIMM disables 16GB RDIMM",
      "productIds": [
        "01tVW00000317uaYAA"
      ],
      "scope": "virtual",
      "target": "product",
      "type": "disable"
    },
    {
      "message": "Additional API disables Additional API Gov",
      "productIds": [
        "01tVW00000317tzYAA"
      ],
      "scope": "virtual",
      "target": "product",
      "type": "disable"
    },
    {
      "message": "Disable All other API Products",
      "productIds": [
        "01tVW00000317u0YAA",
        "01tVW00000317u1YAA"
      ],
      "scope": "virtual",
      "target": "product",
      "type": "disable"
    },
    {
      "message": "32GB RDIMM disables 128GB LRDIMM",
      "productIds": [
        "01tVW00000317v5YAA"
      ],
```

```
      "scope": "virtual",
      "target": "product",
      "type": "disable"
    },
    {
      "message": "API Access Requests AEH disables Additional API Prod",
      "productIds": [
        "01tVW000003l7u1YAA"
      ],
      "scope": "virtual",
      "target": "product",
      "type": "disable"
    }
  ]
}
```

Property Name	Type	Description	Filter Group and Version	Available Version
`attributeId`	String	ID of the attribute associated with this visibility rule.	Small, 67.0	67.0
`attribute PicklistValueId`	String	ID of the attribute picklist value associated with this visibility rule.	Small, 67.0	67.0
`message`	String	Message to display when the visibility rule is applied.	Small, 67.0	67.0
`prcId`	String	ID of the Product Relationship Configuration (PRC) associated with this visibility rule.	Small, 67.0	67.0
`productIds`	String[]	List of product IDs affected by this visibility rule.	Small, 67.0	67.0
`scope`	String	Scope of the visibility rule. Valid values are: • `PRODUCT` • `BUNDLE` • `VIRTUAL`	Small, 67.0	67.0
`stiId`	String	ID of the sales transaction item associated with this visibility rule.	Small, 67.0	67.0
`target`	String	Target of the visibility rule. Valid values are: • `COMPONENT` • `QUANTITY` • `ATTRIBUTE` • `ATTRIBUTE_PICKLIST_VALUE` • `PRODUCT`	Small, 67.0	67.0

Property Name	Type	Description	Filter Group and Version	Available Version
`type`	String	Type of visibility rule. Valid values are: • `HIDE` • `DISABLE`	Small, 67.0	67.0

Product Configurator Standard Invocable Actions

Learn more about the standard invocable actions available with Product Configurator.

Run Config Rules Action
Run rules for a specific quote or order based on a context ID or transaction ID, and process other steps that are part of the configuration directly within a Flow. This action decouples rule execution from configurations to enable independent execution of rules and for easier retrieval of responses.

SEE ALSO:

Actions Developer Guide: Overview

REST API Developer Guide: Invocable Actions Standard

Run Config Rules Action

Run rules for a specific quote or order based on a context ID or transaction ID, and process other steps that are part of the configuration directly within a Flow. This action decouples rule execution from configurations to enable independent execution of rules and for easier retrieval of responses.

This action is available in API version 65.0 and later.

Supported REST HTTP Methods

URI

`/services/data/v`***`67.0`***`/actions/standard/runConfigRules`

Formats

JSON, XML

HTTP Methods

POST

Authentication

`Authorization: Bearer`***`token`***

Inputs

Input	Details
`transactionContextId`	**Type** string **Description** Unique identifier for the transaction context.
`transactionId`	**Type** string **Description** Required. Unique identifier for the transaction.

Outputs

Output	Details
`configRuleResult`	**Type** Apex-defined **Description** An `runtime_industries_cpq.ConfigRuleResult` record that contains the configuration rule execution results including validation messages, product recommendations, visibility rules, and errors from rule processing.
`transactionContextId`	**Type** string **Description** Unique identifier for the transaction context.

Example

POST

This example shows a sample request to run rules for the specified quote based on the transaction context ID and transaction ID.

```
{
  "inputs": [
    {
      "transactionContextId": "008d27d7-e004-4906-a949-ee7d7c323c77",
      "transactionId": "0Q0DU0000005tJh0AI"
    }
```

```
  ]
}
```

This example shows a sample successful response.

```

              ]
            }
          ],
          "errors": []
        }
      },
      "sortOrder": -1,
      "version": 1
    }
]
```

Here's a sample input to call this invocable action by using `transactionContextId` property from Apex code.

```
// Create the invocable action with namespace
Invocable.Action action = Invocable.Action.createStandardAction('runConfigRules');

// Set input parameters using setInvocationParameter
String contextId = '008d27d7-e004-4906-a949-ee7d7c323c77';
System.debug('Setting transactionContextId parameter with value: ' + contextId);

// Use the exact parameter name format from the debug output
action.setInvocationParameter('transactionContextId', contextId);

// Debug the action parameters
System.debug('Action parameters: ' + action);

// Execute the action
System.debug('Invoking action...');
List<Invocable.Action.Result> results = action.invoke();

System.debug('Number of results: ' + results.size());
```

Product Configurator Metadata API Types

Metadata API enables you to access some types and feature settings that you can customize in the user interface.

Flow for Product Configurator

Represents the metadata associated with a flow. With Flow, you can create an application that navigates users through a series of screens to query and update records in the database. You can also execute logic and provide branching capability based on user input to build dynamic applications.

ProductConfiguratorSettings
Represents the settings for Product Configurator.

SEE ALSO:

Metadata API Developer Guide: Understanding Metadata API

Flow for Product Configurator

Represents the metadata associated with a flow. With Flow, you can create an application that navigates users through a series of screens to query and update records in the database. You can also execute logic and provide branching capability based on user input to build dynamic applications.

FlowActionCall

Product Configurator exposes additional actionType values for the FlowActionCall Metadata type.

Field Name	Field Type	Description
`actionType`	InvocableActionType (enumeration of type string)	Required. The action type. Additional valid values only for Product Configurator include: • `runConfigRules`—Run rules for a specific quote or order based on a context ID or transaction ID, and process other steps that are part of the configuration directly within a Flow. This action decouples rule execution from configurations to enable independent execution of rules and for easier retrieval of responses.

ProductConfiguratorSettings

Represents the settings for Product Configurator.

Parent Type and Manifest Access

This type extends the Metadata metadata type and inherits its `fullName` field.

In the package manifest, all the settings metadata types for the org are accessed using the "Settings" name. See Settings for more details.

File Suffix and Directory Location

`ProductConfiguratorSettings` values are stored in the `ProductConfiguratorSettings.settings` file in the `settings` folder. The `.settings` files are different from other named components, because there is only one settings file for each settings component.

Version

ProductConfiguratorSettings components are available in API version 60.0 and later.

Fields

Field Name	Description
enableProductConfigurator	**Field Type** boolean **Description** Indicates whether to enable Product Configurator at run time to customize product components and attributes during the sales process (`true`) or not (`false`). The default value is `false`.

Declarative Metadata Sample Definition

Here's an example of a ProductConfiguratorSettings component.

```
<?xml version="1.0" encoding="UTF-8"?>
<ProductConfiguratorSettings xmlns="http://soap.sforce.com/2006/04/metadata">
    <enableProductConfigurator>true</enableProductConfigurator>
</ProductConfiguratorSettings>
```

Here's an example `package.xml` that references the previous definition.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
    <types>
        <members>ProductConfigurator</members>
        <name>Settings</name>
    </types>
    <version>67.0</version>
</Package>
```

Wildcard Support in the Manifest File

The wildcard character `*` (asterisk) in the `package.xml` manifest file doesn't apply to metadata types for feature settings. The wildcard applies only when retrieving all settings, not for an individual setting. For details, see Settings. For information about using the manifest file, see Deploying and Retrieving Metadata with the Zip File.

Constraint Modeling Language

Constraint Modeling Language (CML) is a domain-specific language that defines models for complex systems. For product configuration, constraint models describe real-world entities and their relationships to each other.

Constraint models enforce business logic declaratively, without the need for extensive code in a general-purpose programming language. In Product Configurator, a product designers or admin create a constraint model in CML, then Constraint Rules Engine compiles the CML code. The constraint model enforces requirements in a product configuration to comply with the specified constraints.

To build a constraint model in CML, use this basic workflow.

- Create global properties and settings that are header-level declarations in CML that define the foundational, fixed values for the entire constraint model. They're crucial for setting up the core configuration environment and ensuring reusability across the model.

- Create variables to define the properties or characteristics of a type. Variables can hold different kinds of data, such as strings, numbers, or lists, and can be calculated from other variables and values. In Revenue Management, variables represent product fields, product attributes, and sometimes context tags. See Create a Context Definition in Salesforce Help.
- Define types, which represent entities or objects in the model. Types are the building blocks of CML. They're similar to classes in object-oriented programming. In Revenue Management, types represent standalone products, bundles, product components, and product classes.
- Define relationships that describe how different types are associated with each other. In Revenue Management, relationships represent the product structure in a bundle. For example, the root product has a relationship with its components.
- Apply constraints to define logical restrictions, and enforce rules and conditions on types, variables, and relationships.

In Product Configurator, use the Visual Builder and CML Editor in Constraint Builder to create constraint models with CML.

- Use Constraint Builder With Constraint Rules Engine
- Define Constraints and Rules with the Visual Builder
- Use Code to Define Constraints and Rules in the CML Editor

See the linked topics for information on working with CML, including detailed code examples.

Modeling a Generator Set

The Constraint Model for a Generator Set examples use CML to define a technical power configuration, illustrating concepts such as calculated variables, enforcement of external standards, and component selection based on requirements.

Core Concepts

Constraint Modeling Language (CML) includes components that cover high-level global configurations to specific data types and constraints.

Core Concept Examples

These examples illustrate core Constraint Modeling Language (CML) concepts including type, relationships, constraints, and so on.

Annotation Examples

Constraint Modeling Language (CML) annotations are labels that you add to parts of a model, such as types, variables, relationships, and constraints. Annotations control how these elements are shown and how they behave in the configurator. Annotations help fine-tune the configurator and the constraint engine without changing the actual structure of the model.

Constraint Modeling Language (CML) Best Practices

To prevent performance degradation or unexpected behaviors when the constraint engine executes CML code, follow these practices when writing code.

Business-Centric Constraint Modeling Language (CML) Guidelines

Constraint Modeling Language (CML) must accurately calculate the total sum or aggregate of specific attributes like quantity or userCount across child components, especially in complex configurations requiring group-level aggregation

Debugging Constraint Modeling Language (CML)

To debug constraint models and troubleshoot performance issues, enable debug logging in Apex and set the debug log level to FINE.

Model Structure

The tables on the following pages show the structure for the constraint model in Core Concept Examples.

Modeling a Generator Set

The Constraint Model for a Generator Set examples use CML to define a technical power configuration, illustrating concepts such as calculated variables, enforcement of external standards, and component selection based on requirements.

The examples on page 1135 correspond to the CML core concepts on page 1080 linked here. See the Generator Set examples for code samples that use the core concepts.

- Global Properties and Settings—`VOLTAGE_REGEX` is a global constant that defines a fixed regular expression pattern used for validation or parsing throughout the model.
- Types—`GeneratorSet` is the root type that represents the main entity. `GeneralModel` represents a related component type.
- Variables—The `GeneratorSet` type defines variables like `requiredKW` (the user's power requirement), `Voltage`, and calculated variables like `surgeLoadKW` and `Voltage3` (derived from parsing the `Voltage` string).
- Relationships—The `GeneralModels` relation connects the `GeneratorSet` type to its possible configurations (`GeneralModel`).
- Constraints—Constraints enforce critical business rules and safety standards, such as ensuring the selected generator model's power meets the required threshold, or restricting configuration options (such as `Voltage`) based on the specified compliance standards (`Listing-UL 2200`).

Core Concepts

Constraint Modeling Language (CML) includes components that cover high-level global configurations to specific data types and constraints.

See these topics for information on each core concept and the ways they work together.

Note: CML supports single-line code comments with // and block comments with /* */.

Global Properties and Settings
Header-level declarations define the global properties and settings for a model, including constants, properties, and external values that set up the foundation of the CML code.

Variables
Variables are the properties or characteristics defined within a type. Variables can hold different types of data and can be calculated from other values.

Types
In Constraint Modeling Language (CML), you define types to represent entities or objects in the model. Types are the foundational building blocks of CML. A type encapsulates the property, relationships, constraint, and rules for the entity.

Relationships
Relationships in Constraint Modeling Language (CML) define how different product types are associated with each other, forming the structural hierarchy of a product bundle. Relationships are also referred to as ports.

Constraints
Constraints enforce rules and conditions on types, variables, and relationships. Use constraints to define logical restrictions and ensure consistency within the model.

Global Properties and Settings

Header-level declarations define the global properties and settings for a model, including constants, properties, and external values that set up the foundation of the CML code.

Use these declarations to create reusable components and configuration settings that you can reference throughout the model.

Global Constants

Use global constants to define values that remain fixed throughout the model. These constants can be numeric values, strings, lists, or other supported data types. Use constants to create standardized settings or options that you can reference multiple times. See Example 1: Use Regex Global Variable on page 1080.

In the example, MAX_COUNT is a global constant that is hard-coded to 100: define MAX_COUNT 100.

Regex (regular expressions) can be used to define global constants. The generalized abstract syntax structure for regex expressions is define <CONSTANT_NAME> "^<REGEX_PATTERN_STRING>$".

Regex Pattern Components

This table lists regex components and their details.

Regex Component	Description	Generalization
^ and $	Anchors that ensure the pattern matches the entire string, from the beginning (^) to the end ($).	Ensures strict adherence to the required format.
()	Capturing Groups used to isolate portions of the matched string. You can reference the captured parts later by using $1, $2, and so on, in functions such as regexpreplace. See String Variable Functions and Operators on page 1084.	Allows extraction of specific data fields from a string.
+	Character Class and Quantifier that matches one or more (+) digits or characters.	Defines the permitted characters and minimum occurrences for the data fields.
/	Literal Character matching the forward slash separator present in the input data.	Matches fixed delimiters in the input string.

In the example, VOLTAGE_REGEX is a global constant that defines a fixed regular expression pattern used for validation or parsing throughout the model define VOLTAGE_REGEX "^([0-9]+)/([0-9]+)$".

For more on the usage of global properties, see External Variables.

Variables

Variables are the properties or characteristics defined within a type. Variables can hold different types of data and can be calculated from other values.

Variable Domains and Domain Restrictions
A variable can have a fixed domain that defines a set of permitted values. You can specify the domain as a list of discrete values, a continuous range, or a combination.

Variable Data Types
Variables support multiple data types including boolean, date, decimal, and so on. Variables without a domain definition may remain unbound, leading to errors.

Variable Domains and Domain Restrictions

A variable can have a fixed domain that defines a set of permitted values. You can specify the domain as a list of discrete values, a continuous range, or a combination.

Variable Domains and Domain Restrictions

A variable can have a fixed domain that defines a set of permitted values. You can specify the domain as:

- A list of discrete values
- A continuous range
- A combination of ranges and discrete values

For more information, see domainComputation in Variable Annotations on page 1086.

Example

This example defines a `SwitchgearBay` type with three variables, each having a fixed domain.

- `BayType` can be one of the specified string values.
- `Bay_Number` can be any integer from 1 through 9 (inclusive).
- `Total_Power_Required_kW` can be any integer from 1 through 100000 (inclusive).

Note: For string (picklist) variables, if you don't specify a `defaultValue` annotation and don't define a default in the Product Attribute Definition in Product Catalog Management (PCM), the configurator uses the first value in the domain as the initial value. In the example, `BayType` defaults to `"load"`. To set a different default, use the `defaultValue` annotation on the variable. To avoid inconsistent behavior at run time, use the same default value in CML as the default value you define in PCM.

```
type SwitchgearBay {
  string BayType = ["load", "lv", "mv"];
  int Bay_Number = [1..9];
  int Total_Power_Required_kW = [1..100000];
}
```

Variable Data Types

Variables support multiple data types including boolean, date, decimal, and so on. Variables without a domain definition may remain unbound, leading to errors.

Data Type	Description	Defaulting Example
boolean	Only true, false, or null can be assigned as a value.	`@(defaultValue="true") boolean isActive;`
date	A value that indicates a particular day, the same as local date in Java.	`date shipDate = ["2023-01-01", "2023-12-31"];` If there's no `defaultValue` specified, the variable defaults to the first value in the domain. See the Constraints using Format Specifiers (%s, %d) and Dates example on page 1135.
double(n)	A 64-bit number that includes a decimal point, the same as double in Java.	`double(2) percentage = [0.00..100.00];` If there's no defaultValue specified, the variable defaults to the first value in the domain.
decimal(n)	A fixed-point numeric value with n decimal places. Note: The decimal variable data type isn't supported for the quantity field in quote line items. Use the integer data type for the quantity field.	`decimal(2) TaxRate = 0.08;`
int	Integer. A 32-bit number that doesn't include a decimal point, the same as int in Java.	`@(defaultValue = "5") int defaultQty = [1..10];` If there's no `defaultValue` specified, the variable defaults to the first value in the domain.
string	Any set of characters surrounded by double quotes (")	`@(defaultValue = "Red") string color = ["Red", "Green", "Blue"];` If there's no `defaultValue` specified, the attribute defaults to the first value in the domain.
string[]	Used in multi-select picklists for the user to select more than one item from multiple options. For example, if a user selects "Red", "Green", and "Blue" values in a color picker, this variable holds those selected values.	`@(defaultValue = '["Red", "Green"]') string[] selectedColors;` If there's no `defaultValue` specified, the attribute picklist defaults to the first value in the domain.

Mathematical Functions (Numerical Derivation)

Mathematical functions and operators are used to calculate derived values based on arithmetic relationships between variables.

Function/Operator	Purpose	CML Keyword/Operator [Source]
Arithmetic Operators	Perform standard arithmetic: addition (+), subtraction (-), multiplication (*), division (/), modulo (% or mod), and power (^).	`+, -, *, /, %, ^`
ceil()	Returns the smallest integer greater than or equal to the argument (rounds up).	`ceil`

Usage Example

```
surgeLoadKW == requiredKW * 1.25);
ceil(totalItems / itemsPerCrate)
```

See Arithmetic Calculations and Functions on page 1135 and examples here on page 1197.

String Variable Functions and Operators

Constraint Modeling Language (CML) provides string manipulation and conversion functions, and string comparison and validation operators.

The functions can be used to modify strings, extract information, or convert strings to numeric types. The operators can be used to validate string values against sets or regular expressions.

Function	Purpose	Syntax, Examples, and Additional Details
strlen()	Returns the length of the string as an integer.	`strlen(inputString)` `strlen("Hello"` returns 5.
substr()	Returns a substring from the input string.	`substr(inputString, startIndex)` or `substr(inputString, startIndex, endIndex)` The index starts with 0. The character at `startIndex` is included, and the character at `endIndex` is excluded.
strconcat()	Concatenates multiple strings using a specified separator.	`strconcat(separator, stringArgsToConcatenate)` `strconcat("-", "a", "b")` results in "a-b".
join()	An aggregate function that concatenates string values across related components, typically using a separator. The separator is a comma by default.	`names = join(name)`

Function	Purpose	Syntax, Examples, and Additional Details
trim()	Returns the string after removing any leading or trailing spaces.	`trim(strToTrim)`
strsplit()	Splits a string into an array of strings around a given separator.	`strsplit(stringToSplit, separator)`
strcontain()	Returns a boolean value (true or false) to specify whether the input string contains the specified search string.	`strcontain(inputString, searchString)`
strshare()	Splits two strings using a delimiter (comma by default) and returns true if the resulting lists have any elements in common.	`strshare(string1, string2, delimiter)`
strformat()	Returns a formatted string based on parameters and format specifiers.	`strformat("%d person", quantity)` Specifiers include `%d` for integer, `%s` for string, `%.2f` for decimal or float, and `%b` for boolean.
strtoint()	Converts a string to an integer.	`strtoint(inputString, defaultValue)` If the string can't be parsed as an integer (for example, it contains text or a decimal point), the provided defaultValue is returned.
strtofloat()	Converts a string to a decimal (floating point) value.	`strtofloat(inputString, defaultValue)` If the conversion fails, the provided `defaultValue` is returned. The resulting decimal attribute must be declared with the intended precision. For example, `decimal(3)`.
regexpreplace()	Take an input string and a defined Regular Expression (regex). Replace the entire input string with a specific captured group from the regex match.	`regexpreplace(InputString, RegexPattern, ReplacementGroup)` This function is commonly used to derive numeric data from complex, formatted strings before they are converted into integers or decimals.
get(index, array)	Used to retrieve an element at a specified index (starting at 0) from an array or list generated by a function like strsplit.	`string splitStr1 = get(0, strsplit("hello constraint engine", " ")); // returns hello`

Function	Purpose	Syntax, Examples, and Additional Details
		Using Get with Table Constraint—If your table constraint output for three columns is stored in a string[] variable named picklistValues, you would access the first row's attributes like this (assuming the columns are stored in a predictable sequence): `// Retrieve the first element (Row 0, Column 0) string value0_0 = get(0, picklistValues); // Retrieve the second element (Row 0, Column 1)`

String Comparison and Validation Operators

The in operator checks if the value of a string attribute is present within a defined set or array of strings.

Example

```
color in ["red", "blue"]
```

Variable Annotations

You can annotate variables with properties such as configurable, defaultValue, domainComputation, and relatedAttributes.

In this example, the `gc_runningKw` variable is annotated to indicate that it's not configurable and has a default value of `0.00`.

Note: This example requires an enclosing type.

```
@(configurable = false, defaultValue = 0.00)
decimal(2) gc_runningKw;
```

Property	Values	Description
allowOverride	true, false	Allows the engine to recalculate a value even if a value was already received from core. This annotation helps save on performance by allowing early calculation.
configurable	true, false	Indicates whether the variable is configurable (`true`) or not (`false`). If the configurable annotation isn't explicitly specified, the engine sets it implicitly as `true` for the variable.

Property	Values	Description
		If the configurable annotation is explicitly specified as `true`, the variable is indicated as configurable. The engine can set the value to the variable according to the defined logic, and users can modify it. If the configurable annotation is explicitly specified as `false`, the engine cannot set a value to the variable, and users can't update it. The variable value in this case is set through the PCM default. See examples here on page 1141.
defaultValue	literal	Indicates the default value for the variable. The configurator uses the default value defined in PCM (in Product Attribute Definition). If no PCM default is available, the configurator uses the first value in the variable domain as the initial value. If no default value is defined in PCM and a defaultValue is specified in CML, the configurator uses the value defined in CML as the initial value of the variable. See examples here on page 1141.
domainComputation	true, false	domainComputation is a CML annotation that specifies how the domain of a model element is determined, either by using a fixed domain or by computing the domain dynamically during configuration. If domainComputation is not explicitly specified, the engine sets it implicitly as false for the variable. If the domainComputation is specified as true, the variable domain is dynamically determined based on the configuration and constraint logic. If the domainComputation is specified as false, the variable domain is fixed. See examples here on page 1141.
nullAssignable	true, false	Sets an initial value for the calculated variable if the expression value can't be calculated.

Property	Values	Description
Peelable	true, false	Indicates whether the constraint engine can override the variable's value (whether set by default or user selection) to resolve a conflict (`true`) or not (`false`). If set to `true`, the engine treats the value as a "soft selection." When a configuration conflict occurs, the engine attempts to "peel" (unbind) this variable and retry the solution. If a valid configuration is found, the engine automatically changes the value to satisfy constraints, rather than displaying an error message to the user. If not explicitly set, or set to false, the engine treats the value as a "hard selection." If the value causes a conflict with a constraint, the engine will not attempt to change it automatically. Instead, it will stop and display a conflict error message to the user, requiring manual intervention to resolve the issue. See examples here on page 1141.
productGroup	integer	Used to represent the group cardinality for relationships under a type, either for specified relationships, or for all relationships (using`*`). We recommend using `maxInstanceQty` and `minInstanceQty` type annotations instead of productGroup. See Type Annotations on page 1093.
relatedAttributes	string value	relatedAttributesannotation is required to reset the domain to the original domain for domain computation. If relatedAttributes annotation is not specified, the engine updates the variable domain according to domainComputation and constraint logic. If the relatedAttributes annotation is specified with one or multiple values (separated by comma), the variable domain is reset to the original domain. See examples here on page 1141.

Property	Values	Description
sequence	integer	Indicates the sequence in which variables are configured. If a sequence value is not explicitly defined, the configurator implicitly determines the order based on the variable declaration order in the CML model. If a sequence value is explicitly defined, the configurator uses the sequence number to control the order in which variables are configured. Variables with lower sequence values are assigned first. See examples here on page 1141.
setDefault	true, false	Sets the variable status to default.
source	string value	Data source defined in the model.
sourceAttribute	Variable name in string	Sets the domain of the current variable to be the domain of the source variable.
strategy	descending, ascending, string	Defines the strategy to configure the variable. • If the strategy is ascending, the engine tries values from low to high. • If the strategy is descending, the engine tries values from high to low. See example here on page 1141.
tagName	string value	To create an external variable linked to a Sales Transaction header, use the tagName annotation with the contextPath annotation to reference context tags on SalesTransactionItem within a type. See contextPath in External Variable Annotations on page 1089.

External Variables

External variables are global Constraint Modeling Language (CML) variables defined within a virtual CML type.

See virtual in Type Annotations on page 1093. The values for external variables are usually set by the environment that launches the constraint solver engine. Use external variables to import runtime data from the context header (such as Quote or Sales Transaction) into the configuration model, with the contextPath annotation to denote header fields, or with tagName annotation to denote lineItem fields. See External Variable Annotations section.

If the external variable isn't mapped to any external data source, it must have a default value. Otherwise, it may remain unbound and cause errors.

Here's a basic declaration syntax.

```
extern int MAX_VALUE = 9999;
extern decimal(2) threshold = 1.5;
```

Example: Using External Variables with Context Path Annotation

In this example, the constraint engine needs access to the quote header (Sales Transaction) field, which defines the shipping location to enforce region-specific compliance requirements. The `contextPath` annotation is used to map the field (`SalesTransaction.ShippingCountry`) to an external CML variable (`ShippingCountry`).

Note: The CML variable name can be different from the context path value.

```
// External variable declaration with context path annotation
@(contextPath = "SalesTransaction.ShippingCountry")
extern string ShippingCountry; // ShippingCountry Value is pulled from the Quote/Order
header
```

See the full example in Using ContextPath and tagName annotations on page 1135.

External Variable Annotations

Here are the details of external variable annotations.

Annotation	Possible Value	Description
contextPath	"SalesTransaction.<ST_FIELD>", where the sales transaction field is pulled directly from the context definition.	References sales transaction values directly from their context definition, such as account name, sales transaction total, or address. The contextPath annotation can only be used for header fields. To create a variable linked to a SalesTransactionItem, use the tagName annotation to reference context tags on SalesTransactionItem within a type. See tagName in Variable Annotations on page 1086.

Types

In Constraint Modeling Language (CML), you define types to represent entities or objects in the model. Types are the foundational building blocks of CML. A type encapsulates the property, relationships, constraint, and rules for the entity.

A type is similar to a class in object-oriented programming. You can define relationships that represent associations between different types. See Relationships on page 1102.

Note: To define a constraint for a child product in a bundle, you must include the entire bundle in the constraint model. For example, if you define a constraint for a laptop, and the laptop is a child product in the Laptop Pro Bundle, you must include the Laptop Pro Bundle in the constraint model for the constraint on the laptop to run.

Note: Product variants aren't supported in constraint models.

Generic Structure of a Type

This table explains the generic structure of types with examples.

Element	Purpose	Example
Declaration	Defines the entity name, optionally preceded by annotations and optionally followed by inheritance, if applicable.	`type Product {}` `Or optionally: @annotation_name("annotation parameters") type Product: BaseProduct {}`
Variables (Attributes)	Defines the properties or characteristics of the entity, including data type and domain.	`int requiredKW = [101..10000]; string color = ["Red", "Blue"];`
Relations	Defines one-to-many associations with other types, specifying cardinality (the quantity range) and optionally, the configuration order.	`relation items : LineItem[1..10] {}`
Constraints and Rules	Enforces business logic and restrictions that must be satisfied by the entity's variables and relationships.	`constraint(condition); require(condition, items [type]);`

Example: Basic Type Declaration with Variables

This example shows the declaration of the main `GeneratorSet` type. It defines several core attributes (variables) that characterize the product.

```
type GeneratorSet{
// Declaration only (inherits LineItem properties)
// Attributes with explicit domains
int requiredKW = [101..10000];
string Voltage = ["220/380", "240/416", "255/440", "277/480", "347/600", "2400/4160",
"7200/12470", "7621/13200", "7976/13800];
string DutyRating = ["Prime Power (PRP)", "Continuous Power (COP)", "Data Center Continuous
 (DCC)", "Emergency Standby Power (ESP)"];
}
```

Type Hierarchies

Constraint Modeling Language (CML) supports inheritance and overriding, which allow you to create hierarchies between types. By establishing these hierarchies, constraint models become more modular and efficient.

Type Annotations

You can annotate types to add information. Type annotations are metadata applied to a type declaration to provide instructions to the constraint engine regarding how instances of that type should be handled, instantiated, or used in the configuration structure.

Group Type

In Constraint Modeling Language (CML), a Group Type is used to logically containerize related components within a bundle configuration, primarily when product component groups are imported from Product Catalog Management (PCM).

Type Hierarchies

Constraint Modeling Language (CML) supports inheritance and overriding, which allow you to create hierarchies between types. By establishing these hierarchies, constraint models become more modular and efficient.

How Hierarchies Function

- Inheritance: This mechanism enables a specialized child type to automatically share common variables (attributes) and relationships defined in its parent type. By inheriting from a base type, child types don't need to redefine shared properties, which ensures consistency across the model.
- Overriding: While child types inherit the structure of the parent, they can override or specialize those properties. For example, a parent type might define a variable with a broad range of possible values, while a child type overrides that variable with a fixed value specific to that individual product.

Practical Examples of Hierarchy

- Simple Product Extension: A `BaseProduct` might define an `id` and `name`. A `PhysicalProduct` can then inherit from `BaseProduct` to gain those fields while adding its own unique characteristics, such as `weight` or `color`.
- Multi-Level Nesting: Hierarchies can extend through multiple layers. For instance, a `Room` type can be the parent to a `Bedroom` type, and a `MasterBedroom` can further inherit from the `Bedroom` type, carrying all properties down the chain.
- Abstract Base Models: In complex configurations such as a `GeneratorSet`, a parent type such as `GeneralModel` defines the necessary attributes (such as `powerKW` and `dB`), while specific child types such as `GeneralModel900` or `GeneralModel1200` inherit those attributes and override them with their specific ratings.

Core Benefits

By establishing these hierarchies, constraint models become more modular and efficient. You can create header-level declarations and base types to serve as a foundation for the entire model, allowing you to reference reusable components multiple times rather than writing redundant code for every product variation. This structural organization allows the constraint engine to effectively enforce business logic and validate configurations across all related types.

Example 1: Simple Product Extension

In this pattern, a specialized type inherits from a broader base type. In the provided generator set model, the `GeneratorSet` type inherits from `LineItem`, gaining any properties defined at the line-item level while adding its own specific configuration fields like `requiredKW` and `Voltage`.

```
// The ultimate base type in the system
type LineItem;
// Child type extending LineItem with generator-specific attributes
type GeneratorSet : LineItem {
int requiredKW = [101..10000];
string Voltage = ["220/380", "240/416", "255/440"];
string DutyRating;
}
```

Example 2: Multi-Level Nesting

CML supports hierarchies with multiple layers of depth. In this example, properties flow from the top-level `LineItem` down to the `GeneratorSet`, and finally to a highly specialized `EmergencyGenerator`. Each level inherits all attributes from the levels above it.

```
type LineItem;
// Level 2: Adds basic generator capacity attributes
type GeneratorSet : LineItem {
int requiredKW = [101..10000];
decimal(2) surgeLoadKW = requiredKW * 1.25; // Calculation shared down the chain
}
// Level 3: Specialized version inheriting everything from GeneratorSet and LineItem
type EmergencyGenerator : GeneratorSet {
// Automatically inherits requiredKW and surgeLoadKW
string DutyRating = "Emergency Standby Power (ESP)"; // Specific fixed rating
}
```

Example 3: Abstract Base Models (Polymorphism & Overriding)

This pattern uses an abstract type as a structural blueprint. Specific components (the "General Models") inherit from this blueprint and override its generic attributes with fixed, real-world ratings.

```
// Base model acting as a blueprint for all engine options
type GeneralModel{
int powerKW = [100..2000]; // Broad domain
int dB = [60..100];
}
// Specific product type that overrides parent domains with fixed values
type GeneralModel900 : GeneralModel {
int powerKW = 900; // Overrides broad range with exact value
int dB = 78;
}
// Another specialized model with different fixed properties
type GeneralModel1500 : GeneralModel {
int powerKW = 1500;
int dB = 83;
}
```

Type Annotations

You can annotate types to add information. Type annotations are metadata applied to a type declaration to provide instructions to the constraint engine regarding how instances of that type should be handled, instantiated, or used in the configuration structure.

Annotation	Possible Values	Description
virtual	true, false	If `true`, specifies whether the indicated type refers to the transaction header (such as Quote or Order) or to a logical container (sub group of the Quote or Order). If the value is `false`, then it's the default behavior for types and doesn't need to be explicitly specified.

Annotation	Possible Values	Description
groupBy	Variable name	Used with `virtual = true`, the `groupBy` annotation organizes child products—the individual instances populating a relationship—into virtual containers based on a shared attribute value. See Relationships on page 1102 and the Grouping Generators by Voltage example on page 1135 .
maxInstanceQty	Integer	Specifies the maximum cardinality for a component in a group. See Group Type on page 1096.
minInstanceQty	Integer	Specifies the minimum cardinality for a component in a group. See Group Type on page 1096.
source	String	Specifies the data source defined in the model.
split	true, false, none	Specifies whether the type should be split or not. • If `split=true`, there can be multiple instances of the type, and the quantity of each instance is always 1. • If `split=false`, there is only one instance in the relationship. If the user adds more instances, the engine adds more quantity to the existing instance. • If `split=none` (the default), there are multiple instances of the same type in the relationship, with different quantities. The `split=true` annotation isn't supported for child products within a dynamic bundle. See examples here on page 1141.
sharingcount	Integer	Specifies the maximum number of times a single instance of a specific type can be shared or reused across different relationships within the configuration model.

Annotation	Possible Values	Description
		This annotation is used in conjunction with the @(`split=true`) annotation. When a type is marked for splitting, the constraint engine can process multiple instances in parallel to improve performance. The `sharingCount` tells the engine exactly how many times it can "split" or reuse that instance to satisfy the configuration requirements without generating entirely new, unique instances. It's a critical tool for managing large-scale configurations (for example, models with over 1,000 components). By setting a sharing limit, you reduce the number of variables the engine must instantiate, which helps prevent performance degradation and system timeouts.The `sharingCount` annotation works with the @(`sharing=true`) annotation applied to Relations. The relation annotation enables the general capability to share components across instances, while the `sharingCount` on the child type sets the numerical limit for that behavior. See Relationship Annotations on page 1107 and the Sharing Accessories in a Generator Set example on page 1135.

Creating a Virtual Container (@virtual = true)

In this example, the `@virtual = true` annotation is applied to a logical container type, `System`, which is primarily used to define relationships. These relationships aggregate data across line items in the quote that forms a sub-group called `system`. See Relationships on page 1102.

```
@(virtual = true)
type System {
// This relation gathers all GeneratorSet line items on the sales transaction
@(sourceContextNode = "SalesTransaction.SalesTransactionItem")
relation generators : GeneratorSet[0..10];
// This variable aggregates the surge load (calculated inside GeneratorSet) from all
collected generators
int totalQuotedLoad = generators.sum(surgeLoadKW);
}
type GeneratorSet {
// The attribute calculated here is aggregated in the virtual 'System' type above
@(configurable = false)
int requiredKW = [101..10000];
```

```
string DutyRating = ["Prime Power (PRP)", "Continuous Power (COP)", "Data Center Continuous
 (DCC)", "Emergency Standby Power (ESP)"];
decimal(2) surgeLoadKW = requiredKW * 1.25;
}
```

Group Type

In Constraint Modeling Language (CML), a Group Type is used to logically containerize related components within a bundle configuration, primarily when product component groups are imported from Product Catalog Management (PCM).

The Group Type uses specific annotations to control the total quantity of components selected from that group, regardless of the individual component type.

Bundles and Group Types (also known as Product Component Groups or PCGs) represent different levels of a product hierarchy and serve distinct functional roles in configuration logic.

Conceptual Hierarchy

- Bundles are high-level parent products that contain multiple child products sold together as a package. In CML, they are defined as "root types" that encapsulate the properties, relationships, and constraints for the entire entity.
- Group Types are structural containers within a bundle. They act as intermediate folders that organize related components imported from Product Catalog Management (PCM). Instances of these Group Types are declared as variables inside the root Bundle type.

Role in Cardinality and Selection

- Bundles establish the primary relationship between a root product and its broad categories of components.
- Group Types are specifically designed to enforce cardinality rules for a collection of products. They use the `@(minInstanceQty)` and `@(maxInstanceQty)` annotations to control exactly how many instances can be selected from a specific set of options (for example, "select at least 1 but no more than 2 accessories"). While the selected component can have a high quantity, the Group Type restricts the number of unique instances chosen from that group.

Syntactic Implementation

- Accessing Components: For standard bundles, you reference components directly via their relation name. For components within a Group Type, you must use dot notation starting with the group variable name defined in the root type (for example, `accessoryGroup.mouse.Wireless == true`).
- Constraint Limitations: You cannot write a constraint directly on a Group Type's attribute to apply it to all components within that group; constraints must reference the specific child components.
- Identification: Group Types are automatically identified by a Group suffix and the presence of instance cardinality annotations during the import from PCM.

Note: The following examples are partial. See the complete code in the final CML code sample.

Example 1: Defining Generator Set Group Types

We can define two group types for a Generator Set configuration: `CoreModelGroup` (mandatory selection of a primary generator model) and `EnclosureGroup` (optional selection of a specific enclosure type).

For the `CoreModelGroup`, setting `minInstanceQty` to 1 and `maxInstanceQty` to 1 means that at least 1 is required, and a maximum of 1 is permitted.

```
@(minInstanceQty=1, maxInstanceQty=1)
type CoreModelGroup {
// Relation holds the actual Generator Model products
relation generalModel : GeneralModel[0..9999];
}
type GeneralModel : LineItem {
int powerKW;
}
```

For the `EnclosureGroup`, setting `minInstanceQty` to 0 and `maxInstanceQty` to 1 means that selecting an enclosure is optional, but if selected, the user can add at most one instance of an enclosure component (such as WeatherproofEnclosure).

```
@(minInstanceQty=0, maxInstanceQty=1)
type EnclosureGroup {
relation enclosure : Enclosure;
relation cabinetHeater : ControlCabinetHeater;
}
type Enclosure : LineItem;
type ControlCabinetHeater : LineItem;
```

Example 2: Referencing Group Types in the Root Bundle

Once defined, instances of these group types are used as variables within the root type, which represents the entire bundle. In this example, the `coreModelGroup` and `enclosureGroup` are instances of the respective group types, defined within the root type `GeneratorSetBundle`.

```
type GeneratorSetBundle {
CoreModelGroup coreModelGroup;
EnclosureGroup enclosureGroup;
}
```

Example 3: Writing Constraints on Group Components

To write constraints or rules that reference components inside a group, use dot notation starting with the group variable name defined in the root type.

This example shows how a constraint might be defined within the `GeneratorSetBundle` type to enforce business logic on components within the groups.

```
// If the selected generator model has a powerKW greater than 1500,
// then a Control Cabinet Heater must be included in the Enclosure Group.
constraint(coreModelGroup.generalModel.powerKW > 1500 ->
enclosureGroup.cabinetHeater[ControlCabinetHeater] == 1);
// Require an Enclosure component if the set requires seismic certification.
require(seismicCertification == "IBC Seismic Certification",
enclosureGroup.enclosure[Enclosure],
"Enclosure required for seismic certification");
```

Final CML Code Sample with Group Types

This structure defines the complete model, showing the component hierarchy and the relationship constraints.

Parent Type	Relation Name	Child Type	Cardinality	Key Attribute Usage
`GeneratorSetBundle`	`coreModelGroup` (Group Instance)	`CoreModelGroup`	Group Cardinality: 1	The group type defined by `@minInstanceQty=1, maxInstanceQty=1`. This enforces that exactly one component choice must be made from the internal generalModel relation.
`GeneratorSetBundle`	`enclosureGroup` (Group Instance)	`EnclosureGroup`	Group Cardinality: [0..1]	The group type defined by `@minInstanceQty=0, maxInstanceQty=1`. This enforces that selecting components from this group is optional (min 0) and at most one total component instance can be selected (max 1).

```
/**
* The Root Bundle: GeneratorSetBundle
* This type holds instances of the defined Group Types and the definition of seismic
certification */
type GeneratorSetBundle {
string seismicCertification = ["IBC Seismic Certification", "OSHPD Seismic Certification"];
CoreModelGroup coreModelGroup;
EnclosureGroup enclosureGroup;
// Constraint 1: If the selected GeneralModel has a powerKW greater than 1500,
// then a Control Cabinet Heater must be included in the Enclosure Group.
constraint(coreModelGroup.generalModel.powerKW > 1500 ->
enclosureGroup.cabinetHeater[ControlCabinetHeater] == 1);
// Constraint 2: Require an Enclosure component if the set requires seismic certification.
require(seismicCertification == "IBC Seismic Certification",
enclosureGroup.enclosure[Enclosure],
"Enclosure required for seismic certification");
// Action Rule Example: Disable a specific enclosure type if the core model is low power
(e.g., 900kW).
rule(coreModelGroup.generalModel.powerKW == 900, "disable", "relation",
"enclosureGroup.enclosure", "type", "ReinforcedEnclosure");
}
/**
* Group Type 1: Core Model Group (Mandatory, Single Select)
* Min/Max Instance Quantity controls the selection rules for components within this group.
*/
@(minInstanceQty=1, maxInstanceQty=1)
type CoreModelGroup {
```

```
// Relation holds the actual Generator Model products
relation generalModel : GeneralModel[0..9999];
}
/**
* Group Type 2: Enclosure and Accessories Group (Optional)
* minInstanceQty=0 means selection is optional. maxInstanceQty=1 limits the selection to
a single enclosure or accessory component instance.
*/
@(minInstanceQty=0, maxInstanceQty=1)
type EnclosureGroup {
relation enclosure : Enclosure;
relation cabinetHeater : ControlCabinetHeater;
}
/**
* Component Types (Children)
*/
type GeneralModel {
int powerKW;
}
type Enclosure {
@(defaultValue = "false")
boolean Weatherproof;
}
type ReinforcedEnclosure : Enclosure; // Subtype of Enclosure
type ControlCabinetHeater;
```

Key Considerations

When reviewing Group Types in the context of the Generator Set model, keep these architectural points in mind.

- Group Cardinality Enforcement: The annotations `@(minInstanceQty)` (minimum instance quantity) and `@(maxInstanceQty)` (maximum instance quantity) are defined on the Group Type itself (`ElectricalSafetyGroup`). These annotations control the overall cardinality for all the components contained within that group, regardless of the individual relation cardinality defined (for example `[0..1]`, `[1..2]`).
- Root Reference: The `GeneratorSetBundle` includes the groups as variables (`coreModelGroup` and `enclosureGroup`).
- Constraint Syntax for Group Components: Constraints access attributes or components inside the groups using dot notation starting with the group variable name (for example, `coreModelGroup.generalModel.powerKW`).
- Limitation on Group Attributes: You cannot write a constraint directly on a group's attribute and expect it to apply to all components within that group (for example, `constraint(enclosureGroup.color == "Black")`) is not a valid constraint).

Define Constraints for Quote Groups, Ramps, and Ramp Segments
Apply rules to quote groups, ramps, and ramp segments by using the SalesTransactionItemGroup context tag. Assign a groupby value to messages defined in Constraint Rules Engine to include the messages in custom grouping strategies.

Define Constraints for Quote Groups, Ramps, and Ramp Segments

Apply rules to quote groups, ramps, and ramp segments by using the SalesTransactionItemGroup context tag. Assign a groupby value to messages defined in Constraint Rules Engine to include the messages in custom grouping strategies.

[Define a Constraint for a Quote Group](#)

To define a constraint for a quote group, use the require rule to assign the SalesTransactionItemGroup attribute that's contained on a type to the value of the QuoteGroup container.

[Define a Constraint for a Ramp Group](#)

To define a constraint that applies to a ramp group, use the IsLineGroupRamped__std attribute in the require rule to specify that the group is a ramp group.

[Define a Constraint for a Ramp Segment](#)

To define a rule that applies to a ramp segment for defined conditions, use the ItemSegmentType attribute.

Define a Constraint for a Quote Group

To define a constraint for a quote group, use the require rule to assign the SalesTransactionItemGroup attribute that's contained on a type to the value of the QuoteGroup container.

