Solution Overview

Approvals

The approval solution transforms the traditional sequential approval process into an intelligent, multi-dimensional system that evaluates approval requirements at the line, bundle, and quote levels simultaneously. By implementing Revenue Cloud's flow-based approval orchestration combined with Smart Approval features, the system dramatically reduces approval cycle times while maintaining compliance with both Tech and Cyber business unit approval matrices. The design enables partial approvals, where individual line items can be rejected without requiring complete quote resubmission, significantly improving sales velocity and customer experience.

Approval Architecture Components

The approval system consists of multiple integrated components working together to provide a seamless approval experience. Each component serves a specific purpose in the overall orchestration, from initial trigger evaluation through final approval notification.

Component	Purpose	Key Features
Flow Orchestration Engine	Core approval orchestration	Visual process builder, conditional branching, parallel processing
Smart Approval Rules	Intelligent routing logic	AI-based predictions, historical analysis, dynamic assignment
Approval Matrix Configuration	Business unit specific rules	Tech and Cyber matrices, discount thresholds, special scenarios
Work Guide Interface	Unified approver experience	Centralized dashboard, mobile support, bulk actions
Platform Events	Real-time notifications	Instant alerts, status updates, integration triggers

Business Unit Approval Matrices

Tech Business Unit Approvals

The Tech business unit maintains specific discount thresholds that trigger approval requirements at different organizational levels. These thresholds ensure proper oversight while empowering sales teams to operate efficiently within defined parameters.

Please reference [Fortra Approval Matrix - Google Sheets](#) for Tech and Cyber Approvals noted on the tabs at the bottom.

Flow-Based Approval Orchestration Design

Multi-Level Approval Evaluation

The system evaluates approval requirements at three distinct levels, each with its own criteria and routing logic. This multi-dimensional approach ensures comprehensive coverage while maintaining efficiency through parallel processing where appropriate.

Approval Level	Trigger Criteria	Evaluation Scope	Processing Mode
Line Level	Individual product discounts, Special terms	Each quote line independently	Parallel evaluation
Bundle Level	Bundle discount thresholds, Component dependencies	All lines within a bundle	Sequential after line approval
Quote Level	Total value, Payment terms, Contract type	Entire quote aggregate	Final validation step

Approval Flow Process

The approval flow follows an intelligent routing pattern that optimizes for both compliance and speed. The process begins with automatic evaluation of all approval requirements, followed by smart routing to appropriate approvers based on the specific criteria triggered.

Flow Orchestration Steps:

1. Initial Evaluation

- Quote submission triggers flow orchestration
- System evaluates all line items against approval matrix
- Identifies required approval levels and approvers
- Creates approval work items

2. Parallel Processing

- Line-level approvals execute simultaneously
- Independent evaluation prevents bottlenecks
- Smart routing based on product type and discount

3. Bundle Consolidation

- After line approvals, bundle-level evaluation
- Aggregates component approvals
- Applies bundle-specific business rules

4. Quote Validation

- Final quote-level checks
- Total value thresholds
- Special scenario validation (MYCAP, Displaced ARR)

5. Smart Approval Features

- AI-powered approval predictions
- Historical pattern matching
- Suggested approver recommendations
- Automatic escalation for time-sensitive deals

Approval User Experience

Sales Representative Experience

Sales representatives benefit from a streamlined submission process with real-time visibility into approval status. The system provides proactive guidance to help avoid common approval delays and rejections.

Key Features for Sales Teams:

- **Pre-Submission Validation:** Real-time alerts for approval triggers
- **Status Dashboard:** Visual approval progress tracking
- **Smart Notifications:** Alerts for required actions or updates
- **Approval History:** Access to previous approval patterns
- **Guidance Text:** Context-sensitive help for approval requirements

Approver Experience

Approvers interact with a unified Work Guide interface that consolidates all pending approvals, provides complete context, and enables efficient decision-making through bulk actions and intelligent recommendations.

Feature	Benefit
Unified Work Queue	All approvals in one place with priority sorting
Context Panel	Complete quote details without navigation
Comparison Tools	Side-by-side analysis with similar deals
Bulk Actions	Approve/reject multiple items simultaneously
Delegation Options	Easy reassignment with audit trail
Mobile Optimization	Full functionality on mobile devices
Analytics Integration	Personal approval metrics and trends
