

SC-3346 — Renewal-Maintenance Pricing

Root cause & fix for renewal-maintenance lines committing the wrong price. Powertech IAM (BoKS) — the Fortra-sanctioned DPP product.

VERDICT

FIXED. Root cause found, fix built, deployed, and proven end-to-end — a renewal now commits the correct COLA net **\$67.38** instead of the frozen **\$60.64 / \$0**. One Setup-UI toggle remains to switch it on in production.

\$67.38

NOW COMMITS (WAS
\$60.64/\$0)

THE DEFECT — IN BUSINESS TERMS

When a customer renews their maintenance, the renewal line was pricing at the **wrong amount** — a stale **\$60.64** (or **\$0**) instead of the correct cost-of-living-adjusted renewal of **\$67.38** (last year's net \$62.48 × 7.85% COLA). The pricing math was always right; the value simply never *committed* to the line. Multiple prior attempts to patch it had failed because they all worked at the wrong layer.

ROOT CAUSE — A SELLING-MODEL MISMATCH (FOUND VIA END-TO-END DEBUG)

- 1 New-business maintenance is sold as a **One-Time** product, so the asset the customer owns is One-Time — **not a renewable subscription**.
- 2 The platform's renewal therefore tags that asset as **"No Change" / quantity 0** — it never enters the COLA renewal-pricing path (which only fires on a **Renew** action).
- 3 The legacy design then **deleted** that owned-asset line and substituted a separate "Renewal Maintenance" line that has **no asset to price against** — so it froze at the wrong value or \$0.
- 4 **The fix:** stop discarding the owned line — **flip it to Renew** and let the native engine apply the COLA uplift to last year's net. No new pricing logic, no catalog change.

THE FIX — WHAT WAS BUILT & DEPLOYED

1 • Apex: `RenewalMaintenanceFlip`

Flips the owned-maintenance renewal line from **No Change** → **Renew** and sets the renew quantity. ~120 lines, bulk-safe, **4/4 unit tests pass**. Deployed to UAT.

2 • Flow: `Fortra_Create_Renewal_Quote`

Wired so every renewal automatically runs **flip** → **reprice**:

```
initiate renewal → Flip Maintenance → Reprice → $67.38 committed
```

VALIDATION — END-TO-END, ON A REAL OWNED ASSET

CHECK	RESULT
Renewal flips owned maintenance to Renew	PASS qty 1, action = Renew
Commits the correct COLA net	PASS NetUnitPrice = \$67.38 (= \$62.48 × 1.0785)
No double partner-discount	PASS COLA applied to the partner-net LTP
Line survives the renewal cleanup	PASS 1 line, \$67.38, no stray \$0 line
Unit tests	PASS 4 / 4
Downstream (Workday line-type, billing, ARR)	SAFE verified independent of the maintenance-type split

WHY EARLIER ATTEMPTS FAILED — THE WRONG LAYER (RULED OUT, SO THEY NEED NEVER BE TRIED AGAIN)

ATTEMPTED LEVER	WHY IT CAN'T WORK
Write NetUnitPrice directly	DEAD engine-owned, read-only on insert
Posthook / procedure committer / RMPS	DEAD reprice-time writes no-op on a settled derived line (proven 3×)
Map the owned product as a price contributor (PBEDP)	DEAD platform-blocked — it's a derived product
Hand-attach a renewal QuoteAction	DEAD doesn't resolve the contributor; only the real renewal does
Re-model the catalog (merge products)	UNNEEDED higher blast radius; the flip achieves the same outcome

TO SWITCH ON IN PRODUCTION

One Setup-UI step (owner): deactivate the Year-2 AutoAdd rule [140WC0000022Eyb2AE](#) so the asset-less “Renewal Maintenance” line is no longer added (it’s Configuration-Rule metadata, only toggable in Setup). With it off, the flipped line is the sole, correctly-priced maintenance line. Then: one production renewal smoke-test, and resolve the pre-existing [COLAUpliftTest](#) coverage drift before prod promotion.