In this example for a GeneratorSet and its Enclosure, all the relations defined in the groupBy container include the `SalesTransactionItemGroup` attribute. Constraint Rules Engine creates a virtual container for each unique value of the `SalesTransactionItemGroup` attribute defined in the `groupBy` container. The engine creates one virtual container with its own self-contained rule execution for each group that contains one or more of the products defined in the `QuoteGroup` container.

Note: Groups don't support rules such as Hide, Disable, or Recommend, that perform an action when specified conditions are true.

Example:

```
type LineItem {
    @(tagName = "SalesTransactionItemGroup")
    string SalesTransactionItemGroup;
}

type GeneratorSet : LineItem;
type Enclosure : LineItem;

// Transaction scoped container
@(virtual = true)
type Quote {
    relation quotegroup : QuoteGroup;
   @(sourceContextNode = "SalesTransaction.SalesTransactionItem") relation generators
 : GeneratorSet;
   @(sourceContextNode = "SalesTransaction.SalesTransactionItem") relation enclosures
 : Enclosure;
}

// Group scoped container
@(virtual = true, groupBy = SalesTransactionItemGroup)
type QuoteGroup {
    string SalesTransactionItemGroup; // Needed for the require rule to save

   @(sourceContextNode = "SalesTransaction.SalesTransactionItem") relation generators
 : GeneratorSet;
   @(sourceContextNode = "SalesTransaction.SalesTransactionItem") relation enclosures
 : Enclosure;

   require(generators[GeneratorSet], enclosures[Enclosure] {SalesTransactionItemGroup
```

```
 = SalesTransactionItemGroup});
}
```

Define a Constraint for a Ramp Group

To define a constraint that applies to a ramp group, use the IsLineGroupRamped__std attribute in the require rule to specify that the group is a ramp group.

In this example, the Enclosure is added to the group only if the GeneratorSet is in a ramp group. In the last lines of the example, the `IsLineGroupRamped__std` attribute in the require rule specifies that the GeneratorSet is in a ramp group.

Note: Groups don't support rules such as Hide, Disable, or Recommend, that perform an action when specified conditions are true.

Note: To add a type to an unramped group only and exclude the type from ramp groups, set the `IsLineGroupRamped__std` attribute to NOT (!) in the require rule. For example, `require(!(generators[GeneratorSet].IsLineGroupRamped__std),`.

Example:

```
type LineItem {
    @(tagName = "SalesTransactionItemGroup")
    string SalesTransactionItemGroup;
    @(tagName = "IsLineGroupRamped__std")
    boolean IsLineGroupRamped__std;
}

type GeneratorSet : LineItem;
type Enclosure : LineItem;

// Transaction scoped container
@(virtual = true) type Quote;

// Group scoped container
@(virtual = true, groupBy = SalesTransactionItemGroup)
type QuoteGroup {
    string SalesTransactionItemGroup; // Needed for the require rule to save

   @(sourceContextNode = "SalesTransaction.SalesTransactionItem") relation generators
 : GeneratorSet;
   @(sourceContextNode = "SalesTransaction.SalesTransactionItem") relation enclosures
 : Enclosure;

    require(generators[GeneratorSet].IsLineGroupRamped__std, enclosures[Enclosure]
{SalesTransactionItemGroup = SalesTransactionItemGroup});
}
```

Define a Constraint for a Ramp Segment

To define a rule that applies to a ramp segment for defined conditions, use the ItemSegmentType attribute.

In this example, Enclosure is included in the group with GeneratorSet only if `ItemSegmentType` for GeneratorSet isn't Trial. To set a value for `ItemSegmentType`, the type must be in a ramp group and be ramped.

Note: Groups don't support rules such as Hide, Disable, or Recommend, that perform an action when specified conditions are true.

Example:

```
type LineItem {
@(tagName = "SalesTransactionItemGroup")
string SalesTransactionItemGroup;
@(tagName = "ItemSegmentType")
string ItemSegmentType;
}

type GeneratorSet : LineItem;
type Enclosure : LineItem;

// Transaction scoped container
@(virtual = true) type Quote;

// Group scoped container
@(virtual = true, groupBy = SalesTransactionItemGroup)
type QuoteGroup {
string SalesTransactionItemGroup; // Needed for the require rule to save

@(sourceContextNode = "SalesTransaction.SalesTransactionItem") relation generators :
GeneratorSet;
@(sourceContextNode = "SalesTransaction.SalesTransactionItem") relation enclosures :
Enclosure;

require(generators[GeneratorSet].ItemSegmentType != "Trial", enclosures[Enclosure]
{SalesTransactionItemGroup = SalesTransactionItemGroup});
}
```

Relationships

Relationships in Constraint Modeling Language (CML) define how different product types are associated with each other, forming the structural hierarchy of a product bundle. Relationships are also referred to as ports.

Here's a comprehensive overview of relationships, their syntax, purpose, and key features, particularly using examples relevant to the Generator Set model.

Definition and Syntax of Relationships

Relationships define the one-to-many connections between a parent type (such as a bundle) and its component types (children).

- Keyword: The keyword used is `relation`.
- Syntax: A basic relationship declaration includes the relation name, the target type, and cardinality bounds.

```
relation <relation name> : <Target Type>[min..max] { /* Optional content */ }
```

- Purpose: Relationships represent the product structure in a bundle. For example, the root product (GeneratorSet) has relationships with its components (`MainAlternators`, `TemperatureSensors`).

Note: Specifying the smallest required cardinality (quantity range) is a best practice to avoid unnecessary testing of value combinations, which improves performance.

Set Maximum Relationship Size

The `maxRelationSize` property is the maximum cardinality for a single relationship in the constraint model. It controls how many instances of a child component can exist under one parent through the relationship. The maximum value for `maxRelationSize` is 1073741824. The default value is 9999.

Use `maxRelationSize` to set a limit based on the number of instances you need for your business purposes. For example, if the most a customer can order of a child component is 200,000, set `maxRelationSize` to 200,000. An overly high cardinality limit increases the risk of unbound variables that cause the constraint engine to backtrack through the entire range to resolve a conflict. Use `maxRelationSize` with the `property`.

```
property maxRelationSize = 100000;

 type Quote {

   relation items : LineItem[0..99999999]; // cardinality uses this max

 }
```

The `maxRelationSize` property doesn't limit these values:

- The number of relationship declarations in a type
- The number of types in the constraint model
- The total component count across all relationships

Omit Unnecessary Relationships

When using the visual builder or the CML editor to create a CML code for a bundle, the system by default imports all the relationships for the selected bundle from the structure defined in Product Catalog Management (PCM). In large and complex CML code, some of these relationships may not be relevant to any constraint and can be potentially omitted.

To enable import of a subset of bundle components, add this property at the top of the constraint model CML file.

```
property allowMissingRelations = "true";
```

If your PCM bundle contains many different relations but your CML code defines only one, the engine will validate the model but this often results in a configuration run-time failure. By setting `allowMissingRelations = "true"`, you do not have to define every relation found in the PCM (such as GeneralModels in the Relationship Ordering example) if they do not require specific configuration logic in your CML file.

Here's an example with allowMissingRelations property.

```
// 1. Enable skipping of unneeded relations from the Product Catalog (PCM)
property allowMissingRelations = "true";

type ConciseGeneratorBundle  {
    // Define only the specific accessory needed for this logic
    relation enclosures : Enclosure;

    // A simple variable to trigger the logic
    int requiredKW = [100..5000];

    // Logic: High power requirements force a specific enclosure type
    // This omits other accessories like filters, batteries, and heaters [2, 3].
    constraint(requiredKW > 2000 -> enclosures[ReinforcedEnclosure] == 1,
```

```
                "Power levels above 2000kW require a Reinforced Enclosure.");
}

// 2. Define the accessory and its specific subtype
type Enclosure ;
type ReinforcedEnclosure : Enclosure;
```

For more information, see Constraints on page 1110.

To ensure run-time stability without the allowMissingRelations property, you must manually define every single relation and type present in the PCM bundle, even if you don't intend to write logic for them. This creates large CML files with a high number of variables and components, which lead to performance degradation, and even timeout issues.

Note: This code isn't recommended.

```
// EXPENSIVE FIX: Mirroring everything
type GeneratorSet {
    relation engineModels : EngineModel; // Unused in CML logic
    relation alternators : Alternator;    // Unused in CML logic
    relation fuelFilters : FuelFilter;    // Unused in CML logic
    relation starterMotors : StarterMotor; // Unused in CML logic
    relation enclosures : Enclosure;      // The only one we need
    // ... potentially 15+ more relations ...

    constraint(requiredKW > 2000 -> enclosures[ReinforcedEnclosure] == 1);
}
type Enclosure ;
type ReinforcedEnclosure : Enclosure;
```

Order Keyword

The `order()` keyword is used within a `relation` declaration to define the specific sequence in which the constraint engine evaluates and attempts to instantiate the child subtypes available in that relationship. This controls the prioritization of component selection.

Example: Relationship Ordering

```
// --- Component Subtypes (Specific Generator Models) ---
// Define a base type for generator models with a power attribute
type GeneralModel {
int powerKW = [0..3000]; // Explicit domain
}
// Specific subtypes that inherit from GeneralModel
type GeneralModel2500 : GeneralModel {
int powerKW = 2500;
}
type GeneralModel1750 : GeneralModel {
int powerKW = 1750;
}
type GeneralModel900 : GeneralModel {
int powerKW = 900;
}
// --- Parent Type (GeneratorSet) ---
```

```
type GeneratorSet {
// Required power defined by the parent (non-configurable)
@(configurable = false)
int requiredKW = [100..3000];
// Relation Declaration using order()
// Cardinality requires exactly one model to be selected.
// order() sets the selection priority (2500 KW model is checked before 1750 KW model).
relation GeneralModels : GeneralModel  order(GeneralModel2500, GeneralModel1750,
GeneralModel900);
}
```

Relationship Variable Functions

CML variable functions are fundamental tools used to perform both aggregation (summarizing data from related components) and complex mathematical calculations on attribute values (variables) within a configuration model. These functions are crucial for enforcing dimensional validity and calculating derived attributes.

You can use functions such as `count()`, `min()`, `max()`, `sum()` and `total()` to calculate values from all variables with the same name in the descendants of the current type. Aggregate functions are used primarily as relationship attributes within a relation to calculate values across multiple instances of a component type (descendants).

Function	Purpose	CML Keyword [Source]
`count()`	Counts the number of component instances within a relationship that match a specific logical condition.	`count`
`max() / min()`	Returns the maximum or minimum value of an attribute found across all instances in a relationship.	`max, min`
`sum()`	Calculates the sum of a specific numeric variable across all instances in a relationship. Note: executes multiplication of a variable value by a product quantity.	`sum`
`total()`	Calculates the sum of a specific numeric variable across all instances in a relationship. Note: Unlike the sum() function, does not execute multiplication of a variable value by line item quantity.	`total`

Example: Using Aggregate Functions

```
type LineItem;
type GeneratorSet : LineItem {
relation modelclassification : ModelClassification {
sumPowerKW = sum(powerKW);
maxPowerKW = max(powerKW);
highPowerModelsAmount = count(powerKW > 500);
}
relation warranties : Warranty  {
totalCoverageDays = total(coverageDays);
}
constraint(modelclassification.sumPowerKW > 2500 && modelclassification.sumPowerKW < 3500);
message(true, "The maximum `powerKW` from selected GeneralModels is: {}",
modelclassification.maxPowerKW);
constraint(warranties[Warranty] == modelclassification.highPowerModelsAmount);
message(true, "Effective Warranty coverage days: {}", warranties.totalCoverageDays);
}
type ModelClassification : LineItem {
int powerKW = [900, 1750, 2500];
}
type GeneralModel1750 : ModelClassification {
int powerKW = 1750;
}
type GeneralModel2500 : ModelClassification {
int powerKW = 2500;
}
type GeneralModel900 : ModelClassification {
int powerKW = 900;
}
type Warranty {
int coverageDays;
}
type Warranty_PRP : Warranty {
int coverageDays = 50;
}
type Warranty_DCC : Warranty {
int coverageDays = 100;
}
type Warranty_ESP : Warranty {
int coverageDays = 200;
}
```

sum()

In the example, the `sum()` function aggregates the `powerKW` variable values of the selected products in the `modelClassification` relationship. The model includes a constraint that enforces the selection rule based on the calculated total: the `sum` of `powerKW` for the selected products must be between 2500 and 3500.

```
constraint(modelclassification.sumPowerKW > 2500 && modelclassification.sumPowerKW < 3500);
```

As a result, the engine selects two products from the `modelClassification` relation (`GeneralModel1750` and `GeneralModel900`), since their calculated sum of `powerKW` values (2650) satisfies the constraint.

max()

In the example, the `max()` function returns the maximum `powerKW` variable value among the selected products in the `modelClassification` relationship. The model defines a message that displays the maximum `powerKW` value in the Product Configurator.

```
message(true, "The maximum `powerKW` from selected GeneralModels is: {}",
modelclassification.maxPowerKW);
```

As a result, because the previously described `sum()` function and constraint selected two products (`GeneralModel1750` and `GeneralModel900`), the maximum returned value is 1750.

count()

In the example, the `count()` function calculates the amount of selected `modelClassification` relationship products that contain the `powerKW` variable value greater than 500. The model includes a constraint that enforces the selection of `warranties` product for each `GeneralModel` counted by the function.

```
constraint(warranties[Warranty] == modelclassification.highPowerModelsAmount);
```

As a result, based on the previous `sum()` description, the engine selects two products (`GeneralModel1750` and `GeneralModel900`). Since both products meet the count() condition (`powerKW` > 500), the engine adds one of the warranties product with quantity 2.

total()

In the example, the `total()` function aggregates the values of the `coverageDays` variable for the selected products of the `warranties` relationship. The model defines a message that displays the calculated total in the Product Configuration.

```
message(true, "Effective Warranty coverage days: {}", warranties.totalCoverageDays);
```

As a result, based on previously described `count()` example, the system selects one of the `warranties` product (e.g., `Warranty_DCC`) with a quantity of 2 and calculates the total value of its `coverageDays` variable (100).

A key difference between `total()` and `sum()` functions is that for `total()` the engine ignores the `warranties` product quantity. The system does not multiply the quantity of the selected warranty by the `coverageDays` variable value when computing the overall total.

See also Arithmetic Calculations and Functions on page 1135 and examples here on page 1197.

Relationship Annotations

You can annotate relationships by using annotations, such as configurable, allowNewInstance, closeRelation, sourceContextNode, and so on.

You can annotate relationships, as in this example, with `configurable=true`.

```
// 1. Define the target type
type Component;
// 2. Define the parent type to hold the relation
type System {
// 3. Add the relation with cardinality and proper nesting
@(configurable = true)
relation components : Component[0..10];
}
```

Here are the details of relationship annotations.

Annotation	Values	Description
allowNewInstance	true, false	Enables require rule constraints to work on relationships that are otherwise closed. Must be set to true to enable require rule constraints on closed relationships.
closeRelation	true, false	If the value is true, prevents the addition of new line items to the relationship. false is the default value and allows the addition of new line items to the relationship. See examples here on page 1141.
compNumberVar	true, false	Avoids creating a component number variable if it is set to false.
disableCardinalityConstraint	true, false	Disable cardinality constraint in the relationship to optimize the performance.
domainComputation	true, false	`domainComputation` is a Constraint Modeling Language (CML) annotation that specifies how the domain of a model element is determined, either by using a fixed domain or by computing the domain dynamically during configuration. If `domainComputation` is not explicitly specified, the engine sets it implicitly as `true` for the relationship. If the domainComputation is specified as `true`, the relationship domain is dynamically determined based on the configuration and constraint logic. If the `domainComputation` is specified as `false`, the relationship domain is fixed. See examples here on page 1141.
generic	true, false	Indicates if generic instance is allowed in the relationship or not. Generic instance is used to prompt the user that they need to select a product in the relationship.
noneLeafCardVar	true, false	Avoids creating cardinality variables for none leaf type (a node with no children) in the relationship to optimize the performance.
propagateUp	true, false	Aggregates values from child elements to parent elements.

Annotation	Values	Description
		If propagateUp is not specified, the engine sets it implicitly as false for the relationship. If the propagateUp annotation is specified as true, the engine aggregates values from children to parent elements (upward propagation). The engine cannot modify this value from the parent level (e.g. via constraint), so the children relation domain will not be affected. If the propagateUp is specified as false, both upward and downward propagations are applicable. The engine aggregates values from children to parent elements (upward propagation). Meanwhile the engine can modify this value (e.g. via constraint) from the parent level. The value is propagated downward and might affect the relation domain (downward propagation). See examples here on page 1141.
readOnly	true, false	Sets a relationship and all child relationships to read-only, to prevent the engine or user from modifying.
relatedAttributes	string value	`relatedAttributes` is a CML annotation that resets the domain to the original one for `domainComputation`. If `domainComputation` is not explicitly specified, the engine sets it implicitly as `true` for the relationship. If the `domainComputation` is specified as `true`, the relationship domain is dynamically determined based on the configuration and constraint logic. If the `domainComputation` is specified as `false`, the relationship domain is fixed. See examples here on page 1141.
relatedRelationships	string value	Related relationships whose cardinality variables must be unbound for domain computation.
sequence	integer	Indicates the sequence in which the relationship is configured and executed.

Annotation	Values	Description
sharing	true, false	Indicates if the relationship is shared or not. If the relationship is shared, the engine connects the instance from another relationship to this relationship instead of instantiating the instance in the relationship itself.
singleton	true, false	Indicates if all types in the relationship must be singleton or none.
source	string	Data source defined in the model.
sourceAttribute	Variable name in string	Sets the domain of the current relationship to the domain of the source attribute.
sourceContextNode	string	For cases that use a virtual container, specifies the path in the context service for the instances in the relationship.

Constraints

Constraints enforce rules and conditions on types, variables, and relationships. Use constraints to define logical restrictions and ensure consistency within the model.

For more information about the supported constraints, see:

- Logical Constraints on page 1113
- Table Constraints on page 1118
- Using Proxy Variables with Constraints on Types and Relationships on page 1120
- Group Type on page 1096
- Message Rule on page 1127
- Preference Rule on page 1128
- Require Rule on page 1128
- Require Rule vs Constraint on page 1129
- SetDefault Rule on page 1129
- Exclude Rule on page 1130
- Action Rule on page 1130
- Hide/Disable Rule on page 1131
- Recommendation Rule on page 1133
- Set Product Selling Model in a Constraint on page 1134

Supported Logic Operators

These logic operators are supported in CML.

Arithmetic Operators

- Multiplication (*)
- Division (/)
- Remainder (%)
- Addition (+)
- Subtraction (-)

Relational Operators

- Greater than (>)
- Greater than or equal to (>=)
- Less than (<)
- Less than or equal to (<=)

Equality Operators

- Equal (==)
- Not equal (!=)

Logic Operators

- Not (!)
- And (&&)
- XOR/Exclusive or (^)
- Or (||)
- Bi-conditional (<->)
- Conditional (?:)
- Implication (->)

Operator Precedence

In resolving equations, operator precedence determines the order in which operations are performed. Operators in CML have precedence in this order:

- Arithmetic operators have the first precedence.
- Relational operators have the second precedence.
- Equality operators have the third precedence.
- Logic operators have a lower precedence than equality operators, in decreasing order as listed, with Implication having the lowest precedence.

Constraint Annotation

Here are the details of `abort`, a constraint annotation.

Annotation	Possible Values	Description
abort	true, false	Specifies that, if this constraint fails, abort search and return `false` for configuration.

Logical Constraints

A logical constraint defines a statement that must hold true logically. The constraint can be any logical expression by using a logical operator.

Table Constraints

The table constraint in Constraint Modeling Language (CML) is used to define a set of valid combinations of values for two or more attributes. These combinations are specified in rows within the constraint definition.

Proxy Variables with Constraints on Types and Relationships

Use proxy variables to reference the variables of related types, including parent, root, and sibling types.

Message Rule

The message rule displays a message to users based on specified conditions.

Preference Rule

The preference rule encourages the constraint solver to satisfy the condition, but doesn't enforce it if the condition can't be met.

Require Rule

The require rule requires certain components to be included in a relationship when specified conditions are met.

Require Rule vs Constraint

In Constraint Modeling Language (CML), constraint() and require() can both enforce behavior, but they operate differently: constraint focuses on logical consistency, require focuses on physical presence of products.

Setdefault Rule

The setdefault rule allows component selection with attribute values and quantity, similar to the require rule.

Exclude Rule

The exclude rule is used to automatically remove a specific type in a relationship if a certain condition is met.

Action Rule

The CML Action Rule is defined using the rule() keyword. Its primary purpose is to execute a designated action, specified as a string literal, when a condition is met.

Hide or Disable Rule

The Hide or Disable Rule uses the rule() keyword to conditionally remove an element from the selection menu (hide) or preserve it in the menu while preventing user selection (disable).

Recommendation Rule

The recommend keyword is used within a Constraint Modeling Language (CML) rule to display suggestions for related products in the Product Configurator. The rule defines the condition under which a specific product type or relation should be suggested to the user.

Set Product Selling Model in a Constraint

Use the productSellingModel tagname to write a constraint that sets the Product Selling Model (PSM) for a type. You can define a PSM as one time, time-deferred (subscription with end date), or evergreen (recurring subscription with no preset end date). The PSM is updated for new line items at runtime, based on the constraint.

Logical Constraints

A logical constraint defines a statement that must hold true logically. The constraint can be any logical expression by using a logical operator.

For example, the statement `c0 ? c1 : c2` means that if `c0` is true, then `c1` needs to be true, otherwise `c2` needs to be true.

Constraint Syntax Patterns

Here are the details of the constraint syntax patterns.

- `constraint(logic expression);`: The simplest form, enforcing a logic statement.
- `constraint(logic expression, string literal | string variable);`: Includes an optional failure explanation that is displayed if the constraint is violated.
- `constraint(logic expression, string literal | string variable, arg, …, arg);`: Includes a failure explanation with additional arguments to be interpolated into the string of the failure explanation.

If a constraint is violated, it takes an optional string variable or string literal as the failure explanation. The failure explanation could be in a string format with additional arguments. CML supports two string formats. One is the standard string format and another is a string with {} placeholder, to be replaced with the actual argument value.

Key Components of the Constraint Syntax

Here are the details of the key components of the constraint syntax.

Component	Description	Code Sample
Logic Expression	This can be a basic mathematical expression (using operators like +, -, * , /) or a relational expression (using ==, !=, >, <, and so on). It can also include logical operators such as AND (&&), OR (||), NOT (!), the implication operator (->), or the bi-directional operator (< - >).	Basic `constraint(generator.sum(quantity) > 20);`
Failure Explanation	This optional string literal or variable provides a human-readable reason for the violation. CML supports two formatting styles for these strings: • Java string format (for example, using `%d` or `%s`). • Placeholder format using `{}`	With Explanation `constraint(x + y <= 100, "Total must not exceed 100");`
Arguments (arg)	Arguments are used to replace the placeholders in the failure explanation string with actual values at runtime.	With Explanation and Arguments `constraint(requiredKW <= 2500, "The required capacity of {} kW exceeds the maximum supported limit of 2500 kW.",requiredKW);`

See the complete example in Constraints using Format Specifiers (%s, %d) and Dates on page 1135.

Constraint Example

In this example, the first constraint specifies that, if the `DutyRating` value isn't `Prime Power (PRP)`, then the quantity of `Warranty_PRP (Warranties subtype)` must be 0. Similarly in the second constraint, if `DutyRating` value isn't `Data Center Continuous (DCC)` then the quantity of `Warranty_DCC` must be 0. Lastly, in the third constraint, if `DutyRating` value isn't `Emergency Standby Power (ESP)`, then the quantity of `Warranty_ESP` must be 0.

```
type Warranty;
type Warranty_PRP : Warranty;
type Warranty_DCC : Warranty;
type Warranty_ESP : Warranty;
type GeneratorSet  {
string DutyRating = ["Prime Power (PRP)", "Continuous Power (COP)", "Data Center Continuous
 (DCC)", "Emergency Standby Power (ESP)"];
relation Warranties : Warranty[3];
constraint(DutyRating != "Prime Power (PRP)" -> Warranties[Warranty_PRP] == 0);
constraint(DutyRating != "Data Center Continuous (DCC)" -> Warranties[Warranty_DCC] == 0);
constraint(DutyRating != "Emergency Standby Power (ESP)" -> Warranties[Warranty_ESP] ==
0);
}
```

Example: Constraints Using String and Logical Operators

This example demonstrates how a GeneratorSet uses string functions to extract a numeric voltage value, and then uses logical operators (`->`, `&&`, `||`) to enforce safety and certification requirements.

Explanation of Operators Used in the Example

Here are the details of the operators used in the example.

Operator/Function	Category	Usage in Example
`strtoint()`	String Function	Converts the extracted voltage string to the integer `Voltage3`.
`regexpreplace()`	String Function	Replaces the full Voltage string with only the second matched group (the high voltage number) using the defined `VOLTAGE_REGEX`.
`strcontain()`	String Function	Checks if the `DutyRating` string contains the substring "Power".
`->`	Logical Implication	Defines a conditional rule: If the condition on the left is true, the condition on the right must be true.
`&&`	Logical AND	Requires both conditions (high requiredKW AND duty rating contains "Power") to be true.

Operator/Function	Category	Usage in Example
`||`	Logical OR	Requires `standardsAndCompliance` to be "`Listing-UL 2200`" or "`Certification-CSA`".
`!=`	Comparison/Relational	Used to check if the string value is "Not Equal" to a specific string literal.

```
// --- Constants (Required for String Manipulation) ---
define VOLTAGE_REGEX "^(+)/(+)$"

// --- Base Type and Configuration Attributes ---
type Warranty;
type Warranty_ESP : Warranty;

type GeneratorSet {
    // String input attribute for user selection
    string Voltage = ["277/480", "2400/4160", "7976/13800"];

    // String input attribute for operational mode
    string DutyRating = ["Prime Power (PRP)", "Continuous Power (COP)", "Emergency Standby
 Power (ESP)"];

    // String input attribute for compliance
    string standardsAndCompliance = ["Certification-CSA", "Listing-UL 2200"];
    // Required KW (Int attribute)
    int requiredKW = [101..10000];
// warranties for generator set
relation Warranties : Warranty[3];

    // 1. STRING OPERATORS/FUNCTIONS: Deriving Numeric Data
    // We use strtoint() combined with regexpreplace() to extract the second number (the
high voltage)
    // from the Voltage string (e.g., extracting 480 from "277/480").
    int Voltage3 = strtoint(regexpreplace(Voltage, VOLTAGE_REGEX, "$2"), 0);
  // Prime Power or Continuous Power using strcontain
    boolean NonstandbyPower = !strcontain(DutyRating, "ESP");

    // 2. LOGICAL OPERATOR (Implication ->): Certification Validation
    // Constraint: If the standard is UL 2200 (precondition), THEN Voltage3 must be <= 600
 (postcondition).
    constraint(
        standardsAndCompliance == "Listing-UL 2200" -> Voltage3 <= 600,
        "The UL 2200 standard covers stationary engine generator assemblies rated at 600
volts or less."
    );

    // 3. LOGICAL OPERATORS (AND &&, OR ||) and STRING FUNCTION (strcontain)
    // Constraint: If the required power is high AND the unit is used for Prime Power OR
Continuous Power,
    // THEN a specific standard must be selected.
```

```
    constraint(
        (requiredKW >= 5000 && NonstandbyPower)
        ->
        (standardsAndCompliance == "Listing-UL 2200" || standardsAndCompliance ==
"Certification-CSA"),  "High power and continuous use requires a major compliance
standard.");

    // 4. LOGICAL OPERATOR (Implication ->) and String Comparison (!=)
    // Constraint: If the Duty Rating is NOT Emergency Standby Power, THEN a specific
warranty (Warranties[Warranty_ESP]) must be excluded/zero.
    constraint(
        DutyRating != "Emergency Standby Power (ESP)" -> Warranties[Warranty_ESP] == 0,
       "The DutyRating when not equal to Emergency Standby Power, implies that the Warranty
 must be 0."
    );
}
```

How User Input Order Affects Constraint Engine Behavior

The constraint engine is architecturally designed to never override or modify a user-selected value when evaluating constraints, except in the specific case of an `exclude` rule. If a constraint violation occurs due to user input, the engine generates an error message rather than attempting to fix the value itself.

Example: Constraint Evaluation Based on Input Order (Generator Set)

The order in which a user configures attributes for a product (such as a `GeneratorSet`) determines whether the constraint engine performs an automatic update or enforces a validation error.

Consider a constraint within the `GeneratorSet` type that links the operational requirement (`DutyRating`) to the required certification (`standardsAndCompliance`).

```
type GeneratorSet {
// Attribute 1 (Precondition): User selects operational mode
string DutyRating = ["Prime Power (PRP)", "Continuous Power (COP)"];
// Attribute 2 (Dependent): Certification standard
string standardsAndCompliance = ["Certification-CSA", "Listing-UL 2200"];
// Constraint: If the unit is configured for Prime Power, it must have UL 2200 Listing.
constraint(
DutyRating == "Prime Power (PRP)" -> standardsAndCompliance == "Listing-UL 2200",
"Prime Power Duty Rating requires UL 2200 Listing"
);
}
```

The outcomes depend on the user's input sequence.

Scenario	User Input Sequence	Constraint Engine Result
Scenario 1: Successful Update (Precondition first)	The user first sets `DutyRating` to "`Prime Power (PRP)`".	The constraint engine recognizes the precondition is met and updates the dependent attribute, setting `standardsAndCompliance` to "`Listing-UL 2200`". The constraint is validated.

Scenario	User Input Sequence	Constraint Engine Result
Scenario 2: Constraint Violation (Conflicting Value first)	The user first sets `standardsAndCompliance` to "`Certification-CSA`", and then sets `DutyRating` to "`Prime Power (PRP)`".	The existing user-selected value ("`Certification-CSA`") violates the constraint. The constraint engine will not override the user's prior selection to change it to "`Listing-UL 2200`". Instead, the engine displays an error.

To resolve the error in Scenario 2, the user must manually adjust one of their selections: either change the `DutyRating` (precondition) or manually update the `standardsAndCompliance` (dependent value) to "`Listing-UL 2200`".

Left-Hand Side and Right-Hand Side Behavior in Constraint Resolution

Operator precedence and constraint engine resolution process determines whether the left-hand side (LHS) or right-hand side (RHS) of a constraint changes or is constrained to maintain logical validity. Variable origin, which means whether variables are user-selected, calculated, or restricted by system limitations, can also affect the outcome for the LHS or RHS in an expression.

These examples show how different user inputs lead to different outcomes for the LHS and RHS in the same expression.

Example 1. Implication Operator (->): Directional Enforcement

```
type Order {
int quantity = [1..1000];
boolean requiresApproval;
constraint bulkOrderApproval (
quantity >= 100 -> requiresApproval == true
);
}
```

The implication constraint `A -> B` (if A, then B) is the primary method for defining a mandatory outcome. The engine evaluates the LHS (A) first. If the `quantity` is 150 (LHS TRUE), then the engine forces `requiresApproval` (RHS) to be `TRUE`.

Scenario	Outcome
Scenario A: LHS is True, RHS Changes	The user sets a quantity greater than or equal to 100 on the LHS, which makes the condition true. The engine sets or changes the value of requiresApproval, the RHS, to true.
Scenario B: RHS is False, LHS is Constrained to be False	The user manually sets requiresApproval, the RHS variable, to false. Since the implication true -> false is forbidden, the LHS condition must be false to satisfy the constraint. The engine constrains quantity on the LHS to be less than 100 to make the LHS false.

Example 2. Bi-conditional (<->): Symmetrical Equivalence

```
type BulkOrderSystem {
int quantity = [1..1000];
boolean requiresApproval;
boolean isBulkOrder;
```

```
constraint bulkOrderStatus (
isBulkOrder <-> (quantity >= 100 && requiresApproval),
"Bulk order status requires 100+ quantity AND management approval."
);
}
```

The bi-conditional constraint A `<->` B (A if and only if B) requires that the LHS and RHS must share the same Boolean truth value. Either side can act as the driver, forcing the other side to change. In the example above:

- A is the boolean variable `isBulkOrder`.
- B is the complex condition `(quantity >= 100 && requiresApproval)`.

Scenario	Outcome
Scenario A: LHS Drives RHS	If the user manually sets the attribute isBulkOrder to true (making the LHS true), the engine immediately forces the RHS (quantity >= 100 && requiresApproval) to also be true, ensuring that both quantity is at least 100 and requiresApproval is set to true.
Scenario B: RHS Drives LHS	If the user selects a configuration where the quantity is high (for example, 500) and then sets requiresApproval to false (making the RHS condition false), the engine immediately forces the LHS attribute isBulkOrder to false to maintain equivalence.

Exception: The exclude Rule

The only scenario where the constraint engine intentionally overrides user input is when processing the `exclude` rule. If a user selects a component or sets an attribute value that violates an `exclude` rule, the engine will automatically override that user input to satisfy the exclusion constraint. In all other constraint types (like implication constraints shown previously), the engine relies on the user to fix the error. For more information, see Exclude Rule on page 1130.

Table Constraints

The table constraint in Constraint Modeling Language (CML) is used to define a set of valid combinations of values for two or more attributes. These combinations are specified in rows within the constraint definition.

The table constraint has this syntax:

```
table(variable, …, variable, {value, .. value}, …, {value, …, value});
```

Each row inside {} defines a valid combination of values.

Example: Table Constraint

In this example:

- Variables: The attributes `Voltage` and `DutyRating` are listed as the columns for the table.
- Table Rows: Each row defined within the curly braces ({}) specifies a valid combination. For instance, `{"7976/13800", "Continuous Power (COP)"}` is a valid pairing.

- Enforcement: If a user attempts to select a high voltage (`"7976/13800"`) while choosing a Prime Power rating (`"Prime Power (PRP)"`), the table constraint is violated, and the engine displays the error message: "Selected Voltage is not compatible with the required Duty Rating."

```
// --- Component Types ---
type GeneratorSet {
// 1. Attributes whose values must align according to the table
string Voltage = ["220/380", "277/480", "7976/13800"];
string DutyRating = ["Prime Power (PRP)", "Continuous Power (COP)", "Emergency Standby
Power (ESP)"];
// 2. Table Constraint
// Defines valid combinations where Voltage and DutyRating are mutually dependent.
constraint validOperationalModes(
table(
Voltage,
DutyRating,
{"220/380", "Prime Power (PRP)"},
{"220/380", "Continuous Power (COP)"},
{"220/380", "Emergency Standby Power (ESP)"},
{"277/480", "Prime Power (PRP)"},
{"277/480", "Emergency Standby Power (ESP)"},
{"7976/13800", "Continuous Power (COP)"}
),
"Selected Voltage is not compatible with the required Duty Rating."
);
}
```

Import Data from a Salesforce Object to Populate a Table Constraint

Import data from a standard or custom Salesforce object to use in a table constraint in a constraint model. The imported data populates the columns and rows in the table constraint in CML, and saves you the step of manually entering the data.

To import data from a Salesforce object, first assign Read, Create, Edit, and Delete permissions for the object to the Constraint Rules Engine Licenseless permission set. See Import Data from Salesforce Objects to Use in Constraint Models in Salesforce Help.

In CML, use the SalesforceTable keyword and the syntax shown here to import data from a Salesforce object. This example uses the `GeneratorSet` type to constrain the calculated running capacity (`gc_runningKw`) based on a user's selection of the nominal output (`Nominal_Power_Output`), referencing an external Salesforce custom object named PowerCst__c.

Example: Imported Table Constraint

```
type GeneratorSet {
// 1. Attribute storing the user-selected power output (String)
string Nominal_Power_Output = ["100 kW", "300 kW", "500 kW", "700 kW"];
// 2. Attribute storing the resulting Running kW (Decimal, calculated)
@(configurable = false, defaultValue = "0")
decimal(2) gc_runningKw;
// Constraint ensures the pairing of Nominal_Power_Output and gc_runningKw is found in the
 imported Salesforce table.
constraint(
table(
Nominal_Power_Output, gc_runningKw,
SalesforceTable("PowerCst__c","Nominal__c,Running__c")
)
```

```
);
}
```

Explanation of the Imported Table

The table constraint ensures that the selected values for `Nominal_Power_Output` and `gc_runningKw` must form one of the valid combinations defined in the external source.

- Table (`Nominal_Power_Output`, `gc_runningKw`, ...): These are the CML attributes whose values must correlate. They define the columns of the required combination table.
- Salesforce Table ("`PowerCst__c", "Nominal__c,Running__c`"): This function keyword directs the constraint engine to import data from the Salesforce custom object PowerCst__c.
- Field Mapping: The fields specified ("`Nominal__c,Running__c`") define the columns in the Salesforce object that correspond to the CML attributes listed in the table function. Nominal__c maps to `Nominal_Power_Output`, and Running__c maps to `gc_runningKw`.

Proxy Variables with Constraints on Types and Relationships

Use proxy variables to reference the variables of related types, including parent, root, and sibling types.

The supported proxy variables include:

- Cardinality
- Parent
- this.quantity

Cardinality

Cardinality is a fundamental concept in Constraint Modeling Language (CML), controlling the quantity of product instances allowed in a defined relationship. It is crucial for ensuring product structure validity and optimizing performance.

The `cardinality` proxy variable refers to the cardinality of a relationship, that is, the quantity of instances of the same type in a relationship. The first parameter is the type name. The second, optional parameter is the port name. This variable differs from the this.quantity proxy variable, which refers to the quantity of the current instance.

Use this format:

```
cardinality(<type name>, <relation name>) or cardinality(<type name>)
```

Each parameter value can be a string or a string variable. If the relation name isn't specified, the engine searches all ports to find the type.

The cardinality bounds are defined within the relation declaration using square brackets, formatted as `[minimum..maximum]`.

Cardinality Examples

These examples illustrate how cardinality is defined and managed in the Generator Set model, focusing on standard definition, conditional enforcement, and reading the quantity.

Example 1: Using Cardinality Full Syntax

```
type Heater ;
type GeneratorSet  {
```

```
//Define the relation and specify the smallest cardinality required for performance
relation Heaters : Heater[0..10];
//Declare a variable to hold the count
int totalHeaterCount = [0..10];
// This counts instances of type "Heater" specifically within the "Heaters" relation.
int InstancesofHeater = cardinality(Heater, Heaters);
constraint(totalHeaterCount == InstancesofHeater);
// Optional message to display the count to the user
message(totalHeaterCount > 0, "Current configuration includes {} heaters.", totalHeaterCount,
 "Info");
}
```

See Message Rule on page 1127.

Example 2: Using Cardinality Partial Syntax

```
type Heater ;
type OutputTerminal ;
// Main Generator Set type
type GeneratorSet {
// Define multiple relations that might contain specific types, each with a specified
cardinality
relation Heaters : Heater[2];
relation OutputTerminals : OutputTerminal[0..99];
// Define derived attributes with an explicit domain
int totalHeatersFound = [0..100];
int totalTerminalsFound = [0..100];
// Partial cardinality SYNTAX
// The engine searches all relations to find the specified type
// Counts all instances of "Heater" across the entire GeneratorSet
int AllHeaterInstances = cardinality(Heater);
constraint(totalHeatersFound == AllHeaterInstances);
// Counts all instances of "OutputTerminal" across all relations
int AllOutputTerminals = cardinality(OutputTerminal);
constraint(totalTerminalsFound == AllOutputTerminals);
// Optional message for user visibility
message(totalHeatersFound > 0, "System found {} heaters in this configuration.",
totalHeatersFound, "Info");
}
```

Example 3: Defining Cardinality in Relations

This example shows how the Generator Set uses different cardinality ranges to define fixed requirements, optional components, and minimum quantities for necessary components.

```
type GeneratorSet {
// 1. Fixed Cardinality: Exactly one General Model (component) is required.
// means min=1 and max=1.
relation GeneralModels : GeneralModel [1..1];
// 2. Bounded Optional Cardinality: Between 0 and 5 Temperature Sensors are allowed.
// [0..5] means the component is optional but limited.
relation TemperatureSensors : TemperatureSensor[0..5];
// 3. Minimum Required Cardinality: At least 1 Test record is required, up to 99.
// [1..99] enforces inclusion.
```

```
relation Testing : Test[1..99];
}
type GeneralModel;
type TemperatureSensor;
type Test ;
```

Key Concepts:

- Syntax: Cardinality is specified immediately after the component type in the relation declaration.
- Best Practice: Specifying the smallest required range, such as [1..1] or [0..5], ensures the constraint engine tests fewer combinations, which prevents performance degradation.

Example 4: Enforcing Conditional Cardinality via require()

Cardinality can be dynamically enforced based on attributes of the parent product using the `require()` constraint keyword. For more information, see Require Rule on page 1128.

```
type GeneratorSet {
int requiredKW = [101..10000];
string standardsAndCompliance = ["Certification-CSA", "Listing-UL 2200"];
// Relation for mandatory installation accessories
relation Accessories : Accessory[1..99];
relation Testing : Test[1..99];
// Conditional Requirement based on power level:
// If the required power is over 5000 kW, exactly 5 specific Accessory instances are
required.
require(
requiredKW > 5000,
Accessories [Accessory] == 5,
"High capacity generators require exactly 5 specialized accessory kits."
);
// Conditional Requirement based on compliance standard:
// If UL 2200 is selected, exactly 2 Test records must be included.
require(
standardsAndCompliance == "Listing-UL 2200",
Testing [Test] == 2,
"UL 2200 listing mandates exactly two certification tests."
);
}
type Accessory;
type Test;
```

This pattern (`require(condition, relation[type] == N, ...)`) allows the CML model to enforce a precise fixed number of child components when a quantity threshold or attribute condition is met on the parent.

Cardinality vs. Count

The `cardinality()` keyword is a proxy variable used to refer to the size of a relationship. The `count()` keyword is an aggregate function that counts matching components or attribute conditions within a relation. Both can be used to read quantities for validation or aggregation rules.

Example for Similarity

Both `cardinality()` and `count()` can be used to determine the total quantity of items in a relationship. In this scenario, they return the same value because the `count()` condition covers all possible active instances.

```
type Accessory{
boolean isPresent = true;
}
type Bundle {
relation items : Accessory[0..10];
int totalByCount = [0..10];
// Similarity: Both can read the headcount of the relation
// Use the proxy variable to set an attribute
int totalByCardinality = cardinality(Accessory, items);
// Use count() aggregate function within a constraint
constraint(totalByCount == items.count(isPresent == true));
}
```

Example for Difference

The core difference is that cardinality is a proxy variable representing the headcount or size of the relation, whereas count is a function used to evaluate specific attribute conditions or filters within those instances.

```
type Accessory {
int weight = [1..100];
boolean isEssential;
}
type Bundle {
relation items : Accessory[1..20];
// 1. Declare variables with explicit domains
int totalHeadcount = cardinality(Accessory,items);
int heavyItemsCount = [0..20];
int essentialItemsCount = [0..20];
// DIFFERENCE 1: Cardinality (Proxy Variable)
// Cardinality refers to the relationship size (how many instances are present).
// It does not look at the values of the attributes within the instances.
// DIFFERENCE 2: Count (Aggregate Function)
// Count MUST use a logical expression to evaluate conditions within the relation.
// It filters the instances based on attribute logic before returning a total.
// Example: Counting only accessories that weigh more than 50kg
constraint(heavyItemsCount == items.count(weight > 50));
// Example: Counting only accessories marked as 'essential'
constraint(essentialItemsCount == items.count(isEssential == true));
// Business Logic using both:
message(
heavyItemsCount > (totalHeadcount / 2),
"Warning: More than half of your accessories ({}) are heavy items.",
heavyItemsCount
);
}
```

For more information, see Message Rule on page 1127.

Parent

The `parent()` proxy variable is used to enable components at any level of the product hierarchy (child, grandchild, etc.) to access the attributes (variables) defined by their ancestor types. This mechanism facilitates the flow of configuration data and calculated values from the top of the bundle down to its components.

The `parent()` keyword functions as a proxy variable used to reference attributes residing in the immediate parent or any ancestor type in the configuration model.

Variable Name	Syntax	Purpose
`parent()`	`parent(<ancestor variable name>, <level>)`	Retrieves the value of an attribute from a parent or ancestor type.

Key Characteristics

- Targeting Ancestors: The first parameter is the name of the attribute in the ancestor type that you wish to reference.
- Level Parameter: The second parameter (`<level>`) is optional and specifies how many levels up the hierarchy the engine should search. If omitted, it typically references the immediate parent. The level index for the `parent()` function effectively starts from 0 (implicit) for the immediate parent.
- Level 0 (Default): When you use `parent(attributeName)`, the engine references the attribute in the immediate parent.
- Level n: When you specify `parent(attributeName, 1)`, the engine reaches one level beyond the immediate parent, to the grandparent.
- Data Flow: `parent()` ensures that the data flows unidirectionally, where the child reads attributes calculated or defined by the parent, thereby helping to prevent complex circular dependencies.
- Single Inheritance: CML follows a single inheritance model, where a type can only extend one other type at a time.
- Same Variable Name: In CML, reusing the same variable name between a parent bundle and its child accessories is a standard architectural pattern for cascading values down a product hierarchy. This allows a child component to automatically inherit or synchronize its properties with the parent type, ensuring configuration consistency.

Example: Standards and Compliance Synchronization

In this example, the `standardsAndCompliance` selection made at the bundle level is automatically passed down to every accessory within that bundle.

```
type AccessoryBundle {
// 1. Define the attribute at the Bundle level
string standardsAndCompliance = ["Certification-CSA", "Listing-UL 2200"];
// Relation to accessories
relation accessories : Accessory[1..10];
}
type Accessory {
// 2. Reuse the same variable name
// The parent() function targets the attribute in the immediate parent
string standardsAndCompliance = parent(standardsAndCompliance);
// Business Logic: If the inherited standard is UL 2200, price is affected
decimal(2) testingFee = [0.00..500.00];
constraint(standardsAndCompliance == "Listing-UL 2200" -> testingFee == 250.00);
}
```

The `parent()` proxy variable is essential for cascading configuration data and constraints down the product hierarchy, allowing child components to reference attributes defined by their ancestors.

Example: Parent Attribute Reference

This example utilizes attributes found on the `GeneratorSet` type (the parent) and demonstrates how related components (like TemperatureSensor) access those values using the parent() proxy variable. Here is the hierarchy context.

Parent Type	Relation Name	Child Type	Cardinality	Key Attribute Usage
Root `GeneratorSet`	`TemperatureSensors`	`TemperatureSensor`	`[0..5]`	Defines primary inputs (`requiredKW`) and a derived attribute (`ULComplianceEnforced`) based on the `standardsAndCompliance` selection.
Child `TemperatureSensor` (Instance within `GeneratorSet` relation)	Not Applicable	Not Applicable	Not Applicable	Uses the `parent()` proxy variable to reference the `requiredKW` attribute from its ancestor (`GeneratorSet`). A constraint ensures the component's capacity (`maxOperatingKW`) meets the requirement inherited from the parent.
Grandchild `StatorTemperatureSensor` (Subtype of `TemperatureSensor`)	Not Applicable	Not Applicable	Not Applicable	Inherits functionality from `TemperatureSensor`. Uses parent() to retrieve the calculated `ULComplianceEnforced` boolean from the `GeneratorSet`. Enforces a conditional installation rule using the Implication Operator (->).

```
// --- Parent Type (GeneratorSet) ---
type GeneratorSet {
// Attributes defined by the parent
int requiredKW = [101..10000]; // Required power rating
string standardsAndCompliance = ["Certification-CSA", "Listing-UL 2200"]; // Compliance
choice
// Derived status: True if UL 2200 is selected (precondition for compliance checks)
boolean ULComplianceEnforced = standardsAndCompliance == "Listing-UL 2200";
// Relation to child components
```

```
relation TemperatureSensors : TemperatureSensor[0..5];
}
// --- Child Component Type (TemperatureSensor) ---
type TemperatureSensor {
// Temperature sensors may have a model that defines max operating KW
int maxOperatingKW = [1000..10000];
// Retrieve the required KW value from the immediate parent (GeneratorSet)
int parentRequiredKW = parent(requiredKW);
// Constraint ensures the sensor can handle the power defined by the parent
constraint(maxOperatingKW >= parentRequiredKW, "Sensor capacity must meet the required KW
 set by the generator set.");
}
// --- Specific Sensor Type (Grandchild) ---
type StatorTemperatureSensor : TemperatureSensor {
// Retrieve the boolean compliance flag from the immediate parent (GeneratorSet)
boolean enforceULCompliance = parent(ULComplianceEnforced);
// Constraint ensures that if UL Compliance is enforced by the parent,
// this sensor must meet a specific installation requirement (e.g., must be shielded)
string installationMethod = ["Standard", "Shielded"];
constraint(enforceULCompliance -> installationMethod == "Shielded",
"UL Compliance requires a shielded temperature sensor installation."
);
}
// Note: To reference a value further up the hierarchy, the optional level parameter can
be used:
// int grandParentValue = parent(requiredKW, 1); // Accesses attribute 1 level up
```

Explanation of Parent Reference

- Direct Reference (Immediate Parent): In the `TemperatureSensor` type, `int parentRequiredKW = parent(requiredKW);` accesses the `requiredKW` attribute defined in the immediately superior type, which is `GeneratorSet`.
- Unidirectional Data Flow: The `parent()` proxy variable is critical for enabling unidirectional data flow, where calculated or defined values in the parent are read by children to enforce constraints. The engine ensures that parent aggregation and calculation are complete before the `parent()` function executes in the child component.

this.quantity

`this.quantity` is a proxy variable used specifically to access the quantity of the current instance (the specific product line item) within a configuration.

Key Characteristics and Usage

- Scope: It refers only to the quantity of the specific instance in which it is used. It is used at the component level to determine the quantity of that item chosen by the user or set by the constraint engine.
- Calculation Rule: The `this.quantity` proxy variable can be used only within a calculation rule.
- Distinction from `cardinality()`: `this.quantity` differs from the `cardinality()` proxy variable, which refers to the total number of instances of a specific type within a relationship and includes the quantity of other instances of the same type.
- Read-Only/Validation: When accessing quantity in CML, attributes like `this.quantity`, or external equivalents like `lineItemQuantity` or `ItemEndQuantity`, are treated as read-only and should be used only in calculation or evaluation rules. It is not recommended to use it to drive component creation, which should be done via cardinality.

Example: Using this.quantity for Calculation

In the Generator Set configuration, a component like the `NaturalGasReformer` may use `this.quantity` to define a local attribute representing how many units were selected, which is then used for internal calculations (like total capacity or total weight contribution).

```
type LineItem;
type NaturalGasReformer : LineItem {
// 1. Definition: The LineItemQuantity attribute captures the quantity of this specific
instance.
// The CML syntax dictates defining an attribute (LineItemQuantity) that equals
this.quantity.
int LineItemQuantity = this.quantity;
// Placeholder: Attribute representing unit capacity per reformer unit
int unitCapacityKW = 100;
// 2. Calculation: Used in a calculation rule to determine total capacity based on the
quantity selected for this line item instance.
int totalReformerCapacity = LineItemQuantity * unitCapacityKW;
}
```

Message Rule

The message rule displays a message to users based on specified conditions.

Message rules have this syntax:

```
message(logical expression, string literal | string variable, argument, .., argument,
severity);
message(logical expression, string literal | string variable, severity);
message(logical expression, string literal | string variable);
```

A message rule can take optional arguments to generate the message and indicate the severity of the message as the last argument. Message severity can be `Info`, `Warning`, or `Error`. Without an explicit message severity argument, the message will be treated as `Info`.

Understand the behaviour of each message severity type at runtime.

- The `Info` message type doesn't require the user to take any action in order to continue with the current task. Info messages display a gray banner.
- The `Warning` message type allows the user to continue working on the current task, but blocks them from taking the next step until they take action to address the issue described in the message. Warning messages display a yellow banner.
- The `Error` message type blocks the user from continuing with the current task until they fix the error described in the message. Error messages display a red banner. Note: An Error message doesn't block a user working in the Transaction Line Editor (Transaction Line Table, or TLT). In that component, the user can still make changes and save the quote, even when the quote contains conditions that trigger an Error message.

Message format can be a Java string, or a string with {} as a placeholder. The constraint solver replaces each {} with arguments specified after the string, in the order they are written.

Example

In this example, if `requiredKW` is greater than `2500`, a message is displayed that the specified required kW is larger than the supported options and must be changed.

```
type GeneratorSet {
int requiredKW = [101..10000];
message(requiredKW > 2500, "The required kW is above what the current options can support.
 Please adjust to 2500 kW or select a new generator set that meets your requirements.");
}
```

Preference Rule

The preference rule encourages the constraint solver to satisfy the condition, but doesn't enforce it if the condition can't be met.

The system tries to satisfy the condition in a preference rule, but if for some reason it can't, the system delivers a failure message to the user with `Info` severity.

The preference rule has this syntax.

```
preference(logic expression, string literal | string variable, argument, .., argument);
preference(logic expression, string literal | string variable);
preference(logic expression);
```

A preference rule can include an optional explanation message for failure. The message is of `Info` severity, meaning it does not block the user from continuing with the action.

In this example, the preference rule encourages the user to mention the `dBMax` value as `90` and the `requiredKW` value as `500`.

```
type GeneratorSet {
   int requiredKW = [101..10000];
   int dBMax = [0..140];
   preference(dBMax == 90, "90 preferred for dbMax");
   preference(requiredKW == 500,"50 preferred for requiredKW");
}
```

Require Rule

The require rule requires certain components to be included in a relationship when specified conditions are met.

Required components can have attributes and quantity specified. The require rule can include an optional explanation message, for the rule failure explanation.

In certain scenarios, you can independently add a type at the header level. This means you can include a specific type even if it isn't explicitly defined as part of any of the relationships you've configured. This capability offers flexibility in managing and including necessary types that might not always fall under a specific relationship structure.

Note: When you assign a require rule to a virtual bundle (a bundle related to the sales transaction, where the parent product has no associated price), set one Product Selling Model Option on the required product to Default. For more information on Product Selling Model Options, see Manage Product Selling Model in Revenue Cloud.

The require rule has this syntax:

```
require(logic expression, relationship[type]{var=value,…,var=value}==integer value,
"Explanation message");
```

In this example, the require rule specifies that if the number of engineers is more than 0, installation is required. The installation will be automatically added upon adding an engineer.

```
type GeneratorSet {
    relation engineers : engineer[0..99];
relation installation : install[0..5];
   require(engineers[engineer] > 0, installation[install], "Installation is required if
engineers are present");
}
type engineer{}
type install{}
```

Require Rule vs Constraint

In Constraint Modeling Language (CML), constraint() and require() can both enforce behavior, but they operate differently: constraint focuses on logical consistency, require focuses on physical presence of products.

Here's a comparison between `constraint()` and `require()`.

Feature	constraint()	require()
Primary goal	Validates if a condition is met (LHS) and operates on the result (RHS).	Forces a product to be present.
Engine action	Resolves the constraint or displays an error if there are no options to resolve.	Adds the required product to the quote.

Setdefault Rule

The setdefault rule allows component selection with attribute values and quantity, similar to the require rule.

Unlike the require rule, the setdefault rule applies a default configuration status and uses a triggering mechanism to control when the solver attempts to satisfy the rule. The setdefault rule can include an optional explanation message.

The setdefault has this syntax, similar to the require rule.

```
setdefault(condition, expression, message);
```

The setdefault rule evaluates the condition. If the condition is false, the solver ignores the expression and doesn't display a message, regardless of whether any part of the condition is changed. If the condition is true, the solver performs one of these actions.

- If any part of the condition is changed or the parent component is new, the solver attempts to satisfy the expression. If the solver can't satisfy the expression, an explanation message is displayed (if included).
- If no part of the condition is changed, the solver evaluates the expression without attempting to satisfy it. If the expression evaluates to false, an explanation message is displayed (if included).

The key difference between the setdefault rule and the require rule is that the setdefault rule attempts to satisfy the expression only when a condition is changed. If no condition is changed, the setdefault rule performs a passive evaluation. The require rule always attempts to satisfy the expression when the condition is true.

In this scenario, we use the requiredKW attribute (the user's power requirement) as the condition and the Accessories relation as the target for the recommended cardinality.

```
type Accessory;
type GeneratorSet  {
int requiredKW = [101..10000];
```

```
relation Accessories : Accessory[1..99];
/**
* @Title High Power Accessory Recommendation
* The setdefault constraint specifies that 2 accessory units are
* recommended when the required power capacity is greater than 2000 kW.
*/
setdefault(
requiredKW > 2000,
Accessories[Accessory] == 2,
"2 specialized accessory kits are recommended for power levels above 2000 kW"
);
}
```

Exclude Rule

The exclude rule is used to automatically remove a specific type in a relationship if a certain condition is met.

The exclude rule has this syntax.

```
exclude(logic expression, relationship[type],"Explanation message");
```

The type must be leaf type, a node without children.

In the exclude rule, if a user sets attribute values in Product Catalog Management (PCM) that violate the rule requirements, the constraint engine overrides the user input in order to validate the constraint. This behavior is different than other constraints, in which the constraint engine doesn't override user input, but displays an error if user input violates the constraint. See How User Input Order Affects Constraint Engine Behavior section in Logical Constraints on page 1113.

In this example, the exclude rule automatically removes the `Heater_120` heater from the type `GeneratorSet` if the `Voltage3` is greater than or equal to `4160`.

```
type GeneratorSet {
int Voltage3 = [120..13800];
relation Heaters : Heater_120 [1..3];
exclude(Voltage3 >= 4160, Heaters[Heater_120]);
}
type Heater_120 {}
```

Action Rule

The CML Action Rule is defined using the rule() keyword. Its primary purpose is to execute a designated action, specified as a string literal, when a condition is met.

This action is typically handled by external systems, such as the Product Configurator API or custom code, to manage business processes, workflows, or complex constraints that fall outside the constraint engine's primary scope.

Action rules have this syntax.

```
rule(condition, action, arg, ..., arg)
rule(<condition>, <action>, "attribute", <attribute>);
rule(<condition>, <action>, "attribute", <attribute>, "value", [<attribute values>]);
rule(<condition>, <action>, "relation", <relation>, "type", <type>);
```

`condition` is any logic expression such as a constraint in CML.

`action` is a string literal that specifies an action that can be interpreted by the Product Configurator API. The Product Configurator API supports these actions.

- Hide: hide attribute, attribute value, product option
- Disable: disable attribute, attribute value, product option
- args are a list of arguments needed to execute the action. An argument is a pair including a string literal and an identifier, a literal, or a domain, enclosed in brackets [ ] to specify multiple values. The string literal specifies what kind of argument follows. The identifier attribute can be defined in the type. The engine retrieves the argument value and passes it to the caller to execute the action.

Hide or Disable Rule

The Hide or Disable Rule uses the rule() keyword to conditionally remove an element from the selection menu (hide) or preserve it in the menu while preventing user selection (disable).

This functionality can be applied.

- On a bundle, hide a component to remove it from the selection menu, or disable a component to preserve it in the menu but prevent users from selecting options for it.
- On an individual product, hide an attribute to remove it from the selection menu, or disable an attribute to preserve it in the menu but prevent users from selecting options for it.
- On an attribute, hide or disable an attribute value to preserve it in the menu but prevent users from selecting options for it. For attribute values, the hide and disable rules have the same behavior.

Note: In Visual Builder in Salesforce, for attribute values, only the hide rule is enabled. When you apply the hide rule to an attribute value in Visual Builder, the value appears in the menu but selections are disabled.

The hide and disable rules use this syntax, where `action` is replaced by either `hide` or `disable`.

```
rule(logic expression, action, actionScope, actionTarget)
rule(logic expression, action, actionScope, actionTarget, actionClassification,
actionValueTarget)
```

Example: Hiding and Disabling Features

In the example in this section, rules rely on specific variables to define the scope and target of the action.

Variable in Rule	Purpose	Example from Generator Set	Description
`logic expression` (Declaration)	Condition upon which the rule occurs.	`requiredKW <= 500`	The logical test that triggers the action.
`action`	Designates whether the rule is hide or disable.	`"hide", "disable"`	Determines if the element is removed from view or made unselectable.
`actionScope`	Designates whether the rule acts on an attribute or relation scope.	`"attribute", "relation"`	Specifies if the target is a variable property or a component relationship.
`actionTarget`	Designates the specific variable or relation that the rule acts on.	`"Voltage", "StarterMotors"`	The Constraint Modeling Language (CML) name of the attribute or relation.
`actionClassification`	Designates whether the rule acts on a type or a value.	`"type", "value"`	Used when targeting components within a relation

Variable in Rule	Purpose	Example from Generator Set	Description
			(type) or specific options within an attribute domain (value).
`actionValueTarget`	Designates the specific type or value that the rule acts on.	`"7976/13800"`, `"StarterMotor_Advanced"`	The specific string value or type name to hide or disable.

```
// --- Component Definitions (For relations referenced below) ---
type LineItem;
type EngineModel : LineItem;
type StarterMotor : LineItem;
type OutputTerminal : LineItem;
type OutputTerminals2HoleLugNEMA : OutputTerminal; // Specific terminal type
type GeneratorSet : LineItem {
// Attributes subject to hide/disable rules
int requiredKW = [101..10000];
string Voltage = ["220/380", "240/416", "4160/7200", "7976/13800"]; // Voltage is the
attribute being hidden/disabled
string specialApplication = ["None - Standard", "Motor Starting"]; // specialApplication
attribute contains a value to hide
// Relations subject to hide/disable rules
relation StarterMotors : StarterMotor; // Relation target (component) to hide/disable
relation OutputTerminals : OutputTerminal[0..99]; // Relation being acted upon
// 1. Disable a Component (Type) in a Relation
// If requiredKW is too low (<= 500 kW), the advanced starter motor component is disabled
 (visible but unselectable).
rule(
requiredKW <= 500,
"disable",
"relation",
"StarterMotors",
"type",
"StarterMotor_Advanced"     );
// 2. Hide an Attribute
// If the Generator is configured for a special purpose (Motor Starting), hide the Voltage
 attribute entirely.
rule(
specialApplication == "Motor Starting",
"hide",
"attribute",
"Voltage"
);
// 3. Hide a Specific Attribute Value
// If the power requirement is low (< 2000 kW), hide the high voltage option (7976/13800)
 from the Voltage attribute domain.
rule(
requiredKW < 2000,
"hide",
"attribute",
"Voltage",
"value",
```

```
"7976/13800"
);
// 4. Disable a Component Type (Alternate Syntax using the component name)
// Disable the OutputTerminals2HoleLugNEMA component if the required KW is high.
rule(
requiredKW >= 5000,
"disable",
"relation",
"OutputTerminals",
"type",
"OutputTerminals2HoleLugNEMA"
);
}
type StarterMotor_Advanced : StarterMotor; // Subtype used in the rule
```

Recommendation Rule

The recommend keyword is used within a Constraint Modeling Language (CML) rule to display suggestions for related products in the Product Configurator. The rule defines the condition under which a specific product type or relation should be suggested to the user.

You can recommend a type, a relation, or both in the same rule. The recommendation rule can be added inside a standalone product, a product bundle, or a virtual container.

Unlike action rules that are interpreted directly by the Product Configurator API, when the condition is met, the engine forces a UI change (hiding or disabling a product option, attribute, or value). Recommendations are not automatically applied to the UI by the configuration engine alone. To suggest types or relations (products/bundles), typically for up-selling or cross-selling based on their current selections at runtime, use the Run Config Rules action within a Salesforce Flow. See Run Config Rules Action in the Revenue Cloud Developer Guide.

- Use an action rule when a selection makes another option invalid or irrelevant. For example, if a user selects a basic warranty, you should "hide" or "disable" the premium support options to prevent a conflicting or impossible setup.
- Use a recommendation rule when you want to nudge the user toward a beneficial add-on. For example, if a user buys a high-end generator, you "recommend" a maintenance service contract. This does not block the user if they choose not to add it.

Here are 3 examples demonstrating how to implement product recommendation rules.

Example 1: Recommending a Type (Based on Attribute Selection)

This rule is placed within the `GeneratorSet` type. If a user selects an extremely high voltage, the configuration engine recommends a specialized engineer component required for installation or commissioning.

```
type GeneratorSet {
// Attribute input
string Voltage = ["277/480", "7976/13800"];
// Relation to the component type being recommended
relation engineers : engineer[0..99];
// Recommend Engineer Specialist (type) for High Voltage
rule(
Voltage == "7976/13800", "recommend", "type", "EngineerSpecialist"
);
}
// Recommended type
type EngineerSpecialist ;
type engineer;
```

Example 2: Recommending a Relation (Based on Component Quantity)

This rule recommends adding items to an existing relation (`Accessories`) if the user selects a high-end component (such as the most robust enclosure, `Enclosure_SA3`).

```
type GeneratorSet  {
// Relations defined in the GeneratorSet
relation Enclosures : Enclosure;
relation Accessories : Accessory[1..99]; // The relation being recommended
// Recommend Accessories when maximum sound dB is chosen
rule(
Enclosures[Enclosure_SA3] == 1,
"recommend",
"relation",
"Accessories");
}
type Enclosure ;
type Enclosure_SA3 : Enclosure;
type Accessory ;
```

Example 3: Recommending a Type (From a Virtual/System Container)

This rule is applied at the Quote or System level (using a `virtual` type) and recommends a system integration product if multiple generators are being configured, reflecting the requirement that large projects often need central control components.

```
@(virtual = true)
type Quote {
// Relation referencing all GeneratorSet instances on the quote
@(sourceContextNode = "SalesTransaction.SalesTransactionItem")
relation lineItems : GeneratorSet[0..10];
// Recommend Switchgear for multi-unit orders
rule(
lineItems[GeneratorSet] > 1,
"recommend",
"type",
"Switchgear"
);
}
type GeneratorSet;
type Switchgear;
```

Set Product Selling Model in a Constraint

Use the productSellingModel tagname to write a constraint that sets the Product Selling Model (PSM) for a type. You can define a PSM as one time, time-deferred (subscription with end date), or evergreen (recurring subscription with no preset end date). The PSM is updated for new line items at runtime, based on the constraint.

You can't use a Constraint Modeling Language (CML) constraint to update the PSM for an existing quote line. For more information on product selling models, see Manage Product Selling Model in Revenue Cloud in Salesforce Help.

Constraint Example

Using the `GeneratorSet` model, a constraint can be defined that sets the PSM based on a specific operational attribute chosen by the user, such as the `DutyRating`. This assumes that different duty ratings correspond to different billing models (for example, permanent installation versus temporary rental).

This example sets the PSM to a specific ID (for example, `PSM_EVERGREEN_ID`) if the user selects the "Continuous Power (COP)" duty rating.

```
//Global variable PSM ID
define PSM_EVERGREEN_ID "a00Tx000000Qz1g"
type GeneratorSet {
// Use the productSellingModel tag from the context definition
@(tagName = "ProductSellingModel")
string productSellingModel;
string DutyRating = ["Prime Power (PRP)", "Continuous Power (COP)", "Emergency Standby
Power (ESP)"];
// Set PSM based on Duty Rating
constraint(
DutyRating == 'Continuous Power (COP)' ->    productSellingModel == PSM_EVERGREEN_ID
);
}
```

Core Concept Examples

These examples illustrate core Constraint Modeling Language (CML) concepts including type, relationships, constraints, and so on.

For an explanation of the constraint model structure in these examples, see Model Structure on page 1202.

Example 1: Use Regex Global Variable

```
// Global Constant: Regex used to parse voltage strings
define VOLTAGE_REGEX "^([11-19]+)/([11-19]+)$"

type LineItem;
type GeneratorSet : LineItem {
   // Core attributes
   @(configurable = false)
   int requiredKW = [101..10000]; // Required power capacity
   string Voltage = ["220/380", "240/416", "277/480", "7976/13800"];
   string standardsAndCompliance = ["Certification-CSA", "Listing-UL 2200"];

   // Calculated attributes
   // Surge load is 1.25 times the required KW
   decimal(2) surgeLoadKW = requiredKW * 1.25;
   // Voltage3 extracts the secondary voltage (e.g., 380 or 416) for checks
   int Voltage3 = strtoint(regexpreplace(Voltage, VOLTAGE_REGEX, "$2"), 0);

   // Relation to model components
   relation GeneralModels : GeneralModel[11];

   // Constraint 1: Ensure model capacity meets the required KW
   constraint(GeneralModels[GeneralModel].powerKW >= requiredKW,
      "Selected Generator Model is insufficient for the required power.");
```

```
   // Constraint 2: UL 2200 standard restricts voltage to 600V or less (Implication rule)

   constraint(standardsAndCompliance == "Listing-UL 2200" -> Voltage3 <= 600,
      "The UL 2200 standard covers stationary engine generator assemblies rated at 600 
volts or less.");
}

// Component type definition (GeneralModel is a product component)
type GeneralModel : LineItem {
   int powerKW = [900, 1200, 1500, 1750, 2500];
   int dB = [20..23];
}
```

Key Technical Details

- The `GeneratorSet` type is related to the `GeneralModel` type through a single relation.

Parent Type	Relation Name	Child Type	Cardinality	Key Attribute Usage
`GeneratorSet`	`GeneralModels`	`GeneralModel`	Not Applicable	Constrained by `requiredKW` on the parent type.

- Parent Type (`GeneratorSet`): Defined as a `LineItem` component, the `GeneratorSet` holds configuration parameters such as the user's power requirement (`requiredKW`), the specified voltage (`Voltage`), and compliance standards (`standardsAndCompliance`). It also includes calculated attributes like `surgeLoadKW` and `Voltage3`.
- Child Type (`GeneralModel`): Defined as a `LineItem` component, the `GeneralModel` specifies the technical attributes of the selected generator configuration, including its power output (`powerKW`) and noise rating (`dB`).
- Cardinality: The relation `GeneralModels : GeneralModel` specifies the quantity bounds for the component, indicating that exactly 11 instances of the `GeneralModel` type must be included in this configuration.

Example 2: Use Groupby Annotation to Create Virtual Group

Using Groupby annotation for types, this model creates a virtual `VoltageGroup` for every unique voltage (for example, "220/380", "480/277") found in the transaction.

```
// 1. The physical product type
type GeneratorSet {
   @(configurable = false)
   int requiredKW = [101..10000];

   string Voltage = ["220/380", "240/416", "255/440", "277/480"];

   // Calculation with explicit domain for best practice
   decimal(2) surgeLoadKW = [126.25..12500.00];
   constraint(surgeLoadKW == requiredKW * 1.25);
}

// 2. The virtual container grouped by the "Voltage" attribute
```

```
@(split=true, virtual=true, groupBy=Voltage)
type VoltageGroup {
   string Voltage; // The attribute used for grouping
   decimal(2) groupTotalSurgeKW = [0.00..99999.99];

   // Map instances to this group from the transaction line items
   @(sourceContextNode="SalesTransaction.SalesTransactionItem")
   relation generators : GeneratorSet[0..50];

   // Aggregation: Sum only the surge load of generators in THIS voltage group
   constraint(groupTotalSurgeKW == generators.sum(surgeLoadKW));

   // Business Rule: Limit total surge load per voltage branch
   message(groupTotalSurgeKW > 10000, "Warning: Surge load for Voltage {} exceeds branch
capacity!", Voltage);
}

// 3. The top-level system managing the groups
@(virtual = true)
type GeneratorSystem {
   relation generators : GeneratorSet[0..100];
   relation voltageGroups : VoltageGroup[1..10];

   decimal(2) systemTotalKW = voltageGroups.sum(groupTotalSurgeKW);
}
```

Key Technical Details

- `groupBy=Voltage`: The engine scans all `GeneratorSet` instances and creates one virtual `VoltageGroup` for each unique voltage value detected (for example, one group for all "220/380" units, another for all "277/480" units).
- `sourceContextNode`: This tells the virtual group to pull its "children" (the generators) from the specific path in the Salesforce context where quote line items are stored.
- Bottom-Up Aggregation: Each `VoltageGroup` independently calculates its `groupTotalSurgeKW` based strictly on the generators assigned to it by the groupBy logic.
- Explicit Domains: Following best practices, the `surgeLoadKW` and `groupTotalSurgeKW` use explicit domains (for example, [0.00..99999.99]) to prevent "NullPointer" or initialization errors during solving.

Example 3: Use Sharingcount Annotation to Reuse Accessory Instances

In this example, we apply sharingcount annotation to the `Accessory` type to allow the engine to reuse accessory instances across the configuration up to a specified limit.

```
// 1. Define the component type with split and sharingCount
// split=true enables parallel solving by splitting quantity into multiple instances
// sharingCount=5 allows a single Accessory instance to be reused 5 times in the model
@(split = true, sharingCount = 5)
type Accessory {
   string category;
   decimal(2) weight;
}
```

```
type GeneratorSet {
   @(configurable = false)
   int requiredKW = [101..10000];

   // 2. Define the relationship with the sharing annotation
   // @(sharing = true) allows the engine to satisfy this relation by
   // "pointing" to existing instances instead of creating new ones
   @(sharing = true)
   relation Accessories : Accessory[1..99];
}
```

Key Technical Details

- Parallel Solving: By setting `split = true`, the engine can process the 99 possible accessories in parallel rather than sequentially, which is critical for large-scale generator configurations.
- Resource Management: The `sharingCount = 5` tells the solver that it doesn't need to instantiate 99 unique `Accessory` objects; it can reuse the same object definition up to five times across different parts of the configuration graph.
- Relationship Requirement: For `sharingCount` to take effect, the Relation (the port) must also be annotated with `@(sharing = true)` to grant the engine permission to reuse instances.

Example 4: Use contextPath and tagName Annotations

```
// 1. GLOBAL EXTERN DECLARATIONS
// Unifying contextPath (header field) and tagName (context identifier)
@(contextPath = "SalesTransaction.ShippingCountry", tagName = "Region_Identifier")
extern string ShippingCountry = "International";

@(contextPath = "SalesTransaction.ProjectUrgency", tagName = "Priority_Level")
extern string ProjectUrgency = "Standard";

// 2. PHYSICAL PRODUCT TYPE
type GeneratorSet {
   // Core technical attributes
   @(configurable = false)
   int requiredKW = [101..10000];

   string DutyRating = ["Prime Power (PRP)", "Emergency Standby Power (ESP)"];

   // Technical calculation with explicit domain (Best Practice)
   decimal(2) surgeLoadKW = [126.25..12500.00];
   constraint(surgeLoadKW == requiredKW * 1.25);

   // 3. LOGIC INTEGRATING EXTERNAL DATA
   // Using contextPath/tagName data to drive technical warnings
   message(ShippingCountry == "US",
           "Regional Notice: Generator must comply with US-specific UL 2200 standards.");

   message(ProjectUrgency == "Critical" && requiredKW > 5000,
           "High Priority Alert: Large scale power requirement in a Critical project
requires site inspection.",
```

```
            requiredKW, "Warning");
}
```

Key Technical Details

- External Variable (`extern`): These are declared outside of any type to hold values supplied by the environment (Salesforce).
- `contextPath` Annotation: This maps the variable directly to a header-level field in the Sales Transaction.
- `tagName` Annotation: This links the variable to a specific Context Tag identifier within the Salesforce Context Definition.

Note: Rules depending on these external variables (such as the `ShippingCountry` message) only re-evaluate when a Line Item change occurs (For example, updating `requiredKW`), not solely when the header field changes.

Example 5: Use Format Specifiers (%s, %d) and Dates in Constraints

In this example, we define a generator configuration that validates the required power (`requiredKW`) against the duty rating and voltage, providing specific feedback when a mismatch occurs.

```
type GeneratorSet  {
   // 1. Core Technical Attributes with explicit domains
   @(configurable = true)
   int requiredKW = [101..10000];

   string DutyRating = ["Prime Power (PRP)", "Continuous Power (COP)",
                        "Data Center Continuous (DCC)", "Emergency Standby Power (ESP)"];

   string Voltage = ["220/380", "277/480", "347/600", "2400/4160"];

   string standardsAndCompliance = ["Certification-CSA", "Listing-UL 2200"];

   // Date Attribute Definition
   // Date variables represent a specific day.
   // You can define a fixed domain for a date as a range between two dates.
   date requestedDeliveryDate = ["2024-01-01", "2025-12-31"];

   // Message Rule with Multiple Arguments using placeholders
   message(requiredKW > 5000 && DutyRating == "Emergency Standby Power (ESP)",
           "High Capacity Alert: The %s rating for %d kW requires an additional cooling
system.",
           DutyRating, requiredKW, "Warning");

   // Constraint with Multiple Arguments using placeholders
   constraint(Voltage == "2400/4160" && standardsAndCompliance == "Listing-UL 2200",
              "Configuration Error: Voltage %s cannot be used with %s standards due to
safety limits.",
              Voltage, standardsAndCompliance);

   // Dates can be used in logical expressions with comparison operators like < or >=.
   message(requestedDeliveryDate < "2024-09-01" && requiredKW > 7000,
           "Schedule Warning: Delivery for %d kW units on %s may require expedited
manufacturing.",
```

```
            requiredKW, requestedDeliveryDate, "Info");
}
```

Key Technical Details

- Multiple Arguments: You can pass several variables after the string literal. The engine maps them to the placeholders in the exact order they appear.
- Format Specifiers
- `%s` is used for string variables (for example, `DutyRating` or `Voltage`).
- `%d` is used for integer variables (for example, `requiredKW`).
- Placeholder Usage: Alternatively, you can use the {} syntax, which the constraint engine automatically replaces with the actual argument values during runtime evaluation.
- Comparison Logic with Dates: You can treat dates as comparable values in `constraint` or `message` rules to enforce scheduling logic (for example, ensuring a delivery date is not too early for a complex build).

Example 6: Use Arithmetic Calculations and Functions

This example demonstrates using aggregate functions (a virtual type for transaction-level aggregation) and mathematical functions within the `GeneratorSet` type for precise quantity calculation.

```
// --- Component Definition —
type GeneratorSet  {
    int requiredKW = [101..10000];
    int quantity = [1..10];
    // BEST PRACTICE: Define derived attributes with an explicit domain
    decimal(2) surgeLoadKW = [0.00..12500.00];
    // BEST PRACTICE: Put calculations inside of constraints
    constraint(surgeLoadKW == requiredKW * 1.25);
}
// --- Accessory Definition ---
type Accessory  {
    int weight_kg = [1..100];
}
// --- Virtual System Type (Aggregation Context) ---
@(virtual = true)
type System {
    @(sourceContextNode = "SalesTransaction.SalesTransactionItem")
    relation generators : GeneratorSet[0..10];
 relation shipmentbatch : ShipmentBatch [0..10];
    // BEST PRACTICE: Attributes must have explicit domains
    decimal(2) totalQuotedLoad = [0.00..125000.00];
    int highPowerCount = [0..10];
    // Aggregate calculations in separate constraints
    constraint(totalQuotedLoad == generators.sum(surgeLoadKW));
    // VARIATION: Condition-based count
    // count() requires a logical expression
    constraint(highPowerCount == generators.count(requiredKW > 5000));
    // Ensuring Shipment batch crates are similar to the number of generators
    message(
        shipmentbatch.requiredCrates != generators[GeneratorSet],
        "The Shipment items ({}) must match the number of Generators ({})",
```

```
        shipmentbatch.requiredCrates, generators[GeneratorSet],
        "Error"
    );
}
type ShipmentBatch {
    int totalItems = [1..100];
    int itemsPerCrate = 10;
    // BEST PRACTICE: Define derived attributes for the relation in the parent type
    int totalWeight = [0..1000];
    int accessoryCount = [0..10];
    // Aggregates within the relation block
    relation accessories : Accessory[0..10] {
        accessoryWeight = sum(weight_kg);
        accessoryCount = count(weight_kg > 0);
    }
    // Mapping relation attributes to parent variables via constraints
    constraint(totalWeight == accessories.accessoryWeight);
    constraint(accessoryCount == accessories.accessoryCount);
    int requiredCrates = [0..100];
    // Mathematical Function Example: CEIL
    constraint calculateCeil(requiredCrates == ceil(totalItems / itemsPerCrate));
}
```

Key Considerations for Calculations and Aggregations

When implementing these functions in CML, follow these architectural best practices for robustness and performance.

- Explicit domains are required: All the derived attributes that result from a calculation or aggregation must have an explicit variable domain definition. This practice ensures accurate aggregation and helps prevent runtime errors.
- Separate calculation from declaration: Define the aggregation or calculation in a separate constraint rather than using an inline derived attribute declaration (for example, `int total = items.sumPrice;`). This separation helps avoid issues where domains may not initialize correctly.
- Correct Pattern: Define the relation aggregate (`totalQty = sum(quantity);`) and then enforce the result via a constraint (`constraint(totalItemCount == items.totalQty);`).

Annotation Examples

Constraint Modeling Language (CML) annotations are labels that you add to parts of a model, such as types, variables, relationships, and constraints. Annotations control how these elements are shown and how they behave in the configurator. Annotations help fine-tune the configurator and the constraint engine without changing the actual structure of the model.

The examples explain what each annotation does, where it can be used in the model, what kinds of values it supports, and how it behaves when the configurator runs and evaluates constraints. CML code samples show how the annotation works in practice.

domainComputation Annotation

`domainComputation` is a CML annotation that specifies how the domain of a model element is determined, either by using a fixed domain or by computing the domain dynamically during configuration.

peelable Annotation

The `peelable` annotation is used to create soft selection values and allow the engine to modify these selections to satisfy a constraint.

productField Annotation

productField is a CML annotation that defines the Product2 field on a variable. productField loads the value from Product Catalog Management (PCM) during constraint model activation.

propagateUp Annotation

`propagateUp` is a Constraint Modeling Language (CML) annotation that controls aggregation propagation between children and parent elements.

relatedAttributes Annotation

`relatedAttributes` is a Constraint Modeling Language (CML) annotation that resets the domain to the original one for domainComputation.

sequence Annotation

The `sequence` annotation defines the execution and configuration order of elements in a Constraint Modeling Language (CML) model.

split Annotation

`split` is a Constraint Modeling Language (CML) annotation that specifies whether the instances of the type should be split or not.

closeRelation Annotation

closeRelation is a CML annotation that controls addition of new line items to the relationship by the engine.

Annotation	`closeRelation`
Applicable to	Relationship
Value Type/Values	true, false
Description	If `closeRelation` is not specified, the engine sets it implicitly as false for the relationship. If `closeRelation` is specified as true, the engine prevents the addition of new line items to the relationship. If `closeRelation` is specified as false, the engine allows the addition of new line items to the relationship.

Example 1

In this example, the `closeRelation` annotation isn't specified for the relationship (`mainalternatorclassification`). The model contains the constraint.

```
type LineItem;
type GeneratorSet : LineItem {
    @(defaultValue = "Emergency Standby Power (ESP)")
```

```
    string dutyRating = ["Emergency Standby Power (ESP)", "Prime Power (PRP)", "Continuous
 Power (COP)", "Data Center Continuous (DCC)"];
    relation mainalternatorclassification : MainAlternatorClassification;
    constraint(dutyRating == "Continuous Power (COP)" ->
mainalternatorclassification[Alternator_240] >= 1);
}
type MainAlternatorClassification : LineItem;
type Alternator_220 : MainAlternatorClassification;
type Alternator_440 : MainAlternatorClassification;
type Alternator_240 : MainAlternatorClassification;
```

Example 2

In this example, the `closeRelation`annotation is defined as `false` for the relationship (`mainalternatorclassification`). The model contains the constraint.

```
type LineItem;
type GeneratorSet : LineItem {
    @(defaultValue = "Emergency Standby Power (ESP)")
    string dutyRating = ["Emergency Standby Power (ESP)", "Prime Power (PRP)", "Continuous
 Power (COP)", "Data Center Continuous (DCC)"];
    @(closeRelation = false)
    relation mainalternatorclassification : MainAlternatorClassification;
    constraint(dutyRating == "Continuous Power (COP)" ->
mainalternatorclassification[Alternator_240] >= 1);
}
type MainAlternatorClassification : LineItem;
type Alternator_220 : MainAlternatorClassification;
type Alternator_440 : MainAlternatorClassification;
type Alternator_240 : MainAlternatorClassification;
```

Example Description and Configurator Result

In example 1, the `mainalternatorclassification` relation is not specified with the `closeRelation` annotation, but the system considers it as `false` by default. In example 2, the relation is explicitly defined with `false`. As a result, if the user updates the `dutyRating` variable to `"Continuous Power (COP)"`, the system adds the `Alternator_240` product according to annotation and constraint logic and allows addition of other products from the `mainalternatorclassification` relation (`Alternator_220,Alternator_440`). The system does not allow to unselect the `Alternator_240` product specified in the constraint while the `"Continuous Power (COP)"` is selected. If the user updates the `dutyRating` variable to another value (For example, `Emergency Standby Power (ESP)"`), the engine removes the `Alternator_240` product, but the user can add/select/unselect all products from the relationship manually.

Example 3

In this example, the `closeRelation` annotation is specified as `true` for the relationship (`mainalternatorclassification`). The model contains the constraint

```
type LineItem;
type GeneratorSet : LineItem {
    @(defaultValue = "Emergency Standby Power (ESP)")
    string dutyRating = ["Emergency Standby Power (ESP)", "Prime Power (PRP)", "Continuous
 Power (COP)", "Data Center Continuous (DCC)"];
```

```
    @(closeRelation = true)
    relation mainalternatorclassification : MainAlternatorClassification;
    constraint(dutyRating == "Continuous Power (COP)" ->
mainalternatorclassification[Alternator_240] >= 1);
}
type MainAlternatorClassification : LineItem;
type Alternator_220 : MainAlternatorClassification;
type Alternator_440 : MainAlternatorClassification;
type Alternator_240 : MainAlternatorClassification;
```

In example 3, the `mainalternatorclassification` relation is specified with the `closeRelation` annotation as `true`. As a result, if a user updates the dutyRating variable to `"Continuous Power (COP)"`, the engine resets it back to `"Emergency Standby Power (ESP)"` to prevent adding the `Alternator_240` product according to the annotation. The user can add all `mainalternatorclassification` products manually (including the `Alternator_240` product specified in the constraint).

Table 8: closeRelation Configuration Settings

Associated Example	Product Group Structure	Applicable to	"closeRelation" annotation	User Action	Engine Action	UI Behavior
N/A	Individual product	Relationship	not specified	Change variable value specified in constraint condition	Add the product according to the constraint. Allow addition of other products to the relationship	Display product specified in constraint as pre-selected: if a User unselects it, the product returns back to selected state. User can select other products from the relationship
N/A	Individual product	Relationship	TRUE	Change variable value specified in constraint condition	Reset the variable value back to the default value to avoid addition the relation product specified in the constraint	Products from the relation are not added or selected (including the product specified in constraint). User can manually select any products from the relationship
N/A	Individual product	Relationship	FALSE	Change variable value specified in constraint condition	Add the product according to the constraint. Allow addition of other	Display product specified in constraint as pre-selected: if a

					product specified in the constraint	in constraint). User can manually browse and add any products from the relationship

configurable Annotation

`configurable` is a CML annotation that controls whether a model element can be configured.

`configurable` annotation specification: Variable

Annotation	`configurable`
Applicable to	Variable
Value Type/Values	true, false
Description	If the `configurable` annotation is not explicitly specified, the engine sets it implicitly as true for the variable. If the `configurable` annotation is explicitly specified as true, the variable is indicated as configurable. The engine sets the value to the variable. If the `configurable` annotation is explicitly specified as false, the engine doesn't set a value to the variable.

Example 1

In this example, the `configurable` annotation is not specified for the variable (Cable Entry) of the VoltageConnection child products. The `defaultValue` is not defined.

```
type GeneratorSet {
    relation voltageConnections : VoltageConnection[1..999999];
}
type VoltageConnection {
    string cableEntry = ["Top Entry", "Bottom Entry", "Side Entry"];
}
```

Example Description and Configurator Result

In this example, the `configurable` annotation is not explicitly specified for the variable `cableEntry`, but the system considers it as `configurable = true` by default. As a result, the system sets the `"Top Entry"` (the first value in the `["Top Entry", "Bottom Entry", "Side Entry"]` CML domain) as the initial value for the configurable `Cable Entry` variable.

Example 2

In this example, the `configurable` annotation is specified as `true` for the variable (Cable Entry) of the VoltageConnection child products. The `defaultValue` is not specified.

```
type GeneratorSet {
    relation voltageConnections : VoltageConnection[1..999999];
}
type VoltageConnection {
    @(configurable = true)
    string cableEntry = ["Top Entry", "Bottom Entry", "Side Entry"];
}
```

Example Description and Configurator Result

In this example, the `configurable` annotation is `true` for the variable. As a result, the system specifies the variable as configurable and sets the `"Top Entry"` (the first value in the `["Top Entry", "Bottom Entry", "Side Entry"]` CML domain) as the initial value for the `Cable Entry`.

Example 3

In this example, the `configurable` annotation is specified as `false` for the variable (Cable Entry) of the VoltageConnection child products. The `defaultValue` is not specified

```
type GeneratorSet {
    relation voltageConnections : VoltageConnection[1..999999];
}
type VoltageConnection {
    @(configurable = false)
    string cableEntry = ["Top Entry", "Bottom Entry", "Side Entry"];
}
```

Example Description and Configurator Result

In this example, the `configurable` annotation is `false` for the variable. As a result, the engine doesn't configure the variable with an initial value, and it is displayed empty on the Product Configuration UI.

Example 4

In this example, the `configurable` is `false` and `defaultValue` annotation is `true` for the variable (Cable Entry) of the VoltageConnection child products.

```
type GeneratorSet {
    relation voltageConnections : VoltageConnection[1..999999];
}
type VoltageConnection {
    @(configurable = true, defaultValue = "Side Entry")
    string cableEntry = ["Top Entry", "Bottom Entry", "Side Entry"];
}
```

Example Description and Configurator Result

In this example, the system indicates the variable as `configurable` and sets the `"Side Entry"` as the initial value for the `Cable Entry` defined in the `defaultValue` annotation.

Example 5

In this example, the `configurable` and `defaultValue` annotations are specified for the variable (Cable Entry) of the VoltageConnection child products.

```
type GeneratorSet {
    relation voltageConnections : VoltageConnection[1..999999];
}
type VoltageConnection {
    @(configurable = false, defaultValue = "Side Entry")
    string cableEntry = ["Top Entry", "Bottom Entry", "Side Entry"];
}
```

Example Description and Configurator Result

In this example, the system sets the `"Side Entry"` as the initial value for the `Cable Entry` according to the `defaultValue` annotation.

Table 9: configurable Configuration Settings

Associated Example	Product Group Structure	Applicable to	"CONFIGURABLE" annotation	User Action	Engine Action	UI Behavior
Example 1	Individual product	Variable	not specified	Configure the product containing variable	Set the first value from the variable domain as initial value. If the User changes the variable value manually, reset it back to the first value from the variable domain. If the default value is defined in PCM, reset it back to the first value from the variable domain	Display defined by engine variable value as the default value
Example 2 Example 4	Individual product	Variable	TRUE	Configure the product containing variable	Set the first value from the variable domain as initial value	Display defined by engine variable value as the default value

Associated Example	Product Group Structure	Applicable to	"CONFIGURABLE" annotation	User Action	Engine Action	UI Behavior
					If the User changes the variable value manually, reset it back to the first value from the variable domain. If the default value is defined in PCM, reset it back to the first value from the variable domain If the defaultValue annotation is specified for the variable, set it as initial value	
Example 3 Example 5	Individual product	Variable	FALSE	Configure the product containing variable	Set emptiness for the variable as initial value (If the default value is specified in PCM for the variable, set it as initial value instead of emptiness). If the defaultValue annotation is specified for the variable, set it as initial value (despite of the PCM default value)	Display defined by engine or PCM variable value as the default value

defaultValue Annotation

The `defaultValue` annotation is used on a variable to define the value it should start with when configuration begins.

Annotation	`defaultValue`
Applicable to	Variable
Value Type/Values	Literal
Description	The configurator uses the default value defined in PCM (Product Attribute Definition). If no PCM default is available, the configurator uses the first value in the variable domain as the initial value. If no default value is defined in PCM and a defaultValue is specified in CML, the configurator uses the value defined in CML as the initial value of the variable.

Example 1

In this example, neither PCM nor CML defines a default value for the Cable Entry variable.

```
type GeneratorSet {
    relation voltageConnections : VoltageConnection[1..999999];
}
type VoltageConnection {
    string cableEntry = ["Top Entry", "Bottom Entry", "Side Entry"];
}
```

Example Description and Configurator Result

The configurator sets `"Top Entry"` as the initial value for `Cable Entry`, because it is the first value in the variable domain `["Top Entry", "Bottom Entry", "Side Entry"`.

Example 2

In this example, PCM (Product Attribute Definition) defines `"Bottom Entry"` as the default value for `Cable Entry`, and no `defaultValue` annotation is defined for this variable in CML.

```
type GeneratorSet {
    relation voltageConnections : VoltageConnection[1..999999];
}
// This annotation is added automatically if PCM has a default before the product is added
 to CML. If the product already exists in CML, the annotation is added or updated only
after running Sync.
@(defaultValue = "Bottom Entry")
type VoltageConnection {
    string cableEntry = ["Top Entry", "Bottom Entry", "Side Entry"];
}
```

Example Description and Configurator Result

The configurator sets the `"Bottom Entry"` as the initial value for the `Cable Entry` of the `VoltageConnection` child products.

As a best practice, define the default value in PCM and use the Sync function in CML to keep the model aligned whenever PCM settings are updated.

Example 3

In this example, a `defaultValue` annotation with `"Side Entry"` is defined in CML, and no default value is defined in PCM for the `Cable Entry` variable.

```
type GeneratorSet {
    relation voltageConnections : VoltageConnection[1..999999];
}

type VoltageConnection {
    @(defaultValue = "Side Entry")
    string cableEntry = ["Top Entry", "Bottom Entry", "Side Entry"];
}
```

Example Description and Configurator Result

The configurator sets the `"Side Entry"` annotation value as the initial value for Cable Entry.

Note: We recommend that you define default values in PCM (Product Attribute Definition) whenever possible, as this approach promotes consistency across products and simplifies maintenance.

The defaultValue annotation in CML should be used only when a default value is not suitable to be defined in PCM due to specific modeling requirements.

When a default value is defined in PCM but the CML model has not been synced, the configurator still applies the PCM default. However, the value displayed in the CML model may become inconsistent with PCM.

To avoid such inconsistencies, it is recommended to run the Sync action in CML after updating default values in PCM, so that the CML model remains aligned with the latest PCM settings.

defaultValue Configuration Settings

Table 10: defaultValue Configuration Settings

Associated Example	Configurable Specified	Configurable Value	defaultValue Specified	Initial Value Behavior	Example UI Result
Example 1	No	default = TRUE	No	Uses the first value in the domain	Automatically set to "Top Entry"
Example 2	Yes	TRUE	No	Uses the first value in the domain	Automatically set to "Bottom Entry"
Example 3	Yes	FALSE	No	No initial value is set	Field remains empty
N/A	Yes	TRUE	Yes	Uses the value defined in defaultValue	Automatically set to "Side Entry"
N/A	Yes	FALSE	Yes	Still uses the value defined in defaultValue	Automatically set to "Side Entry"

domainComputation Annotation

`domainComputation` is a CML annotation that specifies how the domain of a model element is determined, either by using a fixed domain or by computing the domain dynamically during configuration.

`domainComputation` annotation specification: Variable and Relationship

Annotation	`domainComputation`
Applicable to	Variable and Relationship
Value Type/Values	true, false
Description	`If domainComputation annotation is not explicitly specified, the engine sets it implicitly as false for the variable, and true for a relationship` If the `domainComputation` annotation is specified as `true`, the variable or relationship domain is dynamically determined based on the configuration and constraint logic. If the `domainComputation` annotation is specified as `false`, the variable domain is fixed.

Example 1

In this example, the `domainComputation` annotation is not specified for the variable (voltage) of the `GeneratorSet` type. The model contains the constraints.

```
type GeneratorSet {
    @(defaultValue = "Emergency Standby Power (ESP)")
    string dutyRating = ["Emergency Standby Power (ESP)", "Prime Power (PRP)", "Continuous
 Power (COP)", "Data Center Continuous (DCC)"];
    string voltage = ["220/380", "240/416", "347/600", "255/440", "277/480", "2400/4160",
 "7200/12470", "7621/13200", "7976/13800"]
    constraint(dutyRating == "Continuous Power (COP)" -> voltage != "220/380");
    constraint(dutyRating == "Data Center Continuous (DCC)" -> voltage == "255/440");
}
```

Example 2

In this example, the `domainComputation` annotation is explicitly specified as false for the variable (voltage) of the `GeneratorSet` type. The model contains the constraints.

```
type GeneratorSet {
    @(defaultValue = "Emergency Standby Power (ESP)")
    string dutyRating = ["Emergency Standby Power (ESP)", "Prime Power (PRP)", "Continuous
 Power (COP)", "Data Center Continuous (DCC)"];
    @(domainComputation = false)
    string voltage = ["220/380", "240/416", "347/600", "255/440", "277/480", "2400/4160",
 "7200/12470", "7621/13200", "7976/13800"];
    constraint(dutyRating == "Continuous Power (COP)" -> voltage != "220/380");
```

```
    constraint(dutyRating == "Data Center Continuous (DCC)" -> voltage == "255/440");
}
```

Example Description and Configurator Result

In example 1, the `domainComputation` annotation is not explicitly specified for the `voltage` variable, but the system considers it as `false` by default. In example 2, the `domainComputation` annotation is explicitly defined as `false`. As a result, the system remains the variable domain unchanged `(["220/380", "240/416", "347/600", "255/440", "277/480", "2400/4160", "7200/12470", "7621/13200", "7976/13800"])` and executes the constraints:

If the `dutyRating` is selected with the `"Continuous Power (COP)"` value, the `voltage` is pre-populated with the next possible value from the variable domain `("240/416")` to satisfy the constraint.

If the `dutyRating` is selected with the `"Data Center Continuous (DCC)"` value, the `voltage` is pre-populated with the `"255/440"` value to satisfy the constraint.

Example 3

In this example, the `domainComputation` annotation is explicitly specified as `true` for the variable (`voltage`) of the `GeneratorSet` type. The model contains the constraints.

```
type GeneratorSet {
    @(defaultValue = "Emergency Standby Power (ESP)")
    string dutyRating = ["Emergency Standby Power (ESP)", "Prime Power (PRP)", "Continuous
 Power (COP)", "Data Center Continuous (DCC)"];
    @(domainComputation = true)
    string voltage = ["220/380", "240/416", "347/600", "255/440", "277/480", "2400/4160",
 "7200/12470", "7621/13200", "7976/13800"];
    constraint(dutyRating == "Continuous Power (COP)" -> voltage != "220/380");
    constraint(dutyRating == "Data Center Continuous (DCC)" -> voltage == "255/440");
}
```

Example Description and Configurator Result

In example 3, the `domainComputation` annotation is explicitly specified as `true` for the `voltage` variable. As a result, the system updates the variable domain based on the constraint logic.

If the `dutyRating` is selected with the `"Continuous Power (COP)"` value, the voltage is pre-populated with the next possible value from the variable domain `("240/416")` to satisfy the constraint. The variable domain is updated to exclude the `"220/380"` value.

If the `dutyRating` is selected with the `"Data Center Continuous (DCC)"` value, the `voltage` is pre-populated with the `"255/440"` value to satisfy the constraint. The variable domain is updated to contain only the `"255/440"` value.

Example 4

In this example, the `domainComputation` annotation is not specified for the relationship (temperatureSensors). The model contains the constraints.

```
type GeneratorSet {
    @(defaultValue = "Emergency Standby Power (ESP)")
    string dutyRating = ["Emergency Standby Power (ESP)", "Prime Power (PRP)", "Continuous
 Power (COP)", "Data Center Continuous (DCC)"];
```

```
    relation temperatureSensors : TemperatureSensor[0..1];
    constraint(dutyRating == "Continuous Power (COP)" ->
temperatureSensors[BearingTemperatureSensor] == 0);
    constraint(dutyRating == "Data Center Continuous (DCC)" ->
temperatureSensors[StatorTemperatureSensor] == 0);
}
type TemperatureSensor;
type BearingTemperatureSensor : TemperatureSensor;
type StatorTemperatureSensor : TemperatureSensor;
```

Example 5

In this example, the `domainComputation` annotation is explicitly specified as `true` for the relationship (temperatureSensors). The model contains the constraints.

```
type GeneratorSet {
    @(defaultValue = "Emergency Standby Power (ESP)")
    string dutyRating = ["Emergency Standby Power (ESP)", "Prime Power (PRP)", "Continuous
 Power (COP)", "Data Center Continuous (DCC)"];
    @(domainComputation = true)
    relation temperatureSensors : TemperatureSensor[0..1];
    constraint(dutyRating == "Continuous Power (COP)" ->
temperatureSensors[BearingTemperatureSensor] == 0);
    constraint(dutyRating == "Data Center Continuous (DCC)" ->
temperatureSensors[StatorTemperatureSensor] == 0);
}
type TemperatureSensor;
type BearingTemperatureSensor : TemperatureSensor;
type StatorTemperatureSensor : TemperatureSensor;
```

Example Description and Configurator Result

In example 4, the `domainComputation` annotation is not explicitly specified for the `temperatureSensors` relationship, but the system considers it as `true` by default. In example 5, the `domainComputation` annotation is explicitly specified as `true` for the relationship. As a result, the system updates the relationship domain based on the constraint logic.

- If the `dutyRating` is selected with the `"Continuous Power (COP)"` value, the system re-computes the relationship domain and excludes the `BearingTemperatureSensor` product to satisfy the constraint. The `StatorTemperatureSensor` product remains and can be selected in scope of the `GeneratorSet` bundle product;
- If the `dutyRating` is selected with the `"Data Center Continuous (DCC)"` value: the system re-computes the relationship domain and excludes the `StatorTemperatureSensor` product to satisfy the constraint. The `BearingTemperatureSensor` product remains and can be selected in scope of the `GeneratorSet` bundle product.

Example 6

In this example, the `domainComputation` annotation is explicitly specified as `false` for the relationship (`temperatureSensors`). The model contains the constraints.

```
type GeneratorSet {
    @(defaultValue = "Emergency Standby Power (ESP)")
    string dutyRating = ["Emergency Standby Power (ESP)", "Prime Power (PRP)", "Continuous
 Power (COP)", "Data Center Continuous (DCC)"];
```

```
    @(domainComputation = false)
    relation temperatureSensors : TemperatureSensor[0..1];
    constraint(dutyRating == "Continuous Power (COP)" ->
temperatureSensors[BearingTemperatureSensor] == 0);
    constraint(dutyRating == "Data Center Continuous (DCC)" ->
temperatureSensors[StatorTemperatureSensor] == 0);
}
type TemperatureSensor;
type BearingTemperatureSensor : TemperatureSensor;
type StatorTemperatureSensor : TemperatureSensor;
```

Example Description and Configurator Result

In example 6, the `domainComputation` annotation is explicitly specified as `false` for the relationship. As a result, the system remains the relationship domain unchanged and executes the constraints:

If the `dutyRating` is selected with the `"Continuous Power (COP)"` value, the system displays both `BearingTemperatureSensor` and `StatorTemperatureSensor` products in scope of the `GeneratorSet` bundle product. The `BearingTemperatureSensor` product cannot be selected based on the constraint.

If the `dutyRating` is selected with the `"Data Center Continuous (DCC)"` value, the system displays both `BearingTemperatureSensor` and `StatorTemperatureSensor` products in scope of the GeneratorSet bundle product. The `StatorTemperatureSensor` product cannot be selected based on the constraint.

domainComputation Configuration Settings

Table 11: defaultValue Configuration Settings

Applicable to	"domainComputation" annotation	User Action	Actual UI Behavior	Actual Engine Behavior	Constraint Model
string voltage	not specified	Case 1: Duty Rating = any except specified in constraints (e.g. "Prime Power (PRP)", "Emergency Standby Power (ESP)"): • Initial value for the voltage = the value specified in the @defaultValue annotation ("220/380") • The user can select a different voltage value (e.g. "240/416", "255/440" etc.). The system remains User selected voltage	Always show the full voltage domain regardless of the Duty Rating selection.	Remain the full voltage domain. Case 1: Duty Rating = any except specified in constraints (e.g. "Prime Power (PRP)", "Emergency Standby Power (ESP)"): • If the configuration is saved with initial (default) voltage value ("220/380"): attributeName:"voltage", configStatus:"Default" • If the configuration is saved with User selected voltage value (e.g.	`type GeneratorSet { @(defaultValue = "Emergency Standby Power (ESP)") string dutyRating = ["Emergency Standby Power (ESP)", "Prime Power (PRP)", "Continuous Power (COP)",`

Applicable to	"domainComputation" annotation	User Action	Actual UI Behavior	Actual Engine Behavior	Constraint Model

		• The user can save the configuration with both values: initial voltage or user-selected voltage
		
		Case 2: Duty Rating = "Continuous Power (COP)"
		
		• Initial value for the voltage = next possible value from the domain to satisfy the constraint ("240/416")
		
		• Warning: If the user selects a different voltage (e.g. "220/380", "255/440", "2400/4160" etc.), the system reverts it to the initial value ("240/416")
		
		• The user can save the configuration with the initial voltage value (the configuration cannot be saved with other voltage due to reverting)
		
		Case 3: Duty Rating = "Data Center Continuous (DCC)"
		
		• Initial value for the voltage = specified value in constraint that comes first in the domain ("220/380")
		
		• The user can select a different vaild voltage specified in constraint ("255/440"). The system remains User selected voltage
				"255/440"): attributeName":"voltage","configStatus":"Default"
				
				Case 2: Duty Rating = "Continuous Power (COP)"
				
				• If the configuration is saved with initial/reverted to initial voltage value ("240/416"): "attributeName":"voltage","configStatus":"Engine"
				
				Case 3: Duty Rating = "Data Center Continuous (DCC)"
				
				• If the configuration is saved with initial ("220/380")/other constraint specified("255/440")/reverted to constraint specified voltage values ("220/380", "255/440"): "attributeName":"voltage","configStatus":"Default"

peelable Annotation

The `peelable` annotation is used to create soft selection values and allow the engine to modify these selections to satisfy a constraint.

Annotation	`peelable`
Applicable to	Variable
Value Type/Values	true, false
Description	Indicates whether the constraint engine can override the variable's value (whether set by default or user selection) to resolve a conflict. • If `peelable` annotation is set to `true`, the engine treats the value as a "soft selection." When a configuration conflict occurs, the engine attempts to "peel" (unbind) this variable and retry the solution. If a valid configuration is found, the engine automatically changes the value to satisfy constraints rather than displaying an error message. • If `peelable` annotation is set to `false`, the engine treats the value as a "hard selection." If the value causes a conflict with a constraint, the engine will not attempt to change it automatically. Instead, it will stop and display a conflict error message to the user, requiring manual intervention to resolve the issue.

Example 1: peelable = true (Soft Selection)

In this scenario, the `ServiceLevel` defaults to `"Standard"`. Because it is marked `peelable = true`, the Constraint Engine treats this value as a "soft pick." It is authorized to override this value automatically if a conflict arises with another selection.

```
type CloudSubscription {

    // User adds 5TB of storage
    int storageTB = [1..3];

    /*
     * peelable=true: The engine acts as a "negotiator."
     * If a constraint needs to change this value, the engine is allowed
     * to "peel" (remove) the user's selection and apply the required value.
     */
    @(defaultValue = "Standard", peelable = true)
    string ServiceLevel = ["Standard", "Premium"];

    // Constraint: 5TB or more requires Premium Service
    constraint(storageTB >= 5 -> ServiceLevel == "Premium", "High storage requires Premium
 service");
}
```

Example 2: peelable = false (Hard Selection)

In this scenario, `peelable` is omitted (defaulting to `false`) or explicitly set to `false`. The engine treats the value `"Standard"` as a "hard constraint" or a firm user commitment. It is not authorized to change it automatically.

```
type CloudSubscription {

    // User adds 5TB of storage
    int storageTB = [1..3];

    /*
     * peelable=false (Default): The engine acts as a "validator."
     * It respects the current value as a hard fact.
     * It cannot change "Standard" to "Premium" on its own.
     */
    @(defaultValue = "Standard", peelable = false)
    string ServiceLevel = ["Standard", "Premium"];

    // Constraint: 5TB or more requires Premium Service
    constraint(storageTB >= 5 -> ServiceLevel == "Premium", "High storage requires Premium
 service");
}
```

Example Description and Configurator Result

In example 1, the `ServiceLevel` attribute is specified with the `peelable` annotation set to `true`. In example 2, the annotation is not specified, so the system considers it as false by default. As a result, if the user updates the `storageTB` variable to 5, the system automatically changes the `ServiceLevel` to `"Premium"` in example 1 according to constraint logic, effectively "peeling" the default `"Standard"` value to resolve the conflict. The system allows this override without displaying an error message to the user. In example 2, the system does not allow the engine to override the default `"Standard"` value automatically. Consequently, the system displays a conflict error message, and the user must manually update the `ServiceLevel` to `"Premium"` to satisfy the constraint.

Example 3: System-Driven Soft Selection (configurable = false, peelable = true)

In this example, the `Voltage` is set to a high voltage (" `2400/4160`") by default. The annotation `configurable = false` prevents the user from manually changing this value in the UI. However, `peelable = true` is added to allow the constraint engine to override this default if a specific compliance standard is selected.

```
type GeneratorSet {

    string standardsAndCompliance = ["None", "Listing-UL 2200"];

    /*
     * configurable=false: The user cannot change this directly.
     * peelable=true: The engine is authorized to change the default
     * to resolve conflicts with the standardsAndCompliance selection.
     */
    @(defaultValue = "2400/4160", configurable = false, peelable = true)
    string Voltage = ["220/380", "277/480", "2400/4160"];

    // Constraint: UL 2200 listing requires a specific low voltage (277/480)
    constraint(standardsAndCompliance == "Listing-UL 2200" -> Voltage == "277/480");
}
```

Example Description and Configurator Result

In example 3, the `Voltage` is specified with configurable set to `false`, preventing user interaction, but peelable is set to `true`. Initially, the system sets the voltage to "`2400/4160`". If the user updates the `standardsAndCompliance` variable to "`Listing-UL 2200`", the system detects a conflict with the default voltage. Because the variable is peelable, the system automatically "peels" the default "`2400/4160`" value and changes it to "`277/480`" to satisfy the constraint. The transition happens silently without a conflict error, even though the user cannot manually edit the field.

Example 4: System-Driven Hard Constraint (configurable = false, peelable = false)

In this example, the `EmissionsTier` is set to "`Tier 3`" by default. It is marked `configurable = false` (system-controlled) and `peelable` is omitted (defaults to false), treating the default value as a hard constraint.

```
type GeneratorSet {

    string Location = ["US", "International"];

    /*
     * configurable=false: The user cannot change this.
     * peelable=false (Default): The engine treats "Tier 3" as a hard fact.
     */
    @(defaultValue = "Tier 3", configurable = false)
    string EmissionsTier = ["Tier 3", "Tier 4 Final"];

    // Constraint: US Location requires Tier 4 Final
    constraint(Location == "US" -> EmissionsTier == "Tier 4 Final", "US requires Tier 4
Final emissions");
}
```

Example Description and Configurator Result

In example 4, the `EmissionsTier` is specified with configurable set to `false`, and `peelable` is not specified (defaulting to `false`). As a result, the system considers the default value "`Tier 3`" as a hard constraint that cannot be overridden. If the user updates the Location variable to "`US`", the constraint engine attempts to enforce "`Tier 4 Final`" but finds it cannot overwrite the fixed "`Tier 3`" value. Consequently, the system displays a conflict error message stating "`US requires Tier 4 Final emissions`," and the configuration enters an invalid state because the user cannot manually change the EmissionsTier to resolve it.

Example 5: Auto-Correcting User Input (`configurable = true`, `peelable = true`)

In this example, the `EnclosureType` is user-selectable (`configurable = true`) and defaults to "Standard". It is marked with `peelable = true`. This allows the engine to override even an explicit user selection if a subsequent choice makes the enclosure invalid.

```
type GeneratorAccessories {
    /*
     * configurable=true: User explicitly selects 'Standard'.
     * peelable=true: Grants permission to override the User's selection
     * to resolve conflicts with the Environment.
     */
    @(defaultValue = "Standard", configurable = true, peelable = true)
    string EnclosureType = ["Standard", "Heated", "Reinforced"];

    string Environment = ["Indoor", "Arctic"];

    // Constraint: Arctic requires Heated Enclosure
    constraint(Environment == "Arctic" -> EnclosureType == "Heated");
}
```

Example Description and Configurator Result

In example 5, the `EnclosureType` is specified with `configurable` set to `true` and `peelable` set to `true`. Initially, the system allows the user to confirm the selection of "`Standard`". If the user subsequently updates the `Environment` variable to "`Arctic`", the system detects that "`Standard`" is invalid. Typically, the engine protects user selections and would throw an error. However, because `EnclosureType` is peelable, the system treats the user's choice as a "soft pick." It automatically "peels" the "`Standard`" selection and changes it to "`Heated`" to satisfy the logic. The user sees their previous selection update automatically to match the new environment requirement, preventing a "dead end" configuration state.

Example 6: Upstream Correction (`sequence`, `peelable = true`)

In this example, the `Voltage` is configured early in the process (Sequence 1) with a default value of "`Low`". It is marked with `peelable = true` to allow downstream selections to override this initial setting.

```
type GeneratorSet {
    /*
     * sequence=1: Evaluated first. Defaults to 'Low'.
     * peelable=true: Allows 'Application' (seq=2) to force a change to this value.
     */
    @(defaultValue = "Low", sequence = 1, peelable = true)
    string Voltage = ["Low", "Medium", "High"];

    /*
     * sequence=2: Evaluated after Voltage is set.
```

```
     * The user picks 'DataCenter', which requires High Voltage.
     */
    @(sequence = 2)
    string Application = ["Residential", "DataCenter"];

    // Constraint: DataCenter application forces High Voltage
    constraint(Application == "DataCenter" -> Voltage == "High");
}
```

Example Description and Configurator Result

In example 6, the `Voltage` attribute is specified with `sequence` set to `1` and `peelable` set to `true`. As a result, the system initially sets the value to "`Low`" before evaluating the `Application` attribute. If the user updates the `Application` variable to "`DataCenter`" (which runs at sequence 2), the system detects a conflict between the established "`Low`" voltage and the constraint requirement for "`High`" voltage. Because `Voltage` is peelable, the system automatically "peels" the default "`Low`" value and changes it to "`High`" to satisfy the constraint. The transition happens silently without a conflict error, effectively allowing a later user choice to correct an earlier default assumption.

Example 7: Guided Fallback ('strategy`, `peelable = true`)

In this example, the `ServiceTier` defaults to "`Bronze`" (the lowest value). It is marked with `peelable = true` and `strategy = "descending"`. If a constraint forces a change from the default, the strategy directs the engine to try the highest possible valid values first.

```
type ServicePlan {
    /*
     * defaultValue="Bronze": Start cheap.
     * peelable=true: Allow upgrade if needed.
     * strategy="descending": If peeled, try 'Platinum' next (Max value),
     * instead of creeping up to 'Silver'.
     */
    @(defaultValue = "Bronze", strategy = "descending", peelable = true)
    string ServiceTier = ["Bronze", "Silver", "Gold", "Platinum"];

    int UserCount = [1..1000];

    // Constraint: > 100 users requires Premium tiers (Gold or Platinum)
    constraint(UserCount > 100 -> ServiceTier in ["Gold", "Platinum"]);
}
```

Example Description and Configurator Result

In example 7, the `ServiceTier` is specified with `strategy` set to "`descending`" and `peelable` set to `true`. Initially, the system sets the value to "`Bronze`". If the user updates the `UserCount` variable to 150, the constraint requires `ServiceTier` to be either "`Gold`" or "`Platinum`". Because the variable is peelable, the system removes the "`Bronze`" selection. Instead of testing the next closest value ("`Silver`"), the "`descending`" strategy instructs the engine to attempt resolution starting from the top of the domain. Consequently, the system automatically selects "`Platinum`" (the highest valid option) rather than "`Gold`". The user sees the plan upgrade immediately to the highest tier without an error message.

productField Annotation

productField is a CML annotation that defines the Product2 field on a variable. productField loads the value from Product Catalog Management (PCM) during constraint model activation.

Annotation	`productfield`
Applicable to	Variable
Value Type/Values	Literal (case sensitive)
Description	Used to load the value from the corresponding Product2 field defined in Product Catalog Management(PCM). Defined under either a type or supertype. If defined under a supertype, the types, which inherit from the supertype, load the Product2 field value for the corresponding product. Supports a maximum of 50 Product2 fields. Loads product field values for a maximum of 20,000 products. Read-only. Doesn't support a null value.

Example 1

In this example, "TestNumber__c" is a custom field defined on the Product2 object. The constraint rules engine loads the value of "TestNumber__c" for the Laptop product during constraint model activation.

```
type Laptop {
    @(productField = "TestNumber__c")
    int TestNumber;
}
```

Example 2

In this example, the product field variable "productName" is defined under a supertype "LineItem". Any type that inherits the supertype loads the value of "Name" for the corresponding product during constraint model activation.

```
type LineItem {
    @(productField = "Name")
    string productName;
}

type Laptop : LineItem;
type Mouse : LineItem;
}
```

Example 3

In this example, the product field variable "productName" is defined under the parent type "LaptopProBundle". "Laptop" is a child of "LaptopProBundle", and it can access the "productCode" variable from its parent by using the parent() function.

```
type LaptopProBundle {
    @(productField = "ProductCode")
    string productCode;

    relation laptop : Laptop;
}

type Laptop {
    string parentProductCode = parent(productCode);
}
```

propagateUp Annotation

`propagateUp` is a Constraint Modeling Language (CML) annotation that controls aggregation propagation between children and parent elements.

Annotation	`propagateUp`
Applicable to	Relationship
Value Type/Values	true, false
Description	If propagateUp is not specified, the engine sets it implicitly as false for the relationship. • If the propagateUp annotation is specified as true, the engine aggregates values from children to parent elements (upward propagation). The engine cannot modify this value from the parent level (e.g. via constraint), so the children relation domain will not be affected. • If the propagateUp is specified as false, both upward and downward propagations are applicable. The engine aggregates values from children to parent elements (upward propagation). Meanwhile the engine can modify this value (e.g. via constraint) from the parent level. The value is propagated downward and might affect the relation domain (downward propagation).

Example 1

In this example, the `propagateUp` annotation is not specified for the relationship (`warranties`). The model contains technical variable (`coverageDays`) and constraint.

```
type GeneratorSet {

        relation warranties : Warranty {
        totalDays = sum(coverageDays);
    }
```

```
    constraint(warranties.totalDays <= 299);
}

type Warranty {
    int coverageDays = 100;
}

type Warranty_PRP : Warranty;

type Warranty_DCC : Warranty;

type Warranty_ESP : Warranty;
```

Example 2

In this example, the `propagateUp` annotation is defined as `false` for the relationship (`warranties`). The model contains technical variable (coverageDays) and constraint.

```
type GeneratorSet {

        @(propagateUp = false)
        relation warranties : Warranty {
        totalDays = sum(coverageDays);
    }
    constraint(warranties.totalDays <= 299);
}

type Warranty {
    int coverageDays = 100;
}

type Warranty_PRP : Warranty;

type Warranty_DCC : Warranty;

type Warranty_ESP : Warranty;
```

Example Description and Configurator Result

In example 1, the `warranties` relation is not specified with the propagateUp annotation, and the system considers it as `false` by default. In example 2, the relation is explicitly defined with a `false` annotation value. Each product of the `warranties` relation is assigned with the technical `coverageDays` variable equalled to 100. The `totalDays` calculates the `coverageDays` sum of selected `warranties` products. As a result, the system validates the constraint and relation domain in the following way:

- The user selects one `warranties` product (e.g. `Warranty_PRP`). The system calculates the `totalDays` aggregated value for the relation (equal to 100). The system validates the constraint on the parent based on the calculated aggregation variable. The constraint is satisfied (100<= 299). The system also verifies the possibility to add extra products to the relation. The capacity of the constraint allows to add one more product to the relation, so the system will not reduce the relation domain.
- The user selects the second `warranties` product (e.g. `Warranty_DCC`). The system calculates the `totalDays` aggregated value for the relation (equal to 200). The system validates the constraint on the parent based on the calculated aggregation variable. The constraint is satisfied (200<= 299). The system verifies the possibility to add extra products to the relation. The capacity of the constraint (300<= 299) does not allow to add one more product to the relation, so the system will reduce the relation domain.

- The user unselects one of the selected `warranties` products (e.g. `Warranty_PRP`). The system calculates the `totalDays` aggregated value for the relation (equal to 100). The system validates the constraint on the parent based on the calculated aggregation variable. The constraint is satisfied (100<= 299). The system verifies the possibility to add extra products to the relation. The capacity of the constraint allows to add one more product to the relation, so the system will not reduce the relation domain (both `Warranty_DCC` and `Warranty_ESP` products are available for selection).

Example 3

In this example, the `propagateUp` annotation is specified for the relationship (`warranties`) as `true`. The model contains technical variable (`coverageDays`) and constraint.

```
type GeneratorSet {

        @(propagateUp = true)
        relation warranties : Warranty {
        totalDays = sum(coverageDays);
    }
    constraint(warranties.totalDays <= 299);
}

type Warranty {
    int coverageDays = 100;
}

type Warranty_PRP : Warranty;

type Warranty_DCC : Warranty;

type Warranty_ESP : Warranty;
```

Example Description and Configurator Result

In example 3, the relation is specified with `propagateUp` annotation as `true` value. Each product of the `warranties` relation is assigned with the technical `coverageDays` variable equalled to 100. The `totalDays` calculates the `coverageDays` sum of selected `warranties` products. As a result, the system validates the constraint and relation domain in the following way:

The user selects one `warranties` product (e.g. `Warranty_PRP`). The system calculates the `totalDays` aggregated value for the relation (equal to 100). The system validates the constraint on the parent based on the calculated aggregation variable. The constraint is satisfied (100<=299);

The user selects the second `warranties` product (e.g. `Warranty_DCC`). The system calculates the `totalDays` aggregated value for the relation (equal to 200). The system validates the constraint on the parent based on the calculated aggregation variable. The constraint is satisfied (200<=299);

The user selects the third `warranties` product (e.g. `Warranty_ESP`). The system calculates the `totalDays` aggregated value for the relation (equal to 300). The system validates the constraint on the parent based on the calculated aggregation variable. The constraint is not satisfied (300<=299). The system rejects the selection of one of the warranties products to satisfy the constraint.

As a best practice, use the `propagateUp = true` for models with few relationships and rare constraint violations, since it minimizes propagation work and avoids extra domain updates. Meanwhile, set the `propagateUp = false` for large product structures or frequent violations, since bidirectional propagation prevents invalid states early and reduces expensive backtracking.

propagateUp Configuration Settings

Table 12: propagateUp Configuration Settings

Associated Example	Product Group Structure	Applicable to	"propagateUp" annotation	User Action	Engine Action	UI Behavior
Example 1	Individual product	Relationship	not specified	Selects or deselects the products	Calculates the aggregation variable value on the relation, validation of the constraint, limitation of the relation domain when the constraint capacity is used up	Displays the selected products. When constraint capacity is used up, in addition to the selected products the limited list of the available to be added products will be displayed(if any)
Example 2	Individual product	Relationship	FALSE	Selects or deselects the products	Calculates the aggregation variable value on the relation, validation of the constraint, limitation of the relation domain when the constraint capacity is used up	Displays the selected products. When constraint capacity is used up, in addition to the selected products the limited list of the available to be added products will be displayed(if any)
Example 3	Individual product	Relationship	TRUE	Selects or deselects the products	Calculates the aggregation variable value on the relation, validation of the constraint, rejection of the user selection when the constraint validation is failed	Displays the selected products. No limitations for the list of available products

No limitations for the list of available products in the browse popup for the classification

relatedAttributes Annotation

`relatedAttributes` is a Constraint Modeling Language (CML) annotation that resets the domain to the original one for domainComputation.

`relatedAttributes` annotation specification: Variable

Annotation	`relatedAttributes`
Applicable to	Variable and Relationship
Value Type/Values	String
Description	For Variables

Annotation	relatedAttributes
	If `relatedAttributes` annotation is not specified, the engine updates the variable domain according to domainComputation and constraint logic. If the `relatedAttributes` annotation is specified with one or multiple values (separated by comma), the variable domain is reset to the original domain. For relationships If `domainComputation` is not explicitly specified, the engine sets it implicitly as true for the relationship. If the `domainComputation` is specified as `true`, the relationship domain is dynamically determined based on the configuration and constraint logic. If the `domainComputation` is specified as `false`, the relationship domain is fixed.

Example 1

In this example, the `relatedAttributes` annotation is not specified for the variables (`controlLanguage`, `controlPlacement`, `commissioningScope`) of the `Control` type. The `domainComputation` annotation is defined for the variables. The model contains the constraints.

```
type GeneratorSet {
    relation controls : Control;
}

type Control {
    @(domainComputation = true, defaultValue = "English")
    string controlLanguage = ["English", "Danish", "French"];

    @(domainComputation = true, defaultValue = "Left")
    string controlPlacement = ["Left", "Right", "Top"];

    @(domainComputation = true, defaultValue = "None")
    string commissioningScope = ["None", "Remote Support", "On-site Commissioning"];

    constraint(controlPlacement == "Right" -> commissioningScope != "Remote Support");

   constraint(controlLanguage == "Danish" -> commissioningScope != "On-site Commissioning");
```

Example Description and Configurator Result

In example 1, the variables of the `Control` type are not specified with the `relatedAttributes` annotation, but defined with the `domainComputation` annotation. As a result, the system updates the variable domain based on the constraint logic.

If the `controlPlacement` is selected with the "`Right`" value, the `commissioningScope` variable domain is updated to exclude the "`Remote Support`" value;

If the `controlLanguage` is selected with the "`Danish`" value, the `commissioningScope` variable domain is updated to exclude the "`On-site Commissioning`" value.

Example 2

In this example, the `relatedAttributes` annotation is specified for the variable with one value. The `domainComputation` annotation is defined for the variables. The model contains the constraints.

```
type GeneratorSet {
    relation controls : Control;
}

type Control {
    @(domainComputation = true, defaultValue = "English")
    string controlLanguage = ["English", "Danish", "French"];

    @(domainComputation = true, defaultValue = "Left")
    string controlPlacement = ["Left", "Right", "Top"];

     @(domainComputation = true, defaultValue = "None", relatedAttributes =
"controlPlacement")
    string commissioningScope = ["None", "Remote Support", "On-site Commissioning"];

    constraint(controlPlacement == "Right" -> commissioningScope != "Remote Support");

   constraint(controlLanguage == "Danish" -> commissioningScope != "On-site Commissioning");
}
```

Example 3

In this example, the `relatedAttributes` annotation is specified for the variable with one value. The `domainComputation` annotation is defined for the variables. The model contains the constraints.

```
type GeneratorSet {
    relation controls : Control;
}

type Control {
    @(domainComputation = true, defaultValue = "English")
    string controlLanguage = ["English", "Danish", "French"];

    @(domainComputation = true, defaultValue = "Left")
    string controlPlacement = ["Left", "Right", "Top"];

   @(domainComputation = true, defaultValue = "None", relatedAttributes = "controlLanguage")

    string commissioningScope = ["None", "Remote Support", "On-site Commissioning"];

    constraint(controlPlacement == "Right" -> commissioningScope != "Remote Support");

   constraint(controlLanguage == "Danish" -> commissioningScope != "On-site Commissioning");
}
```

Example Description and Configurator Result

In Example 2, the `relatedAttributes` annotation is defined with the "`controlPlacement`" value for the `commissioningScope` variable. As a result, the system controls the domain for the `commissioningScope` differently depending on `controlPlacement` or `controlLanguage` variable selection.

If the `controlPlacement` is selected with the "`Right`" value, the `commissioningScope` variable domain remains unchanged, because the `controlPlacement` is listed in the `relatedAttributes` annotation.

If the controlLanguage is selected with the “`Danish`" value, the `commissioningScope` variable domain is updated to exclude the "`On-site Commissioning`" value according to the constraint, because the `controlLanguage` is not listed in the `relatedAttributes` annotation.

In example 3, the `relatedAttributes` annotation is defined with the "`controlLanguage`" value for the `commissioningScope` variable. As a result, the system controls the domain for the `commissioningScope` differently depending on `controlPlacement` or `controlLanguage` variable selection.

If the `controlPlacement` is selected with the "`Right`" value, the `commissioningScope` variable domain is updated to exclude the "`Remote` Support" value according to the constraint, because the `controlPlacement` is not listed in the `relatedAttributes` annotation.

If the `controlLanguage` is selected with the "`Danish`" value, the `commissioningScope` variable domain remains unchanged, because the `controlLanguage` is listed in the `relatedAttributes` annotation.

Example 4

In this example, the `relatedAttributes` annotation is specified for the variable with several values (separated by comma). The domainComputation annotation is defined for the variables. The model contains the constraints.

```
type GeneratorSet {
    relation controls : Control;
}

type Control {
    @(domainComputation = true, defaultValue = "English")
    string controlLanguage = ["English", "Danish", "French"];

    @(domainComputation = true, defaultValue = "Left")
    string controlPlacement = ["Left", "Right", "Top"];

   @(domainComputation = true, defaultValue = "None", relatedAttributes = "controlPlacement,
 controlLanguage")
    string commissioningScope = ["None", "Remote Support", "On-site Commissioning"];

    constraint(controlPlacement == "Right" -> commissioningScope != "Remote Support");

   constraint(controlLanguage == "Danish" -> commissioningScope != "On-site Commissioning");
}
```

Example Description and Configurator Result

In example 4, the `relatedAttributes` annotation is defined with the "`controlPlacement`" and "`controlLanguage`" values for the commissioningScope variable. As a result, the system remains the `commissioningScope` variable domain unchanged.

If the `controlPlacement` is selected with the "`Right`" value, the `commissioningScope` variable domain remains unchanged, because the `controlPlacement` is listed in the `relatedAttributes` annotation.

If the controlLanguage is selected with the "Danish" value, the commissioningScope variable domain remains unchanged, because the controlLanguage is listed in the relatedAttributes annotation.

Example 5

In this example, the relatedAttributes annotation is not specified for the relationship (temperatureSensors). The domainComputation annotation is defined for the relationship. The model contains the constraints.

```
type GeneratorSet {
    @(defaultValue = "Emergency Standby Power (ESP)")
    string dutyRating = ["Emergency Standby Power (ESP)", "Prime Power (PRP)", "Continuous
 Power (COP)", "Data Center Continuous (DCC)"];

    @(domainComputation = true)
    relation temperatureSensors : TemperatureSensor[0..1];

    constraint(dutyRating == "Continuous Power (COP)" ->
temperatureSensors[BearingTemperatureSensor] == 0);

    constraint(dutyRating == "Data Center Continuous (DCC)" ->
temperatureSensors[StatorTemperatureSensor] == 0);
}

type TemperatureSensor;

type BearingTemperatureSensor : TemperatureSensor;

type StatorTemperatureSensor : TemperatureSensor;
```

Example Description and Configurator Result

In example 5, the temperatureSensors relation is not specified with the relatedAttributes annotation, but defined with the domainComputation as true. As a result, the system updates the relationship domain based on the constraint logic.

If the dutyRating is selected with the "Continuous Power (COP)" value, the system re-computes the relationship domain and excludes the BearingTemperatureSensor product to satisfy the constraint. The StatorTemperatureSensor product remains and can be selected in scope of the GeneratorSet bundle product.

If the dutyRating is selected with the "Data Center Continuous (DCC)" value, the system re-computes the relationship domain and excludes the StatorTemperatureSensor product to satisfy the constraint. The BearingTemperatureSensor product remains and can be selected in scope of the GeneratorSet bundle product.

Example 6

In this example, the relatedAttributes annotation is specified for the relationship (temperatureSensors). The domainComputation annotation is defined for the relationship. The model contains the constraints.

```
type GeneratorSet {
    @(defaultValue = "Emergency Standby Power (ESP)")
    string dutyRating = ["Emergency Standby Power (ESP)", "Prime Power (PRP)", "Continuous
 Power (COP)", "Data Center Continuous (DCC)"];

    @(domainComputation = true, relatedAttributes = 'dutyRating')
    relation temperatureSensors : TemperatureSensor[0..1];
```

```
    constraint(dutyRating == "Continuous Power (COP)" ->
temperatureSensors[BearingTemperatureSensor] == 0);

    constraint(dutyRating == "Data Center Continuous (DCC)" ->
temperatureSensors[StatorTemperatureSensor] == 0);
}

type TemperatureSensor;

type BearingTemperatureSensor : TemperatureSensor;

type StatorTemperatureSensor : TemperatureSensor;
```

Example Description and Configurator Result

In example 6, the `temperatureSensors` relation is specified with the `relatedAttributes` annotation containing the `dutyRating` value, the `domainComputation` annotation is defined as `true`. As a result, the system remains the relationship domain unchanged and executes the constraints.

If the `dutyRating` is selected with the "`Continuous Power (COP)`" value, the system displays both `BearingTemperatureSensor` and `StatorTemperatureSensor` products in scope of the `GeneratorSet` bundle product. The `BearingTemperatureSensor` product cannot be selected based on the constraint.

If the `dutyRating` is selected with the "`Data Center Continuous (DCC)`" value, the system displays both `BearingTemperatureSensor` and `StatorTemperatureSensor` products in scope of the `GeneratorSet` bundle product. The `StatorTemperatureSensor` product cannot be selected based on the constraint.

relatedAttributes Configuration Settings

Table 13: relatedAttributes Configuration Settings

Associated Example	Product Group Structure	Applicable to	"relatedAttributes" annotation	"domainComputation" annotation	User Action	Engine Action	UI Behavior
Example 1	Individual product	Variable	not specified	TRUE	Change variable value specified in constraint condition	Update the variable (specified with domainComputation) domain based on domainComputation and constraint logic	Display updated variable domain
Example 2 Example 3	Individual product	Variable	specified (with one variable)	TRUE	Change variable value specified in constraint condition and relatedAttributes	Reset variable (specified in relatedAttributes) domain to the original domain	Display original variable domain

Associated Example	Product Group Structure	Applicable to	"relatedAttributes" annotation	"domainComputation" annotation	User Action	Engine Action	UI Behavior

If the variable is changed again by the user, the value is reverted to the initial value • if products are added first from browse popup: display added products as selected. If constraint variable is changed again by the user, the value is reverted to the initial value

sequence Annotation

The `sequence` annotation defines the execution and configuration order of elements in a Constraint Modeling Language (CML) model.

`sequence` annotation specification: Variable and Relationship

Annotation	`sequence`
Applicable to	Variable and Relationship
Value Type/Values	integer Example: 1, 2, 10
Description	If a sequence value is not explicitly defined, the configurator implicitly determines the order based on the variable or relationship declaration order in the CML model. If a sequence value is explicitly defined, the configurator uses the sequence number to control the order in which variables or relationships are configured. Variables or Relationships with lower sequence values are assigned first.

Example 1

In this example, the `sequence` annotation is not explicitly specified. The `defaultValue` is defined for 3 variables (`controlPlacement`, `commissioningScope`, and `controlLanguage`) of the `Control` products. The model contains a constraint.

```
type GeneratorSet {
    relation controls : Control[1..999999];
}

type Control {
 @(defaultValue = "Left")
 string controlPlacement = ["Left", "Right", "Top"];

 @(defaultValue = "None")
 string commissioningScope = ["None", "Remote Support", "On-site Commissioning"];

 @(defaultValue = "English")
 string controlLanguage = ["English", "Danish", "French"];

 constraint(controlPlacement == "Left" && controlLanguage == "English" -> commissioningScope
 == "Remote Support");
}
```

Example Description and Configurator Result

The model defines 3 variables with `defaultValue` annotation.

```
controlPlacement = "Left"
commissioningScope = "None"
controlLanguage = "English"
```

Even when sequence is not explicitly specified for the variables, the engine assigns it implicitly based on the variable declaration order in the CML type. For this example, the sequence for the variables is:

```
controlPlacement: sequence = 1 (highest priority)
commissioningScope: sequence = 2
controlLanguage: sequence = 3 (lowest priority)
```

The constraint specifies that a type with `controlPlacement == "Left"` and `controlLanguage == "English"` will have a `commissioningScope == "Remote Support":`.

```
constraint(controlPlacement == "Left" && controlLanguage == "English" -> commissioningScope
 == "Remote Support");
```

For any constraint, the engine enforces logical equivalence between the left-hand side (before ->) and the right-hand side (after ->): if the left side evaluates to true, the right side must also be true (and vice versa).

In this example, the engine resolves the true -> false constraint (to be false -> false): it modifies the controlLanguage with the highest sequence.

As a result, the Product Configurator will have next values for the variables:

```
controlPlacement = "Left"
commissioningScope = "None"
controlLanguage = "Danish"
```

Example 2

In this example, the `sequence` annotation is explicitly specified and the defaultValue is defined for 3 variables (`controlPlacement`, `controlLanguage`, `commissioningScope`) of the `Control` products. The model contains a constraint.

```
type GeneratorSet {
    relation controls : Control[1..999999];
}

type Control{

@(defaultValue = "Left", sequence = 1)
string controlPlacement = ["Left", "Right", "Top"];

@(defaultValue = "English", sequence = 3)
string controlLanguage = ["English", "Danish", "French"];

@(defaultValue = "None", sequence = 2)
string commissioningScope = ["None", "Remote Support", "On-site Commissioning"];

constraint(controlPlacement == "Left" && controlLanguage == "English" -> commissioningScope
 == "Remote Support");
}
```

Example Description and Configurator Result

This example is similar to Example 1, but the `sequence` annotation is specified explicitly for the variables to control solver priority:

```
controlPlacement: sequence = 1 (highest priority)
controlLanguage: sequence = 3 (lowest priority)
commissioningScope: sequence = 2
```

The constraint specifies that a type with `controlPlacement == "Left"` and `controlLanguage == "English"` will have a `commissioningScope == "Remote Support":`.

```
constraint(controlPlacement == "Left" && controlLanguage == "English" -> commissioningScope
 == "Remote Support");
```

- Following the same logical equivalence for constraints described in Example 1 and considering the default values specified in the Example 2, the left side of the constraint is true (`controlPlacement = "Left"` and `controlLanguage = "English"`), while the right side is false (`commissioningScope = "None"`).
- Because the `commissioningScope` has higher priority than the `controlLanguage`, the engine avoids changing the `commissioningScope` and instead resolves the constraint by making the left side false.
- The `controlPlacement` has the highest priority sequence than the `controlLanguage`, so the engine modifies the controlLanguage as the most efficient way to satisfy the constraint.

Available values for the `controlLanguage: ["English", "Danish", "French"]`. To make the left side of the constraint false, the engine selects the first non-matching value (specified in CML domain): `"Danish"`.

As a result, the Product Configurator will have next values for the variables.

```
controlPlacement = "Left"
controlLanguage = "Danish"
commissioningScope = "None"
```

Example 3

In this example, the `sequence` annotation is explicitly specified and the defaultValue is defined for 3 variables (`controlPlacement`, `controlLanguage`, and `commissioningScope`) of the `Control` products. The model contains a constraint.

```
type GeneratorSet {
    relation controls : Control[1..999999];
}

type Control{

@(defaultValue = "Left", sequence = 1)
string controlPlacement = ["Left", "Right", "Top"];

@(defaultValue = "English", sequence = 2)
string controlLanguage = ["English", "Danish", "French"];

@(defaultValue = "None", sequence = 3)
string commissioningScope = ["None", "Remote Support", "On-site Commissioning"];

constraint(controlPlacement == "Left" && controlLanguage == "English" -> commissioningScope
 == "Remote Support");
}
```

Example Description and Configurator Result

This example is similar to Example 2, but the lowest priority sequence is specified for the `commissioningScope`. This is a trigger for the engine to modify the `commissioningScope` first to resolve the true -> false constraint to be true -> true).

As a result, the Product Configurator will have next values for the variables:

```
controlPlacement = "Left"
controlLanguage = "English"
commissioningScope = "Remote Support"
```

Example 4

In this example, the sequence annotation is not explicitly specified for 3 relations (`voltageConnections`, `controls`, and `alternators`). The model contains a constraint.

```
type GeneratorSet {
    relation voltageConnections : VoltageConnection[0..999999];
    relation controls : Control[1..999999];
    relation alternators : Alternator[1..999999];

    int alternatorsQty = controls[Control] + voltageConnections[VoltageConnection];
    constraint(alternators[Alternator] > 0 -> alternators[Alternator] == alternatorsQty,
"alternators[Alternator] = controls[Control] + voltageConnections[VoltageConnection]");
}

type Alternator;

type VoltageConnection;

type Control;
```

Example Description and Configurator Result

Even when sequence is not explicitly specified for the relations, the engine sets it implicitly based on the relation declaration order in the CML type. For this example, the sequence for the relations is:

```
relation voltageConnections: sequence = 1 (highest priority)
relation controls: sequence = 2
relation alternators: sequence = 3 (lowest priority)
```

Note: Use mindful sequencing in CML for variables and relations to avoid backtracking issues. Define them in the order you expect the engine to modify them during constraint resolution.

In this example, the CML model works without conflicts because the relations are implicitly defined with the correct sequence. The `voltageConnections` and controls relations are evaluated first, then the `alternatorsQty` is calculated from their quantities. Finally, the `alternators` relation is adjusted based on that result. Because the `alternators` is processed last, the engine avoids backtracking and errors.

Example 5

In this example, the `sequence` annotation is explicitly specified for 3 relations (`voltageConnections`, `controls`, and `alternators`). The model contains a constraint.

```
type GeneratorSet {
 @(sequence=3)
    relation alternators : Alternator[1..999999];
    @(sequence=1)
    relation voltageConnections : VoltageConnection[0..999999];
```

```
 @(sequence=2)
    relation controls : Control[1..999999];

    int alternatorsQty = controls[Control] + voltageConnections[VoltageConnection];
    constraint(alternators[Alternator] > 0 -> alternators[Alternator] == alternatorsQty,
"alternators[Alternator] = controls[Control] + voltageConnections[VoltageConnection]");
}
type Alternator;

type VoltageConnection;

type Control;
```

Example Description and Configurator Result

This example is similar to Example 4, but the `sequence` is explicitly specified for the relations to control the processing priority and ensure the engine evaluates and modifies them in the correct order during configuration.

sequence Configuration Settings

Table 14: sequence Configuration Settings

Associated Example	Product Group Structure	Applicable to	"sequence" annotation	User Action	Engine Action	UI Behavior
Example 1	N/A	Variable	not specified	Configure the product containing variables	Assign the sequence for the variables based on the variable declaration order in the type. split Annotation

`split` is a Constraint Modeling Language (CML) annotation that specifies whether the instances of the type should be split or not.

Annotation	`split`
Applicable to	Type
Value Type/Values	true, false
Description	If split isn't specified, there are multiple instances of the same type in the relationship with different quantities. If the split is specified as `true`, there can be multiple instances of the type, and the quantity of each instance is always 1. If the split is specified as `false`, there is only one instance in the relationship. If the user adds more instances, the engine adds more quantity to the existing instance.

Example 1

In this example, the split annotation isn't specified for the type (Model).

```
type FESBAGeneratorSet {
    relation models : Model;
}
type Model;
```

Example Description and Configurator Result

In this example, the system allows the multiple instances of the Model type with different quantities defined by the user.

Example 2

In this example, the split annotation is specified as `true` for the type (Model).

```
type FESBAGeneratorSet {
    relation models : Model;
}
@(split = true)
type Model;
```

Example Description and Configurator Result

In this example, the annotation `split = true` specifies that the multiple Model instances are split into individual items with fixed quantity 1.

Example 3

In this example, the split annotation is specified as `false` for the type (Model).

```
type FESBAGeneratorSet {
    relation models : Model;
}
@(split = false)
type Model;
```

Use `@(split=false)` when the line item record must persist across configuration changes and record continuity matters for your business process. The `@(split=false)` annotation prevents the configurator from deleting and recreating existing line item records when the quantity or selection changes. When you apply `@(split=false)`, the configurator updates the quantity on the existing record instead of replacing it with a new one. This preserves the record ID and any data associated with it.

Example Description and Configurator Result

In this example, the system allows one instance of the Model type with different quantity defined by the user.

Note: If there are multiple products of type Model (for example, `FESBA 900kW` and `FESBA 1500kW`), the user can add both models to the configuration and adjust the quantity for each one. However, the user can't add additional separate instances of the same product (for example, to configure unique instances with different variable values).

split Configuration Settings

Table 15: split Configuration Settings

Product Group Structure	"split" annotation	Engine Action	user Action	UI Behavior
Product Classification	TRUE	Add multiple products	N/A	N/A
Product Classification	TRUE	N/A	Selecting or adding the product multiple times manually	Multiple instances created (qty = 1 each). User can add more instances, but can't change quantity per instance.

Product Group Structure	"split" annotation	Engine Action	user Action	UI Behavior
Product Classification	FALSE	Add multiple products	N/A	One instance created with qty > 1. User can change the quantity of this instance, but can't add more instances.
Product Classification	FALSE	N/A	Selecting or adding the product multiple times manually	One instance created with qty = 1. User can change the quantity of this instance, but can't add more instances.
Product Classification	(empty)	Add multiple products	N/A	One instance created with qty > 1. User can change quantity and can add more instances.
Product Classification	(empty)	N/A	Selecting or adding the product multiple times manually	One instance created with qty = 1. User can change quantity and can add more instances.
Individual Product	TRUE	Add multiple products	N/A	Multiple line items created, but Configurator displays only one instance. Users cannot modify quantity for that instance.
Individual Product	TRUE	N/A	Selecting or adding the product manually	One instance created with qty = 1. Users cannot change quantity.
Individual Product	FALSE	Add multiple products		One instance created with qty > 1. Users can't modify quantity for that instance.
Individual Product	FALSE	N/A	Selecting or adding the product manually	One instance created with qty = 1. Users can modify quantity for that instance.
Individual Product	(empty)	Add multiple products		One instance created with qty > 1. Users can't modify quantity for that instance.
Individual Product	(empty)	N/A	Selecting or adding the product manually	One instance created with qty = 1. Users can

Product Group Structure	"split" annotation	Engine Action	user Action	UI Behavior
				modify quantity for that instance.

Constraint Modeling Language (CML) Best Practices

To prevent performance degradation or unexpected behaviors when the constraint engine executes CML code, follow these practices when writing code.

For tips on troubleshooting, see Debugging Constraint Modeling Language (CML) on page 1200.

Relationship Cardinality: Specify the Smallest Range Required

In a relationship, cardinality is the quantity of instances of the same type. Specify the smallest required cardinality for a variable, to avoid testing unneeded combinations of values. If you specify a higher cardinality than required, or don't specify cardinality, the constraint engine tests more combinations, which impacts performance.

This example doesn't specify cardinality. The constraint engine tries to set a quantity with 1, 2, 3, all the way up to 9,999:

```
relation engine : Engine;
```

This example specifies minimum and maximum cardinality as 0 and 1, so the constraint engine sets the quantity to 1. The engine tests fewer combinations to find a solution.

```
relation engine : Engine[0..1];
```

Decimals and Doubles: Consider the Impact of Scale on Performance

In a decimal or double, scale is the number of digits that follow the decimal point. Using decimals and doubles in expressions can cause performance problems due to the number of permutations.

In this example, myNumber is a double with a scale of 2. The value can be 0.00, 0.01, 0.02, all the way up to 2.99, which can impact constraint engine performance:

```
double(2) myNumber = [0..3];
```

In this example, myNumber is an integer. The value can only be 0, 1, 2 or 3, which has less impact on constraint engine performance:

```
int myNumber = [0..3];
```

Variable Domains: Keep Domains as Small as Possible

A variable domain is the set of all possible values that the variable can take. In this example, the variable color has a domain with three values:

```
string color = ["Red", "Yellow", "Green"];
```

The larger the domain, the more possible values for the variable, which means more combinations for the engine to test. A large domain can impact performance and lead to slower searches, errors, or unexpected behaviors.

Calculating Values: Put Calculations Inside of Constraints

To calculate a value, put the calculation inside of a constraint, instead of in an inline expression.

For example, to calculate area, use this constraint:

```
constraint(area == length * width)
```

Avoid this example, which calculates the area with an inline expression, and can impact performance:

```
area = length * width.
```

Relationships: Combine Relationships to Reduce Performance Impact

Creating multiple relationships on a type can impact performance. When possible, combine relationships to improve performance.

When possible, avoid this example, which includes separate relationships for Mouse and Keyboard, two accessories in a product bundle:

```
relation mouse : Mouse;
relation keyboard : Keyboard;
```

Follow this example, which uses one relationship for Accessories, which can include Mouse, Keyboard, and other accessories.

```
relation accessories : Accessories;
```

Sequence: Use the Sequence Variable Annotation to Specify the Order of Execution

If a constraint model includes multiple attributes and relationships that should follow a certain order of execution, use the sequence variable annotation to specify the order. The constraint engine follows sequence designations in satisfying constraint requirements and resolving constraint violations.

In this example, for the Desktop type, the sequence annotation directs the constraint engine to set the default values for attributes in this order:

- Display: sequence=1
- Windows_Processor: sequence=2
- Display_Size: sequence=3

```
type Desktop {
    @(defaultValue = "1080p Built-in Display", sequence=1)
    string Display = ["1080p Built-in Display", "4k Built-in Display", "2k Built-in
Display"];

    @(defaultValue = "15 Inch", sequence=3)
    string Display_Size = ["15 Inch", "24 Inch", "13 Inch", "27 Inch"];

    @(defaultValue = "i5-CPU 4.4GHz", sequence=2)
   string Windows_Processor = ["i5-CPU 4.4GHz", "i7-CPU 4.7GHz", "Intel Core i9 5.2 GHz"];

    constraint(Display == "1080p Built-in Display" && Display_Size == "15 Inch" ->
Windows_Processor == "i7-CPU 4.7GHz");
}
```

For Desktop, Display is set to 1080p, Windows_Processor to i5-CPU, and Display_Size to 15 Inch.

The constraint specifies that a type with Display of 1080p and Display_Size of 15 Inch must have a Windows_Processor of i7-CPU.

```
constraint(Display == "1080p Built-in Display" && Display_Size == "15 Inch" ->
Windows_Processor == "i7-CPU 4.7GHz");
```

The Windows_Processor default value of i5-CPU for Desktop violates the constraint. In order to satisfy the constraint and resolve the violation, the constraint engine uses a different Display_Size for Desktop, such as 24 Inch.

If the user manually updates Display_Size for Desktop to 15 Inch in the Product Configurator, the constraint engine updates Windows_Processor to i7-CPU to satisfy the constraint.

Sequence and Configurable

Using the `configurable` property with the `sequence` variable affects how the solver handles attributes. When configurable is set to `true`, the user can set attribute values, and the solver doesn't override user input unless no other solution exists. When `configurable` is set to `false`, the solver sets attribute values.

In this example for type A, `attribute1` is set to `configurable = true`. The user can set the value, and the solver doesn't override the user input unless no other solution exists. When the left-hand side of the rule is true, the constraint doesn't change `attribute1` to "Enum3".

```
type A : System {
    @(defaultValue = "Enum1", domainComputation = "true", configurable = true, sequence =
 48)
    string attribute1 = ["Enum1", "Enum2", "Enum3"];

  @(configurable = false, defaultValue = "0", sequence = 30)
    decimal(2) attribute2 = f(x, y, z);
    constraint((attribute2 > 3 && attribute2 <= 5) -> attribute1 == "Enum3", "message");
}
```

In this example for type B, `attribute1` is set to `configurable = false`. The solver propagates values to satisfy constraints. When the left-hand side of the rule is true, the constraint automatically sets `attribute1` to "Enum3".

```
type B : System {
    @(defaultValue = "Enum1", domainComputation = "true", configurable = false, sequence
= 48)
    string attribute1 = ["Enum1", "Enum2", "Enum3"];

  @(configurable = false, defaultValue = "0", sequence = 30)
    decimal(2) attribute2 = f(x, y, z);
    constraint((attribute2 > 3 && attribute2 <= 5) -> attribute1 == "Enum3", "message");
```

Use mindful sequencing in CML to avoid backtracking by the solver when looking for a solution, as in this example.

```
type LaptopProBundle {

    //relation mouse : Mouse[1..20];
    //The relation mouse has the highest sequence
    relation warranty : Warranty[0..10];
    relation software : Software;
    relation printerBundle : PrinterBundle;
    relation laptop : Laptop[1..10];
    relation mouse : Mouse[1..20];
    //Put highest sequence last to avoid backtracking
```

```
    int mouseQty = laptop[Laptop] + warranty[Warranty];

    constraint(mouse[Mouse] > 0 -> mouse[Mouse] == mouseQty,
               "mouse[Mouse] = laptop[Laptop] + warranty[Warranty]");
```

Automatically Add a Product: Define as a Separate Constraint

If you need to automatically add a product, and also set attributes on the product, define these procedures as separate constraints, as in this example.

```
constraint(laptop[Laptop] > 0, warranty[Warranty] > 0);
constraint(warranty[Warranty] > 0, warranty[Warranty].type == “Premium”);
```

Avoid this example, which automatically adds a product and sets attributes on the product, in the same constraint.

```
constraint(laptop[Laptop] > 0, warranty[Warranty] > 0 && warranty[Warranty].type ==
"Premium");
```

Access Quantity in CML: Cardinality and Attribute Constraints

There are two ways to access quantity in CML:

A cardinality constraint creates or validates the presence of components. The constraint engine adds or removes instances to satisfy the conditions of the constraint.

An attribute constraint, such as lineItemQuantity or ItemEndQuantity, only reads or validates. The constraint engine validates the expression, but doesn't configure to satisfy the conditions of the constraint

For best performance, follow these guidelines:

- Use a cardinality constraint whenever possible. Use `lineItemQuantity` or `ItemEndQuantity` only when a cardinality constraint can't meet the business need.
- Treat `lineItemQuantity` and `ItemEndQuantity` as read-only. Use only in calculation or evaluation rules.
- Keep scope in mind. When a product can have multiple instances, read `lineItemQuantity` or `ItemEndQuantity` per instance. Avoid reading the attribute at a parent or aggregate scope where it can be unbound or ambiguous.
- Don't use `lineItemQuantity` or `ItemEndQuantity` to create components. Drive component creation by cardinality, not by attribute references.

Use constraint patterns similar to these examples. Do this.

```
constraint(mouse[Mouse] == warranty[Warranty])
```

Avoid this.

```
constraint(mouse[Mouse].lineItemQuantity == warranty[Warranty].lineItemQuantity)
```

Do this.

```
constraint(mouse[Mouse] == 3)
```

Avoid this.

```
constraint(mouse[Mouse].lineItemQuantity == 3)
```

Pricing Fields Not Supported in CML

Pricing fields, such as ListPrice, NetUnitPrice, and others, are not supported in CML and should not be used in constraint models. CML is designed to enforce configuration logic for products, not to perform pricing calculations. Attempting to reference or manipulate pricing fields in CML code leads to errors and unexpected behaviors in the constraint engine. Use dedicated pricing or calculation mechanisms outside of the CML constraint model for such functionality.

Configure Child or Grandchild Products Based on Parent Product

Use the `parent` keyword to configure child and grandchild products dynamically based on the parent product. Control visibility or availability for the child or grandchild using the keyword.

Note: The `parent` keyword isn't supported with Group Type.

In this example, grandchild products are excluded based on which parent product they belong to.

```
type LineItem;

/*
 * Parent 1: Industrial Bundle
 * Sets the context 'ApplicationType' to "Industrial"
 */
type IndustrialGeneratorBundle : LineItem {
    relation enclosurePackage : EnclosurePackage[1..999];

    relation enclosurePackage1 : EnclosurePackage[1..999];

    relation enclosurePackage2 : EnclosurePackage;

    string ApplicationType = "Industrial";
}

/*
 * Parent 2: Residential Bundle
 * Sets the context 'ApplicationType' to "Residential"
 */
type ResidentialGeneratorBundle : LineItem {
    relation enclosurePackage3 : EnclosurePackage[1..999];

    relation enclosurePackage4 : EnclosurePackage;

    string ApplicationType = "Residential";
}

/*
 * Shared Component: Enclosure Package
 * Uses parent() to read the ApplicationType and excludes items accordingly.
 */
type EnclosurePackage : LineItem {
    relation soundInsulation : SoundInsulation[0..999];
    relation weatherProofing : WeatherProofing[0..999];
    relation heater : Heater[0..999];
    relation lighting : InternalLighting[0..999];
```

```
// Retrieve the context tag from the parent bundle
    string parentApp = parent(ApplicationType);

    message(true, parentApp);

    // Logic 1: Exclude Lighting and Heater for BOTH bundles
    exclude(parentApp == "Industrial" || parentApp == "Residential",
lighting[InternalLighting]);
    exclude(parentApp == "Industrial" || parentApp == "Residential", heater[Heater]);

    // Logic 2: Residential (Basic) excludes Sound Insulation
    exclude(parentApp == "Residential", soundInsulation[SoundInsulation]);

    // Logic 3: Industrial (Pro) excludes Weather Proofing
    exclude(parentApp == "Industrial", weatherProofing[WeatherProofing]);
}

// --- Sub-components ---

type SoundInsulation : LineItem {
    @(defaultValue = "Foam")
    string Material = ["Foam", "Fiberglass"];
}

type WeatherProofing : LineItem {
    @(defaultValue = "Standard")
    string Grade = ["Standard", "Marine"];
}

type Heater : LineItem;

type InternalLighting : LineItem;
```

PCG Group Relations: Follow Order in Constraints

Order the Product Component Group (PCG) group relations in the way they appear in the constraints. Specify the groups used in the LHS of the constraints first, followed by those in the RHS.

In this example, the order of PCG groups is incorrect as `Test1Group` is part of the LHS and should be declared first.

```
type TestParent : LineItem {
    Test2Group test2group;

    Test1Group test1group;

    constraint(test1group.testchild1[TestChild1] > 0 -> test2group.testchild2[TestChild2]
 == test1group.testchild1[TestChild1]);

}
```

This example shows the correct order of PCG groups, where `Test1Group` is declared first because it is part of the LHS.

```
type Test20260204Parent : LineItem {

    Test1Group test1group;
```

```
    Test2Group test2group;

    constraint(test1group.testchild1[TestChild1] > 0 -> test2group.testchild2[TestChild2]
 == test1group.testchild1[TestChild1]);

}
```

Relations Without PCG: Follow Order in Constraints

Order of relations matter for constraint evaluation. Specify the relations used in the LHS of the constraints first, followed by those in the RHS.

Relation Aggregates: Stabilize Preferences Using Staged Variables

To improve solver stability and prevent backtracking, avoid referencing relation aggregates directly within preferences when the preferences also influence the same relation. Instead, stage these aggregates through local variables and state anchors.

In this example, the preferences and the calculated quantity depend directly on live relation aggregates.

```
relation ml : ModelTraining {
   totalNumSubscriptions = total(NumSubscriptions);
   subCount = count(Sublicense == true);
}
preference(ml[ModelTraining] > 0 && ml.subCount == 0 -> ml[ModelTraining] == parentQty);
preference(ml[ModelTraining] > 0 && ml.subCount > 0 -> ml[ModelTraining] ==
calculatedQuantity);
constraint(calculatedQuantity == ((ml.totalNumSubscriptions + 99) / 100) * 100);
```

When the solver evaluates preferences that depend directly on a relation's own aggregates, it creates a tight feedback loop:

Relation Quantity Relation Aggregates Preference Guards/Targets Relation Quantity (loop repeats)

The feedback loop can cause the solver to oscillate or backtrack repeatedly before finding a stable solution.

This example shows the stabilized pattern. It introduces staged variables that act as anchors to separate the relation aggregates from the preference logic.

```
relation ml : ModelTraining {
     totalNumSubscriptions = total(NumSubscriptions);
     subCount = count(Sublicense == true);
}

// Stage 1: Convert relation conditions into stable booleans
boolean hasSub;
constraint(hasSub <-> (ml.subCount > 0));

// Stage 2: Copy relation aggregates into local variables
int localTotalNumSubscriptions;
constraint(localTotalNumSubscriptions == ml.totalNumSubscriptions);

// Stage 3: Perform calculations by using the local variables
int calculatedQuantity;
constraint(calculatedQuantity == ((localTotalNumSubscriptions + 99) / 100) * 100);

// Stage 4: Use the staged variables in the preferences
```

```
preference(ml[ModelTraining] > 0 && hasSub == false -> ml[ModelTraining] == parentQty);
preference(ml[ModelTraining] > 0 && hasSub == true -> ml[ModelTraining] ==
calculatedQuantity);
```

With this pattern, instead of solving everything simultaneously, the solver logic processes a pipeline:

Relation Aggregates Anchored State/Local Variables Derived Calculations Preferences

This process reduces oscillation and makes the solving path more deterministic.

Dependent Logic: Use Configurable Variable Annotation to Prevent Premature Default Assignment

To ensure preference rules correctly set target attributes based on calculated values, use the `@(configurable=false)` annotation on the target attribute. This prevents a race condition where the engine assigns a default value during initialization before your calculation and preference rules execute.

When an inline expression is used, CML evaluates the model top-down. If the target attribute is declared before the inline calculation, the engine immediately assigns a default value to the attribute. As a result, any subsequent `preference()` rules are ignored because the engine treats the existing default value as an established selection and avoids overwriting it with the calculated value. Annotating the target attribute with `@(configurable=false)`) forces the engine to leave the variable as `null` until the calculation and preference rules are executed.

In this example, the engine processes `ShippingMethod` first and immediately assigns the default value "Standard" to it. Later, when the calculation for `totalWeight` returns a value high enough to require the “Freight” shipping method, the engine ignores this preference rule because the `ShippingMethod` variable is already bound to "Standard".

```
type Order : LineItem {
    int quantity = [1..100];
    int weightPerUnit = [10..50];

    // Problem: Engine assigns "Standard" immediately during initialization
    @(defaultValue = "Standard")
    string ShippingMethod = ["Standard", "Freight"];

    // Calculated Attribute via Inline Expression

    // The calculation happens after the default is already set
    int totalWeight = quantity * weightPerUnit;

    // This rule is ignored because ShippingMethod is already bound to "Standard"
    preference(totalWeight > 1000 -> ShippingMethod == "Freight");
}
```

In this example, using the `@(configurable=false)` annotation ensures the `ShippingMethod` attribute remains as `null` until the calculation completes and the rules execute.

Note: Provide a second preference rule for the fallback condition (else) to ensure a value is always set.

```
ype Order : LineItem {
    int quantity = [1..100];
    int weightPerUnit = [10..50];

    // Solution: Prevent premature default assignment
    @(configurable=false)
```

```
    string ShippingMethod = ["Standard", "Freight"];

    // Calculated Attribute via Inline Expression
    int totalWeight = quantity * weightPerUnit;

    // Rule 1: Handle the specific condition (high weight)
    preference(totalWeight > 1000 -> ShippingMethod == "Freight");

    // Rule 2: Handle the fallback (low weight)
    preference(totalWeight <= 1000 -> ShippingMethod == "Standard");
}
```

Consolidate Multiple Default Configurations

Apply dynamic, overridable default quantities to a single component based on multiple possible states of a driving attribute. This process avoids rule conflicts where only the last rule evaluates.

When multiple `setdefault` rules target the same assignment in the RHS, evaluations can conflict. For example, a conflict can result when the rule targets the same relation and type, such as `accessories[Accessory] == ...`. The condition side can use different expressions, but if the rules resolve to the same target on the assignment side, behavior can become order-dependent and lead to inconsistent outcomes.

For example, if you want to set a default for the quantity of `Accessories` based on the selected `DutyRating` of a Generator Set, writing three separate `setdefault` rules causes inconsistent behavior depending on the quantity changes of the accessories.

To prevent the conflict, consolidate the conditional logic into a single derived variable using nested ternary expressions, such as `? :`. Then, apply a single `setdefault` rule using that newly derived variable to drive the relation's quantity.

This example shows the recommended process, consolidating the logic into a single variable and rule.

```
type GeneratorSet : LineItem {
    string DutyRating = ["Prime Power (PRP)", "Continuous Power (COP)", "Emergency Standby
 Power (ESP)"];

    relation accessories : Accessory[1..99] {
        default Accessory(1);
    }

    // 1. Consolidate the conditional logic into a single integer variable
    int defaultAccessoryQty = (DutyRating == "Prime Power (PRP)") ? 2 : ((DutyRating ==
"Continuous Power (COP)") ? 4 : 6);

    // 2. Create a dynamic informational message
    string infoMsg = DutyRating + " accessory default overridden";

    // 3. Apply a single setdefault rule using the derived variable
    setdefault(
        DutyRating in ["Prime Power (PRP)", "Continuous Power (COP)", "Emergency Standby
Power (ESP)"],
        accessories[Accessory] == defaultAccessoryQty,
        infoMsg
    );
}
```

Avoid the process shown in this example, which includes multiple conflicting `setdefault` rules.

```
type GeneratorSet : LineItem {
    string DutyRating = ["Prime Power (PRP)", "Continuous Power (COP)", "Emergency Standby
 Power (ESP)"];

    relation accessories : Accessory[1..99] {
        default Accessory(1);
    }

    // X AVOID: Multiple setdefault rules targeting the same relation.
    // Only the last rule will reliably evaluate.
   setdefault(DutyRating == "Prime Power (PRP)", accessories[Accessory] == 2, "PRP error");

    setdefault(DutyRating == "Continuous Power (COP)", accessories[Accessory] == 4, "COP
error");
    setdefault(DutyRating == "Emergency Standby Power (ESP)", accessories[Accessory] ==
6, "ESP error");
}
```

Business-Centric Constraint Modeling Language (CML) Guidelines

Constraint Modeling Language (CML) must accurately calculate the total sum or aggregate of specific attributes like quantity or userCount across child components, especially in complex configurations requiring group-level aggregation

The main modeling obstacles when performing aggregation in CML involve:

- Initialization Errors: Preventing runtime errors, such as `NullPointerException`, which can occur if derived aggregate attributes lack explicit domains.
- Circular Dependencies: Avoiding calculation loops where the parent and children mutually rely on aggregated totals, often involving the `total()` function. If these loops are not broken, the aggregated variable becomes "not bound", which causes the solution to fail.

User Workflow

As a sales representative, when I am configuring a bundle product in the Configurator window, I modify the quantities or specific attributes of the individual child components. I expect the constraint engine to immediately and accurately calculate the overall aggregated totals for the parent product, such as the totalItemCount or sumOfUsers.

Business-Centric CML Examples

These Constraint Modeling Language (CML) structures implement quantity aggregation and resolve calculation dependencies.

Example 1: Derived Aggregates (Total Quantity or Sum)

This CML example shows how to model bundle rollups by separating aggregation from validation, ensuring correct calculation order, solver stability, and business-rule consistency

```
type LineItem;
type GeneratorSet : LineItem {
  int totalItemPowerKW = modelclassification.totalPowerKW;
  // Aggregate `powerKW`
  relation modelclassification : ModelClassification[0..10] {
    totalPowerKW = sum(powerKW);
  }
  message(true, "GeneratorSet totalItemPowerKW = {} kW (calculated roll-up). Sum of selected
 ModelClassification powerKW values = {} kW.", totalItemPowerKW,
modelclassification.totalPowerKW);
}
type ModelClassification : LineItem {
  int powerKW = [900, 1750, 2500];
}
type GeneralModel1750 : ModelClassification {
  int powerKW = 1750;
}
type GeneralModel2500 : ModelClassification {
  int powerKW = 2500;
}
type GeneralModel900 : ModelClassification {
  int powerKW = 900;
}
```

Example Description and Configurator Result

In example 1, the `GeneratorSet` type contains the `totalItemPowerKW` variable that is assigned with the `totalPowerKW`. The model specifies a relationship based on the product classification (`modelClassification`). This relationship includes aggregation using the sum() function that calculates the `totalPowerKW` from the products selected in the `modelClassification` during bundle configuration. The model contains a message for displaying the `totalItemPowerKW` with the `modelClassification.totalPowerKW` on the Product Configuration.

```
message(true, "GeneratorSet totalItemPowerKW = {} kW (calculated roll-up). Sum of selected
 ModelClassification powerKW values = {} kW.", totalItemPowerKW,
modelclassification.totalPowerKW);
```

As a result, the engine calculates the `totalPowerKW` of user selected products in the `modelClassification` and assigns this value to the `totalItemPowerKW`. The system displays both values in the information message on the Product Configuration.

Example 2: Resolving Circular Dependencies

This pattern breaks unsolvable loops by enforcing unidirectional data flow (Parent dictates Child quantity based on Child aggregates).

```
type LineItem;
type GeneratorSet : LineItem {
  // RELATION: THE "READ" PHASE
  // Data flows UP from children to the parent via the port attribute
  relation voltageclassification : VoltageClassification[1..10] {
    sumOfChildPower = total(power);
```

```
  }
  // Explicit domain ensures the solver initializes correctly for calculations
  decimal(2) totalDistributionValue = [0.00..1000.00];
  // CONSTRAINT 1: THE "CALCULATION" PHASE
  // @(sequence = 1) ensures the engine reads child data and calculates first
  @(sequence = 1)
  constraint calcTotalDistribution(totalDistributionValue ==
voltageclassification.sumOfChildPower / 100);
  // CONSTRAINT 2: THE "WRITE/ENFORCE" PHASE
  // @(sequence = 2) ensures this happens last to push values DOWN to children
  @(sequence = 2)
  constraint setChildQuantity(voltageclassification[VoltageClassification] ==
totalDistributionValue * 2);
}
type VoltageClassification : LineItem {
  int power = [1..100];
}
type VoltageConnection_220_380 : VoltageClassification;
type VoltageConnection_240_416 : VoltageClassification;
type VoltageConnection_255_440 : VoltageClassification;
```

Example Description and Configurator Result

In example 2, the relationship includes aggregation using the `total()` function that calculates the `sumOfChildPower` from the selected products in the `voltageclassification`. The `GeneratorSet` type contains the `totalDistributionValue` with the explicit domain ([0.00..1000.00]). The model contains two constraints with corresponding `@sequence` annotation to enforce the logical order for calculation of the `calcTotalDistribution` (using child products data) and defining the quantity for the `voltageclassification` child items.

Example 3: Grouped Aggregation (Sum of Users Across Regions)

This advanced pattern uses the `@(groupBy=attribute)` annotation to create virtual components (`RegionGroup`) for aggregation, referencing the source data relation in the parent type (`SubscriptionOrder.licenses`) using the `sourceContextNode` annotation.

```
// 1. Base Product Type (e.g., Regional License)
type RegionalLicense {
  int regionId = [0..100]; // Attribute for grouping
  int userCount = [0..100];
}
// 2. Virtual Group Type (Performs grouping and user sum)
@(split=true, virtual=true, groupBy=regionId)
type RegionGroup {
  int regionId;
  int groupTotalUsers; // Sum of userCount for this region
  // Relation to licenses matching this region group
  @(sourceContextNode="SubscriptionOrder.licenses")
  relation licenses: RegionalLicense[0..100];
  // Constraint: Calculate the aggregate user count within this group
  constraint(groupTotalUsers == licenses.sum(userCount));
}
// 3. Parent Order Management (Aggregates all region totals)
@(virtual=true)
```

```
type SubscriptionOrder {
  // Overall total users is calculated by referencing the group totals
  int totalUsers = regionGroups.groupTotalUsers;
  relation licenses: RegionalLicense[0..500];
  relation regionGroups: RegionGroup[1..10];
}
```

Example Description and Configurator Result

In example 3, the `licenses` relationship that is brought as an external source by `@(sourceContextNode="SubscriptionOrder.licenses")`, includes an aggregation using the `sum()` function that calculates the `groupTotalUsers` from the selected products in the `RegionalLicense`. The `RegionGroup` type contains the `groupTotalUsers` variable that serves the aggregation. The `SubscriptionOrder` type contains the aggregate metric `totalUsers` which is calculated by summing all `groupTotalUsers`. The model contains one core constraint on `RegionGroup` to enforce that `groupTotalUsers` equals the sum of all `userCount` from its member licenses.

Debugging Constraint Modeling Language (CML)

To debug constraint models and troubleshoot performance issues, enable debug logging in Apex and set the debug log level to FINE.

For more information on debug logging in Salesforce, see these topics in Salesforce Help:

- Set Up Debug Logging
- Debug Log
- Debug Log Levels

Use the Apex log to get information about configurator engine performance when running a constraint model, including performance degradation or unexpected behavior. To improve performance, modify the constraint model based on information in the log.

For tips on writing trouble-free CML, see Constraint Modeling Language (CML) Best Practices on page 1188.

About the Apex Debugging Log File

The Apex debugging log file contains three sections: RLM_CONFIGURATOR_BEGIN, RLM_CONFIGURATOR_STATS, and RLM_CONFIGURATOR_END.

RLM_CONFIGURATOR_BEGIN

JSON representation of the request payload to ExecuteConstraintsRESTService.

```
"contextProperties" : { },
"rootLineItems" : [ {
  "attributes" : { },
  "properties" : {   },
```

```
  "ruleActions" : null,
  "attributeDomains" : { },
  "portDomainsToHide" : { },
  "lineItems" : [ {} ]
} ],
"orgId" : "00Dxx0000006H2F"
}
```

RLM_CONFIGURATOR_STATS

Key statistics of the request execution by the constraint engine, as in this example.

```
"rootId" : "0QLxx0000004D1uGAE",  //Root ID that is being configured
"Product" : "SFDC License",  //Root product name
"Total Execution Time" : "2ms",  //Total solver time
"Constraints Execution Stats" : "Distinct: 18 Total: 70",  //Number of distinct and total
 constraint satisfaction attempts
"Solving goal AndGoal([ConfigureComponentGoal(RootProduct RootProduct_0)]) took " : "2ms",
  //Total solver time for the goal
"Configurator Stats" : "Total Time 2ms",  //Total time
"Number of Component" : "6",  //Number of components instantiated
"Number of Variables" : "42",  //Number of variables instantiated
"Number of Constraints" : "13",  //Number of constraints instantiated
"Number of Backtracks" : "0",  //Number of backtracks solver did for the last choice point
"Constraints Violation Stats" : "Distinct: 0 Total: 0",  //Distinct and total number of
constraint violations followed by a list of top 10
"ChoicePoint Backtracking Stats" : "Distinct: 0 Total: 0"  // Distinct and total number
of backtracked choice points followed by a list of top 10
}
```

RLM_CONFIGURATOR_END

JSON representation of the response payload from ExecuteConstraintsRESTService.

```
"id" : "0QLxx0000004D1uGAE",
"rootId" : null,
"parentId" : null,
"cfgStatus" : "User",
"name" : "RootProduct",
"relation" : null,
"source" : "SalesTransaction.SalesTransactionItem",
"qty" : 1,
"actionCode" : null,
"modelName" : "Support_instance_variable_in_CML",
"productId" : "01txx0000006iP2AAI",
"productRelatedComponentId" : null,
"attributes" : {},  "properties" : {},
"ruleActions" : [ {} ],   "attributeDomains" : {},  "portDomainsToHide" : {},
"lineItems" : [ {} ]
}
```

Use the Apex Debugging Log File

To find possible reasons for the performance problems and identify solutions, look at the RLM_CONFIGURATOR_STATS section of the log file.

See the values for Total Execution Time, Constraints Violation Stats, and ChoicePoint Backtracking Stats.

For example, consider how the constraint engine performs with this sample constraint model. In the constraint model, the value of the `volts` variable is greater than 110/10000 (`volts = power/amps * 9999;`). The constraint engine must backtrack the `power` variable to find a value that satisfies the constraint, starting with 0.01, 0.02, and so on until it reaches a valid value.

```
relation laptops : Laptop[1..9999];
@(sequence = 1)
decimal(2) power = [0..500];
@(sequence = 1)
int amps = [1..5];
decimal(2)  volts = (power / amps) * laptops[Laptop];
constraint(volts > 110);
```

In the log file for this constraint model, see the execution statistics for Total Execution Time, Constraints Violation Stats, and ChoicePoint Backtracking Stats:

```
"rootId" : "ref_a67c6632_fa1f_40b4_8093_226a9ab8a4d0",
"Product" : "Laptop",
"Total Execution Time" : "676ms",
"Constraints Execution Stats" : "Distinct: 2 Total: 132006",
"Solving goal AndGoal([ConfigureComponentGoal(Laptop Laptop_0)]) took " : "677ms",
"Configurator Stats" : "Total Time 677ms",
"Number of Component" : "1",
"Number of Variables" : "4",
"Number of Constraints" : "1",
"Number of Backtracks" : "49500",
"Constraints Violation Stats" : "Distinct: 1 Total: 41250",
"IntComparison(GT,[DecimalVar(volts)])" : "41250",
"ChoicePoint Backtracking Stats" : "Distinct: 2 Total: 98999",
"VariableChoicePoint(DecimalVar(power))" : "49500",
"VariableChoicePoint(IntVar(amps))" : "49499"
```

Optimally, execution time for a constraint model is less than 100 milliseconds, with fewer than 1,000 backtracks and no violations. Values for the constraint model example are significantly higher, indicating that the constraint engine is performing inefficiently. To improve performance in this example, reduce the domain of the power variable without reducing the solution space. For example, define the domain as `[110..500]` instead of `[0..500]`. This change reduces the number of backtracks the constraint engine performs to find a solution.

Model Structure

The tables on the following pages show the structure for the constraint model in Core Concept Examples.

See Core Concept Examples on page 1135.

Level	Product Group	Product	Product Type Name	Product Attribute	API Name OR CML Variable	Configurable or Static	Type	Comments
0	Bundle	Generator Set	GeneratorSet					
				Required KW	requiredKW	CONFIGURABLE	int	
				Surge Load KW	surgeLoadKW	EXPRESSION	decimal	requiredKW * 1.25

CHAPTER 8 Transaction Management

In this chapter ...

Configure, price, and sell products with Transaction Management in Revenue Management. Transaction Management supports subscription lifecycles and ensures end-to-end integrity of your quotes and orders.

SEE ALSO:

EDITIONS

Available in: Lightning Experience

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions of Revenue Cloud where Transaction Management is enabled

Transaction Management Standard Objects

The Transaction Management data model provides objects and fields to manage transactions.

Asset

Represents an item of commercial value, such as a product sold by your company or a competitor, that a customer has purchased.

AssetAction

Represents a change made to a lifecycle-managed asset. The fields can't be edited. This object is available in API version 50.0 and later.

AssetActionSource

Represents an optional way to record what transactions caused changes to lifecycle-managed assets. Use it to trace financial and other information about asset actions. This object supports Salesforce order products and work order line items, and transaction IDs from other systems. The fields can't be edited. This object is available in API version 50.0 and later.

AssetActionSrcPriceAdjustment

Each row represents a junction between an asset and the calculated price adjustment that's applied to an asset. This object is available in API version 66.0 and later.

AssetContractRelationship

Represents a relationship between an asset and a contract. This object is available in API version 60.0 and later.

AssetDowntimePeriod

Represents a period during which an asset is not able to perform as expected. Downtime periods include planned activities, such as maintenance, and unplanned events, such as mechanical breakdown. This object is available in API version 49.0 and later.

AssetOwnerSharingRule

Represents the rules for sharing an Asset with users other than the owner. This object is available in API version 33.0 and later.

AssetRateAdjustment

Stores the tier rate adjustments for the asset rate card entries.This object is available in API version 62.0 and later.

AssetRateCardEntry

Stores the negotiated rate card entries that are associated with an asset in Revenue Cloud. This object is available in API version 62.0 and later.

AssetRelationship

Represents a non-hierarchical relationship between assets due to an asset modification; for example, a replacement, upgrade, or other circumstance. In Revenue Lifecycle Management, this object represents an asset or assets grouped in a bundle or set. This object is available in API version 41.0 and later.

AssetShare

Represents a sharing entry on an Asset. This object is available in API version 33.0 and later.

AssetStatePeriod

Represents a time span when an asset has the same quantity, amount, and monthly recurring revenue (MRR). An asset has as many asset state periods as there are changes to it (asset actions) during its lifecycle. The dashboard and related pages show the current asset state period. The fields can't be edited. This object is available in API version 50.0 and later.

AssetStatePeriodAttribute

Represents a virtual object that holds the key-value pair of the asset attribute in a specified asset state period. This object is a child object of AssetStatePeriod. This object is available in API version 60.0 and later.

AssetTag

Associates a word or short phrase with an Asset.

AssetTokenEvent

The documentation has moved to AssetTokenEvent in the *Platform Events Developer Guide*.

AssetWarranty

Defines the warranty terms applicable to an asset along with any exclusions and extensions. This object is available in API version 50.0 and later.

BindingObjUsageRsrcPlcy

Represents the policies that are used for the usage resource that's associated with an asset or a binding object. This object is available in API version 65.0 and later.

ContractItemPrice

Represents an object that's used to capture a price for a product on a contract. This object is available in API version 61.0 and later.

ContractItemPriceAdjTier

Represents the tiers of a price adjustment to a product on a contract. This object is available in API version 63.0 and later.

ContractItemPriceHistory

Represents the history of changes to the values in the fields of a ContractItemPrice object. This object is available in API version 61.0 and later.

OrderDeliveryMethod

Shows the customizations and options that a buyer selected for their delivery method. This object is available in API version 48.0 and later.

OrderItemAttribute

Represents a virtual object that stores an attribute specified for an order item.This object is available in API version 60.0 and later.

OrderItemDetail

Represents the breakdown details of an order product. Revenue Management generates these records to capture pricing and quantity changes, such as negative quantity reductions, early renewals, derived pricing or repricing during an amendment, and bundle or product attribute reconfigurations. This object is available in API version 60.0 and later.

OrderItemRateAdjustment

Represents the negotiated rate adjustment for an order product. This object is available in API version 62.0 and later.

OrderItemRateCardEntry

Represents the catalog and negotiated rates of a usage metric associated with an order item that's used to charge overage consumption. This object is available in API version 62.0 and later.

OrderItemUsageRsrcGrant

Represents the negotiated grants for the usage resource that's associated with the usage product added in the order item. This object is available in API version 65.0 and later.

OrderItemUsageRsrcPlcy

Represents the policies that are used for the usage resource that's associated with the usage product added in the order item. This object is available in API version 65.0 and later.

SalesTransactionType

Represents the type of the sales transaction. This object is available in API version 61.0 and later.

QuoteAction

Indicates the type of sales transaction that's being quoted; for example, a renewal sale. This object is available in API version 59.0 and later.

QuoteItemTaxItem

The tax that is applied to a quote line item. This object is available in API version 55.0 and later.

QuoteLineDetail

Represents the breakdown details of a quote line item. Revenue Management generates these records to capture pricing and quantity changes, such as negative quantity reductions, early renewals, derived pricing or repricing during an amendment, and bundle or product attribute reconfigurations. This object is available in API version 60.0 and later.

QuoteLineGroup

Stores the group information for line items in a quote. It also stores the aggregated line field information (subtotal). It contains a parent-child relationship to quote. This object is available in API version 61.0 and later.

QuoteLineItemAttribute

Represents a virtual object that stores an attribute specified for a quote line item. This object is available in API version 59.0 and later.

QuotLineItmUseRsrcGrant

Represents the negotiated grants for the usage resource that's associated with the usage product added in the quote line item. This object is available in API version 65.0 and later.

QuotLineItmUsageRsrcPlcy

Represents the policies that are used for the usage resource that's associated with the usage product added in the quote line item. This object is available in API version 65.0 and later.

QuoteLineRateAdjustment

Represents the negotiated rate adjustment for a quote line item. This object is available in API version 62.0 and later.

QuoteLineRateCardEntry

Represents the catalog and negotiated rates of a usage resource associated with a quote line item that's used to charge overage consumption. This object is available in API version 62.0 and later.

SOAP API Developer Guide: Introduction to SOAP API

Asset

Represents an item of commercial value, such as a product sold by your company or a competitor, that a customer has purchased.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AccountId`	**Type** reference

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** (Required) ID of the Account associated with this asset. Must be a valid account ID. Required if `ContactId` isn't specified. This field is a relationship field. **Relationship Name** Account **Relationship Type** Lookup **Refers To** Account
`Address`	**Type** address **Properties** Filter, Nillable **Description** Represents the physical address or geolocation of the asset.
`AssetLevel`	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The asset's position in an asset hierarchy. If the asset has no parent or child assets, its level is 1. Assets that belong to a hierarchy have a level of 1 for the root asset, 2 for the child assets of the root asset, 3 for their children, and so forth. On assets created before the introduction of this field, the asset level defaults to –1. After the asset record is updated, the asset level is calculated and automatically updated.
`AssetProvidedById`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The account that provided the asset, typically a manufacturer. This field is a relationship field. **Relationship Name** AssetProvidedBy

Field	Details
	Relationship Type Lookup **Refers To** Account
AssetServicedById	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The account in charge of servicing the asset. This field is a relationship field. **Relationship Name** AssetServicedBy **Relationship Type** Lookup **Refers To** Account
AssetTypeId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The asset type associated with the asset. This field is a relationship field. This field is available in API version 62.0 and later for users with the Health Cloud Appointment Management permission set. **Relationship Name** AssetType **Relationship Type** Lookup **Refers To** AssetType
Availability	**Type** percent **Properties** Filter, Nillable, Sort **Description** The percentage of expected uptime where the asset was available for use.

Field	Details
AveragetimetoRepair	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Represents the number of hours it typically takes to repair an asset after a failure.
AveragetimeBetweenFailure	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Represents the number of hours that typically elapses before the asset is likely to fail again.
AverageUptimePerDay	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The average number of hours per day the asset is expected to be available for use.
City	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The city detail for the address.
ConsequenceOfFailure	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The business impact associated with the asset's failure. Using this field, you can address the asset's health and take action using Flows. To enable this field, use Object Manager to update the field availability. Make sure that the field is visible for field-level security and for page layout. To learn more, see What Determines Field Access. The picklist values aren't predefined in orgs created before Winter '22 that aren't Field Service enabled. This field is available in API version 53.0 and later. Possible values are: • `Insignificant`

Field	Details
	• `Minor` • `Moderate` • `Major` • `Critical`
`ContactId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Required if `AccountId` isn't specified. ID of the Contact associated with this asset. Must be a valid contact ID that has an account parent (but doesn't need to match the asset's `AccountId`). This field is a relationship field. **Relationship Name** Contact **Relationship Type** Lookup **Refers To** Contact
`Country`	**Type** String **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The country detail for the address.
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Three-letter ISO 4217 currency code associated with the invoice. The default value is USD. This field is available in API version 55.0 and later. This field is available when CPQ Plus, Salesforce Billing, or Revenue Cloud is enabled.
`CurrentAmount`	**Type** currency **Properties** Filter, Nillable, Sort

Field	Details
	Description Reserved for future use. This field is available in API version 50.0 and later. This field is available when CPQ Plus, Salesforce Billing, or Revenue Cloud is enabled.
`CurrentLifecycleEndDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Represents the end of the period shown as current. System-populated field inherited from the end date of the current asset state period. If that field is empty, as with an evergreen subscription, the Current Lifecycle End Date field is also empty. This field is available in API version 50.0 and later. This field is available when CPQ Plus, Salesforce Billing, or Revenue Cloud is enabled.
`CurrentMrr`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The asset's monthly recurring revenue during the current asset state period. System-populated field inherited from the monthly recurring revenue on the current asset state period. If no asset state period is current, the value is `0`. Label is Current Monthly Recurring Revenue. This field is available in API version 50.0 and later. This field is available when CPQ Plus, Salesforce Billing, or Revenue Cloud is enabled.
`CurrentQuantity`	**Type** double **Properties** Filter, Nillable, Sort **Description** The asset's quantity during the current asset state period. System-populated field inherited from the quantity on the current asset state period. If no asset state period is current, the value is `0`. This field is available in API version 50.0 and later. This field is available when CPQ Plus, Salesforce Billing, or Revenue Cloud is enabled.
`Description`	**Type** textarea **Properties** Create, Nillable, Update

Field	Details
	Description Description of the asset.
`DigitalAssetStatus`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Status of digital tracking of the asset. The default picklist includes the following values: • `On` • `Off` • `Warning` • `Error`
`ExternalIdentifier`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the matching record in an external system. This field is available in API version 49.0 and later.
`GeocodeAccuracy`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Accuracy level of the geocode for the address.
`HasLifecycleManagement`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** True if this asset is a lifecycle-managed asset, otherwise false. You can't switch an asset to a lifecycle-managed asset or the reverse. This field is system populated. The default value is *`false`*. This field is available in API version 50.0 and later. This field is available when CPQ Plus, Salesforce Billing, or Revenue Cloud is enabled.

Field	Details
InstallDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Date when the asset was installed.
IsCompetitorProduct	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this Asset represents a product sold by a competitor (`true`) or not (`false`). The default value is `false`. Its UI label is Competitor Asset.
IsInternal	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates that the asset is produced or used internally (`true`) or not (`false`). The default value is `false`. Its UI label is Internal Asset.
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time that the asset was last modified. Its UI label is Last Modified Date.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date and time that the asset was last viewed.
Latitude	**Type** double **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description Used with Longitude to specify the precise geolocation of the address.
LifecycleEndDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Represents the end of the asset's lifecycle. System-populated field inherited from the end date of the final asset state period. If that field is empty, as with an evergreen subscription, the lifecycle has no end date. This field is available in API version 50.0 and later. This field is available when CPQ Plus, Salesforce Billing, or Revenue Cloud is enabled.
LifecycleStartDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Represents the beginning of the asset's lifecycle. System-populated field inherited from the start date of the earliest asset state period. This field can't be edited. When a new asset action affects the start date of an asset state period, the period is deleted and a new one is generated. This field is available in API version 50.0 and later. This field is available when CPQ Plus, Salesforce Billing, or Revenue Cloud is enabled.
LocationId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The asset's location. Typically, this location is the place where the asset is stored, such as a warehouse or van. If you have access to the location entity, it doesn't necessarily mean you can access the location id field. To access the location, you must have `userHasLocation` user access.
Longitude	**Type** double **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Used with Latitude to specify the precise geolocation of the address.
ManufactureDate	**Type** date

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The date when the asset was manufactured. This field is available from API version 49.0 and later.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** (Required) Name of the asset. Label is Asset Name.
`OwnerId`	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The asset’s owner. By default, the asset owner is the user who created the asset record. Its UI label is Asset Owner. This field is a relationship field. **Relationship Name** Owner **Relationship Type** Lookup **Refers To** User
`ParentId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The asset’s parent asset. Its UI label is Parent Asset. This field is a relationship field. **Relationship Name** Parent **Relationship Type** Lookup **Refers To** Asset

Field	Details
PostalCode	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The postal code for the address.
Price	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** Price paid for this asset.
PricingSource	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Pricing source to use when amending or renewing an asset. Valid values are: • LastTransaction—Last Transaction • PriceBookListPrice—Price Book or List Price Available in API version 60.0 and later.
Product2Id	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** (Optional) ID of the Product2 associated with this asset. Must be a valid Product2 ID. Its UI label is Product. This field is a relationship field. **Relationship Name** Product2 **Relationship Type** Lookup **Refers To** Product2

Field	Details
ProductCode	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The product code of the related product.
ProductDescription	**Type** string **Properties** Filter, Sort, Nillable **Description** The product description of the related product.
ProductFamily	**Type** picklist **Properties** Filter, Group, Sort, Nillable **Description** The product family of the related product.
PurchaseDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Date on which this asset was purchased.
Quantity	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** Quantity purchased or installed. The Quantity field value isn't set by Customer Asset Lifecycle Management. Instead, you can populate the field as you need.
QuantityIncreasePricingType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update

Field	Details
	Description Specify which pricing type to use when the quantity of this asset is increased. Its UI label is Pricing Type for Quantity Increase. This field is available in API version 56.0 and later. This field is available when Revenue Cloud is enabled. Possible values are: • `LastNegotiatedPrice`—Available in API version 58.0 and later. • `ListPrice`
`RecordTypeId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The unique identifier for the asset. This field is a relationship field. **Relationship Name** RecordType **Relationship Type** Lookup **Refers To** RecordType
`Reliability`	**Type** percent **Properties** Filter, Nillable, Sort **Description** The percentage of expected uptime where the asset wasn't subject to unplanned downtime.
`RenewalPricingType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The price used when renewing a subscription. Its UI label is Pricing Type for Renewal. This field is available in API version 55.0 and later. This field is available when Revenue Cloud is enabled. Possible values are: • `LastNegotiatedPrice` • `ListPrice`

Field	Details
RenewalTerm	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** With Renewal Term Unit, defines the default subscription term for renewal quotes. This field is available in API version 55.0 and later. This field is available when Revenue Cloud is enabled.
RenewalTermUnit	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The unit of time for a subscription term. This field is available in API version 55.0 and later. This field is available when Revenue Cloud is enabled. Possible values are: • `Annual`—Available in API version 58.0 and later. —UI label is `Years`. • `Months`
SalesStoreId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** ID of the RetailStore or WebStore associated with this Asset. This field is a polymorphic relationship field. To access this field, your org must have a Salesforce Order Management license or a B2B Commerce License. This field is available in API v60.0 and later. **Relationship Name** SalesStore **Relationship Type** Lookup **Refers To** RetailStore, WebStore
SerialNumber	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description Serial number for this asset.
State	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The state detail for the address.
Status	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Customizable picklist of values. The default picklist includes the following values: • Purchased • Shipped • Installed • Registered • Obsolete
StatusReason	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The explanation of the device status. This field is available from API version 49.0 and later. Possible values are: • Not Ready • Off • Offline • Online • Paused • Standby
StockKeepingUnit	**Type** string **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The SKU assigned to the related product.
Street	**Type** textarea **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The street detail for the address.
SumDowntime	**Type** double **Properties** Filter, Nillable, Sort **Description** Accumulated downtime (planned and unplanned), determined as follows: • When only UptimeRecordStart is set, the sum of all downtime from UptimeRecordStart • When UptimeRecordStart and UptimeRecordEnd are set, the sum of all downtime from UptimeRecordStart to UptimeRecordEnd Otherwise, downtime isn't accumulated.
SumUnplannedDowntime	**Type** double **Properties** Filter, Nillable, Sort **Description** Accumulated unplanned downtime, determined as follows: • When only UptimeRecordStart is set, the sum of all unplanned downtime from UptimeRecordStart • When UptimeRecordStart and UptimeRecordEnd are set, the sum of all unplanned downtime from UptimeRecordStart to UptimeRecordEnd Otherwise, unplanned downtime isn't accumulated.
TotalLifecycleAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total amount of revenue for the asset, including revenue from each stage in the asset lifecycle. This field is available when CPQ Plus, Salesforce Billing, or Revenue Cloud is enabled.

Field	Details
UptimeRecordEnd	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date until which SumDowntime and SumUnplannedDowntime are accumulated.
UptimeRecordStart	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date from which SumDowntime and SumUnplannedDowntime are accumulated.
UsageEndDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Date when usage for this asset ends or expires.
Uuid	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The unique ID for the asset. This field is available in API version 49.0 and later.

Usage

Use this object to track products sold to customers. With asset tracking, a client application can quickly determine which products were previously sold or are currently installed at a specific account. You can also create hierarchies of up to 10,000 assets.

For example, suppose that your company wants to renew and upsell opportunities on products sold in the past. Similarly, your company can track competitive products in a customer environment where products can be replaced or swapped out.

Asset tracking is also useful for product support, providing detailed information to assist with product-specific support issues. For example, the PurchaseDate or SerialNumber can indicate whether a given product has certain maintenance requirements, including product recalls. Similarly, the UsageEndDate can indicate when the asset was removed from service or when a license or warranty expires.

If an application creates an Asset record, it must specify a Name and either an AccountId, ContactId, or both.

With REST API, use the `getRelatedListInfo` function to get information about related lists on the asset. Note that when requesting information about *`PrimaryAssets`*, the response is labeled `Related Assets`, and the response for *`RelatedAssets`* is labeled `Primary Assets`.

Associated Objects

This object has the following associated objects. If the API version isn't specified, those objects are available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AssetChangeEvent (API version 44.0)
Change events are available for the object.

AssetFeed
Feed tracking is available for the object.

AssetHistory
History is available for tracked fields of the object.

AssetOwnerSharingRule
Sharing rules are available for the object.

AssetShare
Sharing is available for the object.

AssetAction

Represents a change made to a lifecycle-managed asset. The fields can't be edited. This object is available in API version 50.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`

Special Access Rules

To use Customer Asset Lifecycle Management APIs, you must have the Access Customer Asset Lifecycle Management APIs permission and Read access to the Asset, Asset Action, Asset Action Source, and Asset State Period objects.

Fields

Field	Details
`ActionDate`	**Type** dateTime **Properties** Filter, Sort **Description** The date when an asset action change is recorded. This date can differ from the start date of the related asset state period. For example, suppose that a customer cancels a subscription in June, and the subscription expires in October. The date the customer cancels the

Field	Details
	subscription (June) is the action date of the asset action. The cancellation's effective date (October) is the start date of the asset state period.
ActualTaxChange	**Type** currency **Properties** Filter, Nillable, Sort **Description** The rollup of actual tax from all asset action sources. This field is populated by the system. Label is **Change in Actual Tax**. This field is a calculated field.
AdjustmentAmountChange	**Type** currency **Properties** Filter, Nillable, Sort **Description** The rollup of adjustment amount from all asset action sources. This field is populated by the system. Label is **Change in Adjustment Amount**. This field is a calculated field.
Amount	**Type** currency **Properties** Filter, Sort **Description** The delta in the total asset amount resulting from an asset action.
AssetActionNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The ID of the asset action. Label is **Name**.
AssetId	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the related lifecycle-managed asset. Label is **Asset**.

Field	Details
	This field is a relationship field. **Relationship Name** Asset **Relationship Type** Lookup **Refers To** Asset
`CanRollBack`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the last asset action can be rolled back (`true`). If this property is set to `false`, the asset and the last asset action can't be rolled back. The default value is `false`. This field is available in API version 65.0 and later.
`CategoryEnum`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The business category of the asset action, for use in reporting. Asset action totals are broken out by the picklist values on this required field, and those totals are in turn reflected on assets. These categories are available and aren't customizable. Label is **Business Category**. Possible values are: • `Cancellations` • `Cross-Sells` • `Downgrades` Indicates a transition to a lower-level version or tier of an asset. • `Downsells` Indicates a negative quantity amendment or a decreased Line Item total price with no change in quantity. • `Initial Sale` Indicates that the asset is initially purchased by an account. • `Other` • `Renewals` • `Swaps` Indicates the exchange of one asset for another. Applies to both swapped-out and swapped-in actions. • `Terms And Conditions Changes` • `Transfers` Indicates that an asset is transferred from one account to another. • `Upgrades` Indicates a transition to a higher-level version or tier of an asset. • `Upsells` Indicates a positive quantity amendment or an increased Line Item total price with no change in quantity.

Field	Details
`EstimatedTaxChange`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The rollup of estimated tax from all asset action sources. This field is populated by the system. Label is **Change in Estimated Tax**. This field is a calculated field.
`MrrChange`	**Type** currency **Properties** Filter, Sort **Description** The delta in the asset's monthly recurring revenue resulting from an asset action. For example, suppose that the MRR during an asset state period is $200 and the next asset action adds $100. Then this field's value is $100. Label is **Change in Monthly Recurring Revenue**.
`ProductAmountChange`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The rollup of product amount from all asset action sources. This field is populated by the system. Label is **Change in Product Amount**. This field is a calculated field.
`QuantityChange`	**Type** double **Properties** Filter, Sort **Description** The delta in the asset quantity resulting from an asset action. For example, suppose that the asset quantity during an asset state period is 20 and the next asset action adds 10. Then this field's value is 10. Label is **Change in Quantity**.
RolledbackAssetAction	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The last asset action rolled back in the current rollback transaction. This field is available in API version 65.0 and later.
`SubtotalChange`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The rollup of subtotal from all asset action sources. This field is populated by the system. Label is **Change in Subtotal**. This field is a calculated field.
`Subtype`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The subtype of the action on the asset. Valid values are: • `DowngradeFrom`—Available in API version 66.0 and later. • `DowngradeTo`—Available in API version 66.0 and later. • `FieldAmendment` • `Rollback` • `StartDateAdjustment` • `SwapIn`—Available in API version 66.0 and later. • `SwapOut`—Available in API version 66.0 and later. • `TransferFrom` • `TransferTo` • `UpgradeFrom`—Available in API version 66.0 and later. • `UpgradeTo`—Available in API version 66.0 and later. This field is available in API version 65.0 and later.
`TotalAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the current and previous asset action amount. This field is populated by the system.

Field	Details
	This field is a calculated field.
`TotalCancellationsAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of current and previous asset action amounts categorized as `Cancellations`. This field is populated by the system.
`TotalCrossSellsAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of current and previous asset action amounts categorized as `Cross-Sells`. This field is populated by the system.
`TotalDowngradesAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of current and previous asset action amounts categorized as `Downgrades`. This field is populated by the system and is available in API version 66.0 and later.
`TotalDownsellsAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of current and previous asset action amounts categorized as `Downsells`. This field is populated by the system.
`TotalInitialSaleAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of current and previous asset action amounts categorized as `Initial Sale`. This field is populated by the system.

Field	Details
TotalMrr	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of the monthly recurring revenue for the current and previous asset action. This field is populated by the system. Label is **Total Monthly Recurring Revenue**.
TotalOtherAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of current and previous asset action amounts categorized as `Other`. This field is populated by the system.
TotalQuantity	**Type** double **Properties** Filter, Nillable, Sort **Description** The sum of the changes in quantity for the current and previous asset action. This field is populated by the system.
TotalRenewalsAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of current and previous asset action amounts categorized as `Renewals`. This field is populated by the system.
TotalSwapsAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of current and previous asset action amounts categorized as `Swaps`. This field is populated by the system and is available in API version 66.0 and later.
TotalTermsAndConditionsAmount	**Type** currency

Field	Details
	Properties Filter, Nillable, Sort **Description** The sum of current and previous asset action amounts categorized as `Terms and Conditions Changes`. This field is populated by the system. Label is **Total Terms and Conditions Changes Amount**.
`TotalTransfersAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of current and previous asset action amounts categorized as `Transfers`. This field is populated by the system.
`TotalUpgradesAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of current and previous asset action amounts categorized as `Upgrades`. This field is populated by the system and is available in API version 66.0 and later.
`TotalUpsellsAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of current and previous asset action amounts categorized as `Upsells`. This field is populated by the system.
`Type`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** The REST API used to generate the asset action. This field is populated by the system. Valid values are: • `Cancel` • `Change` • `Convert`

Field	Details
	• `Generate`

AssetActionSource

Represents an optional way to record what transactions caused changes to lifecycle-managed assets. Use it to trace financial and other information about asset actions. This object supports Salesforce order products and work order line items, and transaction IDs from other systems. The fields can't be edited. This object is available in API version 50.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`.

Special Access Rules

To use Customer Asset Lifecycle Management APIs, you must have the Access Customer Asset Lifecycle Management APIs permission and Read access to the Asset, Asset Action, Asset Action Source, and Asset State Period objects.

Fields

Field	Details
`ActualTax`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The region-specific tax amount determined at time of the order. This field is not used for price and tax calculations.
`AdjustmentAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** An adjustment to the product amount, such as a discount.
`AssetActionId`	**Type** reference **Properties** Filter, Group, Sort **Description** The related asset action, that is, the change caused by an asset action source transaction.

Field	Details
	This field is a relationship field. **Relationship Name** AssetAction **Relationship Type** Lookup **Refers To** AssetAction
AssetActionSourceNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The ID of the asset action source. Label is **Name**.
BillingReference	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The ID of the OrderItem or OrderItemDetail record that this AssetActionSource record is created for.
Discount	**Type** percent **Properties** Filter, Nillable, Sort **Description** The discount, expressed as a percentage, that's applied to the asset. This field is available in API version 62.0 and later.
DiscountAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The discount, expressed as currency, that's applied to the asset. This field is available in API version 62.0 and later.
EffectiveGrantDate	**Type** dateTime

Field	Details
	Properties Filter, Nillable, Sort **Description** The date when the resources associated with the asset were granted. This field is available in orgs that have Revenue Cloud when Rate Management is enabled. This field is available in API version 62.0 and later.
`EndDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The end date of the service or change.
`EstimatedTax`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The estimate of the region-specific tax amount made at time of the transaction.
`ExternalReference`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The ID of an asset action source transaction originating in a system outside of Salesforce.
`ExternalReferenceDataSource`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** A system outside of Salesforce that contains asset action source transactions.
`LegalEntityId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the legal entity record associated with the asset action source transaction.

Field	Details
	This field is a relationship field. This field is available in API version 62.0 and later. **Relationship Name** LegalEntity **Relationship Type** Lookup **Refers To** LegalEntity
ListPrice	**Type** currency **Properties** Filter, Nillable, Sort **Description** List price for the order product. Value is inherited from the associated PriceBookEntry upon order product creation.
NetUnitPrice	**Type** currency **Properties** Filter, Nillable, Sort **Description** The final adjusted unit price, inclusive of all adjustments, but exclusive of tax. The unit price after all price adjustments are applied.
ObligatedAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** When a line amount is prorated, this amount shows the service amount that's been consumed.
OriginalLineNumber	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number of the original order item detail line. Salesforce uses this information to create a record to amend, renew, or cancel an order. This field is available in API version 64.0 and later. **Relationship Name** OrderItemDetail

Field	Details
	Relationship Type Lookup **Refers To** LineNumber
PeriodBoundary	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Boundary delimiters for periods. It determines when a period starts and/or ends. Valid values are: • AlignToCalendar • Anniversary • DayOfPeriod • LastDayOfPeriod
PeriodBoundaryDay	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The number specifying the day number when Period Boundary is a specific day in a week/month/year. It only applies when PeriodBoundary is set to "day of period."
PeriodBoundaryStartMonth	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Field is populated based on input in the StartDate, PeriodBoundary, and PeriodBoundaryDay when BillingFrequency2 is Annual or by manual user entry. Possible values are: 1-January 2-February 3-March 4-April 5-May 6-June 7-July 8-August

Field	Details
	9-September 10-October 11-November 12-December
PricebookEntryId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** PricebookEntry is used as a lookup for price information in order to pre-populate OrderItem's ListPrice and UnitPrice.
PricingTermCount	**Type** double **Properties** Filter, Nillable, Sort **Description** Number of pricing terms is this subscription product.
ProductAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The product amount after the asset action source transaction.
ProductSellingModelId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Specifies the product selling model type. Foreignkey to ProductSellingModel entity.
ProrationPolicyId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the ProrationPolicy used for pricing.

Field	Details
`Quantity`	**Type** double **Properties** Filter, Nillable, Sort **Description** The product quantity or the change in product quantity after the asset action source transaction.
`ReferenceEntityItemId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of an asset action source transaction originating in Salesforce. The transaction can be an order product or a work order line item. This field is a polymorphic relationship field. **Relationship Name** ReferenceEntityItem **Relationship Type** Lookup **Refers To** OrderItem, WorkOrderLineItem
`SegmentIdentifier`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The ID of the ramp segment associated with the asset action source transaction. The maximum supported length is 255 characters from API version 67.0 and later. This field is available in API version 62.0 and later.
`StartDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The start date of the service or change.
`Subtotal`	**Type** currency

Field	Details
	Properties Filter, Nillable, Sort **Description** The sum of the product amount and the adjustment amount. This field is a calculated field.
TaxTreatmentId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** Lookup to Tax Treatment entity. It's used to calculate tax.
TotalLineAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The price of the line before any price adjustments were applied. SalesTransactionItem: ProratedStartingTotal / StartingPriceTotal. Note: TotalPrice is computed using the UnitPrice, which includes discounts (price adjustments), while TotalLineAmount doesn't include price adjustments.
TotalPrice	**Type** currency **Properties** Filter, Nillable, Sort **Description** Calculated by the pricing engine for ARC. Summation of TotalAdjustmentAmount plus TotalLineAmount for this item.
TransactionDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date of a source transaction, such as an order date.
UnitPrice	**Type** currency **Properties** Filter, Nillable, Sort

Field	Details
	Description The unit price of the item before any discounts or tax calculation.

AssetActionSrcPriceAdjustment

Each row represents a junction between an asset and the calculated price adjustment that's applied to an asset. This object is available in API version 66.0 and later.

Supported Calls

`create()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Fields

Field	Details
`AdjustmentValue`	**Type** double **Properties** Create, Filter, Nillable, Sort **Description** The value of the price adjustment that was applied to the asset.
`AppliedPriceAdjustmentDate`	**Type** dateTime **Properties** Create, Filter, Sort **Description** The date and time on which the price adjustment was applied to the asset.
`AssetActionSourceId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the asset action source related to the asset for which the price adjustment was applied. This field is a relationship field. **Relationship Name** AssetActionSource

Field	Details
	Relationship Type Master-detail **Refers To** AssetActionSource (the master object)
AssetId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the asset that this price adjustment applies to. This field is a relationship field. **Relationship Name** Asset **Refers To** Asset
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the asset price adjustment record.
PriceAdjustmentCauseId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the record that caused the price adjustment. This field is a polymorphic relationship field. **Relationship Name** PriceAdjustmentCause **Refers To** Promotion
PriceAdjustmentSource	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort

Field	Details
	Description Specifies the source of price adjustment. Possible values are: • `Discretionary`—Reserved for future use. • `Promotion` • `Rule`—Reserved for future use. • `System`—Reserved for future use.
`PrioritySequence`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort **Description** The priority sequence of the applied price adjustment.

AssetContractRelationship

Represents a relationship between an asset and a contract. This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

This object is available in Enterprise, Unlimited, and Developer Editions of Revenue Cloud.

Fields

Field	Details
`AssetId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The ID of the asset related to the contract. This field is a relationship field. **Relationship Name** Asset

Field	Details
	Relationship Type Lookup **Refers To** Asset
`ContractId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The ID of the contract related to the asset. This field is a relationship field. **Relationship Name** Contract **Relationship Type** Lookup **Refers To** Contract
`EndDate`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The end date and time of the relationship between contract and asset.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view. The associated UI label is **Last Modified Date**.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user accessed this record or list view (`LastReferencedDate`) but didn't view it.

Field	Details
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The auto-generated number assigned to AssetContractRelationship. (Read Only)
`StartDate`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The start date and time of the relationship between contract and asset.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AssetContractRelationshipFeed
Feed tracking is available for the object.

AssetContractRelationshipHistory
History is available for tracked fields of the object.

AssetDowntimePeriod

Represents a period during which an asset is not able to perform as expected. Downtime periods include planned activities, such as maintenance, and unplanned events, such as mechanical breakdown. This object is available in API version 49.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AssetDowntimePeriodNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort

Field	Details
	Description The unique number of this asset downtime period record.
`AssetId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the asset this asset downtime period record is for.
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** The description of this asset downtime period.
`DowntimeType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type of this asset downtime period. Possible values are: • `Planned` • `Unplanned`
`EndTime`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The time this asset downtime period ended.
`IsExcluded`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Whether this asset downtime period is excluded from the calculation of accumulated downtime and accumulated unplanned downtime, and therefore not included in availability and reliability calculations.

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.
StartTime	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The time this asset downtime period started.

AssetOwnerSharingRule

Represents the rules for sharing an Asset with users other than the owner. This object is available in API version 33.0 and later.

Note: To enable access to this object for your org, contact Salesforce customer support. However, we recommend that you instead use Metadata API to programmatically update owner sharing rules because it triggers automatic sharing rule recalculation. The SharingRules Metadata API type is enabled for all orgs.

Supported Calls

create(), delete(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), update(), upsert()

Special Access Rules

Customer Portal users can’t access this object.

Fields

Field	Details
AssetAccessLevel	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** A value that represents the type of sharing being allowed. The possible values are: • Read • Edit
Description	**Type** textarea **Properties** Create, Filter, Nillable, Sort, Update **Description** A description of the sharing rule. Maximum size is 1000 characters.
DeveloperName	**Type** string **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to **Rule Name** in the user interface. Note: When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.
GroupId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID representing the source group. Cases owned by users in the source group trigger the rule to give access.

Field	Details
Name	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to **Label** on the user interface.
UserOrGroupId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID representing the target user or group. Target users or groups are given access.

Usage

Use this object to manage the sharing rules for assets. General sharing uses this object.

AssetRateAdjustment

Stores the tier rate adjustments for the asset rate card entries.This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`

Special Access Rules

This object is available in orgs where Revenue Cloud is enabled.

Fields

Field	Details
AdjustmentType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update

Field	Details
	Description The type of rate adjustment. Valid values are: • `Amount`—Adjusts rate by using a specific amount. • `Override`—Adjusts rate by using the override rate. • `Percentage`—Adjusts rate by using a percentage.
`AdjustmentValue`	**Type** double **Properties** Create, Filter, Sort, Update **Description** The value of the adjustment.
`AssetRateCardEntryId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the parent asset rate card entry record associated with the asset rate adjustment. This field is a relationship field. **Relationship Name** AssetRateCardEntry **Relationship Type** Master-detail **Refers To** AssetRateCardEntry (the master object)
`LowerBound`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The minimum quantity for the adjustment to be applicable.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the asset rate adjustment.

Field	Details
UpperBound	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The maximum quantity for the adjustment to be applicable.

AssetRateCardEntry

Stores the negotiated rate card entries that are associated with an asset in Revenue Cloud. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`

Special Access Rules

This object is available in orgs where Revenue Cloud is enabled.

Fields

Field	Details
AssetId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the asset rate card entry record. This field is a relationship field. **Relationship Name** Asset **Relationship Type** Master-detail **Refers To** Asset (the master object)

Field	Details
BindingObjectFormula	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The formula that returns the ID of the associated binding object, if specified. If binding object isn't added, the formula returns the asset ID of the asset related to this asset rate card entry. This field is read-only. Available in API version 65.0 and later.
BindingObjectId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the binding object associated with the asset rate card entry. Available in API version 65.0 and later. This field is a relationship field. **Relationship Name** BindingObject **Refers To** Asset
BindingObjectRateOrder	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The order that determines the applicable binding object rate when multiple rates are defined for an Anchor binding object within a effective period. Available in API version 65.0 and later.
CurrencyIsoCode	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The ID of the binding object associated with the asset rate card entry. Possible values are: • AED - UAE Dirham • AUD - Australian Dollar • BRL - Brazilian Real • CAD - Canadian Dollar

Field	Details
	• EUR - Euro • GBP - British Pound • INR - Indian Rupee • JPY - Japanese Yen • SEK - Swedish Krona • USD - U.S. Dollar The default value is USD. Available in API version 65.0 and later.
`EndDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date when the rate card's time period becomes inactive. The rate card becomes inactive at 11:59:00 PM on the end date.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** An auto-generated number assigned to the asset rate card entry. Read-only.
`NegotiatedRate`	**Type** double **Properties** Create, Filter, Sort, Update **Description** The base negotiated rate used to charge overage consumption.
`RateCardEntryId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the rate card entry record containing the catalog rates that's associated with the asset rate card entry. This field is a relationship field. **Relationship Name** RateCardEntry

Field	Details
	Refers To RateCardEntry
`RateCardId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the rate card record that's associated with the asset rate card entry. This field is a relationship field. **Relationship Name** RateCard **Refers To** RateCard
`RateUnitOfMeasureId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the unit of measure record that's associated with the asset rate card entry. This field is a relationship field. **Relationship Name** RateUnitOfMeasure **Refers To** UnitOfMeasure
`StartDate`	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The date when the rate card's time period becomes active. The rate card becomes active at 12:00:00 AM on the start date.
`UsageResourceId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The ID of the usage resource record that's associated with the asset rate card entry.

Field	Details
	This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource

AssetRelationship

Represents a non-hierarchical relationship between assets due to an asset modification; for example, a replacement, upgrade, or other circumstance. In Revenue Lifecycle Management, this object represents an asset or assets grouped in a bundle or set. This object is available in API version 41.0 and later.

Asset relationships appear in the Primary Assets and Related Assets related lists on asset records in the UI.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

Some fields are available only in Revenue Cloud. Field availability is noted in the field detail column.

Fields

Field Name	Details
`AssetId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The unique identifier of the new asset, which is the asset that is taking the place of the existing asset. This field is a relationship field. **Relationship Name** Asset **Relationship Type** Lookup **Refers To** Asset

Field Name	Details
AssetRelationshipNumber	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** An auto-generated number identifying the asset relationship.
AssetRole	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Describes the position of the main asset relative to the other assets in the relationship. This field is available in API version 58.0 and later. This field is available in orgs with Revenue Cloud. Possible values are: • `Add-on`—The main asset is an add-on. • `Bundle`—The main asset is the bundle parent. • `Set`—The asset is the main asset in the set.
CurrencyIsoCode	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Three-letter ISO 4217 currency code associated with the asset. The default value is USD.
FromDate	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date when the new asset was installed.
GroupingKey	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort

Field Name	Details
	Description Read-only field used to indicate the bundle that an asset belongs to. For example, if two assets have the same GroupingKey value, then it means that the assets are bundled together. This field is available in API v.60.0 and later. This field is available in orgs with Revenue Cloud.
`ProductRelationshipTypeId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The unique identifier of the record that describes the relationship between the main and associated assets. This field is available in API version 58.0 and later. This field is available in orgs with Revenue Cloud. This field is a relationship field. **Relationship Name** ProductRelationshipType **Relationship Type** Lookup **Refers To** ProductRelationshipType
`ProductRelatedComponent`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The product related component that's associated with the asset relationship. This field is a relationship field. This field is available in API 60.0 and later in Revenue Cloud. **Relationship Name** ProductRelatedComponent **Relationship Type** Lookup **Refers To** ProductRelatedComponent
`RelatedAssetId`	**Type** reference

Field Name	Details
	Properties Create, Filter, Group, Sort, Update **Description** The existing asset that is being modified. This field is a relationship field. **Relationship Name** RelatedAsset **Relationship Type** Lookup **Refers To** Asset
`RelatedAssetPricing`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies whether the price of the related asset is included in the bundle price. Valid values are: • `IncludedInBundlePrice` • `NotIncludedInBundlePrice` This field is available in API version 59.0 and later in Revenue Cloud.
`RelatedAssetQtyScaleMethod`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies how the quantity of the related asset changes relative to the quantity of the parent asset. Valid values are: • `Constant` • `Proportional` This field is available in API version 59.0 and later in Revenue Cloud.
`RelatedAssetRole`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort

Field Name	Details
	Description Describes the position of the associated asset relative to other assets in the relationship. This field is available in API version 58.0 and later. This field is available in orgs with Revenue Cloud. Valid values are: • `Add-on`—The main asset is an add-on. • `Bundle`—The main asset is the bundle parent. • `Set`—The asset is the main asset in the set. • `Simple`—The asset is purchased individually and isn't associated with variations. • `Variation Parent`——The main asset is the variation parent.
`RelationshipType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Sort, Update **Description** The type of relationship between the existing asset and the new asset. This field comes with three values—Replacement, Upgrade, and Crossgrade—, but you can create more values in Setup. Possible values are: • `Crossgrade`—The new asset is a crossgrade of an existing asset. For example, changing a subscription to a plan with the same service, but that runs for a longer amount of time. • `Replacement`—The new asset is replacing an existing asset. For example, a customer's faulty widget that was under warranty is being replaced with a new one. • `Upgrade`—The new asset is an upgrade of an existing asset. For example, upgrading a customer's existing subscription plan to a new plan with more services. The default value is `Replacement`.
`ToDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date when the modified asset is uninstalled.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AssetRelationshipChangeEvent (API version 62.0)
Change events are available for the object.

AssetRelationshipFeed
Feed tracking is available for the object.

AssetRelationshipHistory
History is available for tracked fields of the object.

AssetRelationshipOwnerSharingRule (API version 58.0)
Sharing rules are available for the object.

AssetRelationshipShare (API version 58.0)
Sharing is available for the object.

AssetShare

Represents a sharing entry on an Asset. This object is available in API version 33.0 and later.

You can only create, edit, and delete sharing entries for standard objects whose `RowCause` field is set to `Manual`. Sharing entries for standard objects with different `RowCause` values are created as a result of your Salesforce org's sharing configuration and are read-only. For some sharing mechanisms, such as sharing sets, sharing entries aren't stored at all.

Note: While Salesforce currently maintains read-only sharing entries for multiple sharing mechanisms, it's possible that we'll stop storing certain share records to improve performance. As a best practice, don't create customizations that rely on the availability of these sharing entries. Any changes to sharing behavior will be communicated before they occur.

Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

Customer Portal users can't access this object.

Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

Field	Details
`AssetAccessLevel`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort

Field	Details
	Description Level of access that the User or Group has to the Asset. The possible values are: • `Read` • `Edit` • `All` This value is not valid for creating or deleting records. This field must be set to an access level that is higher than the organization's default access level for cases.
`AssetId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the Asset associated with this sharing entry. This field can't be updated. This is a relationship field. **Relationship Name** Asset **Relationship Type** Lookup **Refers To** Asset
`IsDeleted`	**Type** boolean **Properties** Defaulted on create, Filter **Description** Indicates whether the object has been moved to the Recycle Bin (`true`) or not (`false`). Label is **Deleted**.
`RowCause`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Reason that this sharing entry exists. If you're creating a sharing entry, the only permitted value is `Manual`. If no value is specified, the field defaults to `Manual`. All other `RowCause` values are read-only. After the sharing entry is created, this field can't be edited. Valid values include: • `Manual`—The User or Group has access because a user with "All" access manually shared the Asset with them.

Field	Details
	• `Owner`—The User is the owner of the Asset. • `Rule`—The User or Group has access via an Asset sharing rule. • `GuestRule`—The User or Group has access via an Asset guest user sharing rule. • `LpuImplicit`—The User has access to records owned by high-volume Experience Cloud site users via a share group.
`UserOrGroupId`	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the User or Group that has been given access to the Asset. This field can't be updated. This is a polymorphic relationship field. **Relationship Name** UserOrGroup **Relationship Type** Lookup **Refers To** Group, User

Usage

This object allows you to determine which users and groups can view and edit Asset records owned by other users.

If you attempt to create a new record that matches an existing record, request updates any modified fields and returns the existing record.

AssetStatePeriod

Represents a time span when an asset has the same quantity, amount, and monthly recurring revenue (MRR). An asset has as many asset state periods as there are changes to it (asset actions) during its lifecycle. The dashboard and related pages show the current asset state period. The fields can't be edited. This object is available in API version 50.0 and later.

Supported Calls

`createable()`, `deletable()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `updateable()`.

Special Access Rules

To use Customer Asset Lifecycle Management APIs, you must have the Access Customer Asset Lifecycle Management APIs permission and Read access to the Asset, Asset Action, Asset Action Source, and Asset State Period objects.

Fields

Field	Details
`Amount`	**Type** currency **Properties** Createable, Filter, Sort, Updateable **Description** An asset's total amount during an asset state period. Revenue Cloud doesn't set or use this field's value currently.
`AssetId`	**Type** reference **Properties** Createable, Filter, Group, Sort **Description** The asset related to an asset state period. Label is **Asset**. This field is a relationship field. **Relationship Name** Asset **Relationship Type** Lookup **Refers To** Asset
`AssetStatePeriodNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The ID of the asset state period. Label is **Name**.
`BillingFrequency`	**Type** picklist **Properties** Createable, Filter, Group, Nillable, Restricted picklist, Sort, Updateable **Description** The time period that indicates how often the line item is billed. Possible values are: • `Annual` • `Monthly` • `Quarterly`

Field	Details
	• Semi-Annual Available in API version 65.0 and later.
BindingInstanceTargetId	**Type** reference **Properties** Createable, Filter, Group, Nillable, Sort, Updateable **Description** The ID of a custom product target for a usage-based quote line item, order Item, or asset allocation. This field is a polymorphic relationship field. **Relationship Name** BindingInstanceTarget **Refers To** Account, Asset, BindingObjectCustomExt, Contract
Discount	**Type** percent **Properties** Createable, Filter, Nillable, Sort, Updateable **Description** Editable number from 0 to 100. Available in API version 65.0 and later.
DiscountAmount	**Type** currency **Properties** Createable, Filter, Nillable, Sort, Updateable **Description** The fixed amount discount to apply to the line item. Available in API version 65.0 and later.
EndDate	**Type** dateTime **Properties** Createable, Filter, Nillable, Sort, Updateable **Description** The end date and time of an asset state period. On an asset that is an evergreen subscription, the last asset state period has no end date.
LegalEntityId	**Type** reference

Field	Details
	Properties Createable, Filter, Group, Nillable, Sort, Updateable **Description** The ID of the related legal entity. This field is a relationship field. **Relationship Name** LegalEntity **Refers To** LegalEntity
`Mrr`	**Type** currency **Properties** Createable, Filter, Sort, Updateable **Description** An asset's monthly recurring revenue during an asset state period.
`PriceRevisionPolicy`	**Type** reference **Properties** Createable, Filter, Group, Sort, Updateable **Description** Specifies the price uplift policy associated with this asset state period. This field is a relationship field. This field is available in API version 65.0 and later. **Relationship Name** Price Revision Policy **Relationship Type** Lookup **Refers To** PriceRevisionPolicy
`Quantity`	**Type** double **Properties** Createable, Filter, Sort, Updateable **Description** The total quantity of an asset during an asset state period.
`RampIdentifier`	**Type** string

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The ramp record used to group order item segments for this asset state period. This field is available in orgs that have Revenue Cloud when the Ramp Deals setting is enabled. The maximum supported length is 255 characters from API version 67.0 and later. This field is available in API version 62.0 and later.
`SegmentIdentifier`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The order item segment for this asset state period. This field is available in orgs that have Revenue Cloud when the Ramp Deals setting is enabled. The maximum supported length is 255 characters from API version 67.0 and later. This field is available in API version 62.0 and later.
`SegmentName`	**Type** string **Properties** Createable, Filter, Group, Nillable, Sort, Updateable **Description** The name of the order item segment for this asset state period. This field is available in orgs that have Revenue Cloud when the Ramp Deals setting is enabled. The maximum supported length is 255 characters from API version 67.0 and later. This field is available in API version 62.0 and later.
`SegmentType`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Updateable **Description** The period for the order item segment for this asset state period. Valid values are: • `Custom` • `Free Trial` • `Yearly` The default value is `Yearly`. This field is available in orgs that have Revenue Cloud when the Ramp Deals setting is enabled.

Field	Details
	This field is available in API version 62.0 and later.
StartDate	**Type** dateTime **Properties** Createable, Filter, Sort, Updateable **Description** The start date and time of an asset state period.
UnitPrice	**Type** currency **Properties** Createable, Filter, Nillable, Sort, Updateable **Description** The price per unit for the line item. Available in API version 65.0 and later. Revenue Cloud won't populate this field in API version 66.0 and later.
UnitPriceUplift	**Type** percent **Properties** Createable, Filter, Nillable, Sort, Updateable **Description** Indicates the percentage increase of a line item's unit price. Available in API version 65.0 and later.

AssetStatePeriodAttribute

Represents a virtual object that holds the key-value pair of the asset attribute in a specified asset state period. This object is a child object of AssetStatePeriod. This object is available in API version 60.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`

Special Access Rules

This object is available in Enterprise, Unlimited, and Developer Editions of Revenue Cloud with the Access Lifecycle-Managed Assets user permission. This object is editable only through API and not the UI.

Fields

Field	Details
AssetStatePeriodId	**Type** reference **Properties** Filter, Group, Sort **Description** The asset state period that's associated with the asset attribute. This field is a relationship field. **Relationship Name** AssetStatePeriod **Relationship Type** Master-detail **Refers To** AssetStatePeriod (the master object)
AttributeDefinitionId	**Type** reference **Properties** Filter, Group, Sort **Description** The attribute definition that's associated with the asset state period attribute. This field is a relationship field. **Relationship Name** AttributeDefinition **Relationship Type** Lookup **Refers To** AttributeDefinition
AttributeName	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** The name of the asset attribute.
AttributePicklistValueId	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The value specified in the picklist type field that corresponds to the attribute in the AttributePicklistValue object. This field is a relationship field. **Relationship Name** AttributePicklistValue **Relationship Type** Lookup **Refers To** AttributePicklistValue
`AttributeValue`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The value of the asset state period attribute. For example, a shirt can have the value of `blue`, which indicates the shirt's color, or it can have the value of `small`, which indicates the shirt's size. You can use this field to filter records only if the DataType value in the related `AttributeDefinitionId` record is `Text`. If the DataType value is `Picklist`, use the value in the `AttributePicklistValueId` field for filtering. You can't use this field to filter records if the DataType value is `Checkbox`, `Currency`, `Date`, `Datetime`, `Multipicklist`, `Number`, or `Percent`.

Usage

This object doesn't support custom fields, validation rules, or triggers. In SOQL queries, you can filter records by using `Id` and `AttributeDefinition`. You can't use `AttributeValue` in the `WHERE` clause.

AssetTag

Associates a word or short phrase with an Asset.

Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Fields

Field Name	Details
`ItemId`	**Type** reference **Properties** Create, Filter **Description** ID of the tagged item.
`Name`	**Type** string **Properties** Create, Filter **Description** Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.
`TagDefinitionId`	**Type** reference **Properties** Filter **Description** ID of the parent TagDefinition object that owns the tag.
`Type`	**Type** picklist **Properties** Create, Filter, Restricted picklist **Description** Defines the visibility of a tag. Valid values: • `Public`—The tag can be viewed and manipulated by all users in an organization. • `Personal`—The tag can be viewed or manipulated only by a user with a matching `OwnerId`.

Usage

AssetTag stores the relationship between its parent TagDefinition and the Asset being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

AssetTokenEvent

The documentation has moved to AssetTokenEvent in the *Platform Events Developer Guide*.

AssetWarranty

Defines the warranty terms applicable to an asset along with any exclusions and extensions. This object is available in API version 50.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
`AssetId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the asset this warranty term applies to.
`AssetWarrantyNumber`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The identifier of the asset warranty record.
`EndDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date on which this warranty term expires.
`ExchangeType`	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The type of exchange offered by this warranty term.
Exclusions	**Type** textarea **Properties** Create, Nillable, Update **Description** Description of any exclusions.
ExpensesCovered	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The percentage of expenses covered.
ExpensesCoveredEndDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date on which cover for expenses ends.
IsTransferable	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Defines whether the warranty term can be transferred to a new owner.
LaborCovered	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The percentage of labor covered.
LaborCoveredEndDate	**Type** date

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The date on which cover for labor ends.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when the asset warranty term was last modified. Its label in the user interface is `Last Modified Date`.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when the asset warranty term was last viewed.
`PartsCovered`	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The percentage of parts covered.
`PartsCoveredEndDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date on which cover for parts ends.
`Pricebook2Id`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the price book item associated with this asset warranty term.

Field	Details
`StartDate`	**Type** date **Properties** Create, Filter, Group, Sort, Update **Description** The date on which cover under this warranty term starts.
`WarrantyTermId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the warranty term this asset warranty term extends.
`WarrantyType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The type of the warranty.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

AssetWarrantyChangeEvent
Change events are available for the object.

BindingObjUsageRsrcPlcy

Represents the policies that are used for the usage resource that's associated with an asset or a binding object. This object is available in API version 65.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Fields

Field	Details
BindingObjectId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The object that's bounded with the quote line policy or order policy. This field is a polymorphic relationship field. **Relationship Name** BindingObject **Refers To** Account, Asset, BindingObjectCustomExt, Contract
DrawdownOrder	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies the order that's used to debit consumption of entitlements related to the usage resource from the usage entitlement bucket. Valid values are: • ExpiringFirst • GrantedFirst • GrantedLast
EffectiveEndDate	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** The date and time until when the policy remains effective.
EffectiveStartDate	**Type** dateTime **Properties** Create, Filter, Sort, Update **Description** The date and time when the policy becomes effective.

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The auto-generated identifier for the quote line item usage resource policy record. For example, BOURP-000004.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The ID of the owner of the binding object usage resource policy. This field is a polymorphic relationship field. **Relationship Name** Owner **Refers To** Group, User
RatingFrequencyPolicyId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The rating frequency policy associated with the usage resource. This field is a relationship field.

Field	Details
	Relationship Name RatingFrequencyPolicy **Refers To** RatingFrequencyPolicy
UsageAggregationPolicyId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage aggregation policy associated with the usage resource. This field is a relationship field. **Relationship Name** UsageAggregationPolicy **Refers To** UsageResourceBillingPolicy
UsageCommitmentPolicyId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage commitment policy associated with the usage resource. This field is a relationship field. **Relationship Name** UsageCommitmentPolicy **Refers To** UsageCommitmentPolicy
UsageOveragePolicyId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage overage policy associated with the usage resource. This field is a relationship field. **Relationship Name** UsageOveragePolicy **Refers To** UsageOveragePolicy

Field	Details
`UsageResourceId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The usage resource associated with the usage product. This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource

ContractItemPrice

Represents an object that's used to capture a price for a product on a contract. This object is available in API version 61.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available in Enterprise, Unlimited, and Developer Editions of Revenue Cloud.

Fields

Field	Details
`AdjustmentMethod`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Method used to apply discount. Valid values are: • `Range`—Apply the discount to all items after you reach the discount tier. For example, suppose that you give a 10% discount for 50 or more items. If a customer orders 50 products, and the type is `range`, apply the 10% discount to all 50 items.

Field	Details
	• `Slab`—Apply discounts in tiers. For example, suppose that you order 30 products, and the type is `slab`, you can apply a 10% discount to units 1–9, a 20% discount to units 10–19, and a 30% discount to units 20–30.
`ContractId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the contract. This field is a relationship field. **Relationship Name** Contract **Relationship Type** Master-detail **Refers To** Contract (the master object)
`DiscountType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type of discount applied, a percentage of the price or an amount. Valid values are: • `AdjustmentAmount` • `AdjustmentPercentage`
`DiscountValue`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The value of the discount applied, based on the discount type.
`EndDate`	**Type** dateTime **Properties** Create, Filter, Nillable, Sort, Update **Description** End date and time of the relationship between the contract and contract item price.

Field	Details
`ItemId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** ID of the product or product category related to a price in a contract. This field is a polymorphic relationship field. **Relationship Name** Item **Relationship Type** Lookup **Refers To** Product2, ProductCategory
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp when the current user last accessed this record, a record related to this record, or a list view.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp when the current user last viewed this record or list view. If this value is null, the user accessed this record or list view (`LastReferencedDate`) but didn't view it.
ListPrice	**Type** currency **Properties** Filter, Nillable **Description** The list price of the product. This value is read-only and inherited from the price book related to the contract when the contract item price is created. Use the list price to compare the advertised price to prices that customers receive during contract negotiations. This field is available in API version 66.0 and later.
`Name`	**Type** string

Field	Details
	Properties Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** Auto-generated number assigned to the contract item price. (Read only)
`Price`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** Unit price for the product sold as part of the contract.
`ProductSellingModelId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Product selling model for the product associated with the price. This field is a relationship field. **Relationship Name** ProductSellingModel **Relationship Type** Lookup **Refers To** ProductSellingModel
`SellingModelType`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort **Description** Selling mode type to specify whether the product sold is a one-time sale, an evergreen subscription, or a subscription with a defined term. Valid values are: • `Evergreen` • `OneTime` • `TermDefined` The value derived from the product selling model.
`StartDate`	**Type** dateTime

Field	Details
	Properties Create, Filter, Sort, Update **Description** Start date and time of the relationship between the contract and contract item price.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ContractItemPriceHistory on page 1288
History is available for tracked fields of the object.

ContractItemPriceAdjTier

Represents the tiers of a price adjustment to a product on a contract. This object is available in API version 63.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available with Revenue Management.

Fields

Field	Details
`ContractItemPriceId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The contract item price ID associated with the contract item price adjustment tier. This field is a relationship field. **Relationship Name** ContractItemPrice

Field	Details
	Relationship Type Master-detail **Refers To** ContractItemPrice (the master object)
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** Timestamp when the current user last viewed this record or list view. If this value is null, the user accessed this record or list view (`LastReferencedDate`) but didn't view it.
`LowerBound`	**Type** double **Properties** Create, Filter, Sort, Update **Description** The minimum quantity for the adjustment to be applicable.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the record.
`TierType`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The type of adjustment tier.

Field	Details
	Valid values are: • `AdjustmentAmount` • `AdjustmentPercentage` • `OverrideAmount`
`TierValue`	**Type** double **Properties** Create, Filter, Sort, Update **Description** The price adjustment value.
`UpperBound`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The maximum quantity for the adjustment to be applicable.

Associated Objects

This object has associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

ContractItemPriceAdjTierFeed
Feed tracking is available for the object.

ContractItemPriceAdjTierHistory
History is available for tracked fields of the object.

ContractItemPriceHistory

Represents the history of changes to the values in the fields of a ContractItemPrice object. This object is available in API version 61.0 and later.

Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

This object is available in Enterprise, Unlimited, and Developer Editions of Revenue Cloud.

Fields

Field	Details
ContractItemPriceId	**Type** reference **Properties** Filter, Group, Sort **Description** ID of the ContractItemPrice record. This field is a relationship field. **Relationship Name** ContractItemPrice **Relationship Type** Lookup **Refers To** ContractItemPrice
DataType	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Data type of the field that was changed. Valid values are: • Address • AnyType • AutoNumber • Base64 • BitVector • Boolean • Content • Currency • DataCategoryGroupReference • DateOnly • DateTime • Division • Double • DynamicEnum • Email • EncryptedBase64

Field	Details
	• `EncryptedText` • `EntityId` • `EnumOrId` • `ExternalId` • `Fax` • `File` • `HtmlMultiLineText` • `HtmlStringPlusClob` • `InetAddress` • `Json` • `Location` • `MultiEnum` • `MultiLineText` • `Namespace` • `Percent` • `PersonName` • `Phone` • `Raw` • `RecordType` • `SfdcEncryptedText` • `SimpleNamespace` • `StringPlusClob` • `Switchable_PersonName` • `Text` • `TimeOnly` • `Url` • `YearQuarter`
`Field`	**Type** picklist **Properties** Filter, Group, Restricted picklist, Sort **Description** Name of the field that was changed. Possible values are: • `AdjustmentMethod` • `Contract` • `DiscountType`

Field	Details
	• `DiscountValue` • `EndDate` • `Item` • `Name` • `Price` • `ProductSellingModel` • `StartDate` • `created` • `customPersonMerged` • `feedEvent` • `individualMerged` • `locked`—Record locked. • `ownerAccepted`—Owner (Accepted) • `ownerAssignment`—Owner (Assignment) • `unlocked`—Record unlocked.
`NewValue`	**Type** anyType **Properties** Nillable, Sort **Description** New value of the field that was changed.
`OldValue`	**Type** anyType **Properties** Nillable, Sort **Description** Latest value of the field before it was changed.

OrderDeliveryMethod

Shows the customizations and options that a buyer selected for their delivery method. This object is available in API version 48.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

To access Commerce Orders entities, your org must have a Salesforce Order Management license. Commerce Orders entities are available only in Lightning Experience.

Fields

Field	Details
`Carrier`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The carrier that the buyer chose for their delivery method. Developers must add values to this field.
`ClassOfService`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The carrier class of service that the buyer chose for their delivery method. Developers must add values to this field.
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** Description of the delivery method.
`IsActive`	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Assign new delivery groups to active delivery methods.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort

Field	Details
	Description The timestamp for when the current user last viewed a record related to this record.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced (LastReferencedDate) and not viewed.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Required. Default name of this record.
OwnerId	**Type** reference **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** The user who owns an order delivery method record.
ProductId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Optional. This product represents a delivery charge order product for a delivery using this delivery method. For example, you could create a product that represents an overnight express charge and assign it to an overnight express delivery method.
ReferenceNumber	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Reference number for an external delivery method.

Field	Details
ShippingCarrierMethod	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Optional. A specific shipping service provided by a shipping carrier, such as Ground, 2Day, and NextDay. Depends on the range of transit times available for each carrier.

Associated Objects

This object has the following associated objects. If the API version isn't specified, they're available in the same API versions as this object. Otherwise, they're available in the specified API version and later.

OrderDeliveryMethodChangeEvent (API version 62.0)
Change events are available for the object.

OrderItemAttribute

Represents a virtual object that stores an attribute specified for an order item.This object is available in API version 60.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

This object is available in Enterprise, Unlimited, and Developer Editions of Revenue Cloud.

Fields

Field	Details
AttributeDefinitionId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The ID of the attribute definition for this order item attribute. This field is a relationship field. **Relationship Name** AttributeDefinition **Relationship Type** Lookup

Field	Details
	Refers To AttributeDefinition
AttributeName	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort **Description** The name given to order item attribute.
AttributePicklistValueId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the attribute picklist value if the attribute is a picklist type. This field is a relationship field. **Relationship Name** AttributePicklistValue **Relationship Type** Lookup **Refers To** AttributePicklistValue
AttributeValue	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** Stores the value of the order item attribute. For example 5-TB storage. You can use this field to filter records only if the DataType value in the related AttributeDefinitionId record is Text. If the DataType value is Picklist, use the value in the AttributePicklistValueId field for filtering. You can't use this field to filter records if the DataType value is Checkbox, Currency, Date, Datetime, Multipicklist, Number, or Percent.
ExternalId	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description An auto-generated ID of the attribute record saved in an external system (for example an HBase database).
`IsPriceImpacting`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** The pricing impacting the status of the attribute. The default value is `false`.
`OrderItemId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The parent order item associated with the order item attribute. This field is a relationship field. **Relationship Name** OrderItem **Relationship Type** Lookup **Refers To** OrderItem

OrderItemDetail

Represents the breakdown details of an order product. Revenue Management generates these records to capture pricing and quantity changes, such as negative quantity reductions, early renewals, derived pricing or repricing during an amendment, and bundle or product attribute reconfigurations. This object is available in API version 60.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

This object is available in Enterprise, Unlimited, and Developer Editions of Revenue Cloud.

Fields

Field	Details
BillingReference	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Reference to the original order item for which this amend or cancel record is created.
EffectiveFrom	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when the transaction becomes effective.
EffectiveTo	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when the transaction ends.
LineNumber	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The line number of the detail record.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the record.
NetUnitPrice	**Type** currency **Properties** Filter, Sort

Field	Details
	Description The unit price of the item that's calculated after applying any discounts and before tax calculation.
`OrderItemId`	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the related order item. This field is a relationship field. **Relationship Name** OrderItem **Relationship Type** Lookup **Refers To** OrderItem
`PriceWaterfallIdentifier`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The price waterfall identifier generated by Salesforce Pricing that's associated with the pricing of the detail record.
`Quantity`	**Type** double **Properties** Filter, Sort **Description** The quantity specified for the item in the detail record.
`ReferenceDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The reference date of the item. For example, the start date of the subscription that's associated with the detail record.

Field	Details
ReferenceNumber	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The reference number of the item. For example, the order number that's associated with the detail record.
TotalLineAmount	**Type** currency **Properties** Filter, Sort **Description** The net total price of the order product, before price adjustments, inclusive of quantity and subscription term.
TotalPrice	**Type** currency **Properties** Filter, Sort **Description** The total price of the item in the detail record that's calculated using the quantity, net unit price, and after applying the pricing terms.
UnitPrice	**Type** currency **Properties** Filter, Sort **Description** The unit price of the item before any discounts or tax calculation.

OrderItemRateAdjustment

Represents the negotiated rate adjustment for an order product. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

This object is available with Revenue Cloud.

Fields

Field	Details
AdjustmentType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies the type of rate adjustment. Possible values are: • Amount • Override • Percentage
AdjustmentValue	**Type** double **Properties** Create, Filter, Sort, Update **Description** The value of the adjustment.
LowerBound	**Type** double **Properties** Create, Filter, Sort, Update **Description** The minimum quantity for the adjustment to be applicable.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the order item rate adjustment.
OrderItemRateCardEntryId	**Type** reference

Field	Details
	Properties Create, Filter, Group, Sort **Description** The parent order item rate card entry associated with the order item rate adjustment. This field is a relationship field. **Relationship Name** OrderItemRateCardEntry **Relationship Type** Master-detail **Refers To** OrderItemRateCardEntry (the master object)
`UpperBound`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The quantity below which the adjustment must be applicable. For example, if you want the adjustment to be applicable when the quantity is 99 or less, set this value to 100.

OrderItemRateCardEntry

Represents the catalog and negotiated rates of a usage metric associated with an order item that's used to charge overage consumption. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

This object is available with Revenue Cloud.

Fields

Field	Details
IsChosenRate	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this rate is the chosen rate for the associated binding target and usage resource (`true`) or not (`false`). The default value is `false`. Available in API version 64.0 and later.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** An auto-generated number assigned to the order item rate card entry record.
`NegotiatedRate`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The base negotiated rate used to charge overage consumption.
`OrderItemId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The parent order item associated with the order item rate card entry. This field is a relationship field. **Relationship Name** OrderItem **Relationship Type** Master-detail **Refers To** OrderItem (the master object)
`RateCardEntryId`	**Type** reference

Field	Details
	Properties Create, Filter, Group, Sort **Description** The rate card entry containing catalog rates that's associated with the order item rate card entry. This field is a relationship field. **Relationship Name** RateCardEntry **Refers To** RateCardEntry
RateCardId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The rate card associated with the order item rate card entry. This field is a relationship field. **Relationship Name** RateCard **Refers To** RateCard
RateUnitOfMeasureId	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The standard unit of measure containing the unit for the negotiated rate that's associated with the order item rate card entry. This field is a relationship field. **Relationship Name** RateUnitOfMeasure **Refers To** UnitOfMeasure
UsageResourceId	**Type** reference **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The usage resource associated with the order item rate card entry. This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource

OrderItemUsageRsrcGrant

Represents the negotiated grants for the usage resource that's associated with the usage product added in the order item. This object is available in API version 65.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
`GrantQuantity`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The granted or negotiated quantity of a usage resource associated with the usage product.
`GrantType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies the type of model that defines how the usage resource is consumed. Valid values are: • `Commit` • `Grant`

Field	Details
	The default value is `Grant`.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The auto-generated identifier for the order item usage resource grant record. For example, OIURG-00004 or OIURG-4567.
`OrderItemId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The order item associated with the usage product. This field is a relationship field. **Relationship Name** OrderItem **Relationship Type** Master-detail **Refers To** OrderItem (the master object)
`ProductUsageGrantId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The product usage grant associated with the order item. This field is a relationship field. **Relationship Name** ProductUsageGrant **Refers To** ProductUsageGrant
`TokenResourceId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The usage resource of category Token associated with the usage resource related to the usage product added in the order item. This field is a relationship field. **Relationship Name** TokenResource **Refers To** UsageResource
`UsageGrantRefreshPolicyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage grant refresh policy associated with the usage resource related to the usage product added in the order item. This field is a relationship field. **Relationship Name** UsageGrantRefreshPolicy **Refers To** UsageGrantRenewalPolicy
`UsageGrantRolloverPolicyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage grant rollover policy associated with the usage resource related to the usage product added in the order item. This field is a relationship field. **Relationship Name** UsageGrantRolloverPolicy **Refers To** UsageGrantRolloverPolicy
`UsageResourceId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The usage resource associated with the usage product that's added in the order item.

Field	Details
	This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource
`ValidityPeriodTerm`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The duration for which the usage resource grant is valid, when used with the validity period units.
`ValidityPeriodUnit`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The length of a validity period for the usage resource grant, when used with the validity period term. Valid values are: • `Month` • `None` • `Year`

OrderItemUsageRsrcPlcy

Represents the policies that are used for the usage resource that's associated with the usage product added in the order item. This object is available in API version 65.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
DrawdownOrder	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies the order that's used to debit consumption of entitlements related to the usage resource from the usage entitlement bucket. Valid values are: • ExpiringFirst • GrantedFirst • GrantedLast
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** An auto-generated number assigned to the order item for usage product grant record. For example, OIURG-4567
OrderItemId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The order item associated with the usage product. This field is a relationship field. **Relationship Name** OrderItem **Relationship Type** Master-detail **Refers To** OrderItem (the master object)
ProductUsageResourcePolicyId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The product usage resource policy associated with the usage resource related to the usage product added in the order item. This field is a relationship field. **Relationship Name** ProductUsageResourcePolicy **Refers To** ProductUsageResourcePolicy
RatingFrequencyPolicyId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The rating frequency policy associated with the usage resource related to the usage product added in the order item. This field is a relationship field. **Relationship Name** RatingFrequencyPolicy **Refers To** RatingFrequencyPolicy
UsageAggregationPolicyId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage aggregation policy associated with the usage resource related to the usage product added in the order item. This field is a relationship field. **Relationship Name** UsageAggregationPolicy **Refers To** UsageResourceBillingPolicy
UsageCommitmentPolicyId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The usage commitment policy associated with the usage resource related to the usage product added in the order item. This field is a relationship field. **Relationship Name** UsageCommitmentPolicy **Refers To** UsageCommitmentPolicy
`UsageOveragePolicyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage overage policy associated with the usage resource related to the usage product added in the order item. This field is a relationship field. **Relationship Name** UsageOveragePolicy **Refers To** UsageOveragePolicy
`UsageResourceId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The usage resource associated with the usage product that's added in the order item. This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource

SalesTransactionType

Represents the type of the sales transaction. This object is available in API version 61.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available in Enterprise, Unlimited, and Developer Editions of Revenue Cloud.

Fields

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record, a record related to this record, or a list view.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user might have only accessed this record or list view but not viewed it directly.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the sales transaction type.

QuoteAction

Indicates the type of sales transaction that's being quoted; for example, a renewal sale. This object is available in API version 59.0 and later.

If a quote doesn't have a quote action, Salesforce treats it as a quote of the `Add` type. When such a quote is used to create an order, Salesforce automatically creates an order action of the `Add` type.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available in orgs with Revenue Cloud. It's also available in Industries Automotive and Industries Field Service.

Fields

Field	Details
`CurrencyIsoCode`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** ISO code of the currency. Use only one of the valid alphabetic, three-letter currency ISO codes defined by the ISO 4217 standard, such as `USD`, `GBP`, or `JPY`. Must be unique within your organization. Label is **Currency ISO Code**. The default value is `USD`. See Supported Currencies (ICU) for a list of currency codes Salesforce supports. This field is available in Revenue Cloud in API version 66.0 and later.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last accessed this record indirectly, for example, through a list view or related record.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp when the current user last viewed this record or list view. If this value is null, the user accessed this record or list view indirectly, but didn't view it.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort

Field	Details
	Description The name given to the quote action.
`QuoteId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The quote related to this quote action. This field is a relationship field. **Relationship Name** Quote **Relationship Type** Lookup **Refers To** Quote
`SourceAssetId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The asset changed by this sales transaction. For example, if the quote action is a quantity amendment, this field contains the ID of the asset that's amended. This field is a relationship field. **Relationship Name** SourceAsset **Relationship Type** Lookup **Refers To** Asset
`Subtype`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The subtype of the action on the quote line item. Valid values are: • `DowngradeFrom`—Available in API version 66.0 and later.

Field	Details
	• `DowngradeTo`—Available in API version 66.0 and later. • `FieldAmendment` • `Rollback` • `StartDateAdjustment` • `SwapIn`—Available in API version 66.0 and later. • `SwapOut`—Available in API version 66.0 and later. • `TransferFrom` • `TransferTo` • `UpgradeFrom`—Available in API version 66.0 and later. • `UpgradeTo`—Available in API version 66.0 and later. This field is available with Revenue Cloud in API version 64.0 and later.
`Type`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort **Description** The type of sales transaction that the related quote is for. Valid values are: • `Add` • `Amend` • `Association`—Available in API version 66.0 and later. • `Cancel` • `No Change` • `Renew` • `Transfer`—Available with Revenue Cloud in API version 65.0 and later.

QuoteItemTaxItem

The tax that is applied to a quote line item. This object is available in API version 55.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Special Access Rules

This object is available if Subscription Management is enabled in your org. This object is also available in Enterprise, Unlimited, and Developer Editions of Revenue Cloud.

Fields

Field	Details
`Amount`	**Type** currency **Properties** Create, Filter, Sort, Update **Description** The tax amount for the quote line item.
`CurrencyIsoCode`	**Type** picklist **Properties** Defaulted on create, Filter, Group, Restricted picklist, Sort **Description** Available only for orgs with the multicurrency feature enabled. Contains the ISO code for any currency allowed by the org. Possible values are: • `BHD`—Bahraini Dinar • `EUR`—Euro • `JPY`—Japanese Yen • `USD`—U.S. Dollar The default value is 'USD'.
`Description`	**Type** textarea **Properties** Create, Nillable, Update **Description** User-defined description of the tax. For example, state sales tax or value-added tax (VAT).
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** Name of the tax.
`ProductSurchargeId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The product surcharge associated with the quote item tax item. This field is a relationship field. This field is available with Digital Insurance. **Relationship Name** ProductSurcharge **Refers To** ProductSurcharge
ProratedSurchargeAmount	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The prorated portion of the tax amount based on the quote line item's effective dates. This field is available with Digital Insurance.
QuoteLineItemId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** ID of the related quote line item. This is a relationship field. **Relationship Name** QuoteLineItem **Relationship Type** Lookup **Refers To** QuoteLineItem
Rate	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** If the tax is a percentage tax, then this field contains the percent value. If the tax is a fixed amount, then this field is null.
TaxEffectiveDate	**Type** date

Field	Details
	Properties Create, Filter, Group, Sort, Update **Description** The date used to calculate the tax rate.
`Type`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Whether the tax is estimated or calculated by the tax provider. Possible values are: • `Actual` • `Estimated`

QuoteLineDetail

Represents the breakdown details of a quote line item. Revenue Management generates these records to capture pricing and quantity changes, such as negative quantity reductions, early renewals, derived pricing or repricing during an amendment, and bundle or product attribute reconfigurations. This object is available in API version 60.0 and later.

Supported Calls

`describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

Special Access Rules

This object is available in Enterprise, Unlimited, and Developer Editions of Revenue Cloud.

Fields

Field	Details
`BillingReference`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** Reference to the original order item for which this amend or cancel record is created.

Field	Details
EffectiveFrom	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when the transaction becomes effective.
EffectiveTo	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when the transaction ends.
LineNumber	**Type** int **Properties** Filter, Group, Nillable, Sort **Description** The line number of the detail record.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The name of the record.
NetUnitPrice	**Type** currency **Properties** Filter, Sort **Description** The unit price of the item that's calculated after applying any discounts and before tax calculation.
PriceWaterfallIdentifier	**Type** string **Properties** Filter, Group, Nillable, Sort

Field	Details
	Description The price waterfall identifier generated by Salesforce Pricing that's associated with the pricing of the detail record.
`Quantity`	**Type** double **Properties** Filter, Sort **Description** The quantity specified for the item in the detail record.
`QuoteLineItemId`	**Type** reference **Properties** Filter, Group, Sort **Description** The ID of the related quote line. This field is a relationship field. **Relationship Name** QuoteLineItem **Relationship Type** Lookup **Refers To** QuoteLineItem
`ReferenceDate`	**Type** date **Properties** Filter, Group, Nillable, Sort **Description** The reference date of the item. For example, the start date of the subscription that's associated with the detail record.
`ReferenceNumber`	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The reference number of the item. For example, the order number that's associated with the detail record.

Field	Details
TotalLineAmount	**Type** currency **Properties** Filter, Sort **Description** The net total price of the order product, before price adjustments, inclusive of quantity and the subscription term.
TotalPrice	**Type** currency **Properties** Filter, Sort **Description** The total price of the item in the detail record that's calculated using the quantity, net unit price, and after applying the pricing terms.
UnitPrice	**Type** currency **Properties** Filter, Sort **Description** The unit price of the item before any discounts or tax calculation.

QuoteLineGroup

Stores the group information for line items in a quote. It also stores the aggregated line field information (subtotal). It contains a parent-child relationship to quote. This object is available in API version 61.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
Description	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The description of the group.
Discount	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The optional discount percentage, specified by the sales representative at the group level.
DiscountAmount	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The optional discount amount, specified by the sales representative at the group level.
EndDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The end date of the group ramp segment.
IsRamped	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** Indicates whether the group is a group ramp segment, which is a period in a group ramp deal with specific prices and volume. The default value is `false`.
Margin	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The optional margin percentage, specified by the sales representative at the group level.
MarginAmount	**Type** currency

Field	Details
	Properties Create, Filter, Nillable, Sort, Update **Description** The optional margin amount, specified by the sales representative at the group level. This amount can also be considered as the summary margin amount calculated by subtracting the total cost from the summary subtotal.
`Name`	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the group.
`ParentQuoteLineGroupId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the parent group for a nested quote line group. This field is a relationship field. **Relationship Name** ParentQuoteLineGroup **Refers To** QuoteLineGroup
`QuoteId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The ID of the related quote. This field is a relationship field. **Relationship Name** Quote **Relationship Type** Master-detail **Refers To** Quote (the master object)

Field	Details
SegmentType	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The duration type of the segment. Possible values are: • Custom • Yearly
SortOrder	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description**
StartDate	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The start date of the group ramp segment.
SummarySubtotal	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The aggregated subtotal amount of nested group lines.
SummaryTotalAmount	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The aggregated total amount of nested group lines before any discounts are applied.
TotalAdjustment	**Type** percent **Properties** Filter, Nillable, Sort

Field	Details
	Description The total discount percentage applied at the group level. This percentage is calculated by using the formula: (Summary Total Amount - Summary Subtotal) / Summary Total Amount.
TotalAdjustmentAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total discount amount at the group level. This amount is calculated by subtracting the summary subtotal from the summary total amount.
TotalCost	**Type** currency **Properties** Filter, Nillable, Sort **Description** The aggregated total cost of nested group lines.
TotalMargin	**Type** percent **Properties** Filter, Nillable, Sort **Description** The summary margin percentage at the line item level. This percentage is calculated by using the formula: (Summary Subtotal - Total Cost) / Summary Subtotal.
TotalMarginAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The summary margin amount calculated at the group level.
Type	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The type of quote line group. Possible values are:

Field	Details
	• `AssetDowngrade` • `AssetSwap` • `AssetUpgrade` • `CPQQuoteGroup`—CPQ Line Grouping • `RampScheduleGroup` The default value is `CPQQuoteGroup`.

QuoteLineItemAttribute

Represents a virtual object that stores an attribute specified for a quote line item. This object is available in API version 59.0 and later.

Note: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

This object is available in Enterprise, Unlimited, and Developer Editions of Revenue Management.

Fields

Field	Details
`AttributeDefinitionId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The ID of the attribute definition for this quote line item attribute. This field is a relationship field. **Relationship Name** AttributeDefinition **Refers To** AttributeDefinition
`AttributeName`	**Type** string **Properties** Filter, Group, idLookup, Nillable, Sort

Field	Details
	Description The name of the quote line item attribute.
`AttributePicklistValueId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the attribute picklist value if the attribute is a picklist type. This field is a relationship field. **Relationship Name** AttributePicklistValue **Refers To** AttributePicklistValue
`AttributeValue`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The value of the quote line item attribute. For example 5-TB storage. You can use this field to filter records only if the DataType value in the related `AttributeDefinitionId` record is `Text`. If the DataType value is `Picklist`, use the value in the `AttributePicklistValueId` field for filtering. You can't use this field to filter records if the DataType value is `Checkbox`, `Currency`, `Date`, `Datetime`, `Multipicklist`, `Number`, or `Percent`.
`ExternalId`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** An auto-generated ID of the attribute record saved in an external system, such as an HBase database.
`IsPriceImpacting`	**Type** boolean **Properties** Defaulted on create, Filter, Group, Sort **Description** The pricing impacting the status of the attribute.

Field	Details
	The default value is `false`.
`QuoteLineItemId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The associated parent quote line item. This field is a relationship field. **Relationship Name** QuoteLineItem **Relationship Type** Master-detail **Refers To** QuoteLineItem (the master object)

Usage

This object doesn't support custom fields, validation rules, or triggers. In SOQL queries, you can filter records by using `Id` and `AttributeDefinition`. You can't use `AttributeValue` in the `WHERE` clause.

QuotLineItmUseRsrcGrant

Represents the negotiated grants for the usage resource that's associated with the usage product added in the quote line item. This object is available in API version 65.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

Fields

Field	Details
`GrantQuantity`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update

Field	Details
	Description The granted or negotiated quantity of a usage resource associated with the usage product.
`GrantType`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies the type of model that defines how the usage resource is consumed. Valid values are: • `Commit` • `Grant` The default value is `Grant`.
`LastReferencedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.
`LastViewedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
`Name`	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The auto-generated identifier for the quote line item usage resource grant record. For example, QLIURG-00004 or QLIURG-4567.
`ProductUsageGrantId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The product usage grant associated with the quote line item. This field is a relationship field. **Relationship Name** ProductUsageGrant **Refers To** ProductUsageGrant
`QuoteLineItemId`	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The quote line item associated with the usage product. This field is a relationship field. **Relationship Name** QuoteLineItem **Relationship Type** Master-detail **Refers To** QuoteLineItem (the master object)
`TokenResourceId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage resource of category Token associated with the usage resource related to the usage product added in the order item. This field is a relationship field. **Relationship Name** TokenResource **Refers To** UsageResource
`UsageGrantRefreshPolicyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The usage grant refresh policy associated with the usage resource related to the usage product added in the quote line item. This field is a relationship field. **Relationship Name** UsageGrantRefreshPolicy **Refers To** UsageGrantRenewalPolicy
`UsageGrantRolloverPolicyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage grant rollover policy associated with the usage resource related to the usage product added in the quote line item. This field is a relationship field. **Relationship Name** UsageGrantRolloverPolicy **Refers To** UsageGrantRolloverPolicy
`UsageResourceId`	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The usage resource associated with the usage product that's added as the quote line item. This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource
`ValidityPeriodTerm`	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The duration for which the usage resource grant is valid, when used with the validity period units.

Field	Details
ValidityPeriodUnit	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The length of a validity period for the usage resource grant, when used with the validity period term. Valid values are: • Month • None • Year

QuotLineItmUsageRsrcPlcy

Represents the policies that are used for the usage resource that's associated with the usage product added in the quote line item. This object is available in API version 65.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), update(), upsert()

Fields

Field	Details
DrawdownOrder	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies the order that's used to debit consumption of entitlements related to the usage resource from the usage entitlement bucket. Valid values are: • ExpiringFirst • GrantedFirst • GrantedLast

Field	Details
LastReferencedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when this record was last referenced.
LastViewedDate	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The timestamp for when the current user last viewed a record related to this record.
Name	**Type** string **Properties** Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** The auto-generated identifier for the quote line item usage resource policy record. For example, QLIURP-00004 or QLIURP-4567.
ProductUsageResourcePolicyId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The product usage resource policy associated with the quote line item. This field is a relationship field. **Relationship Name** ProductUsageResourcePolicy **Refers To** ProductUsageResourcePolicy
QuoteLineItemId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The quote line item associated with the usage product. This field is a relationship field.

Field	Details
	Relationship Name QuoteLineItem **Relationship Type** Master-detail **Refers To** QuoteLineItem (the master object)
`RatingFrequencyPolicyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The rating frequency policy associated with the usage resource related to the usage product added in the quote line item. This field is a relationship field. **Relationship Name** RatingFrequencyPolicy **Refers To** RatingFrequencyPolicy
`UsageAggregationPolicyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage aggregation policy associated with the usage resource related to the usage product added in the quote line item. This field is a relationship field. **Relationship Name** UsageAggregationPolicy **Refers To** UsageResourceBillingPolicy
`UsageCommitmentPolicyId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage commitment policy associated with the usage resource related to the usage product added in the quote line item. This field is a relationship field.

Field	Details
	Relationship Name UsageCommitmentPolicy **Refers To** UsageCommitmentPolicy
UsageOveragePolicyId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The usage overage policy associated with the quote line item. This field is a relationship field. **Relationship Name** UsageOveragePolicy **Refers To** UsageOveragePolicy
UsageResourceId	**Type** reference **Properties** Create, Filter, Group, Sort, Update **Description** The usage resource associated with the usage product that's added in the quote line item. This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource

QuoteLineRateAdjustment

Represents the negotiated rate adjustment for a quote line item. This object is available in API version 62.0 and later.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Special Access Rules

This object is available with Revenue Cloud.

Fields

Field	Details
AdjustmentType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies the type of rate adjustment. Possible values are: • Amount • Override • Percentage
AdjustmentValue	**Type** double **Properties** Create, Filter, Sort, Update **Description** The value of the adjustment.
LowerBound	**Type** double **Properties** Create, Filter, Sort, Update **Description** The minimum quantity for the adjustment to be applicable.
Name	**Type** string **Properties** Create, Filter, Group, idLookup, Sort, Update **Description** The name of the quote line rate adjustment record.
QuoteLineRateCardEntryId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The parent quote line rate card entry associated with the quote line rate adjustment. This field is a relationship field.

Field	Details
	Relationship Name QuoteLineRateCardEntry **Relationship Type** Master-detail **Refers To** QuoteLineRateCardEntry (the master object)
`UpperBound`	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The quantity below which the adjustment must be applicable. For example, if you want the adjustment to be applicable when the quantity is 99 or less, set this value to 100.

QuoteLineRateCardEntry

Represents the catalog and negotiated rates of a usage resource associated with a quote line item that's used to charge overage consumption. This object is available in API version 62.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

Fields

Field	Details
IsChosenRate	**Type** boolean **Properties** Create, Defaulted on create, Filter, Group, Sort, Update **Description** Indicates whether this rate is the chosen rate for the associated binding target and usage resource (`true`) or not (`false`). The default value is `false`. Available in API version 64.0 and later.
`Name`	**Type** string

Field	Details
	Properties Autonumber, Defaulted on create, Filter, idLookup, Sort **Description** An auto-generated number assigned to the quote line rate card entry record.
NegotiatedRate	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The base negotiated rate used to charge overage consumption.
QuoteLineItemId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The parent quote line item associated with the quote line rate card entry. This field is a relationship field. **Relationship Name** QuoteLineItem **Relationship Type** Master-detail **Refers To** QuoteLineItem (the master object)
RateCardEntryId	**Type** reference **Properties** Create, Filter, Group, Sort **Description** The rate card entry containing catalog rates that's associated with the quote line rate card entry. This field is a relationship field. **Relationship Name** RateCardEntry **Refers To** RateCardEntry
RateCardId	**Type** reference

Field	Details
	Properties Filter, Group, Nillable, Sort **Description** The rate card associated with the quote line rate card entry. This field is a relationship field. **Relationship Name** RateCard **Refers To** RateCard
`RateUnitOfMeasureId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The standard unit of measure containing the unit for the negotiated rate that's associated with the quote line rate card entry. This field is a relationship field. **Relationship Name** RateUnitOfMeasure **Refers To** UnitOfMeasure
`UsageResourceId`	**Type** reference **Properties** Filter, Group, Nillable, Sort **Description** The usage resource associated with the quote line rate card entry. This field is a relationship field. **Relationship Name** UsageResource **Refers To** UsageResource

Transaction Management Fields on Standard Objects

Transaction Management adds standard and custom fields to some standard Salesforce objects. These fields are available only in orgs where Transaction Management is enabled.

Transaction Management Fields on Object State Definition

Standard and custom fields extend the standard Object State Definition object for use in Transaction Management to represent the object state model for a particular status field for an entity. This object is available in API version 60.0 and later.

Fields

Field	Details
AppUsageType	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** This field indicates under which AppUsageType the transition applies to. For example, ObjectStateDefinition associated with "Revenue Lifecycle Management" AppUsageType will apply to quotes, assets, or orders associated with "Revenue Lifecycle Management".

Transaction Management Fields on Object State Transition

Standard and custom fields extend the standard Object State Transition object for use in Transaction Management to define the valid transition between two statuses. This object is available in API version 60.0 and later.

Fields

Field	Details
CustomPermissionId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the associated custom permission. This field is a relationship field. **Relationship Name** CustomPermission **Relationship Type** Lookup **Refers To** CustomPermission

Transaction Management Fields on Object State Value

Standard and custom fields extend the standard Object State Transition object for use in Transaction Management This object is available in API version 60.0 and later.

Fields

Field	Details
CustomPermissionId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the associated custom permission. This field is a relationship field. **Relationship Name** CustomPermission **Relationship Type** Lookup **Refers To** CustomPermission

Transaction Management Fields on Order

Standard and custom fields extend the standard Order object for use in Transaction Management.

Special Access Rules

To view these fields, you must have the Revenue Cloud Advanced license. See Order for fields on the Salesforce platform object.

Fields

Field	Details
AdjustmentDistributionLogic	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies how the overall discount amount distributes among all the order line items that have prices associated with them. The amount distributed is either the value specified in the `AppliedDiscountAmount` field or the difference between the values in the calculated `TotalAmount` and the user-specified `TotalAmountOverride` fields. Valid values are: • `Equal`—Distributes the discount amount equally among all the order items.

Field	Details
	• `Proportionate`—Distributes the discount amount in proportion to the `ListPriceTotal` values of the order items. Available in API version 65.0 and later.
`AppliedDiscount`	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The discount amount that's distributed among all the order items that have prices associated with them. This amount is distributed based on the logic specified in the `AdjustmentDistributionLogic` field. Available in API version 65.0 and later.
`AppliedDiscountAmount`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The percent discount applied to each order item. Available in API version 65.0 and later.
`CalculationStatus`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The status of the price and tax calculations for the order. Valid values are: • `CompletedWithPricing`—Indicates that pricing is complete and tax will now be calculated. • `CompletedWithTax`—Indicates that pricing and tax calculation are complete. • `CompletedWithoutPricing`—Indicates that pricing and tax calculation were skipped. For a sales rep, this value appears as `Unknown` on the order page. • `ConfigurationFailed`—Indicates that configuration failed. Available in API version 62.0 • `ConfigurationInProgress`—Indicates that the configuration is in progress. Available in API version 62.0 • `GroupRampConfigurationFailed`—Indicates that the checks for group ramps have failed. Available in API version 65.0 and later. • `OrderRequestFailed`—Indicates that the requested order changes weren't saved. Available in API version 62.0 • `OrderRequestPartiallySaved`—Indicates that the requested order changes were partially saved. Available in API version 62.0

Field	Details
	• PriceCalculationFailed—Indicates that pricing failed. • ReconciliationFailed—Indicates that the arrangement of order data failed. Available in API version 62.0 • ReconciliationInProgress—Indicates that the arrangement of data is in progress. For a sales rep, this value appears as Saving on the order page. Available in API version 62.0 • SaveFailedOrIncomplete—Indicates that the recent changes to the order weren't saved. For a sales rep, this value appears as Some Records Weren't Saved on the order page. • TaxCalculationFailed—Indicates that pricing is complete but tax calculation failed. • TaxCalculationWaiting—Indicates that pricing is complete and a request sent to the tax engine, but tax calculation isn't complete. This read-only field is available in API version 61.0 and later.
DiscountPercent	**Type** percent **Properties** Filter, Nillable, Sort **Description** The percentage of discount applied to the order. The discount percent calculation is ((TotalRoundedLineAmount - TotalAmount) / TotalRoundedLineAmount) * 100. Available in API version 60.0 and later.
FulfillmentPlanId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The unique ID of the fulfillment plan associated with the order. This field is a relationship field. This field is available only in orgs where Dynamic Revenue Orchestrator is enabled. Available in API version 60.0 and later. **Relationship Name** FulfillmentPlan **Relationship Type** Lookup **Refers To** FulfillmentPlan
LastPricedDate	**Type** dateTime

Field	Details
	Properties Filter, Nillable, Sort **Description** The date when the order price was last calculated. Available in API version 60.0 and later.
`OrchestrationSbmsStatus`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** The status of order submission for orchestration. This field is available only in orgs where Dynamic Revenue Orchestrator is enabled. Valid values are: • `Completed` • `Rejected` • `Submitted` This read-only field is available in API version 61.0 and later.
`OriginalActionType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies the action that created the order. Valid values are: • `Amend`—Indicates that the order was created to amend assets. • `Cancel`—Indicates that the order was created to cancel assets. • `Renew`—Indicates that the order was created to renew assets. • `Transfer`—Indicates that the order was created to transfer assets. Available in API version 61.0 and later.
`SalesTransactionTypeId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The foreign key to the Sales Transaction Type object. Available in API version 61.0 and later. This field is a relationship field.

Field	Details
	Relationship Name SalesTransactionType **Relationship Type** Lookup **Refers To** SalesTransactionType
`TotalAmountOverride`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The value that the `TotalAmount` field must be set to by applying overall discounts. Transaction Management calculates the overall discount amount by finding the difference between the value in the calculated `TotalAmount` field and the value in this field. It then uses the logic specified in the `AdjustmentDistributionLogic` field to distribute the discount amount among all the order items that have prices associated with them. Available in API version 65.0 and later.
`TotalRoundedLineAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total amount of all line items in an order without pricing adjustments, such as discounts or tax calculations. Available in API version 60.0 and later.
`TransactionType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies the type of order being processed. The valid value is: • `AdvancedConfigurator`—Indicates that the order must be processed by using the configuration rules and constraints set up in Constraint Rules Engine. Available in API version 61.0 and later.
`ValidationResult`	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies whether the order was configured and priced. Orders can be activated only after they're configured and priced. Valid values are: • `MissingContributor`—Indicates that the order contains a derived product but not its pricing source. • `TransactionIncomplete`—Indicates that the order wasn't configured and priced. Available in API version 61.0 and later.

Transaction Management Fields on Order Item

Standard and custom fields extend the standard Order Item object for use in Transaction Management.

Special Access Rules

To view these fields, you must have the Revenue Cloud Advanced license. See Order Item for fields on the Salesforce platform object.

Fields

Field	Details
`CustomProductName`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The custom name of a product that's used to override the product name. The maximum supported length is 80 characters. Available in API version 61.0 and later.
`Discount`	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The manual discount percentage for the order item. Available in API version 60.0 and later.
`DiscountAmount`	**Type** currency

Field	Details
	Properties Create, Filter, Nillable, Sort, Update **Description** The manual discount amount for the order item. Available in API version 60.0 and later.
`EffectiveGrantDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date on which the resources associated with the order item are granted.
`EndDateTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The end date and time of the order item, which is calculated by using the values in the `EndDate`, `EndTime`, and `ServiceEndTimeZone` fields. If the `EndTime` field doesn't have a value, 23:59:59 is used for the calculation. If the `ServiceEndTimeZone` field doesn't have a value, GMT is used for the calculation. Available in API version 65.0 and later.
`EndQuantity`	**Type** double **Properties** Filter, Nillable, Sort **Description** The revised quantity of the item after adjusting changes. The field is read-only. It's calculated by adding the Start Quantity and the Quantity fields. Available in API version 60.0 and later.
`EndTime`	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** The end time of the order item. Available in API version 65.0 and later.
`Margin`	**Type** percent

Field	Details
	Properties Create, Filter, Nillable, Sort, Update **Description** The optional margin percentage, specified by the sales representative at the line item level. Available in API version 65.0 and later.
`MarginAmount`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The optional margin amount, specified by the sales representative at the line item level. Available in API version 65.0 and later.
`NetTotalPrice`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The total price after applying all price adjustments. Available in API version 60.0 and later.
`OrderItemGroupId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The order item group associated with the order item. This field is a relationship field. **Relationship Name** OrderItemGroup **Refers To** OrderItemGroup
`PartnerDiscountPercent`	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The discount percentage given to the partner for the order item. Available in API version 60.0 and later.

Field	Details
PartnerUnitPrice	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The unit price after applying the discount given to the partner for the order item. Available in API version 60.0 and later.
PriceWaterfallIdentifier	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The price waterfall identifier generated by Salesforce Pricing that's associated with the pricing of this order item record. Available in API version 60.0 and later.
SegmentType	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The duration type of the segment. You can use this field from Revenue Cloud only when the **Ramp Deals for Groups in Quotes and Orders** setting is turned on. Valid values are: • `Custom`—Available in API version 65.0 and later. • `Prorated`—Available in API version 67.0 and later. • `Trial`—Available in API version 67.0 and later. • `Yearly`—Available in API version 65.0 and later. The default value is `Yearly`.
ServiceDateTime	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The start date and time of the order item, which is calculated by using the values in the `ServiceDate`, `ServiceTime`, and `ServiceEndTimeZone` fields. If the `ServiceTime` field doesn't have a value, 00:00:00 is used for the calculation. If the `ServiceEndTimeZone` field doesn't have a value, GMT is used for the calculation. Available in API version 65.0 and later.

Field	Details
ServiceEndTimeZone	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The time zone for the order item's start and end dates, times, and datetimes. Available in API version 65.0 and later.
ServiceTime	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** The start time of the order item. Available in API version 65.0 and later.
StartQuantity	**Type** double **Properties** Create, Filter, Nillable, Sort, Update **Description** The quantity available on the order item start date. Available in API version 60.0 and later.
Status	**Type** picklist **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The status of the order item. Available in API version 60.0 and later.
SubscriptionTerm	**Type** int **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The number of terms in the subscription for the item. The unit of the subscription term is stored in the PricingTermUnit field of this order item's related product selling model record (OrderItem.ProductSellingModel.PricingTermUnit). Available in API version 61.0 and later.
TotalAdjustment	**Type** percent

Field	Details
	Properties Filter, Nillable, Sort **Description** The total discount percentage applied at the line item level. This percentage is calculated by using the formula: (Total Line Amount - Net Total Price) / Total Line Amount. Available in API version 65.0 and later.
`TotalCost`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total cost of all products sold in the order, calculated by multiplying the quantity by the unit cost. Available in API version 65.0 and later.
`TotalMargin`	**Type** percent **Properties** Filter, Nillable, Sort **Description** The effective margin percentage at the line item level. This percentage is calculated by using the formula: (Net Total Price - Total Cost) / Net Total Price. Available in API version 65.0 and later.
`TotalMarginAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The effective margin amount at the line item level. This amount is calculated by subtracting total cost from net total price. Available in API version 65.0 and later.
`UnitCost`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The unit cost of a product being sold as part of the order. Available in API version 65.0 and later.
`ValidationResult`	**Type** picklist

Field	Details
	Properties Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies whether the order item was configured and priced. An order can be activated only after all its order items are configured and priced. Valid value is: • `Warning`—Indicates that the order item isn't configured and priced. Available in API version 60.0 and later.

Transaction Management Fields on Order Item Group

Standard and custom fields extend the standard Order Item Group object for use in Transaction Management.

Special Access Rules

To view these fields, you must have the Revenue Cloud Advanced license. See Order Item Group for fields on the Salesforce platform object.

Fields

Field	Details
`Discount`	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The optional discount percentage, specified by the sales representative at the group level. Available in API version 65.0 and later.
`DiscountAmount`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The optional discount amount, specified by the sales representative at the group level. Available in API version 65.0 and later.
`EndDate`	**Type** date

Field	Details
	Properties Create, Filter, Group, Nillable, Sort, Update **Description** The end date of the group. If the `IsRamped` field is set to `true`, Transaction Management sets this date as the end date of all the line items in the group that have the Term-Defined product selling model. Available in API version 65.0 and later.
`IsRamped`	**Type** boolean **Properties** Create, Defaulted on Create, Filter, Group, Sort, Update **Description** Indicates whether the group is a group ramp segment, which is a period in a group ramp schedule with specific products, quantities, and discounts. You can use this field from Revenue Management only when the **Ramp Deals for Groups in Quotes and Orders** setting is turned on. The default value is `false`. Available in API version 65.0 and later.
`Margin`	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The optional margin percentage, specified by the sales representative at the group level. Available in API version 65.0 and later.
`MarginAmount`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The optional margin amount, specified by the sales representative at the group level. This amount can also be considered as the summary margin amount calculated by subtracting the total cost from the summary subtotal. Available in API version 65.0 and later.
`ParentOrderItemGroupId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description The ID of the parent group for a nested quote line group. Available in API version 65.0 and later. This field is a relationship field. **Relationship Name** ParentOrderItemGroup **Refers To** OrderItemGroup
`SegmentType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The duration type of the segment. You can use this field from Revenue Management only when the **Ramp Deals for Groups in Quotes and Orders** setting is turned on. Valid values are: • `Custom`—Available in API version 65.0 and later. • `Prorated`—Available in API version 67.0 and later. • `Trial`—Available in API version 67.0 and later. • `Yearly`—Available in API version 65.0 and later.
`StartDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The start date of the group. If the `IsRamped` field is set to `true`, Transaction Management sets this date as the start date of all the line items in the group. Available in API version 65.0 and later.
`SummaryTotalAmount`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The aggregated total amount of nested group lines before any discounts are applied. Available in API version 65.0 and later.

Field	Details
`TotalAdjustment`	**Type** percent **Properties** Filter, Nillable, Sort **Description** The total discount percentage applied at the group level. This percentage is calculated by using the formula: (Summary Total Amount - Summary Subtotal) / Summary Total Amount. Available in API version 65.0 and later.
`TotalAdjustmentAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total discount amount at the group level. This amount is calculated by subtracting the summary subtotal from the summary total amount. Available in API version 65.0 and later.
`TotalCost`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The aggregated total cost of nested group lines. Available in API version 65.0 and later.
`TotalMargin`	**Type** percent **Properties** Filter, Nillable, Sort **Description** The summary margin percentage at the line item level. This percentage is calculated by using the formula: (Summary Subtotal Total Cost) / Summary Subtotal. Available in API version 65.0 and later.
`TotalMarginAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The summary margin amount calculated at the group level. Available in API version 65.0 and later.

Transaction Management Fields on Order Action

Standard and custom fields extend the standard Order Action object for use in Transaction Management. This object is available in API version 55.0 and later.

Special Access Rules

To view these fields, you must have the Revenue Cloud Advanced license. See Order Action for fields on the Salesforce platform object.

Fields

Field	Details
`Type`	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** The business action that created the order product. Valid values are: • `Add` • `Amend` • `Cancel` • `No Change`—A child product was added to the bundle, but the top-level product in the bundle was otherwise unchanged. • `Renew`

Transaction Management Fields on Order Item Relationship

Standard and custom fields extend the standard Order Item Relationship object for use in Transaction Management. This object is available in API version 58.0 and later.

Special Access Rules

To view these fields, you must have the Revenue Cloud Advanced license. See Order Item Relationship for fields on the Salesforce platform object.

Fields

Field	Details
`ProductRelatedComponentId`	**Type** reference

Field	Details
	Properties Create, Filter, Group, Nillable, Sort **Description** The ID of the product that is included in a product bundle, a set, or a product and an add-on. This field is a relationship field. **Relationship Name** ProductRelatedComponent **Relationship Type** Lookup **Refers To** ProductRelatedComponent

Transaction Management Fields on Quote

Standard and custom fields extend the standard Quote object for use in Transaction Management to represent information about quotes. This object is available in API version 60.0 and later.

Special Access Rules

To view these fields, you must have the Revenue Cloud Advanced license. See Quote for fields on the Salesforce platform object.

Fields

Field	Details
`AdjustmentDistributionLogic`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies how the overall discount amount is distributed among all the quote line items that have prices associated with them. The amount distributed is either the value specified in the `AppliedDiscountAmount` field or the difference between the values in the calculated `TotalPrice` and the user-specified `TotalPriceOverride` fields. Valid values are: • `Equal`—Distributes the discount amount equally among all the quote line items. • `Proportionate`—Distributes the discount amount in proportion to the `ListPriceTotal` values of the quote line items. Available in API version 65.0 and later.

Field	Details
`AppliedDiscount`	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The percent discount applied to each quote line item. Available in API version 65.0 and later.
`AppliedDiscountAmount`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The discount amount that's distributed among all the quote line items that have prices associated with them. This amount is distributed based on the logic specified in the `AdjustmentDistributionLogic` field. Available in API version 65.0 and later.
`LastPricedDate`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The date when the quote is last priced.
`OriginalActionType`	**Type** picklist **Properties** Filter, Group, Nillable, Restricted picklist, Sort **Description** Specifies the action that created the quote. Valid values are: • `Amend`—Indicates that the quote was created to amend assets. • `Cancel`—Indicates that the quote was created to cancel assets. • `Renew`—Indicates that the quote was created to renew assets. • `Transfer`—Indicates that the quote was created to transfer assets. Available in API version 61.0 and later.
`PartnerAccountId`	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update

Field	Details
	Description ID of the related partner account. This field is a relationship field. **Relationship Name** PartnerAccount **Relationship Type** Lookup **Refers To** Account
`TotalPriceOverride`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The value that the `TotalPrice` field must be set to by applying overall discounts. Transaction Management calculates the overall discount amount by finding the difference between the value in the calculated `TotalPrice` field and the value in this field. It then uses the logic specified in the `AdjustmentDistributionLogic` field to distribute the discount amount among all the quote line items that have prices associated with them. Available in API version 65.0 and later.
`TotalPriceWithTax`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The sum of `TotalPrice` and `TotalTaxAmount`. This field is available only when you turn on Add Estimated Tax to Quotes and Orders settings and enable Revenue Cloud in your org. Available in API version 64.0 and later.
`TotalTaxAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total amount of all taxes. This field is available only when you turn on Add Estimated Tax to Quotes and Orders settings and enable Revenue Cloud in your org. Available in API version 64.0 and later.

Field	Details
	This field is a calculated field.
`TransactionType`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies the type of quote being processed. Valid value is: • `AdvancedConfigurator`—Indicates that the transaction must be processed by using the configuration rules and constraints set up in Constraint Rules Engine. Available in API version 62.0 and later.
`ValidationResult`	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies whether the quote was configured and priced. This field serves as a staleness indicator. When this value is blank, pricing is up-to-date. When this value is set, it signals that the quote needs attention before its pricing can be trusted. Valid values are: • `Blank/null`—Specifies that the quote pricing is current and valid. • `MissingContributor`—Specifies that the quote contains a derived product but not its pricing source. This occurs when the quote contains derived products without its necessary pricing sources. • `TransactionIncomplete`—Specifies that the quote wasn't configured and priced. This typically occurs when a line item or action is modified outside the standard pricing flow, such as saving changes through a method other than the Place Quote or Place Sales Transaction API. Available in API version 61.0 and later.

Transaction Management Fields on Quote Line Group

Standard and custom fields extend the standard Quote Line Group object for use in Transaction Management.

Special Access Rules

To view these fields, you must have the Revenue Cloud Advanced license. See Quote Line Group for fields on the Salesforce platform object.

Fields

Field	Details
`Discount`	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The optional discount percentage, specified by the sales representative at the group level. Available in API version 65.0 and later.
`DiscountAmount`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The optional discount amount, specified by the sales representative at the group level. Available in API version 65.0 and later.
`EndDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The end date of the group. If the `IsRamped` field is set to `true`, Transaction Management sets this date as the end date of all the line items in the group that have the Term-Defined product selling model. Available in API version 65.0 and later.
`IsRamped`	**Type** boolean **Properties** Create, Defaulted on Create, Filter, Group, Sort, Update **Description** Indicates whether the group is a group ramp segment, which is a period in a group ramp schedule with specific products, quantities, and discounts. You can use this field from Revenue Management only when the **Ramp Deals for Groups in Quotes and Orders** setting is turned on. The default value is `false`. Available in API version 65.0 and later.

Field	Details
Margin	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The optional margin percentage, specified by the sales representative at the group level. Available in API version 65.0 and later.
MarginAmount	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The optional margin amount, specified by the sales representative at the group level. This amount can also be considered as the summary margin amount calculated by subtracting the total cost from the summary subtotal. Available in API version 65.0 and later.
ParentQuoteLineGroupId	**Type** reference **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The ID of the parent group for a nested quote line group. Available in API version 65.0 and later. This field is a relationship field. **Relationship Name** ParentQuoteLineGroup **Refers To** QuoteLineGroup
SegmentType	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The duration type of the segment. You can use this field from Revenue Management only when the **Ramp Deals for Groups in Quotes and Orders** setting is turned on. Valid values are: • `Custom`—Available in API version 65.0 and later. • `Prorated`—Available in API version 67.0 and later. • `Trial`—Available in API version 67.0 and later.

Field	Details
	• `Yearly`—Available in API version 65.0 and later.
`StartDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The start date of the group. If the `IsRamped` field is set to `true`, Transaction Management sets this date as the start date of all the line items in the group. Available in API version 65.0 and later.
`SummaryTotalAmount`	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The aggregated total amount of nested group lines before any discounts are applied. Available in API version 65.0 and later.
`TotalAdjustment`	**Type** percent **Properties** Filter, Nillable, Sort **Description** The total discount percentage applied at the group level. This percentage is calculated by using the formula: (Summary Total Amount - Summary Subtotal) / Summary Total Amount. Available in API version 65.0 and later.
`TotalAdjustmentAmount`	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total discount amount at the group level. This amount is calculated by subtracting the summary subtotal from the summary total amount. Available in API version 65.0 and later.
`TotalCost`	**Type** currency **Properties** Filter, Nillable, Sort

Field	Details
	Description The aggregated total cost of nested group lines. Available in API version 65.0 and later.
TotalMargin	**Type** percent **Properties** Filter, Nillable, Sort **Description** The summary margin percentage at the line item level. This percentage is calculated by using the formula: (Summary Subtotal Total Cost) / Summary Subtotal. Available in API version 65.0 and later.
TotalMarginAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The summary margin amount calculated at the group level. Available in API version 65.0 and later.

Transaction Management Fields on Quote Line Item

Standard and custom fields extend the standard Quote Line Item object for use in Transaction Management to represent information about line items in a quote. This object is available in API version 60.0 and later.

Special Access Rules

To view these fields, you must have the Revenue Cloud Advanced license. See Quote Line Item for fields on the Salesforce platform object.

Fields

Field	Details
DiscountAmount	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** Specifies the fixed amount discount to apply to the quote line item.

Field	Details
`EffectiveGrantDate`	**Type** date **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The date on which the resources associated with the quote line item are granted.
`EndDateTime`	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The end date and time of the quote line item, which is calculated by using the values in the `EndDate`, `EndTime`, and `StartEndTimeZone` fields. If the `EndTime` field doesn't have a value, 23:59:59 is used for the calculation. If the `StartEndTimeZone` field doesn't have a value, GMT is used for the calculation. Available in API version 65.0 and later.
`EndQuantity`	**Type** double **Properties** Filter, Nillable, Sort **Description** The quantity available on the quote line item end date. The field is read-only. It is calculated by adding the Start Quantity and the existing Quantity fields.
`EndTime`	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** The end time of the quote line item. Available in API version 65.0 and later.
`Margin`	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The optional margin percentage, specified by the sales representative at the line item level. Available in API version 65.0 and later.

Field	Details
MarginAmount	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The optional margin amount, specified by the sales representative at the line item level. Available in API version 65.0 and later.
PartnerDiscountPercent	**Type** percent **Properties** Create, Filter, Nillable, Sort, Update **Description** The discount percentage given to the partner for the quote line.
PartnerUnitPrice	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The unit price after discount given to the partner for the quote line.
PriceWaterfallIdentifier	**Type** string **Properties** Filter, Group, Nillable, Sort **Description** The price waterfall identifier generated by Salesforce Pricing that's associated with the pricing of the detail record.
StartDateTime	**Type** dateTime **Properties** Filter, Nillable, Sort **Description** The start date and time of the quote line item, which is calculated by using the values in the StartDate, StartTime, and StartEndTimeZone fields. If the StartTime field doesn't have a value, 00:00:00 is used for the calculation. If the StartEndTimeZone field doesn't have a value, GMT is used for the calculation. Available in API version 65.0 and later.

Field	Details
StartEndTimeZone	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The time zone for the quote line item's start and end dates, times, and datetimes. Available in API version 65.0 and later.
StartTime	**Type** time **Properties** Create, Filter, Nillable, Sort, Update **Description** The start time of the quote line item. Available in API version 65.0 and later.
StartQuantity	**Type** double **Properties** Create, Filter, Nillable, Sort **Description** The quantity available on the quote line item start date.
TotalAdjustment	**Type** percent **Properties** Filter, Nillable, Sort **Description** The total discount percentage applied at the line item level. This percentage is calculated by using the formula: (Total Line Amount - Net Total Price) / Total Line Amount. Available in API version 65.0 and later.
TotalCost	**Type** currency **Properties** Filter, Nillable, Sort **Description** The total cost of all products sold in the order, calculated by multiplying the quantity by the unit cost. Available in API version 65.0 and later.
TotalMargin	**Type** percent

Field	Details
	Properties Filter, Nillable, Sort **Description** The effective margin percentage at the line item level. This percentage is calculated by using the formula: (Net Total Price - Total Cost) / Net Total Price. Available in API version 65.0 and later.
TotalMarginAmount	**Type** currency **Properties** Filter, Nillable, Sort **Description** The effective margin amount at the line item level. This amount is calculated by subtracting total cost from net total price. Available in API version 65.0 and later.
UnitCost	**Type** currency **Properties** Create, Filter, Nillable, Sort, Update **Description** The unit cost of a product being sold as part of the order. Available in API version 65.0 and later.
ValidationResult	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies whether the quote line item is configured and priced. A quote can be activated only after all its quote line items are configured and priced. Valid value is: • `Warning`—Indicates that the quote line item isn’t configured and priced. Available in API version 60.0 and later.

Transaction Management Fields on Quote Document

Standard and custom fields extend the standard Quote Document object for use in Transaction Management to represent information about quote documents. This object is available in API version 61.0 and later.

Special Access Rules

To view these fields, you must have the Revenue Cloud Advanced license. See Quote Document for fields on the Salesforce platform object.

Fields

Field	Details
`Document Template`	**Type** String **Properties** Create, Filter, Group, Nillable, Sort **Description** The template ID used for generating the quote document.
`Status`	**Type** Picklist **Properties** Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** The status of the quote document. Possible values are: • `Completed` • `Failed` • `Generating` • `In Progress` • `None` • `Queued` The default value is `None`.

Transaction Management Tooling API Objects

Tooling API exposes metadata used in developer tooling that you can access through REST or SOAP. Tooling API's SOQL capabilities for many metadata types allow you to retrieve smaller pieces of metadata.

TransactionProcessingType
Represents the settings to configure the processing constraints for a request.. This object is available in API version 63.0 and later.

TransactionProcessingType

Represents the settings to configure the processing constraints for a request.. This object is available in API version 63.0 and later.

Important: Where possible, we changed noninclusive terms to align with our company value of Equality. We maintained certain terms to avoid any effect on customer implementations.

Refer to the Usage section to learn more about creating Transaction Processing Type records based on your requirements. See the setup details to specify the default rule engine on the Revenue Settings page.

Supported SOAP API Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`

Supported REST API Methods

`GET, HEAD, POST, Query`

Fields

Field	Details
`Description`	**Type** string **Properties** Create, Filter, Group, Nillable, Sort, Update **Description** The description of the transaction processing configuration to help Salesforce admins with configuration in their orgs.
`DeveloperName`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** Required. The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is **Record Type Name**.
`Language`	**Type** picklist **Properties** Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Nillable, Update **Description** The language of the TransactionProcessingType object. Valid values are:

Field	Details
	• `da`—Danish • `de`—German • `en_US`—English • `es`—Spanish • `es_MX`—Spanish (Mexico) • `fi`—Finnish • `fr`—French • `it`—Italian • `ja`—Japanese • `ko`—Korean • `nl_NL`—Dutch • `no`—Norwegian • `pt_BR`—Portuguese (Brazil) • `ru`—Russian • `sv`—Swedish • `th`—Thai • `zh_CN`—Chinese (Simplified) • `zh_TW`—Chinese (Traditional)
`MasterLabel`	**Type** string **Properties** Create, Filter, Group, Sort, Update **Description** The label for the TransactionProcessingType object.
`PricingPreference`	**Type** string **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies whether to execute the price calculation step for each sales transaction record. Valid values are: • `Force`—Reprices all lines. • `System`—Performs a delta pricing request on the unprocessed lines when Delta Pricing is enabled in the org. • `Skip`—Skips the pricing request on all lines. Available in API version 65.0 and later.

Field	Details
RatingPreference	**Type** string **Properties** **Description** Specifies whether catalog rates are fetched and saved during quote creation. Valid value is `Fetch`. Use this value to retrieve and save catalog rates for usage resources associated with each sales transaction record. If this value isn't specified, catalog rates aren't saved by default when a quote line item is added to a quote. Available in API version 66.0 and later if Rate Management is enabled.
RuleEngine	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort **Description** The rule engine to be used for processing rules. Valid values are: • `AdvancedConfigurator` • `StandardConfigurator`
SaveType	**Type** picklist **Properties** Create, Filter, Group, Restricted picklist, Sort, Update **Description** Specifies how the transaction results are processed when saved for Salesforce administrators to adjust the user experience as desired. Valid values are: • `Standard` • `Large`—Reserved for future use.
TaxPreference	**Type** picklist **Properties** Create, Filter, Group, Nillable, Restricted picklist, Sort, Update **Description** Specifies whether to execute or skip the tax calculation step for each sales transaction record. Valid value is `Skip`. If this value isn't specified, then tax calculation request is performed by default. Available in API version 65.0 and later.

Usage

Create transaction type records by calling this resource through a POST method.

```
/services/data/v67.0/tooling/sobjects/TransactionProcessingType
```

Here's a sample payload that specifies the rule engine to use and steps to skip for each sales transaction record.

```
{
  "SaveType": "Standard",
  "Description": "Setup for Transaction Processing Type",
  "DeveloperName": "SkipPricingAndTaxStep",
  "MasterLabel": "SkipPricingAndTaxStep",
  "RuleEngine": "StandardConfigurator",
  "PricingPreference": "Skip",
  "TaxPreference": "Skip"
}
```

Here's a sample payload that specifies a value for rating preference and the steps to skip for each sales transaction record.

```
{
  "SaveType": "Standard",
  "Description": "Setup for Transaction Processing Type",
  "DeveloperName": "SkipPricingAndTaxStep",
  "MasterLabel": "SkipPricingAndTaxStep",
  "RuleEngine": "StandardConfigurator",
  "PricingPreference": "Skip",
  "TaxPreference": "Skip",
  "RatingPreference": "Fetch"
}
```

Transaction Management Platform Event

Use the QuoteSaveEvent event to notify subscribers after saving of a quote is processed.

EDITIONS

Available in: Lightning Experience

Available in all Salesforce orgs where the admin settings for products related to the use case are enabled. The Salesforce org must have a Revenue Management or Subscription Management license.

CreateAssetOrderEvent
: Notifies subscribers that the process started by the `/actions/standard/createOrUpdateAssetFromOrder` or `/actions/standard/createOrUpdateAssetFromOrderItem` request is complete. If the process is successful, use this event to learn about the new assets. If the request isn't successful, use this event to learn about the errors and how to fix them. This object is available in API version 55.0 and later.

PlaceOrderCompletedEvent
: Notifies subscribers of an order being created or updated by invoking the Place Order API or the Place Sales Transaction API. This object is available in API version 63.0 and later.

QuoteSaveEvent
: Notifies subscribers that the process started by the Place Quote or Place Sales Transaction API request is complete. If the process is successful, use this event to learn about the updated quote. If the request isn't successful, use this event to learn about the errors and how to fix them. This object is available in API version 60.0 and later.

QuoteToOrderCompletedEvent

Notifies subscribers when the `/actions/standard/createOrderFromQuote` REST request is complete. If the request is successful, use this event to learn about the Order record. If the request isn't successful, use this event to learn about the errors associated with the request. This object is available in API version 56.0 and later.

CreateAssetOrderEvent

Notifies subscribers that the process started by the `/actions/standard/createOrUpdateAssetFromOrder` or `/actions/standard/createOrUpdateAssetFromOrderItem` request is complete. If the process is successful, use this event to learn about the new assets. If the request isn't successful, use this event to learn about the errors and how to fix them. This object is available in API version 55.0 and later.

Supported Calls

`describeSObjects()`

Subscription Channel

`/event/CreateAssetOrderEvent`

Event Delivery Allocation Enforced

No

Special Access Rules

This object is available if Subscription Management or Revenue Cloud is enabled in your org. Users must have Read access on this event to receive or view event notifications.

Fields

Field	Details
`AssetDetails`	**Type** CreateAssetOrderDtlEvent on page 1377 **Properties** Nillable **Description** A list of AssetDetail records created as a result of a successful request. Each AssetDetail contains an order item ID, asset ID, and IsSuccess flag. If the request failed, the AssetDetail also contains an error code and error message.
`CorrelationIdentifier`	**Type** string **Properties** Nillable **Description** Reserved for future use.
`EventUuid`	**Type** string **Properties** Nillable **Description** A universally unique identifier (UUID) that identifies a platform event message.
`IsLastEvent`	**Type** boolean **Properties** Defaulted on create **Description** Indicates whether this event is the final event in the request (`true`) or not (`false`). If `true`, then there are no more events associated with the request. This field is populated only in the final event in the request. The default value is `false`. This field is available in API version 62.0 and later.
`OrderIdentifier`	**Type** string **Properties** Nillable

Field	Details
	Description The ID of the order associated with this event. Available with Revenue Cloud in API version 64.0 and later.
`ReplayId`	**Type** string **Properties** Nillable **Description** Represents an ID value that is populated by the system and refers to the position of the event in the event stream. Replay ID values aren't guaranteed to be contiguous for consecutive events. A subscriber can store a replay ID value and use it on resubscription to retrieve missed events that are within the retention window.
`RequestIdentifier`	**Type** string **Properties** Nillable **Description** Id of the request that triggered the event.

Example: A user successfully runs a `createOrUpdateAssetFromOrder` request on an order with two order items. The published createAssetOrderEvent contains this information.

- RequestId: 0001
- AssetDetail
  - OrderItemId: 802XX0000000001
  - AssetId: 02iXX000000001
  - IsSuccess: True
- AssetDetail
  - OrderItemId: 802XX0000000001
  - AssetId: 02iXX000000002
  - IsSuccess: True

Example: A user runs a `createOrUpdateAssetFromOrder` request on an order with two order items, but doesn't have Create access on assets. The request fails, and the published createAssetOrderEvent contains this information.

- RequestId: 0002
- AssetDetail
  - OrderItemId: 802XX0000000001
  - IsSuccess: False

    - ErrorCode: `INSUFFICIENT_ACCESS`
    - ErrorMessage: User doesn’t have Create Access to asset.
- AssetDetail
    - OrderItemId: 802XX0000000001
    - IsSuccess: False
    - ErrorCode: `INSUFFICIENT_ACCESS`
    - ErrorMessage: User doesn’t have Create Access to asset.

CreateAssetOrderDtlEvent
Contains information about an attempt to create or update an asset as a result of `/actions/standard/createOrUpdateAssetFromOrder`. If the request was successful, the event shows information about the asset. If the request failed, the event shows error information. This object is included in an `CreateAssetOrderEvent` message. You can't subscribe to `CreateAssetOrderDtlEvent` directly. This object is available in API version 55.0 and later.

CreateAssetOrderDtlEvent

Contains information about an attempt to create or update an asset as a result of `/actions/standard/createOrUpdateAssetFromOrder`. If the request was successful, the event shows information about the asset. If the request failed, the event shows error information. This object is included in an `CreateAssetOrderEvent` message. You can't subscribe to `CreateAssetOrderDtlEvent` directly. This object is available in API version 55.0 and later.

Fields

Field	Details
`AssetId`	**Type** reference **Properties** Nillable **Description** The ID of the asset that was created or updated. This field is a relationship field. **Relationship Name** Asset **Relationship Type** Lookup **Refers To** Asset
`ErrorCode`	**Type** string **Properties** Nillable **Description** Reference code for the type of error that occurred.
`ErrorMessage`	**Type** string **Properties** Nillable **Description** Information about the error that occurred after the request was made.
`EventUuid`	**Type** string **Properties** Nillable **Description** A universally unique identifier (UUID) that identifies a platform event message.
`IsSuccess`	**Type** boolean **Properties** Defaulted on create

Field	Details
	Description Indicates whether the request to create the asset for the order item was successful (true) or not (false). The default value is `false`. Available in API version 61.0 and later.
`OrderItemId`	**Type** reference **Properties** **Description** The ID of the order item used in the request. Available in API version 61.0 and later. This field is a relationship field. **Relationship Name** OrderItem **Relationship Type** Lookup **Refers To** OrderItem
`ReplayId`	**Type** string **Properties** Nillable **Description** Represents an ID value that is populated by the system and refers to the position of the event in the event stream. Replay ID values aren't guaranteed to be contiguous for consecutive events. A subscriber can store a replay ID value and use it on resubscription to retrieve missed events that are within the retention window.

PlaceOrderCompletedEvent

Notifies subscribers of an order being created or updated by invoking the Place Order API or the Place Sales Transaction API. This object is available in API version 63.0 and later.

Fields

Field	Details
`AppUsageTypes`	**Type** string **Properties** Nillable **Description** Tag that represents the application that's using the order and determines how an order is processed. For example, the `AppUsageTypes` field value for Revenue Cloud orders is `RevenueLifecycleManagement`.
`CorrelationIdentifier`	**Type** string **Properties** Nillable **Description** Reserved for future use.
`EventUuid`	**Type** string **Properties** Nillable

Field	Details
	Description A universally unique identifier (UUID) that identifies a platform event message.
`HasErrors`	**Type** boolean **Properties** Defaulted on create **Description** Indicates whether errors occurred when creating or updating the order (`true`) or not (`false`). The default value is `false`.
`OrderId`	**Type** reference **Properties** Nillable **Description** ID of the order record. This field is a relationship field. **Relationship Name** Order **Refers To** Order
`ReplayId`	**Type** string **Properties** Nillable **Description** Represents an ID value that is populated by the system and refers to the position of the event in the event stream. Replay ID values aren't guaranteed to be contiguous for consecutive events. A subscriber can store a replay ID value and use it on resubscription to retrieve missed events that are within the retention window.
`RequestIdentifier`	**Type** string **Properties** Nillable **Description** ID of the request that triggered the event.

QuoteSaveEvent

Notifies subscribers that the process started by the Place Quote or Place Sales Transaction API request is complete. If the process is successful, use this event to learn about the updated quote. If the request isn't successful, use this event to learn about the errors and how to fix them. This object is available in API version 60.0 and later.

	events. A subscriber can store a replay ID value and use it on resubscription to retrieve missed events that are within the retention window.
`RequestIdentifier`	**Type** string **Properties** Nillable **Description** The unique ID returned in the `actions/standard/createOrderFromQuote` response. Use this ID to identify the event for a specific request.

Transaction Management Business APIs

Use the Transaction Management Business APIs to fetch instant pricing data on a quote or an order, to create a quote, or to create an order.

This table lists the available Transaction Management resources.

Resource	Description
`/connect/revenue-management/assets/actions/amend` (POST)	Initiate and execute the amendment of a quote or an order.
`/connect/revenue-management/assets/actions/cancel` (POST)	Initiate and execute the cancellation of an asset.
`/connect/revenue-management/assets/actions/renew` (POST)	Initiate and execute the renewal of an asset.
`/industries/cpq/quotes/actions/get-instant-price` (POST)	Fetch instant pricing data on the quote or order line data grid and associated summary component. This API offers capabilities to either create a context or update the existing one based on the provided context ID.
`/commerce/sales-orders/actions/place` (POST)	Place orders with integrated pricing, configuration, and validation, and manage them throughout their entire lifecycle. Additionally, update an order or insert order items.

Resource	Description
/commerce/quotes/actions/place (POST)	Create a quote to discover and price products and services. Additionally, insert, update, or delete a quote line item.
/connect/revenue-management/sales-transaction-contexts/**resourceId**/actions/ramp-deal-create (POST)	Create a ramp deal for a customer on a product. Sales reps can use ramp deals to provide yearly deals to a customer, resulting in long-term revenue and customer relationship. A customer can create, update, or view multiple segments of periods for their subscription term with different attributes for each segment.
/connect/revenue-management/sales-transaction-contexts/**resourceId**/actions/ramp-deal-update (POST)	Modify a ramp deal in scenarios where a segment has updates such as quantity, discount, or date change.
/connect/revenue-management/sales-transaction-contexts/**resourceId**/actions/ramp-deal-view (GET)	View a ramp deal related to a quote line item or an order item.
/connect/revenue-management/sales-transaction-contexts/**resourceId**/actions/ramp-deal-delete (POST)	Delete a ramp deal to convert a ramped product to include a single quote line item or order item.
/connect/rev/sales-transaction/actions/place (POST)	Create a sales transaction, such as an order or a quote, with integrated pricing and configuration. Also, update an order or a quote, and insert and delete order or quote line items to calculate the estimated tax.
/connect/rev/sales-transaction/actions/clone (POST)	Create a clone of a sales transaction, such as a quote or an order. You can also clone a quote line item or an order item record with its related records and configurations.
/connect/rev/sales-transaction/actions/place-supplemental-transaction (POST)	Create a supplemental order or change orders after they are submitted for processing, such as during the fulfillment process.

Resource	Description
/connect/revenue/transaction-management/sales-transactions/actions/read (POST)	Retrieve sales transaction data efficiently from an initialized or a hydrated context.
/global-promotions-management/promotions (GET, POST, PUT)	Get rewards based on a product selling model template.
/revenue/transaction-management/sales-transactions/actions/get-eligible-promotions (POST)	Get eligible promotions for line items within a quote or an order.
/revenue/transaction-management/assets/actions/swap (POST)	Exchange one product for another of equivalent or different value. The change is tracked as a swap request with linked asset actions and a net-zero order total where applicable. The API creates an amendment quote and order with order actions and quote action subtypes.
/revenue/transaction-management/assets/actions/upgrade (POST)	Move a lower-tier product to a higher-tier product. The change is tracked as an upgrade request with linked asset actions and quote or order line linkage for reporting and auditing. This API creates an amendment quote and order with order actions and quote action subtypes.
/revenue/transaction-management/assets/actions/downgrade (POST)	Move to a lower-tier or lower-value product. The change is tracked as a downgrade request with linked asset actions and quote or order line linkage for reporting and auditing. This API creates an amendment quote and order with downgrade-specific order actions and quote action subtypes.

SEE ALSO:

Connect REST API Developer Guide: Introduction

Resources

Learn more about the available Quote and Order Capture resources.

Asset Amendment (POST)

Initiate and execute the amendment of a quote or an order.

Asset Cancellation (POST)

Initiate and execute the cancellation of an asset.

Asset Renewal (POST)

Initiate and execute the renewal of an asset.

Clone Sales Transaction (POST)

Create a clone of a sales transaction, such as a quote or an order. You can also clone a quote line item or an order item record with its related records and configurations.

Create Promotions (GET, POST, PUT)

Get rewards based on a product selling model template.

Get Eligible Promotions (POST)

Get eligible promotions for line items within a quote or an order.

Initiate Downgrade (POST)

Move to a lower-tier or lower-value product. The change is tracked as a downgrade request with linked asset actions and quote or order line linkage for reporting and auditing. This API creates an amendment quote and order with downgrade-specific order actions and quote action subtypes.

Initiate Swap (POST)

Exchange one product for another of equivalent or different value. The change is tracked as a swap request with linked asset actions and a net-zero order total where applicable. The API creates an amendment quote and order with order actions and quote action subtypes.

Initiate Upgrade (POST)

Move a lower-tier product to a higher-tier product. The change is tracked as an upgrade request with linked asset actions and quote or order line linkage for reporting and auditing. This API creates an amendment quote and order with order actions and quote action subtypes.

Instant Pricing (POST)

Fetch instant pricing data on the quote or order line data grid and associated summary component. This API offers capabilities to either create a context or update the existing one based on the provided context ID.

Place Order (POST)

Place orders with integrated pricing, configuration, and validation, and manage them throughout their entire lifecycle. Additionally, update an order or insert order items.

Place Quote (POST)

Create a quote to discover and price products and services. Additionally, insert, update, or delete a quote line item.

Place Sales Transaction (POST)

Create a sales transaction, such as an order or a quote, with integrated pricing and configuration. Also, update an order or a quote, and insert and delete order or quote line items to calculate the estimated tax.

Place Supplemental Transaction (POST)

Create a supplemental order or change orders after they are submitted for processing, such as during the fulfillment process.

Read Sales Transaction (POST)

Retrieve sales transaction data efficiently from an initialized or a hydrated context.

Retrieve Sales Transaction API Errors (GET)

Retrieve any asynchronous error details associated with a sales transaction request.

Create Ramp Deal (POST)

Create a ramp deal for a customer on a product. Sales reps can use ramp deals to provide yearly deals to a customer, resulting in long-term revenue and customer relationship. A customer can create, update, or view multiple segments of periods for their subscription term with different attributes for each segment.

Delete Ramp Deal (POST)

Delete a ramp deal to convert a ramped product to include a single quote line item or order item.

Update Ramp Deal (POST)

Modify a ramp deal in scenarios where a segment has updates such as quantity, discount, or date change.

View Ramp Deal (GET)

View a ramp deal related to a quote line item or an order item.

Asset Amendment (POST)

Initiate and execute the amendment of a quote or an order.

Considerations

For usage products, creating an order directly by setting `outputRecordType` to `Order` is currently not supported. The direct-to-order flow can create Order Products without required related Rate Card Entry records, which can cause order activation to fail.

When you amend usage assets, use a two-step flow.

- Create an amendment quote by calling `initiateAmendment` with `outputRecordType` set to `Quote`.
- Create an order from that amendment quote.

Special Access Rules

To use this API, you need the InitiateAmend API permission set.

Resource

```
/connect/revenue-management/assets/actions/amend
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/revenue-management/assets/actions/amend
```

Available version

62.0

HTTP methods

POST

Request body for POST

JSON example

```
{
  "assetIds": [
    "02iSG0000003NMhYAM",
    "02iSG0000006DvSYAU"
  ],
  "amendmentStartDate": "2023-10-04T00:00:00",

  "opportunityId": "006SG000004W5tVYAS",
  "outputRecordId": "801SG00000DX1jWYAT",
  "outputRecordType": "Quote",
  "quantityChange": 5
}
```

Properties

Name	Type	Description	Required or Optional	Available Version
assetIds	String[]	IDs of the assets that you want to add to the amendment record.	Required	62.0
amendmentStartDate	String	Start date of the amendment.	Required	62.0
contractId	String	ID of the Contract record that you want to sync with the amendment quote.	Optional	62.0
opportunityId	String	ID of the Opportunity record that you want to sync with the amendment quote.	Optional	62.0
outputRecordId	String	ID of the quote or order record that you want to add the assets to.	Optional	62.0
outputRecordType	String	Type of amendment record that you want to create. For usage products, set this value to Quote. The usage-related records (QuoteLineItemUseResourceGrant, QuoteLineItemUsageResourcePolicy, and QuoteLineRateCardEntry) are copied in the quote action flow, not in the amend order flow.	Required	62.0
quantityChange	Double	Quantity to add to or reduce from the asset's existing quantity.	Required	62.0

Response body for POST

Amendment

Asset Cancellation (POST)

Initiate and execute the cancellation of an asset.

Special Access Rules

To use this API, you need the InitiateCancellation API permission set.

Resource

```
/connect/revenue-management/assets/actions/cancel
```

Resource example

```
https://yourInstance.salesforce.com/services/data/v67.0/connect/revenue-management/assets/actions/cancel
```
